the small systems journal
SWTPC announces first dual minifloppy kit under $1,000

Now SWTPC offers complete best-buy computer system with $995 dual minifloppy, $500 video terminal/monitor, $395 4K computer.

$995 MF-68 Dual Minifloppy
You need dual drives to get full benefits from a minifloppy. So we waited to offer a floppy until we could give you a dependable dual system at the right price.

The MF-68 is a complete top-quality minifloppy for your SWTPC Computer. The kit has controller, chassis, cover, power supply, cables, assembly instructions, two highly reliable Shugart drives, and a diskette with the Floppy Disk Operating System (FDOS) and disk BASIC. (A floppy is no better than its operating system, and the MF-68 has one of the best available.) An optional $850 MF-6X kit expands the system to four drives.

$500 Terminal/ Monitor
The CT-64 terminal kit offers these premium features: 64-character lines, upper/lower case letters, switchable control character printing, word highlighting, full cursor control, 110-1200 Baud serial interface, and many others. Separately the CT-64 is $325, the 12 MHz CT-VM monitor $175.

$395 4K 6800 Computer
The SWTPC 6800 comes complete with 4K memory, serial interface, power supply, chassis, famous Motorola MIKBUG® mini-operating system in read-only memory (ROM), and the most complete documentation with any computer kit. Our growing software library includes 4K and 8K BASIC (cassettes $4.95 and $9.95; paper tape $10.00 and $20.00). Extra memory, $100/4K or $250/8K.

Other SWTPC peripherals include $250 PR-40 Alphanumeric Line Printer (40 characters/line, 5 x 7 dot matrix, 75 line/minute speed. compatible with our 6800 computer and MITS/IMSAI); $79.50 AC-30 Cassette Interface System (writes/reads Kansas City standard tapes, controls two recorders, usable with other computers); and other peripherals now and to come.

Now SWTPC offers complete best-buy computer system with $995 dual minifloppy, $500 video terminal/monitor, $395 4K computer.

Enclosed is:

$1,990 for the full system shown above (MF-68 Minifloppy, CT-64 Terminal wth CT-VM Monitor)
$995 for the Dual Minifloppy
$325 for the CT-64 Terminal
$175 for the CT-VM Monitor
$395 for the 4K 6800 Computer

$250 for the PR-40 Line Printer
$79.50 for AC-30 Cassette Interface
Additional 4K memory boards at $100
Additional 8K memory boards at $250
Or BAC # Exp. Date

To make your computer more useful—
a wide choice of memory, I/O, CPU

Your computer's usefulness depends on the capability of its CPU, memories, and I/O interfaces, right?

So here's a broad line of truly useful computer products that lets you do interesting things with your Cromemco Z-1 and Z-2 computers. And with your S-100-compatible Altairs and IMSAIs, too.

**CPU**
- **Z-80 MICROPROCESSOR CARD.** The most advanced µP card available. Forms the heart of our Z-1 and Z-2 systems. Also a direct replacement for Altair/IMSAI CPUs. Has 4-MHz clock rate and the power of the Z-80 µP chip. Kit (Model ZPU-K): $295. Assembled (Model ZPU-W): $395.

**MEMORIES**
- **16K RAM.** The fastest available. Also has bank-select feature. Kit (Model 16KZ-K): $495. Assembled (Model 16KZ-W): $795.
- **THE BYTESAVER—a 8K capacity PROM card with integral programmer.** Uses high-speed 2708 erasable PROMS. A must for all computers. Will load 8K BASIC into RAM in less than a second. Kit (Model BSK-O): $145. Assembled (Model BSW-O): $245.
- **16K CAPACITY PROM CARD.** Capacity for up to 16K of high-speed 2708 erasable PROM. Kit (Model 16KPR-K): $145. Assembled (Model 16KPR-W): $245.

**I/O INTERFACES**
- **FAST 7-CHANNEL DIGITAL-ANALOG I/O.** Extremely useful board with 7 A/D channels and 7 D/A channels. Also one 8-bit parallel I/O channel. Kit (Model D + 7A-K): $145. Assembled (Model D + 7A-W): $245.
- **DIGITAL INTERFACE (OUR NEW TU-ART).** Interfaces with teletype, CRT terminals, line printers, etc. Has not one but two serial I/O ports and two 8-bit parallel I/O ports as well as 10 on-board interval timers. Kit (Model TRT-K): $195. Assembled (Model TRT-W): $295.
- **JOYSTICK.** A console that lets you input physical position data with above Model D + 7 A/D card. For games, process control, etc. Contains speaker for sound effects. Kit (Model JS-1-K): $65. Assembled (Model JS-1-W): $95.

**PROFESSIONAL QUALITY**
You get first-class quality with Cromemco.

Here are actual quotes from articles by independent experts: “The Cromemco boards are absolutely beautiful” . . . “The BYTESAVER is tremendous” . . . “Construction of Cromemco I/O and joystick are outstanding” . . . “Cromemco peripherals ran with no trouble whatsoever.”

Everyone agrees. Cromemco is tops.

**STORES/MAIL**
So count on Cromemco. Look into these Cromemco products at your store. Or order by mail from the factory.

We wish you pleasure and success with your computer.
Meet the most powerful 
μC system available for dedicated work.
Yet it’s only $595.

Here’s the muscle you’ve been telling us you wanted: a powerful Cromemco microcomputer in a style and price range ideal for your dedicated computer jobs—ideal for industrial, business, instrumentation and similar applications.

It’s the new Cromemco Z-2 Computer System. Here’s some of what you get in the Z-2 for only $595:
• The industry’s fastest μP board (Cromemco’s highly regarded 4 MHz, 250-nanosecond cycle time board).
• The power and convenience of the well-known Z-80 μP.
• A power supply you won’t believe (+8V @ 30A, +18V and -18V @ 15A — ample power for additional peripherals such as floppy disk drives).
• A full-length shielded motherboard with 21 card slots.
• Power-on-jump circuitry to begin automatic program execution when power is turned on.
• S-100 bus.
• Standard rack-mount style construction.
• All-metal chassis and dust case.
• 110- or 220-volt operation.

DEDICATED APPLICATIONS
The new Z-2 is specifically designed as a powerful but economical dedicated computer for systems work. Notice that the front panel is entirely free of controls or switches of any kind. That makes the Z-2 virtually tamper-proof. No accidental program changes or surprise memory erasures.

FASTEST, MOST POWERFUL μC
Cromemco’s microcomputers are the fastest and most powerful available. They use the Z-80 microprocessor which is widely regarded as the standard of the future. So you’re in the technical forefront with the Z-2.

BROAD SOFTWARE/PERIPHERALS SUPPORT
Since the Z-2 uses the Z-80, your present 8080 software can be used with the Z-2. Also, Cromemco offers broad software support including a monitor, assembler, and a BASIC interpreter.
The Z-2 uses the S-100 bus which is supported by the peripherals of dozens of manufacturers. Naturally, all Cromemco peripherals such as our 7-channel A/D and D/A converter, our well-known BYTESAVER with its built-in PROM programmer, our color graphics interface, etc., will also plug into the S-100 bus.

LOW, LOW PRICE
You’ll be impressed with the Z-2’s low price, technical excellence and quality. So see it right away at your computer store—or order directly from the factory.

Z-2 COMPUTER SYSTEM KIT (MODEL Z-2K) (includes 4 MHz μP card, full-length 21-card-slot motherboard, power supply, one card socket and card-guide set, and front panel; for rack mounting) .............. $595.

Z-2 COMPUTER SYSTEM ASSEMBLED (MODEL Z-2W) (includes the above as well as all 21 sockets and card guides and a cooling fan; for rack mounting) . . . . $995.

BYTE is published monthly by BYTE Publications Inc, 70 Main St, Peterborough NH 03458. Address all mail except subscriptions to above address; phone (603) 924-7217. Address all editorial correspondence to the editor at the above address. Unacceptable manuscripts will be returned if accompanied by sufficient first class postage. Not responsible for lost manuscripts or photos. Opinions expressed by the authors are not necessarily those of BYTE. Address all subscriptions, change of address, Form 3579, and fulfillment complaints to BYTE Subscriptions, PO Box 381, Arlington MA 02174; phone (617) 668-4329. Second class postage paid at Peterborough NH 03458 and at additional mailing offices—USPS Publication No. 102410. Subscriptions are $12 for one year, $22 for two years, and $33 for three years in the USA and its possessions. Add $5.50 per year for subscriptions to Canada and Mexico. $12 for a one year subscription by surface mail worldwide. Air delivery to select ed areas at additional rates available upon request. $25 for a one year subscription by air delivery to Europe, or DM 80,— for a one year subscription through our European distributor in Darmstadt, West Germany. Single copy price is $1.50 in the USA and its possessions, $2 in Canada and Mexico, and $3 elsewhere, or DM 7,— through our European distributer in Darmstadt, West Germany.

Foreign subscriptions and sales should be remitted in United States funds. Printed in United States of America. Entire contents copyright © 1977 by BYTE Publications Inc. All rights reserved.
In This Issue

One of the most exciting aspects of experimentation with computers is using the computer to make objects move. Distilling this excitement to its simplest form, Leon Svare, Thomas Dwyer and Margot Critchfield at the University of Pittsburgh's Project Solo have designed a "one-dimensional plotter" which is used as the output display for the familiar Lunar Lander simulation game. Read Controlling Small DC Motors with Analog Signals.

The small computer field is expanding fast. Growing with it is a need for more microprocessor oriented courses in our universities. In his article, A Microprocessor Course, Mark E Fohl explains how he helped initiate a microprocessor course at Franklin University in Columbus OH and details some of the difficulties instructors might expect to run into.

Read Joe Weisbecker's COSMAC VIP, the RCA Fun Machine, a personal description of his new COSMAC VIP kit. This article contains some background information on one man's design philosophy and its result in a new product from RCA.

The lead article of our special section on APL (A Programming Language) was written, appropriately, by the man who developed it at IBM during the early 1960s: Dr Kenneth E Iverson. In Understanding APL, Dr Iverson analyzes some basic APL operators through a series of questions designed to test your powers of induction. The article concludes with some challenging APL "thought experiments" for your decoding pleasure.

An excellent way to become more familiar with APL is to read David D Keefe's Here's APL in Action! David has written an APL version of the popular Lunar Lander game along with a detailed description of the entire program to help the reader decipher those high information density APL statements.

Have you ever wanted to own a truly powerful computer? APL may be an answer to this quest for an ultimate language when it is added to an otherwise mundane computer. Mike Wimble's An APL Interpreter for Microcomputers can help you implement APL if you have a flair for doing it yourself software. With a little effort you can use any of the popular processors to produce your own APL interpreter from Mike's design.

Have you always wanted to have an elegant looking computer art program for graphic display, but didn't want to spend the time required to program it? Try Serendipitous Circles! Authors Galway and Anderson have discovered a simple algorithm to create beautiful and unusual moving patterns in no time at all.

The ability to handle and manipulate text is a very useful function. It allows programs to be changed very quickly without having to manipulate large amounts of data (and it is certainly better than an IBM correcting Selectric typewriter for writing and manipulating text). In his article, Editorializing with Your Computer, Gary McGath describes some of the properties of simple text editing programs.

What makes APL such a heavily discussed topic among small system enthusiasts? How does it differ from BASIC, and why should you use it at all? Allen Atwood discusses all of these topics and more in Why People Get Hooked on APL. Find out what you've been missing by programming in BASIC.

Often it is necessary to determine the data that is present on a particular port or set of lines of a computer for purposes such as debugging. The usual indicator bit pattern consisting of individual lamps can be very confusing and lead to errors if read quickly. R R Burns offers a solution to this problem. In his article, An 8 Digit Hexadecimal Readout, he describes a test rig that can monitor 32 lines in groups of four bits.

In this issue, Ralph Tenny describes some of the tricks (some call them kluges) which can be done with pulse waveform edges, Schmitt triggers, resistors and capacitors. Turn to Look What You Can Do... with an Edge as a Cue to understand some of the design practices you may occasionally find in a processor.

In two earlier articles in BYTE W Douglas Maurer described an algorithm for processing algebraic expressions when implementing compilers or interpreters. In his latest contribution to BYTE's ongoing flow of tutorials on computer science problems and techniques, Dr Maurer presents an ingenious extension of the Bauer-Samelson algorithm which will enable the do-it-yourself compiler writer to create efficient object code for expressions involving logical operators and comparisons of operands.

Many people use their computers as number crunchers and want quick, accurate algorithms for determining some fairly involved mathematical functions. Typical examples are trigonometric functions, hyperbolic functions and exponentiation. In his article, Simple Algorithms for Calculating Elementary Functions, John Rheinstein details several algorithms to calculate these functions quickly.

How do you get rid of bugs? Set out a few traps using techniques outlined in John M Schulein's article on A Trapping Technique for the 8080.
I am sometimes asked by persons new to the field, “What is the best way to approach the problem of learning enough about computers and their intricacies to allow the neophyte to accomplish useful tasks?” Some thoughts on this subject, with an aside on simplicity and system design, provide the theme for this essay on the philosophy of personal computing usage and experimentation. My point of departure for this thought journey is an old but useful principle adapted to a modern context.

The Principle of Simplicity

There is a famous rule of thumb which is well-known to philosophers, logicians, mathematicians and natural scientists, which might be called the “Principle of Simplicity.” The familiar name for this principle is the rule of “Occam’s Razor” after a medieval logician (William of Occam) who has become identified with the concept. Paraphrased from the typical undergraduate

Continued on page 66
One Sol-20 equals three computers.

To do real work with any computer, big or small, it takes a complete system. That's one of the nice things about the Sol-20. It was built from the ground-up as the heart of three fixed price computer systems with all the peripheral gear and software included to get you up and on the air.

Sol System I costs just $1649 in kit form or $2129 fully burned in and tested. Here's what you get: a Sol-20 with the SOLOS personality module for stand alone computer power, an 8192 word memory, a 12" TV/video monitor, a cassette recorder with BASIC software tape and all necessary cables.

Sol System II has the same equipment plus a larger
capacity 16,384 word memory. It sells for $1883 in kit form; $2283 fully assembled.

For even more demanding tasks, Sol System III features Sol-20/SOLOS, a 32,768 word memory, the video monitor, Helios II Disk Memory System and DISK BASIC Diskette. Price, $4750 in kit form, $5450 fully assembled and tested.

And remember, though we call these small or personal computer systems, they have more power per dollar than anything ever offered. They provide performance comparable with mini-computer systems priced thousands of dollars more.

The Small Computer Catalog for the rest of the real computer system story.

Visit your local computer store for a copy of our fully illustrated 22 page catalog. Or you may write or call us if more convenient. Please address Processor Technology, Box B, 6200 Hollis Street, Emeryville, CA 94608. (415) 652-8080.

The functional beauty of Sol Computer Systems is more than skin deep. A look inside reveals a simple elegance of design and sturdy construction.
OPTIMIZING KEYBOARDS?

Dear Mr. Holmes:

In your editorial in the April 1977 BYTE, you made mention of the Dvorak system. By one of those peculiar coincidences, among great minds like ourselves, I was justly a concept of an ergonomic keyboard—based upon the Dvorak system and the new P.C.D. Ltd. $42 Queens Road, Barnborough, Hulls, England, I Multimedia Electric Typewriter—Keyboard (see photo, pg 96 April 1977 Popular Science). Below is a rough version, the gold keys single function, red cut lined keys—suitable for use with ASCII. Current functions, carry over.

It seems to me that computer/typewriter becomes more universal, we should investigate the Dvorak + ergonomic styles.

Gary Goodman
P.O. Box 596
Harrisonburg, Ky., 40443
(602) 227-1806

With the ability to reduce keystrokes at will, it is possible to do considerable experimentation with keyboard meaning just within the confines of a standard key layout. The PCD keyboard seen in Popular Science April 1977 and sketched in your letter represents experimentation with physical placement, a different order of problem.

HIRED GIRL AND THE MOWBOT

Re: James F Ward (Ask BYTE, BYTE, Volume 2, Number 4, page 59):

There is a robot lawnmower. It is called "Mowbot," and has been written up in magazines such as Scientific American and Esquire. It is a self-propelled mower that covers the area to be mowed in a random walk. Out-of-bounds areas are marked by a current carrying wire buried just below the surface of the ground; the Mowbot senses the magnetic field around the wire and "bounces" off the boundary in a random direction. If it contacts an object, it stops. Besides not requiring an operator, one claimed advantage is that the random path covered by the machine eliminates undesirable mowing patterns. The time required to cover a given area in a random path is surprisingly not much greater than the time required using a regular path (nonrandom path). This gadget has been marketed for some time. A similar idea could be used for a home vacuum cleaner, although making it small enough to sweep under the furniture would be a tough mechanical problem. Those who were devotees of B grade TV as children will remember "Science Fiction Theater" story that featured a mysterious couple from the future who used such a gadget in their home. Of course, Dan Davis has already invented it. (See Heinlein, R. A., The Door into Summer, Signet Books, New York.) I bought it when paperbacks were still 50 cents. In the book, "Hired Girl" was first marketed in 1970; however, not in this universe.

William R Hamblen
946 Evans Rd
Nashville TN 37204

MORE INFORMATION ON MOWBOT

Enclosed is a data sheet for the Mowbot automatic lawnmower which I distribute in the Cincinnati OH area. This lawnmower has been around for at least seven years and costs considerably less than the $1500 quoted in the letter from James Ward found on page 59 of April 1977 BYTE.

The lawnmower is completely automatic and will cut around trees, permanent obstacles and patios with no problem. The secret to the Mowbot's performance is a buried 14 gauge copper wire which is placed around the perimeter of your yard about 1 to 2 inches below the surface. The signal generator which comes with the Mowbot generates a high frequency current which the Mowbot detects and turns away from. The Mowbot's pattern is completely random which gives your lawn a finished manicured look. And meanwhile, you are off watching TV, playing golf or working on your robot to clean your house (a chore the Mowbot will not presently perform). If you thought you might be interested in this "robot" lawnmower. If I can be of any more assistance, please let me know.

Kim Pollock
11824 Fairsprings Ct
Cincinnati OH 45246

The Mowbot is manufactured by Kistler Products, 9 Hacket Dr., Tonawanda NY 14150. A factory representative in phone conversation said that a limited number are available from stock for $775. The company also markets a swimming pool cleaner which works on a similar principle.

SMALL COMPUTERS

While skimming EDN magazine this morning I found an item that brought to mind your April 1977 editorial concerning Arthur Clarke's Minisec. Pages 43 to 46 of the April 20 1977 issue of EDN have an article on a microproces-
The program, as it stands, requires that the lower limit + 16 be greater than the upper limit at the end of the program to start its last record (03BB DAC303 JC PN1). Changing this instruction to JM PN1 solves this problem.

Bug Report on
“Flights of Fancy...”

In the March 1977 issue I found an old friend about whom I'd like to make a few comments. I am referring to “Flights of Fancy with the Enterprise.” This version of Star Trek is a modified version (aren't they all) of STTR1, the Star Trek game provided by Hewlett-Packard for their 2000F series time-sharing systems. Further, it was a submitted program, so where it came from originally, I ran across it in their program library listings soon after I had discovered computers and programming in high school. Being an optimistic beginner I decided that I would modify it to run on our 2000E series system which did not support formatted output nor have a workspace large enough to hold the entire program.

After some work I succeeded in splitting it into three pieces which could chain (call into execution) to each other, and which communicated through a common block which was undisturbed by the chaining process. As a side effect of this work I discovered some of the bugs in the original version, one of which is still present in the listing which appears in the March issue.

If one attempts to warp out of the galaxy, the program will die a ghastly death with a subscript out of range error. This is because the handy code used if you move more than one quadrant (lines 1360 to 1470) does not check for or correct this situation. To see that this

SWTP 6800 Owners–We Have a Cassette I/O for You!

The CIS-30+ allows you to record and playback data using an ordinary cassette recorder at 30, 60 or 120 Bytes/Sec! No Hassle! Your terminal connects to the CIS-30+ which plugs into either the Control (MP-C) or Serial (MP-S) Interface of your SWTP 6800 Computer. The CIS-30+ uses the self clocking ‘Kansas City’/Biphase Standard. The CIS-30+ is the FASTEST, MOST RELIABLE CASSETTE I/O you can buy for your SWTP 6800 Computer.

PerCom has a Cassette I/O for your computer!

POWER.

IMSAI Introduces the Megabyte Micro.

The Megabyte Memory

Until today, the largest memory you could fit and address in a single microcomputer CPU was 65K.

Now, IMSAI presents an incredible memory system for micros 16 times more powerful than yesterday's best.

Imagine, a full megabyte of power from sixteen 65K RAM boards.

And, to control all this, the IMSAI Intelligent Memory Manager (IMM), the super control board.

You can write protect blocks throughout the full megabyte. Or, map in 16K blocks.

Plus, preset 16 mapping configurations with protect for high speed transfer or rapid change.

All interrupts are fully vectored, and there's an interrupt if an attempt is made to write into protected memory.

There's even a real "time of day" clock.

65K, 32K and 16K RAM Boards

Until today, the most memory you could plug into a single slot was 16K.

Now, IMSAI presents memory boards in astonishing multiples of sixteen: 65K, 32K and 16K low power, dynamic RAM Boards. They can be used in any S-100 bus computer individually or in combination to form conventional systems up to 65K bytes.

Every board is fast. With "hidden refresh" and no "wait state."

The Complete Megabyte Microcomputer System

The IMSAI Megabyte Micro™ is only part of the story. The full system can include dual floppy disks, terminals, plotters, printers and tape cassettes.

IMSAI also offers the finest high level and peripheral software available. Paper tape and Tape Cassette I/O and super Disk Operating Systems. Plus, BASIC and Disk BASIC with more high level languages coming.

Until today, the microcomputer's potential was just something you talked about.

Now, you can put it to work. Powerfully.

Circle 106 on inquiry card.
problem really exists, start in quadrant 1, sector 1, and move in direction 3 with warp factor of 1 (01 = 1, S1 = 1, S2 = 1, W1 = 1, C1 = 3).
You will find that you end up in quadrant 1, sector 8, and the next time an array is indexed with the quadrant coordinates you will have a problem.

Exactly what one should do isn't clear: you can either type a nasty error message and stop the ship at the edge of the galaxy, or you can make the galaxy "circular" so that the ship comes back in on the other side. In my original correction I modified the move section to actually move the ship from one sector to the next, across as many quadrants as necessary to complete the move. This single stepping allowed me to catch the ship in the act of trying to leave the galaxy and stop it at the edge with a warning about navigation out of the galaxy being prohibited. These changes or those to implement any other reasonable solution are not difficult but do require careful thought.

In hand tracing my example above you will find a bug new to this version: the array C (which is used in course calculations) is not completely defined. In lines 170 and 180 of the 18 elements are initialized. What the other seven have in them when they are first used (presuming your system will let you evaluate expressions with undefined variables in them) is anyone's guess and will most certainly not be what you want. The other seven values should be defined in say line 185 as follows:

I don't wish to sound like I'm putting Mr Price's work down; overall, this version looks quite reasonable. I do have two suggestions (both are things that were in the original but are not in this version) which I feel make the game more enjoyable.

1. The short range scans should be completely optional as they take a long time to type on a Teletype and are often not needed.
2. The player should be told what quadrant and sector they are in after each ship movement. It seems to me that this game would be very difficult to play since you don't know where you started or where you are in the galaxy. How do you know where to look for the rest of the Klingons without wandering around aimlessly hoping to find them? (Not knowing where you've been makes it hard to know where you haven't been.) This lack of information also makes the "flight out of the galaxy" bug worse; if you don't know where you are it's easier to go too far the wrong way.

I also seem to remember that there is a problem in the library computer section, but I don't remember exactly what or where it is. Perhaps it has been corrected in this version, if it comes back to me I'll let you know.

John Stafford

Information on Selectric conversions is coming; have patience. Dan Fy为中国's article on the 10 Selectrices is a first step, for the electronics of his interface is the same as that required for a converted manual machine. The mechanical details of the interface are discussed in one article presently being edited and a second article promised (but not yet in our office). Both of these latter articles are written by people who have successfully installed working systems.
When we combined our highly praised ZPU board and our System Monitor Board, we defined the standard for the industry; we integrated more power and flexibility in two slots of our motherboard than most other systems can muster using five or more boards. When we put this setup into our rugged aluminum case we created the first XITAN system, the alpha 1. By adding a CRT terminal and/or teleprinter you will have a complete computer system.

KIT: $769  ASSEMBLED & TESTED: $1039

By adding a Z16 memory module and our PACKAGE A software to the alpha 1 we created a second XITAN system, the alpha 2. Thus, a complete and extremely powerful micro-computer system emerges well worthy of you who are operating at the most sophisticated levels. The XITAN alpha 2 provides you with 18K of RAM, 2K of ROM, 2 serial I/O ports, 1 parallel I/O port, our 1200 baud audio cassette interface as well as our extraordinarily powerful software package which includes 8K Basic, the Text Output Processor, the Zapple Text Editor and the Relocating Macro-Assembler. Add your own I/O device and GO...with the most powerful and flexible micro-computer package ever offered.

KIT: $1389  ASSEMBLED & TESTED: $1749

IS YOUR DOLLAR BUYING AS MUCH POWER & FLEXIBILITY AS TDL'S XITAN SYSTEMS PROVIDE?

When we combined our highly praised ZPU board and our System Monitor Board, we defined the standard for the industry; we integrated more power and flexibility in two slots of our motherboard than most other systems can muster using five or more boards. When we put this setup into our rugged aluminum case we created the first XITAN system, the alpha 1. By adding a CRT terminal and/or teleprinter you will have a complete computer system.

KIT: $769  ASSEMBLED & TESTED: $1039

By adding a Z16 memory module and our PACKAGE A software to the alpha 1 we created a second XITAN system, the alpha 2. Thus, a complete and extremely powerful micro-computer system emerges well worthy of you who are operating at the most sophisticated levels. The XITAN alpha 2 provides you with 18K of RAM, 2K of ROM, 2 serial I/O ports, 1 parallel I/O port, our 1200 baud audio cassette interface as well as our extraordinarily powerful software package which includes 8K Basic, the Text Output Processor, the Zapple Text Editor and the Relocating Macro-Assembler. Add your own I/O device and GO...with the most powerful and flexible micro-computer package ever offered.

KIT: $1389  ASSEMBLED & TESTED: $1749

IF YOU ARE A BEGINNER, YOU WON'T EASILY OUTGROW THE XITAN SYSTEM. IF YOU ARE AN ADVANCED USER, YOU WILL DISCOVER XITAN IS EXACTLY WHAT YOU NEED.

Circle 10 on inquiry card.

†Write for descriptive brochure on the XITAN alpha series and system software. When you ask at your dealer, say "ZY-TAN."

ORDERING INFORMATION: Send check, money order or BankAmericard, Master Charge current number and expiration date. Shipping is usually made via UPS or UPS Blue Label. Specify other arrangements if you wish. Prepaid orders are shipped postpaid.

Introducing Apple II.
You've just run out of excuses for not owning a personal computer.

Clear the kitchen table. Bring in the color TV. Plug in your new Apple IIe and connect any standard cassette recorder/player. Now you're ready for an evening of discovery in the new world of personal computers.

Only Apple II makes it easy. It's a complete, ready to use computer, not a kit. At $1298, it includes video graphics in 15 colors. It includes 8K bytes ROM and 4K bytes RAM—easily expandable to 48K bytes using 16K RAMs (see box). But you don't even need to know a RAM from a ROM to use and enjoy Apple II. For example, it's the first personal computer with a fast version of BASIC permanently stored in ROM. That means you can begin writing your own programs the first evening, even if you've had no previous computer experience.

The familiar typewriter-style keyboard makes it easy to enter your instructions. And your programs can be stored on—and retrieved from—a cassette interface, so you can swap with other Apple II users.

You can create dazzling color displays using the unique color graphics commands in Apple BASIC. Write simple programs to display beautiful kaleidoscopic designs. Or invent your own games. Games like PONG—using the game paddles supplied. You can even add the dimension of sound through Apple II's built-in speaker.

But Apple II is more than an advanced, infinitely flexible game machine. Use it to teach your children arithmetic, or spelling for instance. Apple II makes learning fun.

Apple II can also manage household finances, chart the stock market or index recipes, record collections, even control your home environment.

Right now, we're finalizing a peripheral board that will slide into one of the eight available motherboard slots and enable you to compose music electronically. And there will be other peripherals announced soon to allow your Apple II to talk with another Apple II, or to interface to a printer or teletype.

Apple II is designed to grow with you as your skill and experience with computers grows. It is the state of the art in personal computing today, and compatible upgrades and peripherals will keep Apple II in the forefront for years to come.

Write us today for our detailed brochure and order form. Or call us for the name and address of the Apple II dealer nearest you. (408) 996-1010. Apple Computer Inc., 20863 Stevens Creek Boulevard, Bldg. B3-C, Cupertino, California 95014.

SPECIFICATIONS
• Microprocessor: 6502 (1 MHz).
• Video Display: Memory mapped, 5 modes—all Software-selectable:
  · Text—40 characters/line, 24 lines upper case.
  · Color graphics—40h x 48v, 15 colors
  · High-resolution graphics—280h x 192v; black, white, violet, green (12K RAM minimum required)
• Both graphics modes can be selected to include 4 lines of text at the bottom of the display area.
• Completely transparent memory access. All color generation done digitally.
• Memory: up to 48K bytes on-board RAM (4K supplied)
• Uses either 4K or new 16K dynamic memory chips
• Up to 12K ROM (8K supplied)
• Software
  · Fast extended integer BASIC in ROM with color graphics commands
  · Extensive monitor in ROM
• I/O
  · 1500 bps cassette interface
  · 8-slot motherboard
  · Apple game I/O connector
  · ASCII keyboard port
  · Speaker
  · Composite video output

Apple II is a completely self-contained computer system with BASIC in ROM, color graphics, ASCII keyboard, light-weight, efficient switching power supply and molded case. It is supplied with BASIC in ROM, up to 48K bytes of RAM, and with cassette tape, video and game I/O interfaces built-in. Also included are two game paddles and a demonstration cassette.

Apple II™ is a completely self-contained computer system with BASIC in ROM, color graphics, ASCII keyboard, light-weight, efficient switching power supply and molded case. It is supplied with BASIC in ROM, up to 48K bytes of RAM, and with cassette tape, video and game I/O interfaces built-in. Also included are two game paddles and a demonstration cassette.

SPECIFICATIONS
• Microprocessor: 6502 (1 MHz).
• Video Display: Memory mapped, 5 modes—all Software-selectable:
  · Text—40 characters/line, 24 lines upper case.

## Apple II™

Apple II™ is a completely self-contained computer system with BASIC in ROM, color graphics, ASCII keyboard, light-weight, efficient switching power supply and molded case. It is supplied with BASIC in ROM, up to 48K bytes of RAM, and with cassette tape, video and game I/O interfaces built-in. Also included are two game paddles and a demonstration cassette.

Apple II™ is also available in board-only form for the do-it-yourself hobbyist. Has all of the features of the Apple II system, but does not include case, keyboard, power supply or game paddles. $598.

PONG is a trademark of Atari Inc.

*Apple II plugs into any standard TV using an inexpensive modulator (not supplied).
Order your Apple II now.

Use this order form to get your Apple II fast. As a special offer for those who order now, we will include free a custom vinyl carrying case (a $50 value). And we will also pay shipping charges to anywhere in the continental United States.

An APL Update

E H Anthony
Zoology Department
University of Guelph
Guelph, Ontario N1G 2W1
CANADA

You and your contributor, Mark Arnold, are to be congratulated for introducing your readers to APL. Nevertheless, the article in your November 1976 issue may benefit from updating with respect to current usage of some fundamental terminology, especially for those who may have encountered APL for the first time in your journal.

Arnold lists functions such as + × ÷ “↑” but calls them operators. They are functions. Then, when he gets to operators, such as / and . , Arnold calls them composite operators. They are simply operators. Is this not merely nit picking? No, it is not. Is this distinction in terms really important? Yes, it is. To say otherwise is to overlook much that is significant in the evolution of APL.

I believe the corrections proposed here align with the grain of APL in a significant manner. Computer languages scarcely bear close comparison with APL for the simple reason that it is more than just a computer language. First and foremost it is a teaching language. Teaching is the role for which it was born. Requiring a language to be useful in teaching apparently invokes a different and better set of constraints than merely requiring that it enable us to operate a digital computer. In general, it may be said that what is good for teaching is good for all aspects of society. Certainly computer science is not immune to this thesis.

An obvious requirement of a teaching language is consistency in notation and terminology. The lack of such consistency has been a common source of difficulty for those learning traditional mathematics. Common functions like plus and minus have frequently been referred to as operators, while less common ones like sine and cosine have been called functions in the same text. This distinction in terminology tends to divert attention from the basic activity they have in common, namely accepting an (non-functional) argument (or arguments) and returning a result. Using terminology that relates them to the same class of activity emphasizes the underlying unity. The term function seems admirably suited to that usage, although the choice is obviously arbitrary.

Operators perform a higher level of manipulation in APL. They are characterized by the fact that they take a function as one or both of their arguments. (Their introduction necessitates a hierarchy in the order of execution, such that operators are executed prior to functions.) The differences between function and operator in APL may be illustrated with reference to the symbol /, which serves dual roles. If we say / 0 1 1 0/1 2 3 4 5 , we are using the symbol as a compression function. It then has a Boolean vector as left argument and an ordinary numeric vector as a right argument and returns 1 3 4 as a result. Note that neither argument is a function; the only function in the expression is compression, represented by /. If, on the other hand, we say +/1 2 3 4 5 , we are using / as the reduction operator. It takes as its left argument a primitive scalar dyadic function, ie: a function whose three properties are indigenous to APL (present on the keyboard of an APL terminal), that it is defined initially for scalars (single numbers), and that it accepts two arguments. In this specific instance, the left argument of reduction is the plus function. Plus reduction is summation and the oper-

Controlling Small DC Motors

with Analog Signals

(Or, the Key to Making a Realistic Lunar Lander Simulation Display)

Microcomputers are starting to show up in an unexpected variety of places: engineering labs, businesses, factories, golf courses, radio stations, the home, and most recently, the classrooms of adventuresome teachers.

One consequence of this growth has been a rapid expansion in what might be called "blue sky" thinking about how computers might be used. Amateurs aren't afraid to fantasize a bit, knowing that's where half the fun lies. Even when these ideas are too ambitious for immediate implementation, they often suggest simpler partial projects that will eventually fit in as components of a bigger system. For example, getting simple black and white graphics to work on CRT monitors could be the prelude to running a more ambitious sound and color "spectacular" under computer control.

Our experience at Soloworks in applying computers to education indicates that working at this imaginative level helps foster the natural ability of people to learn through creative explorations. This in turn suggests that the more flexible the technology, the better the learning. Computers hold special promise because of the way they can be "transformed" with software. Their main limitation has been at the interface level. For example, it has not been easy to find hardware for controlling "things" (as opposed to symbols on a terminal).

An important first step in solving this problem has been the appearance of analog to digital and digital to analog interface boards (eg: the Cromemco D+7A). On the input side, continuous joystick control now becomes easy. But what about output? In particular, it now makes sense to ask if a computer can be used for control of continuous DC motors. We'll also want to ask if computers can move things according to algorithms that specify position. The answer is yes, provided that (a) we can find a way to amplify the analog output so it can drive a motor, and (b) we can create a feedback path that lets the motor know if it has run long (or fast) enough to accomplish the task at hand.

This article describes one simple approach to solving these two problems. In order to make the ideas involved easier to follow, they are presented in terms of a specific project, namely building a one-dimensional dynamic plotter for use with a "lunar lander" style game. However, with a little imagination, many other applications of these ideas should be possible, including the control of several motors.
The One-Dimensional Plotter

A plotter is an electro-mechanical instrument for displaying the position or motion of some object, usually as a function of time. It can be used for such things as showing the flight path of an airplane or the trajectory of a rocket. To display the position of an airplane it would be necessary to have a three-dimensional display or a three-dimensional plotter \((x, y, z)\), where \(z\) is altitude). To show the flight path of a plane flying at constant altitude only a two-dimensional plotter would be needed. The graph produced would have one axis corresponding to the north-south component of motion, while the other axis would represent the east-west component.

While most general plotting work is done in two dimensions with the mechanism dragging a pen to create a picture on paper, a one-dimensional plotter also has applications. For example, a one-dimensional plotter could be used to show the vertical descent phase of a spaceship making a simulated landing on a moon or planet. A small scale model of the spaceship could be raised and lowered a number of feet with respect to a landing surface (the planet's surface) by a motor-driven derrick-like arrangement. The result would be a dynamic plotter that allowed the "pilot" to practice landings in one-dimension, up-down (see figure 1). Later, other components of motion (dimensions) could be added by using a fancier mechanical setup.

Authors' note: The next few paragraphs can be read over rapidly by those who are not familiar with calculus.

In this design, the information displayed, either graphically or dynamically by a plotter, is the position of the spaceship or other object of interest. The plotter must be told the initial position, and any changes in position as part of the mathematical model of a spaceship landing. Sometimes this change information is not known directly, and must be calculated from other information, such as velocity. For the spaceship problem, the change in position (called displacement or \(\Delta X\)) can be calculated from velocity by integrating the velocity with respect to time: \(\Delta X = \int_0^t v \, dt\). For a constant
In summary, the correct position \( X_C \) is compared by the \( \Sigma \) circuit which tells the motor driver if \( X_C \) is greater than \( X_A \), less...
Figure 3: Details of the motor drive servo circuit. This basic circuit can be used (with appropriate choices of gearing and mechanical arrangement at the feedback pots) to control a large number of mechanisms which depend upon DC motors to set position. The feedback from the position measuring potentiometer $X_d$ is compared with the set point $X_c$ by amplifier IC1. The error signal resulting (if large enough) directly drives the motor after inversion by IC4 when the set point $X_c$ is far away from the actual position $X_d$. As the set point is approached, the direct error signal becomes nearly zero, so the amplified error signals for small positive or negative displacements (IC2 and IC3) become the dominant terms in the summation at the input of IC5, until finally $X_d$ matches $X_c$ within limits set by the small error threshold potentiometers. This complexity of the circuit is required by the fact that the DC motors require a certain minimum drive voltage in order for any motion to occur.

The output of the potentiometer is the position feedback. The job of the circuit of figure 3 is to attempt to make the position feedback voltage equal to the position command voltage by moving the motor until the difference between the two is zero. This is accomplished as follows.

IC1 is connected as a difference amplifier so that its output is equal to approximately $4\varepsilon$, where $\varepsilon = (\text{position command } X_c) - (\text{position feedback } X_d)$. This difference is fed through R15 to the summing amplifier IC4 so that its magnitude is one component of the final motor voltage. Thus, the larger the difference, the larger the voltage, and the faster the motor turns. In actual practice, as this difference approaches 0, it would not be enough to drive a 12 VDC motor. Here is where comparators IC2 and IC3 come in. They are constantly looking to see if the difference voltage, a portion of which appears across R6, is larger than some small positive voltage (set by R13), or smaller than some small negative voltage (set by R14). If

![Circuit Diagram](image-url)
You can buy software from anybody but ours works in your system.

We only sell one product, Quality. Our general ledger does what everybody else's Payroll, A/R, A/P, Inventory, General Ledger, and Tax programs do and it's much shorter and easier to use.

Our "General Ledger Program" (Vol. VI) is a complete comprehensive business system designed to keep ALL of your company's records without the need for updating from other programs and there is NO need to keep monthly tear sheets to be added together for end of the year reports as our system will provide you with year end account totals. This program generates over 30 major reports, including: 941's, P/L's, Balance Sheets, and year end account totals for filing Federal Income Tax Schedule C's and/or 1120's.

All of our programs are available on machine readable media. For those that have specific needs, we can tailor any of our programs for you or we can write one to fit your specific needs.

Future additions:
Soon to be released! A "fantastic" word processing package set up for lawyers, publishers and writers; and a Medical Billing system which will also allow a patient's record to be individually scanned. AND there are rumors that a 12K chess game, in Basic, will also be released.

Subjects Covered in Volumes I - VI

Figure 4: A pictorial schematic of the mechanical arrangement used for the lunar lander model. A main shaft is connected directly to the motor and has a spool of thread used to suspend the model. The direction of the motor controls whether the module rises or falls relative to the ground surface of the planet model as the shaft rotates. The main shaft has a spur gear which drives a large gear to achieve a gear reduction which maps complete physical travel of the model lander into the motion of the pot's wiper through its complete range.

...)
That's right! The TSC Multi-User System brings you the capability you've been asking for! Four simultaneous users, all running BASIC, all independent, and all on the same Micro!

You thought it couldn't be done, but TSC has done it! The basic system sells for less than $130 and is available now. Write for complete details or visit your dealer.

Presently, the system is available only for the SWTPC 6800. It includes a 4-user version of TSC's Micro BASIC Plus. Also available are 8K tape and disc-based BASICS.

*Also be sure to check out the complete line of TSC software, including Text Editors, Word Processing Systems, Assemblers, Utilities, Diagnostics, Interpreters, Games, and more!

Technical Systems Consultants, Inc., P.O. Box 2574, West Lafayette IN 47906

Circle 110 on inquiry card.
In August 1975 Franklin University made a commitment to offer a program in microprocessors. I would like to describe what has happened since then, both in terms of Franklin's goals in offering the course and of my experience in developing and teaching the course.

First of all, the character of Franklin may explain some of the rationale used in organizing the course. Franklin University is located in downtown Columbus, OH. With some 4,000 students, it is the second largest institution of higher education within 50 miles of Columbus, second only to Ohio State. Sixty percent of the students attend classes in the evening. Franklin promotes itself as "a third kind of education": broader than a technical school but more detailed than a liberal arts school. Franklin offers bachelors and associates degrees in business and engineering, and has recently been accredited by the North Central Association of Colleges and Secondary Schools. Franklin keeps in touch with the needs of local industry and stresses practical education.

I am currently a software design engineer at North Electric Company, located near Columbus. Prior to this, I worked at a government division of RCA doing mostly design automation work. One of my projects there was coordinating the design automation efforts for the design and production of a 3 chip CMOS microprocessor. While at North, I taught math part-time at a small school about 40 miles north of Columbus. I wanted to teach closer to home, so I blanketed the schools in Columbus with a letter asking for a teaching position in math, programming or electronics. Dean Sidney Kelly of Franklin responded that there were no such positions open there, but that Franklin was considering offering a course in microprocessors. Following an afternoon interview, we both thought it was worth a try.

Franklin decided that its microprocessor course would offer thorough coverage of the fundamental concepts of microprocessors along with in-depth experience on one particular system. It was also decided that the course would start with the basics with respect to available prerequisites, and continue with hands on experience in a laboratory environment. These goals suggested that the course occupy two trimesters, and that it actually be a 2 course sequence. Each course would have four class hours per week for 15 weeks, and each course would be worth three semester credits. Furthermore, the sequence would be divided equally between lecture and laboratory, with almost all lecture in the beginning, gradually changing to almost all lab in the end. The course prerequisites were listed as a familiarity with digital logic and the binary number system. These prerequisites could be met with Franklin's series of electronics courses, and
It's like adding a room to your brain!

The System 8813 from PolyMorphic Systems is a complete, powerful problem solver in a single walnut cabinet. This machine allows you to perform complex financial, engineering, and scientific models in the comfort of your office or den.

The high speed video display presents your results in text, tables and graphics. The detachable typewriter-like keyboard permits relaxed program entry and operation. Convenient mini-discs store programs and data for compact filing, secure storage, and fast access. Our disc BASIC programming language is simple enough for the computer newcomer, yet powerful enough to amaze the most advanced users.

The whole family can immediately use and enjoy pre-programmed applications and educational packages. Let the System 8813 become your trusted business, profession, and personal tool. The PolyMorphic Disc System is a completely assembled and tested unit with brushed aluminum front panel, walnut cover, detachable keyboard, video monitor, 16K RAM. Includes system software and fully extended BASIC on disc.

System with 1 disc drive — $3250
System with 2 disc drives — 3840
System with 3 disc drives — 4430

Delivery 60 days ARO. Upgrade packages for POLY 88 owners will also be available. Prices and specifications subject to change without notice.

with a course entitled "Computer Calculations." The sequence would be offered not only to full-time students at Franklin, but also to anyone in the community who, for either industrial or personal reasons, wanted a solid background in microprocessors. Students would need no previous experience with microprocessors, and the sequence would be offered as an attractive alternative to a 3 day seminar.

With the philosophies and preliminaries taken care of, implementation of the sequence remained. By this time it was late August, and the sequence was scheduled to begin the following January. Being the instructor, I was responsible for putting the entire package together. Two tasks presented themselves: the first was to adopt a course outline and prepare corresponding lectures, and the second was to equip the laboratory.

The first task was relatively easy. The obvious strategy was to start from the absolute basics and work upward. Accordingly, the course would begin with a review of binary numbers and binary operations. A review of digital logic elements, both gates and flip flops, would be next, followed by development of a generalized arithmetic and logic unit. The arithmetic and logic unit would proceed to a generalized microprocessor unit, followed by a discussion of a particular microprocessor. Course development could not proceed until specific laboratory equipment was selected.

One of the problems at this point was selection of a suitable textbook. No general textbooks on microprocessors were available at the time. I chose Blakeslee's Digital Design with Standard MSI and LSI because a few of its chapters covered microprocessors and microcomputer system elements. In retrospect, the text was not very good for the sequence because of its constant emphasis on hardware design considerations.

While preparing the lectures, I began the process of acquiring laboratory equipment. At the time, the two manufacturers who seemed to be far ahead of the pack were Intel and Motorola. I thought that these two would be in the best position to donate equipment, considering their stable positions in the marketplace and their competitiveness. Accordingly, I contacted local representatives from both Intel and Motorola. I asked each for any help they could provide, and I reminded each that I was talking to the other.

The Intel representative stated flatly that there was nothing he could do personally, but he advised me of a university donation program. I wrote to Intel in California requesting more information and an application form. The material came shortly thereafter, and it turned out that each application was good for up to four kits, each containing an 8080 chip, 256 words of programmable memory, 1 K of blank erasable read only memory, and four 8212 data latch chips. I made a copy of the application and gave it to another instructor at Franklin. We sent in our applications sometime in September; in mid-November, we received eight kits in the mail. Each kit contained the chips plus one programmer reference card.

The Motorola representative said he didn't know exactly what to do, but he was sure there was something. After much correspondence (among him, me, Austin and Phoenix), he said Motorola would provide five Microcomputer Evaluation Kits, without read only memories, if the University would purchase four kits. Each of these kits contained an M6800, 128 words of programmable memory, two PIA's, one ACIA, a printed circuit board, 1 K of read only memory containing the MIKBUG debugging program, assembly instructions, a reference manual, and an applications manual. This offer came in early December.

It appeared that the cash values of Intel's and Motorola's donations were about equal. Intel's equipment was already in, and I had to decide how to proceed. Whereas Intel's donation represented more raw computing power, Motorola's contribution was a better package, which included a tested system design, software and a Teletype interface. Considering that I would have to do the system design for the Intel package, and considering that I was up to my ears already, I opted for the Motorola deal.

The time came now to spend some money. Class was scheduled to start in about four weeks, but we wouldn't be using the lab equipment until about the seventh or eighth week. The dean was reluctant at first to spend any money, but at this point there was no alternative. Besides, the tuition from the students already enrolled in the course was enough to cover both my salary and the lab equipment. The dean gave his blessing, and we proceeded from there. I contacted the Motorola representative and informed him of our decision; then I called the local distributor and ordered the equipment. I expected the equipment to be ready in about two to three weeks, about the same time as the beginning of the winter trimester.

The equipment I ordered from the distributor included all the discrete circuitry specified in the assembly instructions. There were still two glaring omissions from the microcomputer system: the power supply and the IO device. In addition, there was the

COSMAC VIP, the RCA Fun Machine

Joseph A Weisbecker
1220 Wayne Av
Erlton, Cherry Hill NJ 08002

Most beginners think of computers only in terms of solving equations or processing data in English language format. Ask someone with limited exposure to computers about their use in homes and they invariably mention kitchen recipe files, meal planning, income tax preparation or checkbook balancing. I don’t think any of these applications has really caught on so far. This view of computers as super calculators or data processors is apparently shared by many people currently involved in the home computer movement. This orientation keeps prices higher than necessary for the majority of potential hobby users who could have just as much fun with much less sophisticated machines.

The COSMAC VIP was created to provide a viable alternative to expensive hobby computers. It was not designed to compete
with existing systems, but rather to maximize the number of people who can afford to own their own high technology graphics and games fun machine.

In this article I'll give you some background information, outline my design philosophy, and describe the COSMARC VIP system. You can then decide whether this article represents a blatant sales pitch or an honest explanation of a relatively low cost approach to small personal computers. Home or business users who want extensive data processing capability should stop reading now. You will be better off with one of the more expensive BASIC language oriented systems. Those who are beginners or are interested in computers for fun at absolute minimum cost should continue reading.

First some background. About five years ago I developed a system called FRED. This was the prototype for a low cost microcomputer aimed at video games, hobby and school use. (FRED was described in the August 1974 issue of the IEEE Computer magazine.) COSMARC VIP evolved from this FRED system. My family and friends have been using this type of system for almost five years and we've only scratched the surface of applications for it. In fact, my $2000 personal BASIC system seems dull by comparison and is gathering dust. The development of the 1 card COSMARC VIP system is due primarily to a desire to share fun I've been having with as many others as possible. RCA deserves a lot of credit for supporting the development and making the system available for home and school use.

Design Philosophy

COSMARC VIP is based on the premise that a home computer should be low cost, easy to use and fun for the whole family. It is therefore aimed at video graphics and games applications. Even the youngest family member can have hours of fun drawing pictures on the TV screen.

Let's examine some cost factors. While memory and logic costs continue to decrease, a 2 K byte programmable memory will always be cheaper than a 16 K byte one. To many designers, lower memory costs mean that they can design more memory into a system at the same price. To me it means that I can design lower cost computers using about the same amount I've always used. When the current crop of $1000 computers drops to $500, a COSMARC VIP type computer might drop to $150. The lower the cost, the more people can own their own computers.

The drastic price reduction for a central processing unit caused by the development of single chip microprocessors has not been matched by equivalent cost reductions for conventional computer input and output devices. The lowest cost home computers can only be achieved if the need for specialized IO devices is minimized. I don't think it is fair to ask the limited budget, unsophisticated beginner to spend several hundred dollars on a system which uses a $10 central processor but requires an additional expenditure of $1000 for a terminal and enough memory to make it useful. The COSMARC VIP minimizes IO device cost by relying only on a video monitor, audio cassette recorder and 16 position key pad. CMOS circuits reduce power supply costs, and a minimum number of integrated circuits permit the entire computer, including keyboard, to be packaged on one inexpensive printed circuit board.

As I see it, four major obstacles must be overcome before everyone can own their own computers. The first obstacle involves justifying a relatively high priced piece of equipment which is often useful to only one family member. COSMARC VIP was designed for relatively low cost and includes 20 video game listings that can be immediately loaded and played by the whole family. This goes a long way toward eliminating the first obstacle.

The second obstacle is the complexity of conventional computer operating and programming procedures. I can't understand how a beginner can be expected to cope with complex operating systems. COSMARC VIP programs are initiated with a single RUN switch. Any memory byte can be examined or modified using the built-in hexadecimal keyboard. Loading programs is easy. Just enter the starting address followed by the byte sequence to be stored. No extra key depressions are required between bytes. Memory addresses and stored bytes are displayed on the TV screen in hexadecimal format. Tapping a single key steps through memory letting the user examine stored bytes without modifying them.

To load a cassette program into memory, you merely enter the starting memory address and single digit block length code via the hexadecimal keyboard and play the tape. Less than 30 seconds later, COSMARC VIP shows you the last byte loaded into memory on the TV screen and you're ready to run your program. Recording the contents of memory on a cassette is just as easy.

A third obstacle in the path of home

B. ON-CARD OPTIONS

C. SUPPLIED BY USER

Figure 1: Block diagram depicting the essentials of a fully functioning COSMAC microprocessor. The system provides the user with everything needed to start programming except a video monitor and a cassette recorder.

Hardware

Figure 1 shows a block diagram of the COSMAC VIP system. It shows exactly what is provided in the price and what the user has to provide. What you don't get is a video monitor, inexpensive speaker, standard audio cassette recorder and expensive cabinet. What you do get is everything else needed to immediately load and run 20 video games and write and debug your own graphic, game or educational programs. This includes all the memory you need and an easy to use numerically oriented language. You also have the ability to use COSMAC machine code.

All system timing is derived from a crystal clock so there are no adjustments required. A single tone can be generated by programs. This tone can be used in games or sounded when a key is pressed. The hexadecimal keyboard is a reliable touch pad type, and is fully debounced by read only memory software.

The audio cassette interface was designed to allow saving programs on tape. You load a program into memory from the hexadecimal keyboard and then record the contents on an audio cassette. You can then load the program from the audio cassette any time you want to use it again. The cassette data transfer rate is about 100 bytes per second. You must manually start and stop the cassette recorder, unless you add your own start and stop relays. The reliability of any audio cassette data system may not be suitable for commercial work. Audio cassettes are however the best means of saving programs available for the hobby computer user working on a limited budget. With proper care in use they have proven themselves to be quite adequate. In the COSMAC VIP tape system, each byte on

Our American Economic System is □ good □ bad. (check one)

We asked thousands of your fellow citizens this question. You should know how your answer compares with theirs.

Not too surprising, most people have gripes. Inflation. Unemployment. Taxes. These are among the concerns that topped the list.

Yet, if you checked "good," you join the great majority of Americans (about 80%) who believe that fundamentally the American Economic System—with the individual freedom and high standard of living that have accompanied it—is the best in the world.

The question is: how do we overcome the bad without destroying the good?

Obviously, the more we all know about our system and how it works, the better we can decide what to preserve, what to change.

That's why we are offering a booklet that explains the American Economic System. It is easy to read, interesting—and free. Mail the coupon for your copy today.

Every American ought to know what it says.

The American Economic System.
It's one of your basic freedoms.

Booklets, P.O. Box 1887, New York, N.Y. 10001

□ Please send me a free copy of the booklet about our economic system.
□ I would also like a copy of the survey highlights.

Meet the First Family in floppies.

The roots of our floppy family

1143M controller • LSI technology • 1K buffer

Dual head

50 pin LSI interface

1149M Multipurpose
Cabinet assembly. Rack or table mounted.

Our host adaptors

CalComp's got it all together for you. A total floppy family. Any way you want it...single products or the total package. In every case you get true multifunction, LSI technology, high MTBF and low MTTR reliability, compatibility and multiple interfaces.

And that’s not all. Field-proven double density — now one or two-sided. And our new 1143M controller along with three host adaptors.

With CalComp it’s all there. Choice. Flexibility. Everything you need for all or part of a total memory subsystem. Plus CalComp's worldwide service to support our family. We've delivered 50,000 drives — why not add your application requirements to our growing family.

Just call us or use the coupon. We'd like to tell you more about our family.

CALCOMP
Understanding APL

A Note to Those Unfamiliar with APL

If you are totally unfamiliar with APL, a good first step would be to consult some of the references listed at the end of this article and Mike Wimble's article. We recommend the IBM APL/1130 Primer, available from IBM branch offices, as an excellent self-teaching tool...

CM

Note: In the APL listings which follow, the user's entries are reproduced in blue while the computer's responses are in red for clarity.

Adin Falkoff, in his review of APL conferences to be published in Computer Reviews (as of this writing), indicates the "widely ranging subject matter" covered in APL papers by listing dozens of applications, covering such areas as word processing, convex geometry and database systems, to name a few. Because of this potential breadth, it is necessary, in a short paper, to focus more narrowly on some one aspect of APL.

In scanning previous issues of BYTE to identify some aspect which would be relevant to its readers, I concluded that, however diverse their interests, this audience held one thing in common: a penchant for experimentation and exploration, for playing around with ideas and things. I have therefore chosen to emphasize these aspects of APL: the use of experimentation on an APL computer in learning the language itself, and the exploration of other topics both with and without the aid of a computer.

True experimentation must be carried out on a real physical device. Readers who have the use of APL computers or terminals may find them useful for verification of the questions posed later in the article. For other readers we will try to approximate this experience by showing certain experiments together with the results they produce. The reader may then study the results of these experiments in the same way he or she would study the results of his or her own experiments on a real computer.

However, unlike the experimenter at a real APL computer, the reader cannot then decide what experiment to try next in order to settle the questions raised in his or her mind by the last experiment, but can only use the experiments next presented by the author. Although each experiment may have been chosen to answer questions raised by its predecessors, it may miss many of the questions raised in the minds of particular readers. However, this difficulty can also be overcome to a large degree by the use of "thought experiments," discussed later in this article.

To fully appreciate and enjoy the experimental approach used here, one should make the most of each experiment by not reading any result until every clue has been used to puzzle out what the result should be. For example, one would try to reason out and state the definition of the function \( \mathbf{r} \) from the following experiments:

\[
\begin{array}{cccc}
3 \mathbf{r} 5 & 3 & 5 \\
5 \mathbf{r} 3 & 5 & 3 \\
7 \mathbf{r} 7 & 3 & 5 & 3
\end{array}
\]

before going on to read that "the symbol \( \mathbf{r} \) denotes the maximum function which yields the value of the larger of its arguments." Remember, of course, that APL statements (shown in red here) start at the left margin, while user entries are indented. Similarly, try to guess the result of the following experiment:

\[
\begin{array}{c}
\mathbf{b} \\
1 \mathbf{2} \mathbf{8}
\end{array}
\]

before reading it, since the relation of the symbols \( \mathbf{r} \) and \( \mathbf{l} \) alone suggests that \( \mathbf{l} \) denotes the minimum function.

One final comment on the reading of this paper: although it is clear that this magazine enjoys the patronage of many young readers, I have, in the interests of clarity and precision, chosen to use words which may be unfamiliar to some readers. If you happen to fall into this class, then this is as good a time as any to acquire the important habit of reading with a good dictionary at your elbow.

Systematic Experimentation

Simple functions yield to experiments with randomly chosen arguments, as happened in the case of the maximum function. Even there, however, the arguments were chosen with more care than might appear. For example, if only the two on the left (3\( \mathbf{r} \)5 and 4\( \mathbf{l} \)7) had been given, one might
Now, on only one fully static card, the Digital Group has squeezed in a whopping 32K of memory. Which, with a little quick addition, means a full 64K architecture now requires only 2 boards instead of 8. That’s a 4-to-1 space reduction ...and leaves one extra memory slot on the Digital Group’s standard motherboard still available for future products.

All this and one low price, too.

It just may be the best news of all. Our full static, assembled and tested 32K memory board is only $995. Now that’s worth remembering. It’s substantially less than our equivalent assembled 8K board prices. (Please note: We’re initially offering this 32K board assembled only, but kit versions will soon be available, too—at even lower prices.)

Here’s what you get.

Specifications:
- 32K on single card
- Speed—450ns. All of our current CPUs will operate at full-rated speed.
- Decoding—Lower or upper 32K bank
- Power—+5V only @ 4A
- Card size—12" x 5" (excluding connector fingers)

Features:
- May be intermixed on Digital Group systems with our 8K memory cards
- All data and address lines are buffered
- Fully static memories—EMM 4801 (450ns) or equivalent

Price:
32K board complete, assembled and tested $995.00

For all the memorable details, just fill out the coupon below. (Then all you have to remember is to mail it in.)

---

have concluded that the result of the function was simply the value of its right argument, but the third case $(5|3)$ ruled out this possibility.

Experimentation with a systematic set of arguments usually gives a clearer picture of the function. For example, we might use a fixed left argument and a set of successive integers for the right argument, as in $3|1$ and $3|2$, and so on. This can be done most conveniently by giving a list of arguments as follows:

```
5 6 7 8 9 10 11 12
```

The behavior of the two new functions $(\geq$ and $\neq$) are probably clear from the last two experiments. However, the experiment:

```
1 2 3 4 5 6 7
```

might leave one in doubt, wishing to see cases with different left arguments such as 4, 5, etc. In general, one might wish to see a whole table of values for a systematic set of left arguments. This will be explored in the section on tables.

Names

It is clearly convenient to give a name to any number or list or table of numbers that is used repeatedly. For example, we could give the name $S$ to the list $1 2 3 4 5 6 7$ as follows:

```
S = 1 2 3 4 5 6 7
```

We could then write the preceding experiments more simply as $3xS$ and $3+S$ and $3|S$, etc. Thus:

```
3xS
4 8 12 16 20 24 28
```

This use of names corresponds to the notion of variables in algebra.

Tables

In the experiment:

```
xS
4 8 12 16 20 24 28
```

it is clear that the multiplication applies to the left argument 4 together with each element of the right argument. In the experiments:

```
S+S
2 4 6 8 10 12 14
```

```
S+S
1 4 9 16 25 36 49
```

it is clear that the functions apply to each of the corresponding pairs of elements of the left and right arguments.

In order to make an addition table for the integers from 1 to 7, it would be necessary to add each element of the left argument to every element of the right argument. This will be indicated by placing the symbols for null ($\epsilon$) and dot ($\cdot$) before the plus sign as follows:

```
S*S
2 3 4 5 6 7 8
```

```
S*S
3 4 5 6 7 8 9
```

```
S*S
4 5 6 7 8 9 10
```

```
S*S
5 6 7 8 9 10 11
```

```
S*S
6 7 8 9 10 11 12
```

```
S*S
7 8 9 10 11 12 13
```

```
S*S
8 9 10 11 12 13 14
```

Tables for times ($\times$), maximum ($\max$), and less than ($<$) can be produced similarly:

```
3xS
1 2 3 4 5 6 7
```

```
max7
1 2 3 4 5 6 7
```

```
<7
1 2 3 4 5 6 7
```

The patterns of numbers (such as the diagonals of twos, threes, etc, in the addition table, and the L-shaped patterns in the maximum table) are often surprising even if one is already familiar with the particular function, and it is entertaining to predict patterns before actually producing the table.

Tables are also useful in determining the definition of an unknown function. To illustrate this we will return to the function $\mid$ for which we have already seen the case:

```
3|1 2 3 4 5 6 7
```

```
1 2 0 1 2 0 1
```

The following table should suffice to identify the function for most readers:

```
S*1
0 0 0 0 0 0
```

```
1 0 1 0 1 0
```

```
1 2 0 1 2 0
```

```
1 2 3 0 1 2 3
```

```
1 2 3 4 0 1 2
```

```
1 2 3 4 5 0 1
```

```
1 2 3 4 5 6 0
```

Some Tools

The functions introduced by the following experiments are not only interesting
Here's everything you need to program your own '8080'!

SCELBI does it again! Here, for the first time, are all the tools you need to get the most out of your '8080'. About the only thing missing is the '8080' itself. Just look at what's in this total package...

'8080' Octal Code Card and/or '8080' Hexadecimal Code Card, instant slide rule aids for programming or debugging '8080' software. Contains all standard mnemonics, with corresponding codes for either octal or hexadecimal modes. Easy-reading instructions are color coded to indicate which flags are affected during instruction execution. Front of card features quick, logical reference formats, while back displays ASCII code chart for all 128 characters, plus '8080' status words and register pair codes.

The '8080' Programmer's Pocket Guide is a compact 3 x 4½” ever-ready, instant reference for either Code Card, that explains the instruction set in detail, giving both octal and hexadecimal codes.

SPECIAL MONEY SAVING INTRODUCTORY OFFER!
Each of these "must" programming tools sells individually for only $2.95. If you order today, you can own any two for only $5.50... or all three for only $7.95! You need these low cost, highly productive tools. So, order today, and save, Save, SAVE! Clip this handy mail order coupon and mail it today!

in themselves, but prove very useful in further experiments:

These functions can be used in many interesting ways to bring out the properties of other functions. For example, the relation between addition and multiplication and the relation between multiplication and power can be brought out by considering the following expressions for various values of \( N \) and \( M \):

<table>
<thead>
<tr>
<th>( N )</th>
<th>( \frac{1}{N} )</th>
<th>( \frac{1}{\frac{1}{N}} )</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>0.1</td>
<td>10</td>
</tr>
<tr>
<td>20</td>
<td>0.05</td>
<td>20</td>
</tr>
<tr>
<td>50</td>
<td>0.02</td>
<td>50</td>
</tr>
<tr>
<td>100</td>
<td>0.01</td>
<td>100</td>
</tr>
</tbody>
</table>

Thought Experiments

Thus far we have considered only experiments performed with the aid of a computer or, what amounts to the same thing, with the aid of printed results prepared in advance by a computer. However, if the rules governing the notation are simple and uniform (as they are in APL), then one can perform interesting and revealing thought experiments by simply applying the rules. For example, the following expressions can be seen to be equivalent by performing thought experiments for various chosen values of \( N \):

\[
\frac{1}{N} + \frac{1}{\frac{1}{N}} = \frac{1}{N} + \frac{N}{1}\]

In particular, the last expression is a neat way of evaluating the first. For example, if \( N \) is 100, then \( \frac{1}{100} \) is the sum of the first 100 integers, and is equal to \( 100 \times 50 \) or 5050.

We will conclude with two thought experiments which use only functions already treated. The first:

\[
\frac{2^{10}}{100} = (10)^2, (10)^1, N \]

has a result which, when obtained for any argument \( N \) equal to 7 or more, should be recognized by any reader.

The second concerns comparisons of two tables \( M \) and \( T \). The expression \( M \neq T \) yields a table of the same size containing ones and zeros, with ones only where \( M \) and \( T \) disagree. Therefore \( +/M \neq T \) gives counts of the disagreements in each row, and \( +/+/M \neq T \) gives a single total count. Hence the latter expression yields zero only if \( M \) and \( T \) are identical.

The expression \(+/+/M \neq \Phi M\) therefore yields zero only if \( M \) agrees with its transpose \( \Phi M \) obtained by "flipping \( M \) about its diagonal to interchange the rows with the columns." Evaluate the expression \(+/+/M \neq \Phi M\) for values of \( M \) produced as function tables for various functions such as:

\[
H+S, +S N+S, \times S H+S, -S H+S, +S
\]

Then try to determine what class of functions yields a zero result.

Ideas for experiments in a variety of fields are available in existing publications. Among the references cited at the end of this article, Iverson (references 2 and 3) presents further definitions of APL functions. Blaauw (4) presents a 1 page APL definition of the Intel 8080 instruction set, the exercises in Iverson (5 and 6) and in Orth (7) present topics in mathematics at various levels, Spence (8) treats electric circuits, and Iverson (9) treats a variety of topics which include geometry and computer science.

* As a challenge to readers, we will print the answer to this thought experiment next month together with a complete explanation of how the expression is evaluated.

REFERENCES

IF YOU'RE NOT DESIGNING WITH A CSC PROTO-BOARD, LOOK AT ALL YOU'RE MISSING.

Utility—Models are available with or without built-in regulated power supplies (fixed or adjustable).

Economy—Eliminates heat and mechanical damage to expensive parts. Save money by re-using components.

Versatility—Use with virtually all types of parts, including resistors, capacitors, transistors, DIP's, TO-5's, LED's, transformers, relays, pots, etc. Most plug in directly, in seconds.

Durability—All Proto-Board models are carefully constructed of premium materials, designed and tested for long, trouble-free service.

Expandability—Proto-Board units can be instantly interconnected for greater capacity.

Visibility—All parts are instantly and easily visible, for quick circuit analysis and diagramming.

Speed—Assemble, test and modify circuits as fast as you can push in or pull out a lead. Save hours on every project.

Adaptability—Use in design, packaging, inspection, QC, etc. Works with most types of circuits, in many, many applications.

Flexibility—Use independently, or in conjunction with other accessories, such as scopes, counters, CSC Proto-Clip™ connectors, Design Mate™ test equipment, etc. One Proto-Board unit can serve a thousand applications.

Accessibility—All parts are instantly and easily accessible, for quick signal tracing, circuit modifications, etc.

Variety—A wide variety of models are available with capacities ranging from 630 to 3060 solderless tie-points (6 to 32 14-pin DIP's), to fit every technical and budget requirement.

Whatever type of electronic circuits you work with, you can do more in less time with CSC's solderless Proto-Board systems. As fast and easy as pushing in or pulling out a lead, you can design, test and modify circuits at will. Components plug into rugged 5-point terminals, and jumpers, where needed, are lengths of #22 AWG solid wire. In the same time you took to read this ad, you could be well on your way to assembling a new circuit.

For more information, see your CSC dealer, or write for our catalog and distributor list.

Prices and specifications subject to change without notice.
Imagine a system complete with terminal, CPU, memory, floppy disk, software, and all the little necessities to make it work together immediately. Now imagine this complete system available not only fully assembled, but priced much lower than anyone else's kit. What you are dreaming of is OSI's "new" Challenger System!

In the configuration shown above, the Challenger includes everything an end user needs for a complete small computer system. All you add is 110 VAC power and a desk to put it on.

This fully-assembled system includes:

**HARDWARE:**
- OSI Challenger 65 with 16K RAM, serial interface, system monitor PROM, and floppy disk bootstrap PROM.
- OSI Challenger single drive floppy disk formatted for 250K bytes storage per diskette surface.
- Stand-alone terminal and Sanyo monitor for 16 lines of 64 characters at 2400 baud (other terminal options are available).
- And all interconnecting cables!

**SOFTWARE:**
- 2 diskettes containing over 100,000 bytes of software including OSI's powerful Disk Operating System with variable length sectors. 6502 DISK BASED RESIDENT ASSEMBLER/EDITOR! A totally interactive Assembler/Editor which assembles up to 600 lines a minute and is completely compatible with MOS Technology's Cross Assembler format. This program also contains a powerful disk-based line editor with commands for general text editing. OSI'S EXTENDED MONITOR: A powerful machine language debugging and utilities package including a Disassembler which is format compatible with the Assembler!
- OSI 6502 8K BASIC FOR DISK BY MICROSOFT: This powerful BASIC has all the features of Altair® 8K BASIC for the 8080 plus higher speed and disk storage. And it comes complete with a BASIC program library.

**DOCUMENTATION AND SUPPORT:**
- We include over 600 pages of hardware, software, programming, and operation manuals. The Challenger is based on the well-proven OSI 400 system. The over 2,000 OSI 400s and Challengers now in use assure continuing hardware and software support for this system for years to come!

**EXPANDABILITY:**
The Challenger System can now be expanded to 192K of RAM and 16K of I/O and ROM. There are over 13 accessory boards including A/D, D/A, parallel and serial I/O, cassette interfaces, dual drive floppy, a video graphics display, several RAM and PROM boards, and multiple-processor configurations.

**APPLICATIONS:**
The Challenger system is complete, fully assembled and configured so that the Disk Operating System can be booted in immediately on system power-up. Even a relatively inexperienced operator can have a complex BASIC program on-line just seconds after the system is turned on. The ease of use, high reliability, and large library of standard BASIC applications programs make the OSI Challenger System the first practical and affordable small computer system for small businesses, educational institutions, labs, and the personal computerist.

**PRICES:**
- Challenger System, complete as stated above with terminal and monitor
  - $2599.00

- As above without terminal. Specify RS-232 or 20mA loop and baud rate
  - $2099.00

**IMPORTANT NOTE:**
One of the most important features of the Challenger System is that it is not really "new". OSI has been delivering the basic circuitry of the Challenger since November 1975 and the floppy disk since June 1976. The only thing new is the total integration of the components as a complete, simple to use, fully-assembled, small computer system.

For more free information and the address of the OSI Computer Dealer or representative in your area, write to: OSI; Dept. S; Hiram, Ohio 44234 or enclose $1.00 for the full OSI catalog which contains kits from $134 and fully assembled computers from $439.
Ohio Scientific's new Model 500 computer has full mini-computer BASIC in ROM and a minimum of 4K RAM for user programs. BASIC is always there when the computer is turned on.

Make your terminal intelligent!

If your company or school has remote computer terminals, consider the Model 500-1. It fits in the communications line between the terminal and modem or system. When the 500-1 is off, the terminal talks to the Model 500. Use the Model 500 for short and medium sized programs in BASIC. Use its immediate mode as an ultra-powerful scientific calculator!

Computers for Students

Couple a Model 500 to a low cost purchased or leased terminal such as the popular ASP-33 teletype for student instruction. The Model 500's BASIC is a perfect instructional language for students. Since the computer's machine code is also accessible, the Model 500 can challenge the advanced student with other optional software such as our interactive Assembler/Editor.

Personal Computing

The Model 500 has eliminated all of the grief of the first generation personal computers. This computer comes fully assembled, tested, and guaranteed. Most importantly, it is easy to use since the BASIC is always there.

Flexibility and Expandability

The Model 500 uses Ohio Scientific's standard 48 line bus so that it is fully compatible with our Model 400 kits and Challenger™ product lines. Any of thirteen accessory boards including RAM, PROM, parallel, serial, A/D, D/A, cassette, and video graphics can be added as well as peripherals including floppy disks, line printers, color graphics, and more.

The Model 500 is offered here in three forms to meet every application and pocketbook.

Specifications

Model 500 Board $298.00

8" x 10" fully assembled board including 6502 microprocessor running at 1MHz, 512 bytes of PROM, 8192 bytes of ROM containing 8K BASIC and 4096 bytes of RAM for user programs. The board contains an ACIA based serial interface which is jumper selectable for RS-232C or 20ma loop at 110, 300, 1200, 2400, or 4800 baud.

The 8K BASIC features: full floating point math including transcendental functions, N dimension arrays, multiple letter variables, full string functions, logical operators, PEEK, POKE, USR, and lots more!

The Model 500 board requires 6+ volts at 2 amps, -9 volts at 500ma, an external reset switch, and an ASCII serial terminal for operation.

Model 500-1 $429.00

Fully enclosed 500 board with power supply, reset switch, and two 25 pin EIA standard terminal connectors for loop through operation. The 500-1 is 12" x 15" x 4".

Model 500-8 $629.00

This unit is a 500 board in an eight slot Challenger™ case allowing seven slots for expansion. The unit has a heavy-duty UL recognized power supply and is 15" x 17" x 10".

ORDER FORM

Order directly from: Ohio Scientific, Hiram, Ohio 44234
This introductory offer expires August 31, 1977. Please allow up to 60 days for delivery.

Listing 1: An APL Lunar Lander program. The program consists of the main program function FLY, plus an optional initialization program LEM and a set of subfunctions called from FLY. All input and output operations are contained in the subfunctions so that the operator can more easily experiment with different output formats. The program has been written for a hypothetical APL interpreter designed for use in microcomputers, and as such uses a subset of the standard APL operators. Note the compact nature of the program (an APL hallmark), and the fact that line numbers used in program functions can be repeated in subfunctions.

About the Game
This APL version of the Lunar Lander program has been written using a significant subset of the full APL operator set (such as APLSV implemented on the IBM 5100), and is eventually intended for use on a small system APL interpreter. In general, the functions use no array operations or vector subscripting (indexing). However, for illustration purposes specific examples of array reduction and vector indexing are included. In these cases the text describes alternate procedures with examples to show why it is advantageous to keep this higher level of capability. The operator subset used is based on a proposal contained in Mark Arnold's article "What is APL?" (November 1976 BYTE, page 20), which has been expanded slightly to include the execute and vector rotation operators.

About the Author: Dave Keefe describes himself as an incredibly lazy programmer. He is convinced that APL lets him write, test and bring up a new application in less time, less effort and with less symbols than any other major language. He wrote this article over the holiday season in the hope that the game format would make a good vehicle for showing how APL can be applied. The game program took a couple of evenings at an APL machine's terminal. The rest of the article took considerably longer.
to use vector operations within the force equations, resulting in a simplified program structure. Vector operations also allow the game to be easily expanded: For example, the user can now specify Coriolis force elements, seen as an effect on the horizontal and transverse velocities as a result of the rotation of the target planet. These forces are applied as part of the same equation which applies the gravitational force.

The Program

The APL LEM program consists of a main program function (FLY), an optional initialization function (LEM), and a set of subfunctions which are called from within FLY. In general, the input and output operations associated with LEM have been put into separate functions. This permits experimentation with variations of the I/O formats without affecting the main processing program which calls these functions. The accompanying write-up describes each of the statements in the FLY program and the general operations performed in the other functions. It is intended as a tutorial to be read in conjunction with the function listings, which continue on the next two pages.

Listing 1, continued:

Listing 2: An explanation of the Lunar Lander program shown in listing 1. Author Keefe provides detailed comments about the program, a virtual necessity when programming or reviewing programs in APL, because of its conciseness. In the case of the subroutine CKSCALE, an alternate program is described which avoids the use of vector and array indices.

FUNCTION NAME: FLY

THIS FUNCTION IS THE PRINCIPAL CALCULATION AND LOGIC PROCESS IN THE LUNAR LANDE( LEM - THE MAIN LINE). BRANCH POINTS WITHIN FLY ARE LABELED 'XXX' WHERE XXX TO THE LINE NUMBER IS THE BASIC VERSION OF LEN WHICH IS MOST COMPARABLE TO THE PROCESSING WHICH OCCURS AT THIS STATEMENT. THE FOLLOWING SECTION PROVIDES A LINE BY LINE DESCRIPTION OF THE PROCESSING WHICH IS PERFORMED IN FLY.

LINE NO | DESCRIPTION
--- | ---
1-20 | THIS LINE SHOWS HOW A SINGLE APL STATEMENT CAN BE USED TO SPECIFY MULTIPLE VARIABLES FOR BOTH VECTORS AND SCALARS. THIS STATEMENT SETS ALL OF THE VARIABLES NAMED TO ZERO. E2, S, AND T ARE ELEMENT VECTORS; T3, ST, AND S ARE SCALARS.
2 | E IS A VECTOR WHICH SHOWS THE NUMBER OF BURNS LEFT FOR A DAMAGED ENGINE. IF ANY ELEMENT OF E EVER REACHES ZERO THE ENGINE WILL EXPLODE.
3 | S IS THE REMAINING FUEL. IT IS INITIALIZED TO THE VALUE INPUT IN THE LEM ROUTINE.
4 | D IS THE DISTANCE VECTOR CONTAINING THE ALTITUDE, TRANSVERSE AND HORIZONTAL DISTANCE FROM THE TARGET LANDING AREA. NOTE HOW ESTIMATED IS USED TO FORM THE VECTOR FROM THE THREE SCALARS WHICH WERE ENTERED IN LEM.
5 | V IS THE VELOCITY VECTOR MADE UP OF THE VERTICAL.

Listing 3: The APL LEM program consists of a main program function (FLY), an optional initialization function (LEM), and a set of subfunctions which are called from within FLY. The APL LEM program consists of a main program function (FLY), an optional initialization function (LEM), and a set of subfunctions which are called from within FLY. The APL LEM program consists of a main program function (FLY), an optional initialization function (LEM), and a set of subfunctions which are called from within FLY. The APL LEM program consists of a main program function (FLY), an optional initialization function (LEM), and a set of subfunctions which are called from within FLY. The APL LEM program consists of a main program function (FLY), an optional initialization function (LEM), and a set of subfunctions which are called from within FLY.
Listing 2, continued:

13 A REAL EXAMPLE OF THE POWER OF MPL, NOW HOW THE RESULTS OF THE LOGICAL OPERATION 4 & 18 (MAXIMUM BURN RATE LESS THAN THE ABSOLUTE VALUE OF THE BURN VECTOR ELEMENTS) ARE USED TO INCREASE THE I Z VECTOR WHICH INDICATES ENGINE DAMAGI. IF ANY OF THE BURN VECTOR ELEMENTS EXCEED 0, THE CORRESPONDING ELEMENT IN I Z IS INCREASED.

14 THE RESULTANT B IS LIMITED TO THE MAXIMUM BURN RATE. THE OPERATION 4 & B REPLACES THE SIGN OF EACH ELEMENT OF B WHICH WAS REJECTED BY THE ABSOLUTE VALUE OR MAGNITUDE OPERATION.

16 THE NEW BURN VALUE IS CALCULATED AND THEN TESTED, A BRANCH TO LINE 5 OCCURS IF MORE THAN 9 THOUSANDTHS OF A BURN UNIT REMAIN.

17 PRINTS THE OUT OF FUEL WARNING.

18 [13] CONTAINS A POWERFUL TEST USED TO DETERMINE IF ANY ENGINE HAS BEEN ABUSED. TWO LOGICAL VECTORS (4 & B AND 2-2) ARE CREATATED AND THE RESULT IS TESTED.

Listing 3: A sample run of the Lunar Lander program. This is the classic version of the game in which the operator attempts to become a senior pilot by optimally landing his craft within the constraints of the program. As part of its printout, the program provides a set of two coordinate axes showing the position of the operator's ship at discrete time intervals.

FUNCTION NAME: FICTAT

This function prints out the current flight statistics.

FUNCTION NAME: SAM

This function is used to output the initial parameters to the workspace. Note that more variables are requested in the version of SAM that is the BASIC version. The vector variables let you make the game more challenging by specifying the maximum burn rate and other options.

FUNCTION NAME: CUTSCALE

This function displays a grid showing the map position and symbol relative to the target landing area. The grid appears as soon as the altitude is 600-3000 m.

FUNCTION NAME: FLY

This function prints out the current flight statistics.
Soon To Be Unveiled

What is a Firmware System?
A Firmware system is the entire package — Software and Hardware that work.

Our Firmware includes a miniature micro 8080 computer; S-100 Buss, with over 65K of user RAM. No switches to set, Power-on operation, multiple I/O interfaces, printer, Video Terminal, over 600K Byte Disk, Disk Extended Basic and applications Software on diskettes complete with full documentation (includes General Ledger, Payroll, Word Processing, Medical A/R, A/P, Engineering, Statistics, more) plus a lease purchase plan and field service in most areas. Hard to believe!

For less than $300 you could lease your very own, nothing else to purchase. Foreign packages available last of '77.

Includes over $25,000.00 of business programs free and that's only part of what we're giving away. We built our reputation providing quality software at affordable prices. Now we are going to do the same with Firmware.

Dealer Inquiries Invited.

Complete System (fully assembled) . . . . . $8999.00*

Additional 600K disks optional.

Compare at $30,000 for other micros or $70,000 for mini's

*Add $80 for UPS shipping and handling • No Purchase Orders -- Include 50% deposit with all COD orders.

SOFTWARE

Attention ALTAIR DISK Owners

Now available—an Accounts Receivable System for the small user. This system is expressly designed to be run on an 8080 based microcomputer using an Altair floppy disk with Altair Basic, Video Terminal and Printer. Many features normally found only on large scale computers are included. Provided are such functions as: Adding New Customer Accounts, Deleting Dormant Accounts, Transaction Processing, and Report Generation. The Monthly Statements include both current and aged balances. Other reports generated are the Aged-Accounts Receivable and Delinquency Notices.

This easily usable system requires very little operator training. All communication is in an interactive mode with the program constantly prompting the appropriate responses. Operator errors are easily corrected and accidental data base deletions are prevented by requiring additional confirmation.

This Accounts Receivable System, although supplied ready for use, may readily be modified to include special installation-dependent functions. All major programs are written in high level language making program additions and alterations a simple task. This program module is designed to serve as the basis for a complete accounting package. Provisions are included for linking Billing Inventory Control and General Ledger modules which will be available in the near future.

We carry a full line of the following: TDL, OAE, Processor Tech., Hayden, Tarbell, IMSAI, Cromemco, Compucolor, Icom, Lear Siegler, Okidata, DEC, Javelin, Teletype, North Star, Heuristics, Peripheral Vision, TRW. Same day delivery and shipping on most items. Full, modern repair facilities on premises for complete servicing of everything we sell.

Circle 118 on inquiry card.
An APL Interpreter for Microcomputers: Part 1

Michael Wimble
6026 Underwood Av SW
Cedar Rapids IA 52404

With this article we begin a three part series by Mike Wimble about an APL interpreter for small systems. The articles consist of a series of flowcharts from which the enterprising reader can construct his or her own code. Considering the complexities of APL, it is interesting to note that Mike's own program for this interpreter (written in PL/I) is less than 1600 statements long!

The format of this article will be slightly different from most of the other articles that have appeared in BYTE. Because this series of articles is predominantly pictorial, we have integrated the main text into the figure captions. As a result, some of the captions discuss topics related to other figures. In these cases we have added cross references for clarity's sake. We hope this format will eliminate unnecessary page turning.

Table of Contents

The following table of contents describes the material covered in this month's article as well as the two upcoming articles (to be published in the September and October issues of BYTE).

Part 1: The Scanner
- Statement scanner tables
- Results of a hypothetical program containing a user-defined function
- Statement scanner overall flowchart
- Scanner subroutine flowcharts

Part 2: The Statement Interpreter — Expression Evaluation
- Interpretation of variables
- Interpretation of constants
- Interpreter flowcharts

Part 3: The Statement Interpreter — Mathematical Processing
- Recognition of operators
- Interpretation of operators
- Interpreter flowcharts

September 1977 BYTE

October 1977 BYTE
The Great APL Interpreter Contest

As an incentive to those experimenters who would like to try writing their own APL interpreters, based on this series of articles, BYTE announces the Great APL Interpreter Contest. We will award prizes for APL interpreters (suitable for publication with royalties to authors) based on Mike's flowcharts (or independent of them if you prefer).

Contestants are free to write their interpreters for any microprocessor they choose. Entries will, however, be judged on their suitability for use on small systems with a minimum of 16 K bytes of memory, as well as on programming elegance and efficient use of space. All of these factors should therefore be kept in mind.

Entries should be addressed to BYTE, attn: The Great APL Interpreter Contest, 70 Main St, Peterborough NH 03458, and must be postmarked no later than midnight, February 28 1978. Entries must be in the form of a publication quality manuscript which describes the implementation of the interpreter and which includes a listing of source code and object code. Contestants should also submit machine readable source and object code in the form of paper tape or cassette.

The winners (if any) will receive $1000 plus normal author payments, should the entry be chosen for publication in book form or as an article in BYTE. We reserve the right to choose more than one winner under the same terms.

Judging will be done by the editors of this magazine. Those seriously interested in entering this contest should call Carl Helmers or Chris Morgan at BYTE, (603)924-7217. May the midnight oil burn prosperously for all.

Introduction

Under the sponsorship of the National Science Foundation, Bernard J Robinet produced an NTIS report entitled, "Architectural Design of a Directly-Executed APL Processor". Although at a detail level the paper is fraught with logical and typographical errors, it presents an excellent and complete plan for implementing an APL interpreter via software, firmware or hardware. This article is a description of just such an interpreter. The program was originally written in the PL/I language but is presently being enhanced and translated for execution on a TMS 9900 microprocessor. No attempt will be made herein to describe APL, and the information is aimed at the experienced programmer who can use flowcharts and diagrams as a starting point. Emphasis is placed on architecture, rather than on actual code so that, while the more experienced programmer should have enough information to program his or her own interpreter, even the neophyte can still learn many of the techniques of interpreter design.

The APL interpreter is organized as two separate subprograms which are executed sequentially. The first subprogram is the scanner, the second is the interpreter. The scanner accepts all program input, translating the program into a series of syllables and pointers, until the end of an immediate mode statement is found. The interpreter gains control to execute an immediate mode statement, using the information built by the scanner, and returns control to the scanner upon completion. We begin our discussion by looking at some of the tables common to both subprograms. After this discussion one should have a general understanding of the working of the interpreter and we can begin a detailed description of the actual program.

Table 1: A sample APL statement, plus a breakdown of the statement into "tokens." This program inputs a list of numbers and prints their average. The token is the basic semantic element of a program. Just as a program consists of one or more statements, a statement consists of one or more tokens. (In the literature, the term token is sometimes equated with "symbol" or "atom." This can lead to some confusion because the term "atom" has a somewhat different meaning when used by LISP programmers.)

Table 2: Set of noun-adjective combinations (syllables) used by the interpreter. One of the main functions of the scanner is to extract the tokens from each statement, left to right, and to store them in a table as a noun-adjective combination. Surprisingly few nouns (only nine) are needed to construct a powerful interpreter. The table of noun-adjective pairs built by the scanner is labelled SP, and each entry consists of two elements: C is the noun and P is the associated adjective. Three of the adjectives are labelled “variable number.” This number is actually a pointer to the symbol table VTAB which is indexed by VAR. Each entry in VTAB has three elements: V1, V2 and V3. V1 is the character representation of the symbol. V2 is a pointer to another table, FTAB (see table 5), but V2 is used to distinguish between global variables and formal parameters of the same name. V3 is also a pointer to another table, D (see tables 4a and 4b), and is set by the statement interpreter as memory is assigned to hold a value for the variable. V3, then, is either the address, or a pointer to the address, of the value of the variable.

Table 3: Representation of the tokens of the APL statement ∘(+/XX)←p,XX←□ in table SP (see table 1). After a program has been stored left to right in table SP by the scanner, the interpreter will execute the statements from right to left. Obviously more information is needed for statement execution than is contained in this table.

Table 4a: Format of entry in table D for a vector or a matrix. When a constant is encountered in a statement, the actual value is stored in this table, and the appropriate adjective in table SP points to the address of the constant in this table. Constants, values assigned to variables, and intermediate results of computations are stored in this table. Each entry in the table is a variable length string consisting of several elements.

Table 4b: Format of entry in table D for a vector or a matrix. When a constant is encountered in a statement, the actual value is stored in this table, and the appropriate adjective in table SP points to the address of the constant in this table. Constants, values assigned to variables, and intermediate results of computations are stored in this table. Each entry in the table is a variable length string consisting of several elements.

Table 5: Representation of the tokens of the APL statement ∘(+/XX)←p,XX←□ in table SP (see table 1). After a program has been stored left to right in table SP by the scanner, the interpreter will execute the statements from right to left. Obviously more information is needed for statement execution than is contained in this table.

Table 6: Representation of the tokens of the APL statement ∘(+/XX)←p,XX←□ in table SP (see table 1). After a program has been stored left to right in table SP by the scanner, the interpreter will execute the statements from right to left. Obviously more information is needed for statement execution than is contained in this table.
Table 4b: Format of entry in table D for a scalar.

Table 5: Format of an entry in the FTAB table. This table is used to store function headers when they are encountered. Each entry has seven elements, as shown. The remaining table that deals with function definitions is table VFUNC (table 6). There are also several tables of constants, but they are used primarily to simplify the scanner, and are discussed as necessary in the section entitled Statement Scanner later in the article.

</table>

Note: "ARITY" is a mathematical term denoting the number of arguments in a function.

Table 6: Organization of table VFUNC. VFUNC, indexed by VAL, holds the address pointers to the individual statements in a function. The sample program and comments in STATEMENT 1 IN FUNCTION 1. listing 1 should help to clarify the use of VFUNC. Two more tables are discussed in parts 2 and 3 of this series of articles.

ENTRY VALUE

1. NUMBER OF STATEMENTS IN FUNCTION 1.
2. POSITION OF RIGHTMOST SYLLABLE IN TABLE 'SP' OF STATEMENT 1 IN FUNCTION 1.
3. POSITION OF RIGHTMOST SYLLABLE IN TABLE 'SP' OF STATEMENT 2 IN FUNCTION 1.

\[ \ldots \]

\[ \text{N+1} \] POSITION OF RIGHTMOST SYLLABLE IN TABLE 'SP' OF STATEMENT N IN FUNCTION 1.

\[ \text{N+2} \] NUMBER OF STATEMENTS IN FUNCTION 2.

\[ \text{N+3} \] POSITION OF RIGHTMOST SYLLABLE IN TABLE 'SP' OF STATEMENT 1 IN FUNCTION 2.

\[ \ldots \]
### Listing 1: Results of a hypothetical program containing a user-defined function. This exercise demonstrates the interrelationships of tables 1 through 7. The program consists of a definition for a function AVG with a monadic argument Y and an explicit result X. Following the function definition is an immediate mode call of the function.

The scanner begins by inserting a `statement end` noun type in table SP, position 1, and proceeds to scan the first statement. When the function header is recognized, an entry is made in table FTAB as shown and scanning continues with the second statement. Again a statement end noun is inserted into table SP, position 2, but this time it is known that this should be statement number 1 of the function, so the adjective has a value of 1. Positions 3 thru 14 are the noun-adjective description of the second program statement and are similar to table 3, the differences being due mainly to the fact that the variables are no longer global but rather are formal arguments and formal results. Program statement 3 produces no entry in table SP but merely signals the end of a function definition. Table SP, positions 15 thru 19, contains the noun-adjective description of the immediate statement. Note how position 19 indicates a constant whose value is stored in table D beginning at position 1. Also note how the element vector is stored in D and relate this to the description in table 4a.

For the one entry in FTAB, element F7 points to position 1 in table VFUNC (see table 6). Here, VFUNC shows that there is only one statement in the function and that its rightmost syllable (noun-adjective pair) is at position 14 in table SP. Positions 3, 7, 12 and 18 in table SP refer to variables, and the associated adjectives point to entries in table VTAB. For variables X

### Tables 7a, 7b, 7c and 7d:

These tables complete the set of APL tokens used by this APL interpreter. The tables are scanned by subroutine OTHERS when a token is encountered which has not already been recognized by subroutines IDEN or NOMBRE.

Results of Scanning a Hypothetical Program Containing a User Defined Function

PROGRAM:

\[\begin{align*}
V & \leftarrow \text{AVG} \ Y \\
X & \leftarrow (+/Y) \div \rho \\
Y & \leftarrow \square
\end{align*}\]

Note: Colored arrows indicate pointer destinations

and Y in VTAB, element V2 indicates that the symbols are local to function AVG, while the symbol AVG in VTAB has a V2 value of zero indicating a global variable name. V3 values are all zero at this time, and will be set when the statement interpreter executes.

Having now discussed the major tables used by the interpreter and shown the general direction or goal of the scanner we can now discuss the statement scanner in greater detail. The scanner is a relatively easy function to program, and with the detailed discussion and flowcharts which follow one should be able to implement a scanner for any of the popular small computers.
The Statement Scanner

The main function of this module is to build the various tables required by the statement interpreter. There are two types of statements and two modes of scanning to be handled by this module. The first statement type is the function header which defines the form of a function and which also causes the scanner to enter the function definition mode. The second type of statement is any statement other than a function header. This type of statement can occur when the scanner is in either immediate or function definition mode.

Upon startup, the scanner is in immediate mode. When a del character (\(\uparrow\)) is encountered in immediate mode, the scanner switches to function definition mode and the characters immediately following the del, on the same line, form the function header. After the function header come the statements forming the function body. When another del character is found while in function definition mode, the scanner returns to
immediate mode. When a statement is finally scanned in immediate mode, control is transferred to the statement interpreter to execute the statement, using any previously defined functions as necessary. Following execution of the immediate statement, control is again returned to the statement scanner and the process repeats. When a line of input code is read, it is stored in a character vector called S, indexed by J. Each element in S is one character long; the last character for each line must be a carriage return. Thus the expression S(J) refers to the Jth character of the input string. Similarly the expression S(J) = CR is a test for the Jth character being a carriage return (CR). After some initialization, then, block IP loads vector S with the next statement and sets index J to 1.

Subroutine SKIPS (see figure 2) is next invoked to skip over any leading spaces. If the next character is a carriage return, then the line was all blank and is ignored. Otherwise a check is made for a del character, which causes switching between the two scanning modes as mentioned above. If FLAG is true, the scanner is in function mode and a del will return the scanner to immediate mode. If FLAG is false, the scanner is in immediate mode and a del will put the scanner into function definition mode, and processing will proceed at the box labelled FUNC which scans the function header. If no del character is found, scanning proceeds as normal. The next step is to call subroutine IKPST (figure 3) which is invoked to determine if the next token is an identifier. If not, scanning will resume at block NOMBRE (see figure 4). When an identifier is found, it must be encoded and entered into the appropriate tables. The identifier can be one of four things: a global variable, a formal argument, a formal result, or a label. If FLAG is false (immediate mode), then the identifier can be neither a formal argument nor formal result. If FLAG is true (function definition mode), a quick test will determine the type of identifier: if the identifier is equal to element F4 in table FTAB, the identifier is a formal argument of the current function. Similarly, the identifier being equal to elements F5 or F6 in table FTAB means the identifier is a formal argument of the current function.

One must check two things to test if an identifier is a label: if the character immediately after the identifier is a colon (ie: S(J) = ':') and no other semantic information has yet been scanned for this statement (ie: SP(-1).C=9), then a label has been found. In any case, the identifier must be put into the symbol table, if not already there, and the appropriate noun-adjective combination must be entered in table SP.

Finally, if a label was found, the value link (V3) for the symbol table entry is made to point at a scalar in table D. The value of the scalar is equal to the statement numbers where the label is found.

If the next token is not an identifier, scanning continues at the block labelled NOMBRE, as mentioned previously. Figure 4 shows the scanning process for numbers in the source program. Subroutine NUMBER is invoked to extract a number (see figure 5). If the next token is not a number, scanning proceeds at block OTHERS, described next; otherwise the number is stacked in a temporary vector, TVAL. The stacking process continues as long as numbers separated by spaces are found. Finally, the noun-adjective pair for a number is entered into table SP, and the appropriate scalar or vector is created in table D.

OTHERS, shown in figure 6, handles the scanning for tokens not previously recognized. Tables 7a, 7b, 7c and 7d aid in this processing. A call to subroutine LOOKUP appears several times with the accompanying parentheses containing three arguments. Subroutine LOOKUP will scan the table named in the second argument for an occurrence of the first argument: if found, the third argument points to the relative position of the match; otherwise, the third argument is set to zero.

The next step, then, is to check if the next character is in the table of monadic operators. If S(J) is not a monadic operator, a further test is performed to determine if it is a dyadic operator, carriage return, or valid special character. Figure 6 illustrates the handling for each case. If a monadic operator is found, a further test is made to determine if it is part of a reduction character pair. Again, figure 6 shows the testing and handling of each case. The handling of a carriage return will be discussed in the last paragraph of this section.

Returning to the beginning of the discussion of the statement scanner, you will recall that function headers require a special scan. Figures 1, 7a, 7b, 7c, 8 and 9 detail this processing, which is actually quite simple, although at first glance it may appear to be lengthy. The tokens after the del character (del indicates the beginning of a function header) are examined to determine the type of function, its name, its arguments and its result. There may of course be zero, one or two arguments (corresponding to a niladic, monadic and dyadic function respectively),
and one or no explicit result. After these pieces of information have been extracted, they are used to build an entry in the table FTAB, one entry for each function. The symbol table VTAB is updated to reflect the occurrence of any formal parameters. 

There comes a point, finally, when a carriage return is found and the scanner is in immediate mode. This occurrence causes the statement scanner to end and the statement interpreter to begin. All the tables described in the first part of this article are now complete, and the variable I points to the first syllable to be interpreted. Next month we will begin to describe the statement interpreter. You should, however, at this point be able to take any APL program and produce a valid set of encoded tables using the flowcharts shown. Do not be intimidated by the number of flowcharts used, since the actual amount of code required for implementation is not too lengthy when using any of the more powerful microprocessors.

Figure 1: Subroutine FUNC. This routine is called whenever the scanner encounters a del function, which signifies that the following statement contains a function header. The function header contains the syntactic form and the name of a user defined function (see listing 1). The purpose of FUNC is to perform the scanning operation for this special case.
Figure 2: Subroutine SKIPSP. This routine is used to skip over leading blanks.

Call SKIPSP
Result: Global variable J is incremented until S(J) is a nonblank character.

Figure 3: Subroutine IDEN. This subroutine is invoked to determine if the next token is an identifier. If not, scanning resumes at block NOMBRE (see figure 4). If a variable is found as the next token, B will be true and Q will contain the character representation of the variable.

Call IDEN (Q, B)
Result: If a variable is found as the next token, B will be true and Q will contain the character representation of the variable.
If the next token is not a variable, B will be false.
Figure 4: Subroutine NOMBRE. This subroutine is called when the next token scanned is not an identifier. It calls subroutine NUMBER (see figure 5) to determine if the token is a number. If not, a further call is made to subroutine OTHERS (see figure 6) to scan for tokens not previously recognized. The noun-adjective pair for a number is entered into table SP (table 3) and the appropriate scalar or vector is created in table D (see tables 4a and 4b).

THE PAIA 8700 COMPUTER/CONTROLLER
An exceptional price on an applications oriented 6503 based micro-processor system featuring:

- 1K bytes RAM locations (512 bytes supplied)
- 1K bytes ROM (256 byte monitor included)
- 2 - 8 bit input ports
- 2 - 8 bit output ports (1 latched, 1 buffered)
- 24 key touch operated keypad (used by monitor to allow entry & execution of user programs also user definable.)
- 2 - latched seven segment displays (used by monitor to display memory location & contents easily user programmmed)
- Optional cassette interface ($22.50) fits entirely on the processor board.

THE IDEAL, LOW COST SOLUTION TO IMPLEMENTING ALL THOSE WILD COMPUTER BASED CONTROL SYSTEMS YOU'VE BEEN DREAMING OF!
PAIA software currently available or under development includes: Music synthesizer interface; home applications package including: multi-zone fire/burglar alarm, real time clock, energy saving heat/air conditioning control, computer generated 'floor-bell'; Model railroad controller and more.

8700 COMPUTER CONTROLLER KIT ........ $149.95
(requires 5v, $1.2A.; 12v, $150 ma.)
Shipped direct from PAIA (add $3.00 postage)

Also available at FULL-LINE Computer stores.
Call Number (VALUE, B)
Result: If a numeric constant is found as the next token, B will be true and VALUE will contain the value of the constant. If the next token is not a numeric constant, B will be false.

Figure 5: Subroutine NUMBER. This subroutine tests the token being scanned to determine whether it is a number or not. If a numerical constant is found, B will be true and VALUE will contain the value of the constant. If the next token is not a number, B will be false.

Practical Microcomputer Programming: The Intel 8080

Here is a comprehensive source of programming information for the present or prospective user of the 8080 microcomputer, an architecture which appears in the MITS Altair, 8800, Processor Technology SOL, IMSAI 8080, Polymorphics POLY-88, and other popular microcomputer system products.

After several preliminary chapters, the authors get down to practical details with topics such as moving data, binary arithmetic operations, multiplication and division, use of the stack pointer, subroutines, arrays and tables, conversions, decimal arithmetic, various I/O options, real time clocks and interrupt driven processes, and debugging techniques. Most examples are given in symbolic assembly form, with occasional listings of assembled code using a Computer Automation software development system.

This 306 page hardcover book is well worth its $21.95 price and should be in every 8080 or Z-80 user’s library.

by W J Weller, A V Shatzel, and H Y Nice

Price shown is subject to change without notice.
In unusual cases, processing may exceed 30 days.
Figure 6: Subroutine OTHERS. This subroutine is used to identify those tokens (listed in tables 7a, 7b, 7c and 7d) not already identified by subroutines IDEN or NOMBRE.

NOTE: THE SYMBOL "||" INDICATES CONCATENATION.
Figure 7a: Subroutine NILAD. This subroutine performs the scanning function for a niladic function header. A niladic function is one which takes no arguments.

Figure 7b: Subroutine MONAD. This subroutine scans monadic function headers. A monadic function is one which takes one argument.
Figure 7c: Subroutine DYAD. This subroutine scans dyadic function headers. A dyadic function is one which takes two arguments.

Figure 8: Subroutine EOL. This routine performs the common processing needed for function headers. See section entitled "The Statement Scanner."

Figure 9: Subroutine FN_VAR_ADD. This routine aids subroutine EOL by adding user defined formal parameter names to the symbol table.

Figure 10: Subroutine CARRET. This routine scans carriage returns.
GLOSSARY

Array: A group of numbers or characters which can be subscripted and treated as a single object. APL arrays can be vectors or matrices.

Compiler: A program which translates a high level language source program into machine language object code. APL, like any language, may be compiled but is usually executed interpretively.

Composite Operator: An APL operator which operates on all the elements of an array.

Dyadic: Taking two operands. Used to describe certain APL functions or operators.

Execute Mode: The APL mode in which a line of APL code entered by the user is immediately executed by the computer (also called immediate mode). Compare Function Definition Mode.

Function Definition Mode: The APL mode in which functions are created.

Function Header: A line of APL consisting of a delimiter (\(\downarrow\)) followed by a function name and information about the number of arguments the function takes and whether or not it returns a result.

Global Variable: A variable which is available to any calculation or any function in the workspace.

Interpreter: A program which takes a source listing from a high level language (like APL) and executes it sequentially (usually line by line).

Local Variable: A variable which is available only during the execution of the function in which it is defined. For example, in the function header

\[\downarrow Y + \downarrow R \downarrow Q \downarrow I \downarrow J\]

\(I\) and \(J\) would be local variables.

Monadic: Taking one argument. Used to describe certain APL functions or operators.

Niladic: Taking no arguments. Used to describe certain APL functions or operators.

Kenneth Iverson, A Programming Language, Queens University, Kingston, Ontario, 1968.

Continued from page 5

philosophy course, the elements of this principle are:

**Given multiple, equivalent logical formulations of an argument, that argument is best which is both complete and of the simplest structure.**

Complete means that the argument takes into account all the necessary details of the point being made.

Simplest structure means that the argument in some sense is the most compact or easiest to understand.

The whole point of this principle is that in order to reduce the complexity of long and involved logical constructions, one should choose paths of explanation which are direct and concise rather than long and convoluted. However, the principle says nothing about the need for complicated logical structures to describe complicated concepts. It merely says that for a given level of complexity the simplest argument, which accounts for all features of the point being made, is the best argument to adopt.

**Simplicity and Personal Computing**

The design of systems and the programming of computers are activities, like many human activities, which benefit from the application of this principle. If I take the liberty of reformulating the principle of simplicity from an engineering or programming point of view, it might read:

*That system (program) is best which accomplishes its goals with minimum complexity.*

This application of an old principle to a modern context is a desirable design goal for the personal computer, or its attendant programming. But understanding and utilization of such constructs can only be simplified within the limits of the function which is the goal of the design. A complex structure is a complex structure, and ceases to be itself when pieces are removed by a simplification which compromises the goals and functions of the structure. Within any given definition of the functions or goals of a computing system or program, the principle of simplicity is most applicable; but if the overall goal is not simple, the available alternatives...
of view) within the new system. It can be used when acquiring knowledge about a new area by the technique of slicing up a complicated subject into manageable units. We see the success of this method as design discipline in numerous ways, ranging from the modular low level hardware function boxes called integrated circuits, to the design of finished product personal systems, to the modular design of systems software, to the applications software an intelligent user designs modularly with an eye towards the problems of managing complexity.

Applying the Principle of Simplicity: A Caution

The owner of the personal computing system can use this principle of simplicity in numerous ways. However, it is not possible to accomplish positive goals with a personal computer by ignoring complexity and demanding some form of "absolute" simplicity which amounts to a lack of awareness of the subject matter.

The computer as a servant to mankind cannot be used to its fullest potential without active thought on the part of an interactive user. A "brain amplifier" is less than maximally useful without

for approaching this goal will necessarily reflect this lack of simplicity.

However, all is not lost. One of the greatest contributions of the past half century of systems engineering is what might be called a principle of local simplicity within a larger (ie: system wide or "global") structure. The goal is still complex, but the details are locally simple. This principle is inherited by today's personal computing designs, as well as much of modern technology from aerospace control systems to robotic manufacturing and process control.

The practical application of the concept of keeping designs and structures as simple as possible, consistent with accomplishment of complex goals, is seen in the idea of modularity as implemented in both hardware and software. It is nearly impossible to keep track of a myriad of details about a large and complicated system. But, if the design is approached from a modular and hierarchical point of view, the principle of simplicity is much more easily and usefully applied on a local basis and reflected in the entire system's conception. Local simplicity is used by the designer to minimize complication by choosing and evaluating the best alternatives at each level (or point...
brain activities (thoughts) to “amplify.” With an understanding of the idea that most complex problems can be organized and presented by applying the principal of simplicity locally, a knowledge of the organization and design of systems and their use can grow and flourish in each active user’s understanding of the technology.

I consider it very important to emphasize the point that the user of a computer is an active participant in the technology, that knowledge of the technology and its potential is essential to its full utilization by individuals. When we publish an article on some subject, it helps in this endeavor by providing a local and specific focus on that subject within the global knowledge of computer science. This is a sort of modularization of some aspect of the technology, with various pointers and references to the more general context of computer science practices as necessary. But each such element assumes an active and intelligent reader not willing to turn off input activities at the scanning of the end mark (©) for an article. There is no simple shortcut to knowledge and understanding; we can only provide aids and pointers to help mark the path.

Practical Philosophy for the Neophyte

The osmosis theory of education, coupled with a bit of inspiration from the principle of simplicity, is perhaps the best method of approaching the unknowns of personal computing systems on the part of the beginner. The osmosis theory may be described as a form of directed Brownian motion (in analogy to a well-known physical phenomenon of random motion). It is a directed activity in the sense that there is a particular goal used to judge the relevance of sources of information. It is a random activity in the sense that prior to acquiring an understanding of the field, there is no hard and fast criterion upon which to judge the order and timing of materials to be read and intellectually digested. In its simplest form, it is to simply plunge into the literature of a field and read every scrap of information which is related to the desired goal of understanding the subject. As new points are encountered with this approach, they are integrated into a personal internal structure of knowledge. The strategy is eminently successful when it covers all levels of detail about a subject through various readings, coupled with reflection and a bit of feedback which helps
eliminate the randomness in the direction of future readings.

In one respect, I write about this osmosis method of acquiring knowledge (and its relationship to the principle of simplicity) with some authority; I know that the method is practical because I've personally applied it to gain my present understanding of computer science, such as it is.

This process of acquiring knowledge about a field is prone to an apt computer science analogy: imagine that the person acquiring the knowledge is analogous to a compiler program, that the source text of the compilation is the literature of the field, and that the object text out of the compiler is an internal understanding of the field. The analogy is illuminating with respect to the problems compilers often have with parsing and detecting subtle semantic nuances of a source language, or the problems of forward references to undefined elements of a program, which are analogous to gaps in the knowledge of a person embarking upon a detailed study of a field.

Learning About Mental Amplifiers

I think it can be safely asserted that the raison d'être for computing is to amplify one's mental powers by automating various processes which can benefit from the effort. There is, of course, the intoxication with technology's details, which affects us all, and a certain degree of speculation on the experimenter's part as to whether an ultimately useful result will ensue when enough hardware and software development has been accumulated. But the pot of gold which attracts a lot of such speculations in the present era is the idea that computers can become amplifiers for mental functions. When both the mental and physical functions are modeled and automated, the result is a robot, hence one of the reasons for the dual fascination with robots and computers.

Mental powers and mental operations are far from simple. The range of activities to which I can turn my conscious attention is wide and varied; the same applies to every reader. In dealing with a complex subject, mental operations and their assistance through automation, the principle of simplicity is by no means to be forgotten, for it gives a criterion for judgment and discrimination among numerous alternatives at all levels.
Serendipitous Circles

In this article we describe a simple algorithm which produces beautiful computer art. The algorithm was written to draw circles, but when we tried to draw large circles, we saw strange complex patterns. The screen was filled with wildly oscillating jelly bean shapes which would periodically explode in a beautiful sparkling flash and collapse back into new jelly beans. Experimenting with different diameters, we discovered many new dynamic patterns.

The Magical Algorithm

The algorithm that produced these serendipitous circles is remarkably simple. A flowchart is shown in figure 1. This algorithm can be implemented on the smallest of home computers in a short time, and is guaranteed to impress everybody with pretty pictures while providing an interesting mathematical puzzle. An example of an assembly language listing for the Motorola 6800 is shown in listing 1.

Implementing this algorithm on a computer which has graphics capabilities is very easy. However, if you are one of the many unfortunate people with no graphics capability...
Figure 1: The magical circle drawing algorithm. This straightforward procedure results in some surprisingly sophisticated displays when each coordinate pair is calculated and displayed on a graphics peripheral device. The algorithm solves a difference equation which has as its solution an ellipse. The nonelliptical patterns arise from overflows in the computer's registers during the calculations, and from lack of precision due to the finite size of computer words.

Listing 1: The serendipitous circle algorithm as written for the 6800 microprocessor. This program uses 16 bit arithmetic. The photos shown in this article illustrate circles generated with 24 bit arithmetic, although the results for both methods are quite similar. Different precision arithmetics can be used to generate slightly different results.

The screen was filled with wildly oscillating jelly bean shapes which would periodically explode in a beautiful sparkling flash and collapse back into new jelly beans.

word. For example, overflow occurs when your computer adds two positive numbers and gets a negative number. Lack of precision occurs when your computer divides 5 by 2 and gets 2 as the result.

Variations on the Algorithm
There are several different ways that the program in figure 1 can be varied. Some of these are described below.

• Initial X and Y
The choice of a starting point determines the pattern the program draws. Points close to the origin draw ellipses; larger values can produce more interesting patterns. Photo 2 was produced by using slightly larger starting values than for photo 1. The best way to understand this effect is to experiment with different values of X and Y yourself.

• Display Wrap Around
Most display devices have less than 16 bits of resolution, typically ten or fewer bits are used. If X and Y are represented as 16 bit integers, which ten bits should be displayed? The logical solution is to display only the most significant bits. Different interesting results can be obtained by displaying successively less significant 10 bit slices from a 16 bit value of X and Y. Choosing a 10 bit slice that excludes some high order bits produces an effect called wrap around. The effect is the same as magnifying the original picture and then folding it over on itself to fit the display screen. Photo 3 was produced from the same initial point as photo 2; but photo 2 displays the ten most significant bits, while photo 3 displays the ten bits just below the most significant bit. Photo 4 was produced by displaying an even less significant
Figure 2a: One of two preferred locations for the origin of your coordinate system display. Here the origin is placed in the middle of the display to produce an ellipse centered about the origin. See photo 1.

Figure 2b: In this case the origin has been placed in the corner, splitting the ellipse up into four quarters. This is called "display wrap around."

Photo 3: This photo shows the effect of displaying the ten bits just below the most significant bit for both X and Y. Note the radical change in appearance.
Once again the display changes significantly, this time by choosing an even less significant group of ten bits for display. The technique of using only certain groups of bits is analogous to magnifying the original picture and then folding it over on itself to fit the display screen.

- Position of Origin

Figure 2 shows two choices of placement for the origin. Choosing the origin in the center of the display, as in figure 2a, results in the ellipse drawn in the center of the display. However, if the origin is placed in the corner as shown in figure 2b, then one quarter of the ellipse is drawn around each corner. Choosing the origin in the center corresponds to using a signed digital to analog conversion and choosing the origin in the corner corresponds to an unsigned conversion. Patterns that are not very interesting with one origin may be very interesting with the other origin.

- Speed of Display

The speed of displaying points, i.e., the number of points per second, is an important factor in the appearance of a pattern. You can put a loop in your program to introduce a delay and experiment with this effect.

Generalizing the Equation

Still more patterns can be produced by using the more general equation:

\[ X_{\text{new}} = X - aY \]
\[ Y_{\text{new}} = Y + bX_{\text{new}} \]
The photographs in this article used $a=b=\frac{1}{2}$. We have tried values other than $\frac{1}{2}$ with interesting results, but have never used different values for $a$ and $b$.

**Precision of Arithmetic**

Most of the programs we have written to draw our patterns have used 16 bit arithmetic. The program used for the pictures in this article used 24 bits (double precision on a PDP-8 computer). It is possible that using fewer bits will not produce such interesting results.

**Other Algorithms**

Another algorithm you might try is shown in figure 3. Without much trouble it can be shown that this is a difference equation analog of a differential equation that draws parabolas. This particular algorithm can produce interesting and complicated musical sounds if the output of the Y DAC is amplified and played through a speaker.

It is easy enough to try new forms of these or other difference equations. It has been our experience that these algorithms often produce new visual and audio effects that will astound you.

\[ \text{CHOOSE AN INITIAL } X \text{ VALUE AND } Y \text{ VALUE} \]

\[ \text{DISPLAY THE POINT } (X,Y) \]

\[ X_{\text{NEW}} = X + 1 \]

\[ Y_{\text{NEW}} = Y + X_{\text{NEW}} \]

\[ X = X_{\text{NEW}} \]

\[ Y = Y_{\text{NEW}} \]

This algorithm can produce interesting and complicated musical sounds if the output of the Y digital to analog converter is amplified and played through a speaker.

*Figure 3: A serendipitous algorithm based on a parabola. (This can be more easily seen by manually executing the algorithm and plotting a few points for $X$ and $Y$.) The parabola is the solution to a difference equation which forms the basis of the algorithm.*

Circle 121 on inquiry card.
PC '77 offers you the most complete show of its kind ever held. Proven in '76 and acclaimed in '77 by all the major professional publications as the coming event of the year, this show is a ‘must’. Make plans now to attend. Here are some of the scheduled events:

**PRE-CONVENTION PROFESSIONAL SEMINARS**

- **August 22-26** Technical Design Labs and Trenton State College Z80 Seminars at nearby Trenton State College.
  Five software and four hardware seminars.
- **August 24, 25, 26** TYCHON INC. Microcomputer Interfacing Workshop at the Shelburne Hotel.
- **August 26, 27** Osborne & Associates Microprocessors — Where they came from and where they are going, an analysis of all products on the market today. At the Shelburne Hotel.

**MORE NEW PRODUCTS THAN EVER!**

All the products you’ve been reading about in the ads will be on display at PC '77. Many companies will be showing exciting new products. HEATH COMPANY will display exclusively, for the first time, their complete computer line. SOLID STATE MUSIC, POLYMORPHIC SYSTEMS, THE DIGITAL GROUP, THOMAS INSTRUMENTATION, MOS TECHNOLOGY, TECHNICAL DESIGN LABS, SOUTHWEST TECHNICAL PRODUCTS, CROMEMCO, E & L INSTRUMENTS, THE INTERPRING GROUP, KENT-MOORE INSTRUMENTS, PERSCI INC, GEORGE RISK INDUSTRIES, MID WEST SCIENTIFIC, OSBORNE AND ASSOCIATES, EXPANDOR, QUAY CORP, MATRIX PUBLISHERS, CAMELOT PUBLISHING CO, HAYDEN BOOK CO, GAW ELECTRONICS, ENCLOSURE DYNAMICS AND SOROC TERMINALS will all be showing new products. Plan to attend!

**OUTSTANDING COMPUTER HOBBYIST OF THE YEAR AWARD**

This is an annual award presented to a person who has given outstanding service to others in the personal computing field with no commercial motives. Nominations are currently being accepted from individuals and clubs.

For an interesting evening of family entertainment, plan to attend the Ice Capades which are in town the week of PC '77.

**LET'S KEEP THE PERSONAL IN PERSONAL COMPUTING!**
Deal yourself in™ on the biggest personal computing show of the year!

"MICROPROCESSORS — WHERE THEY CAME FROM AND WHERE THEY ARE GOING. AN ANALYSIS OF ALL PRODUCTS ON THE MARKET TODAY."

Dr. Adam Osborne will present a 6 hour seminar covering topics such as: Bringing in five new areas of technology: All microprocessors are not equal — each serves one market better than the other; Identifying those markets best suited to each microprocessor: Real sales, sales predictions, and industry trends. Vaccination expected for 1977; Comparisons including: 8085 vs. Z80, 8086 vs. 88, etc.

For information and reservations contact: Osborne and Associates, Inc., Dept. PC77, P.O. Box 2036, Berkeley, CA 94702 (415) 548-2805.

SYBEX INCORPORATED
Thursday, August 25 & Sunday, August 28

INTRODUCTION TO MICROPROCESSORS
This intensive seminar is intended for all non-specialists who wish to acquire a broad understanding of the basic concepts and advantages of microprocessors. It explains how microprocessors work and it stresses microprocessor evaluation. The seminar begins with an introduction to the microprocessor, the microprocessor family, and the microprocessor computer. Each type of microprocessor is covered in detail, including: BASIC DEFINITIONS, SYSTEM COMPONENTS, MICROPROCESSOR APPLICATIONS, SYSTEM COMPONENTS, MICROPROCESSOR APPLICATIONS, WHAT TO LOOK FOR, AND IMPACT AND EVALUATION.

PROGRAMMING MICROPROCESSORS
This seminar covers in detail the internal operation of a microprocessor system, including how instructions are fetched and executed. The seminar covers the instruction set of the Z-80 microprocessor. The seminar also covers the operation of microprocessors, including: arithmetic operations, logic functions, and I/O operations. The seminar also covers the operation of microprocessors, including: arithmetic operations, logic functions, and I/O operations.

Friday, August 26

MICROPROCESSOR APPLICATIONS
This seminar presents in detail the main application techniques of microprocessors. Topics covered include: INTRODUCTION TO MICROPROCESSORS, MICROPROCESSOR SYSTEMS, APPLICATION TECHNIQUES, CROSSTALK STUDIES (industrial and medical applications, medical and business applications), and microprocessor applications in the home and on the go. The seminar also covers the operation of microprocessors, including: arithmetic operations, logic functions, and I/O operations.

For information and reservations contact: Sybex Inc., 2161 Shattuck Ave., Berkeley, CA 94704 (415) 848-9235.

OSBORNE AND SYBEX ASSOCIATES, SYBEX AND TYCHON SEMINARS ARE ALL HELD IN THE SHELBURNE HOTEL, ATLANTIC CITY, NEW JERSEY. TECHNICAL DESIGN LABS AND TRENTO STATE COLLEGE SEMINARS ARE HELD AT NEARBY TRENTO STATE COLLEGE, TRENTON, NEW JERSEY.
Where does one get software? The lucky winners of the Scientific Research Basic software library will have a good start at answering this question.

Scientific Research Vol I - V
Where does one get software? The lucky winners of the Scientific Research Basic software library will have a good start at answering this question.

Interface Age
Life Time Subscription
Interface Age is an exciting window on this burgeoning new technology. Find out about microcomputing for the home and the small businessman using this monthly compendium.

Solid State Music
Plug in any one of a number of Solid State Music modules and enhance the State Music modules and enhance the power of an Altair (S-100) bus system. In particular enjoy the new SB-1 music synthesizer and the VBJA video board to be given out as door prizes at PC77.

Technical Design Labs
The Xitan Alpha 1 is the beginning of a general purpose Z-80 microcomputer system. Add your own serial terminal and interfaces to the Altair (S-100) bus system.

Heathkit
This new Heathkit H9 video terminal features data rates ranging from 110 to 9600 bps, EIA RS-232 and 20 ma current loop interfaces, a full ASCII keyboard and 12 lines of 80 characters per line.

Midwestern Scientific Instruments
The newest and most advanced 6800 Computer System available. At PC '77, MSI will demonstrate the new MSI 6800 and the MSI FD-8 Floppy Disk Memory System running Multi-User BASIC with full program and Data File handling capability.

E & L MMD - 1
Complete 8080 based microcomputer with keyboard, 500 word RAM memory, 24 LED read out, power supply and case. Includes Bug Book V & VII, programmed self-training course in digital electronics and microcomputer technology.

DOOR PRIZES

Heathkit
This new Heathkit H9 video terminal features data rates ranging from 110 to 9600 bps, EIA RS-232 and 20 ma current loop interfaces, a full ASCII keyboard and 12 lines of 80 characters per line.
Silicone Sea ... There's a new excitement in Atlantic City. With the advent of casino gambling, $800,000,000 is being invested by such companies as Caesar's International, Playboy, Penthouse, Bal-ly Corporation, Resorts International, Loew's Corporation and many others in new hotel, restaurant and entertainment facilities. And of course all the old attractions of this famous resort remain, the miles of sandy beach with gentle surf, the clean, well run amusement parks, the boardwalk with its exotic shops and much more. All of this adds up to the perfect family vacation spot, easily reached in less than two hours driving time from Washington DC, Philadelphia or New York City.

There is parking for 20,000 cars within a three block area of convention headquarters. The convention hotel is right on the boardwalk. Hotel parking is for hotel guests only. Others park on near-by Pacific Avenue.

Club Booth ... Every computer club is welcome to participate with us at PC '77 at our gigantic club booth. Clubs may have members manning the booth to engage in non-commercial activities such as meeting new people from their areas, giving out club literature, newsletters, membership forms and signing up new members.

Helpful Hints for Getting the Most Out of the Show
1. Make a list of the companies that you particularly want to see.
2. Bring pregummed address labels with your address printed on them for exhibitor questionnaires, booth prize tickets and requests for information. This will save having to write your name hundreds of times and give you more time to get around the show.
3. Plan on returning to your room or car several times during the day to drop off literature and to change into a fresh pair of comfortable shoes.
4. Bring a good tape recorder, lots of spare batteries and tapes and record information, make notes, and record the seminars. (Recording of seminars is for personal use only, reproduction is prohibited.)
5. If you are planning to attend only one day, make that day Saturday. If you find you really need more time you'll be able to come back on Sunday.
6. Make hotel reservations early. Have them confirmed to save both time and disappointment.
7. Bring spare pencils, pens, and note paper.
8. Bring adequate identification in order to make purchases.
9. Be open minded when talking to exhibitors. Listen to what they have to say, you may learn something valuable.
10. Bring your camera, there will be much to photograph.
11. Remember that advance registration will save you from having to wait in line. Mail the coupon below today!

PC '77 Weekend admission at the door will be $10.00. Register before August 10th SAVE 20% AVOID WAITING IN LINE! Admission includes exhibits and seminars for both days, August 27-28th.

Please rush __________ advance registration tickets for August 27-28th at $8.00 each.
Please rush __________ Banquet tickets for Saturday, August 28th at $17.50 each.
Send reduced Hotel rate information __________.
Make all checks payable to "PERSONAL COMPUTING '77" and mail to:

Dr. John Mauchly and ENIAC ... Enthusiasts will have a chance to meet one of the earliest pioneers of the computer industry. Dr. John Mauchly, co-inventor of ENIAC, the first electronic digital computer, will be a featured speaker and guest at PC '77. Dr. Mauchly will be telling the inside story of the trials and tribulations, as well as the triumphs, of ENIAC. And remember, all of this was going on during World War II! Accompanying Dr. Mauchly will be Mrs. Mauchly who worked on the project as one of the original woman computer programmers. Dr. Mauchly, who is an active home computerist, will be available to speak informally with hobbyists during the convention. Don't miss this!

Club Hospitality Suite ... The Amateur Computer Group of New Jersey, Northern New Jersey Amateur Computer Group, Philadelphia Area Computer Society and the Chesapeake Micro Computer Club will host a hospitality suite during the show. Representatives of all computer clubs are encouraged to drop by the suite during the show to exchange views, greet old friends and meet new ones.

SPECIAL GROUP TRAVEL RATES ... for Clubs and Organizations from West Coast and Mid America. Contact Seven Seas Travel, 17220 South Norwalk Blvd., Cerritos, Calif. 90701, Dawn Corrigan, 213/924-8383.

Your Computer

One of the basic requirements of a software system is a way to get text input. Programs need data to work on; and you need some way to turn this data from markings on a piece of paper to bits inside the machine. The most obvious examples, if only because you have to use them before you can have any other programs of your own creation, are assemblers and compilers. The source program to be translated is just the data for the translating program. Other kinds of programs, tabulations, statistical analyses, and so forth, also cry out for a convenient way to get a large amount of text into the computer. This is where the text editor comes in.

A text editor is a program which allows the user to enter and modify encoded character data. With it, you can enter a program or a list of figures or anything else, go back and make corrections, and finally output the text onto a storage device or leave it in memory for your next program to work over. A text editor is a fairly simple program to write, and the 8 bit machine which you are probably using actually has one advantage for editing over many big computers: Its unit of information is just the right size for holding one ASCII character.

There are two basic requirements for an editor: a place to put the text and a way to handle it. The place to put it is the text buffer, which is simply a block of main memory of a reasonable size. The way you handle it is with a command language, which will run interactively through your console.

The buffer can always have the same starting location, but where it ends depends on how much text it holds at any moment. So a pointer indicating the current end of the buffer has to be kept. Initially (or after you “scratch” your life), it points to the beginning of the buffer, since there is no text yet. The convention assumed here is that the end of buffer pointer indicates the first unused location. There is also an absolute end to the buffer, which does not change; this is the end of the memory allocated for it. The editor should guard against any attempt to store characters beyond this point, for that might wipe out a program or crucial data.

Another pointer which the editor needs is the cursor. This pointer indicates the exact location in the buffer which will be affected by editing commands. Inserted characters will appear at this point; deletions will wipe out the characters which are here. When the editor starts up, the cursor addresses the beginning of the empty buffer.

Text Modifying Commands

The commands which an editor needs can be classified into text modification, cursor
The Text Editing Buffer Concept

A text editing buffer is an area in memory address space which has programmable memory implemented. It is the computer equivalent of a blackboard on which to create programs, letters to friends, or even novels or other writings. A typical way of describing such a buffer is through several pointers (address values) which identify the limits of available programmable storage. The starting location is a fixed address which is built into the text editor program when such a program is typically implemented on a small computer. Similarly, the absolute end of buffer space is a fixed address which points to the next location after the end of the buffer. The cursor location is a variable in the text editing program which is allowed to range between the starting location value and the current end of buffer. The current end of buffer is another variable, which identifies the location of the next available unused byte in the buffer space. This variable should be constrained to be greater than the cursor location, but always less than the absolute end of buffer. When the current end of buffer is the last byte in the buffer, the buffer is full.

positioning and IO commands. Since the main concern of the editor is to do something with text, I'll start with the commands that modify text.

At the very least, a command to input text from the keyboard is needed. There doesn't actually have to be an explicit input command; if all commands are issued by special control characters (excluding carriage return, tab, etc), then the editor can take every noncommand character which it reads in its normal course and insert it directly into the text buffer. Alternatively, a specific input command can cause all text which is typed to be stored in a temporary buffer, up to a preselected termination character, such as the aptly named "escape" code. The temporary buffer is then copied into the text buffer after getting the termination character. The latter method makes typing in control characters, except the termination character, easier. It is even more efficient in some cases where "efficient" means quicker response to the user. On the other hand, direct insertion can be handled with fewer instructions, avoids the need for a buffer, and eliminates the chance of forgetting whether the editor is waiting for commands or input.

Inserting characters is easy when the cursor is moved along. But when the cursor is somewhere else, then the character which it points at and all the characters after it have to be moved down to make room for the inserted character(s). This is where buffered input is more efficient. Without it, the characters have to be pushed down every time a new character comes in; with it, they can be moved over by the number of characters in the buffer all at once. If, for example, you want to insert 40 characters at a point in text that has 100 characters after it, you would have to do 4000 memory to memory transfers, not counting the insertion itself, without buffering, as opposed to 100 with buffering. But this only matters if you can type characters in faster than your processor can handle them. [In the text edition I wrote for my 6800 based system, I used the "quick and dirty" brute force technique just described. With my homebrew machine on long text chunks (12 K or so) it takes typically 1/5 second for the program to respond, intolerably slow... CH]

The other basic text modifying operation is character deletion. Probably the best character to delete is the one just before the cursor, so that you can rub out what you just typed in if you made a mistake. But be sure to check for deleting past the beginning of the buffer! If the deletion occurs at the
Peripheral Vision is a brand-new company that's dedicated to selling reasonably priced peripherals for various manufacturers' CPU's.

We think you'll flip over our first product.

It's a full-size floppy disk for the Altair-Imsai plug-in compatible S-100 BUS. And it's available for as low as $750.

Here are the features:

• 1 interface card supports 4 drives
• Stores over 300,000 bytes per floppy
• Bootstrap EPROM included—no more toggling or paper tape
• Completely S-100 plug-in compatible
• Interface cabling included
• Drive is from Innovex (the originator of the floppy concept)—assembled and tested
• Interface card design is licensed from Dr. Kenneth Welles and the Digital Group
• Disk operating system with file management system included on floppy
• Cabinet and power supply optional

Prices:

Now, a little more about our company.

Peripheral Vision may be brand-new, but we have some old-fashioned ideas about how to run our business.

We know there are serious incompatibilities among the different manufacturers' peripherals and CPU's. We want to get them together. And, we want to bring significant new products to market—products consisting of everything from adaptation instructions/kits for hardware and software to major new products.

It's a tall order, but we feel we're up to the task. Peripheral Vision has already obtained a license from The Digital Group to adapt versions of some of their products to the S-100 BUS. And we're working on getting more from other companies.

Most important to our customers, Peripheral Vision is committed to helping you get along with your computer. We'll do all we can to make it easy.

Write us now for all the information on our company, our philosophy and our exciting line of products. And be prepared to flip over all of it.

Send me the works, and I just might flip over it!

Circle 124 on inquiry card.
end of the buffer, then the end of buffer pointer just has to be decremented; for neatness, the deleted character might also be zeroed out. If the cursor is in the middle of the buffer, then the character it points at and all subsequent characters are moved back one position, thus overwriting the unwanted character.

For added power, the deletion command could be allowed to take a numerical argument, indicating how many characters to delete. A number reader for this command can also be used in connection with other commands. Other options conceivable include deleting all characters up to and including the next "end of line" character, thus enabling the editor to delete one or more lines.

Cursor Commands

Commands which position the cursor are fairly easy to implement, since they require no moving of text. Commands to increment and decrement the cursor, and to move it to the top and bottom of the buffer, are trivial to implement. The only thing to worry about is the possibility of moving the cursor outside the buffer.

Commands to move up and down a line of text are just a little trickier. Assuming that the end of a line is designated an "end of line" character such as the carriage return character, the next line command searches the text buffer, starting at the cursor, for a carriage return; it then positions the cursor immediately after the carriage return. The previous line command searches backwards from the cursor for the second carriage return it encounters (the first carriage return is at the end of the previous line), and positions the cursor at the character immediately after this second carriage return. Numeric arguments can be used to move up or down several lines at a time.

The most complex cursor positioning command is the search command. Its function is to search the buffer for a user specified sequence of characters, and then to position the cursor where the sequence is found. The search may be forward or backward from the cursor.

A buffer will be needed to hold the search string: the sequence of characters to be matched. If you implemented a buffer for input, you can use it again here. To conduct the search, scan the text buffer for the first character; then, having found a match for it, check if the immediately succeeding characters match the rest of the search string. If they don't, resume scanning for the first character. Continue until a match is found or the buffer runs out. If the search is unsuccessful, the cursor is probably best left where it was before the search started.

Input and Output Commands

There are two kinds of input and output that the editor needs to be able to do. One is communication with the terminal; the other is interaction with long term mass storage such as cassettes, tape cartridges or floppy disks.

Terminal input has been implicit in the discussion of all the commands. Terminal output has two specific functions: giving the user messages and displaying parts of the text buffer. Messages should include complaints about illegal commands, notifications of whether searches succeeded, warnings about attempts to go outside the buffer, indications of failure in transfers to or from mass storage, and so forth. Typeouts from the buffer can be handled in various ways, but what is important is that it be easy to look at the vicinity of the cursor. A minimal print or display command might just print the line which includes the cursor character. For greater flexibility, arguments to indicate a number of lines could be implemented. With two arguments, a number of lines before the cursor and a number afterward could be printed out; if both arguments are zero, just the line containing the cursor character would appear.

The other part of input and output is based on the need to store your text for later use. It is not very efficient to have to type in your whole program anew every time you want to update it; it is far more convenient to have a copy of the previous version on magnetic or paper tape, disk, or whatever medium is available to you, so that you can load the editor's text buffer, make the necessary changes, and output the new version for later sessions.

This is simple enough if the entire text file with which you are working will fit in the text buffer (given that you have the necessary interfacing and I/O routines). But when there is too much text for the editor to handle at once, it has to be broken down into buffer sized pieces. To do this, you need the ability to alternate between reading one file and writing another. If you have cassette storage, this means you should have two recorders with motor control. The trick can probably be done with one recorder, but only with painful quantities of rewinding and positioning via the tape counter as the tape is moved between the two files.

A large text file should be broken up into pages. This is done by inserting the form feed character control L into the text at reasonable intervals. The text input routine
can then be designed to read the input file up to and including the first control L encountered, copy it into the buffer area, and then wait for another command before reading another page in. This method allows you to fix up one page at a time, outputting each page before getting another page from the input file.

Table 1 presents a possible command language for an editor which includes the features discussed here. If a command takes no literal or numeric arguments, it needs no terminator; the next character is a new command. Where there are arguments, the character control C terminates the command. Note that with this command language, control C itself cannot be inserted; this should not be a great loss, since control C is normally an end of text indicator.

These commands will provide you with a small, yet versatile editor. If you want to expand further, options such as scratch buffers, iteration, and macro-commands are possible; for an example of a powerful editing program, see Digital Equipment Corporation's TECO. At the other end, you can leave out numeric arguments, searching and even line positioning for the simplest editor possible. It all depends on what you can afford in time, effort and storage.

Table 1: A set of possible commands for a text editor. These commands are just suggestions for the type of arguments that may be used in an editor language. Note that the character 'C stands for control C. Control C cannot be encountered in the text to be edited since it is used as an indicator at the end of a command.
The New Heathkit Computer Line

On June 7, 1977, we traveled to the Heath Company's plant near Benton Harbor MI to take part in the "Heath Computer Product Press Party." This was a gathering of people from various publications to preview the new product line which Heath is introducing to the general public at the Personal Computing '77 show in Atlantic City NJ at the end of August. The major features of the new Heath product line are best described by pictures supplied to us at the press party, along with notes based both on the press release and our experiences.

The H8 Computer Kit (Photo 1)

The Heath product line has one 8 bit member, the H8 computer based upon the Intel 8080A design. This product, which sells at $375 for the basic processor box, includes cabinetry, front panel with 1 K ROM monitor, processor board and power supply. Memory cards are available with the H8-1 kit for 4 K bytes by 8 bits at $140 and the H8-3 expansion module adding another 4 K by 8 bits to the H8-1 for $95. (The cabinet shown is said to be capable of holding up to 32 K bytes in the form of H8-1 cards fully populated with memory chips.) Peripherals cards presently available include the H8-2 parallel interface card ($150) with three input and three output ports, and the H8-5 serial interface board ($110) which contains RS-232 interfaces at a number of data rates, 20 mA current loop interface, and an audio cassette interface which uses 1200 bps modified Manchester phase encoding at the "Kansas City" standard frequencies.

These systems come complete with software for immediate use, included as part of the price. At the press party, we exercised the H8 with Benton Harbor BASIC, a full implementation of Dartmouth BASIC for the 8080 which takes 8 K bytes and features dynamic storage allocation (programs expand and contract with use of data). The more complete 12 K Benton Harbor BASIC, extended, adds strings and other extensions to the 8 K version. Both versions have a number of user-oriented editing features which are both unique and useful as demonstrated to us at the press party. The design and coordination of the systems software for the H8 system were performed by Gordon Lutwin, Heath's resident software wizard, whose title is Lead Systems Programmer for the Computer Products Line.

The H11 Computer "Kit" (Photo 2)

The second star in the Heathkit constellation is the top of the line H11 system, a confirmation of persistent rumors over the past year that Heath had allied itself with Digital Equipment Corporation. The H11 is an LSI-11 board from Digital Equipment Corp, mounted in a Heath supplied chassis and accompanied by Heath's switching power supply, backplane assemblies, and heavy duty documentation. It is intended for use with a terminal such as the Heath H9 or the LA-36 DECwriter which Heath will market, and at the time of initial deliveries the H11 is intended to be used as a stand alone paper tape system using the Heath H10 product as its paper tape facility. (Floppy disk systems and software are in the works but are not yet available from Heathkit.) The H11 computer itself is $1295 for the cabinet, LSI-11 board, Heath backplane and power supply. This price of course includes the built-in terminal support software of the LSI-11, the 4 K by 16 bit semiconductor memory of the LSI-11 board, and a terminal interface. Purchase of the Heathkit enrolls the user in the DECUS library and includes complete DEC systems software on paper tape: Editor, PAL-11 assembler, linker, ODT, BASIC, and FOCAL languages. (BASIC requires additional memory.) Other components of the H11 line include the H11-1 4 K by 16 bit memory board at $275, the H11-2 parallel interface board at $95, and the H11-5 serial interface board at $95. The
A new high in S100 bus memory cost effectiveness. Fully assembled (with sockets), tested, burned-in and guaranteed. 4Kx1 dynamic memory chips (the same ones used by the ton in IBM compatible memory systems) combined with self contained control logic, yield a memory system with:

- Low power consumption, total board 5 watts.
- Transparent refresh, which means the memory looks static to the outside world.
- No waiting. In fact, xrdy is not even connected to the memory.
- Full DMA capability
- Reliable, low level clock and control signals.

Dynabyte

Dynabyte® brings to the S-100 Bus a state of the art, industrial quality memory system. 16K on a single board for $485.00, Guaranteed for 1 year.
H11 box will accommodate up to 20 K words of memory, according to the press release copy.

Other Systems Products

Both the H8 and the H11 are designed for use with other products which have generic applicability to any computer system. At present these include the H9 video terminal and the H10 paper tape reader and punch unit. The H9 video terminal at $530 is probably one of the best buys available in a kit based terminal unit today. Its features include a full 67 key ASCII encoded keyboard, a 12 line by 80 character display format (upper case only), a formatting option for four columns of 12 lines of 20 characters built into its hardware, a block transmission feature, and a limited plotting mode of operation. The entire unit is contained in an attractive cabinet, as seen in photo 3.

The H10 paper tape reader punch is Heath's principal mass storage unit for use with the H11 product line as currently available (although, according to the people at Heath, this is by no means intended as the last word in that area). It can also of course be used with the H8, and any other computer which has a parallel 8 bit TTL compatible interface for input and output. Features of this unit, shown in photo 4, include a built-in power supply, stepper motor drive, a stand alone tape copy mode, and data rates of 50 characters per second reading, 10 characters per second punching. The price of the H10 kit is $350.

All Heathkit products can be purchased under Heath Company's revolving charge credit plan, a benefit which should be of major interest to potential computer hobbyists. Shipping dates for all new computer products are scheduled for the fall. For further information write for the "Computer Information Package" — Heath Company, Dept 360-26, Benton Harbor MI 49022.

Computerized Morse Code Reception Package

Polaris Computer Systems has announced a Morse Code reception package for Altair (S-100) bus 8080 microcomputers. The package consists of a tone to DC converter module and complete software. The converter connects to the communications receiver via headphone jacks and to the computer via a parallel I/O port. The converter contains a phase locked loop for tone decoding and adjustable center frequency and bandwidth controls. Its design is highly immune to impulse noise. Provision for audio and visual synchronization (with an oscilloscope) of the incoming signal is provided.

The software adjusts for variations in transmission as each code element is received, allowing for manual or automatic transmission of CW at speeds ranging from 5 to 60 words per minute. Noise and dropout negating logic is included. Final output of received text is to an SIO port for display to a printer or CRT.

Package price in kit form for the converter, object program and complete documentation is $95. An assembled and tested version lists at $145. Source tapes and complete turnkey packages are also available. A schematic of the converter, object dump and documentation of the device are available for $17. Polaris Computer Systems is located at 3311 Richmond Av, Houston TX 77098.

Continued from page 28

matter of assembling the kits. The dean introduced me to two senior students who worked part-time in the school's electronics lab. These students, he said, would design a power supply and assemble the kits. The students began immediately on the power supply, and in about a week they finished the design. They gave me their parts lists, and I phoned the order in to the distributor. There was nothing left to do now except wait for the equipment.

It was now time to begin class. I went to the classroom the first evening and found a room full of students. Of 30 people who registered, 29 showed up. We got all the preliminaries out of the way early. I announced the class schedule, the type of equipment we would use, the grading scheme, my office hours, prerequisites, and all the other good stuff that's announced during the first class session. After some philosophizing about the history and potential of microprocessors, we got down to the business of the sequence. We started with the binary number system as planned. The lectures went very well. There was the usual supply of questions, answers, quizzes, homework, problems, and discussions.

Meanwhile, the equipment was not coming in from the distributor as planned. We got the Evaluation Kits from Motorola, all except the read only memories. The discrete circuits just trickled in, a resistor here, a socket there, maybe a potentiometer or a voltage regulator. No amount of discussion, coaxing, cajoling, begging or screaming could get the components in. Some of the components, they admitted, had a 7 or 8 week lead time. Four weeks into the class schedule, we had approximately 90 percent of the pieces for one system. The students went to a local electronic shop to buy the missing items. This brought out our other major problem: namely, there were no terminals with which to talk to the system. I mentioned this to the dean, then borrowed an old CRT from North Electric for debugging purposes. At this point the dean ordered six new ASR-33s from Teletype. He explained that these would be used for other courses also.

One of the interesting developments of all this was that my student helpers, who were super careful in their work, discovered a few minor errors in the schematic that Motorola provided with their Evaluation Kit. The students routinely corrected the drawings and made up about 40 C size sheets for distribution to the rest of the students. In the process, I sent a copy of the revised schematic to the Motorola applications engineer in Cleveland to see if Motorola would object. He was quite surprised that the errors had not been found before. Not only did he not object, but he also was grateful for the sheet and asked if we could spare a few more!

After 11 weeks of class, including four weeks of excuses and apologies to the students, six lab stations were equipped. The packaging left a little to be desired (see photo 1), but the power supply and the kit worked, and the entire system served as an excellent educational vehicle. By this time, the lectures had covered the M6800 processor architecture, the Evaluation Kit system structure including the address space, and most of the M6800 instruction set. The students were more than ready to get their
Announcing...

MICROTECH SOFTWARE

Microtech, Incorporated introduces a number of sophisticated software packages for microcomputer users. Our software is created expressly for microprocessors, making it fast and memory-efficient. Our higher level language, MICROTECH BASIC, provides features never before offered for microcomputers, and our applications and documentation allow even first-time users to be up-and-running quickly and effortlessly.

MICROTECH BASIC is designed with great flexibility. The structure easily accommodates driving a wide range of peripheral devices through BASIC commands. The language is constructed expressly for Z-80 based microcomputers, affording a truly sophisticated higher level language with a small (under 7 K without I/O drivers) memory requirement. Briefly, MICROTECH BASIC has all of these features:

- 32 BIT ARITHMETIC—numeric range ±2,147,483,647 without loss of accuracy.
- COMPLETE STRING VARIABLE PACKAGE.
- TABLE DRIVEN VARIABLE STORAGE—reduced memory overhead for variable storage.
- MASS STORAGE DATA FILE HANDLING—allows data to be read or written to mass storage devices either sequentially or randomly.
- MASS STORAGE PROGRAM FILE HANDLING—a full directory based program file capability has been implemented. Commands available include PGRM (used to create a directory entry), SAVE, ERASE, LOAD, and RUN (load and go).
- COMPLETE PROGRAM OVERLAY CAPABILITY—a powerful programming technique that allows an executing program to load and execute any other program currently in the directory with all variable values passed to the new program.

MICROTECH BASIC is currently available in audio cassette form for Digital Group Z-80 systems. We have hooked MICROTECH BASIC to our own Phi-Deck driver software to create TOS (Tape Operating System) BASIC. Up to four Phi-Decks may be used for mass data and program storage. All tape control is provided through BASIC commands. This package, with all audio, video, and mass storage drivers, requires roughly 9.5 K. A minimum 18 K system is recommended.

MICROTECH BASIC will soon be available for many Z-80 based microcomputers and will include a variety of drivers for tape and disc mass storage systems. Write for complete details.

APPLICATIONS

MICROTECH has an extensive library of applications written in MICROTECH BASIC. As examples, we have:

- BASIC GAMES—a collection of 10 programs on tape (to be used with our Phi-Deck BASIC). This is a comprehensive package including Casino Games, Educational Games, Space Battle, and Tic-Tac-Toe.
- PERSONAL CHECKBOOK MANAGEMENT SYSTEM—a group of programs that allows checkbook management, bank reconciliation, and tracking of deductibles for tax purposes. It uses a single tape drive for programs and data storage.

You may purchase our products through computer retailers or directly by mail.

PRICING

TOS BASIC (for Digital Group Systems)—includes BASIC, data tape formatting routine, and deck-to-deck copying routine—28 page user's manual and free updating service..... Special introductory price $59.95 (specify 32 or 64 character video when ordering) ($100.00 after 9/15/77)
BASIC GAMES—Program tape and documentation........................................$20.00
PERSONAL CHECKBOOK MANAGEMENT SYSTEM—

hands on the system. Consequently, most of the next four weeks were spent in the lab, writing and testing small programs.

On the 15th week of class, 25 students took the final exam. The first trimester, which covered in significant detail a complete microcomputer system, was finally finished. In my opinion, it was a resounding success, even considering some of the problems.

After a month long vacation the second trimester began. In this trimester, applications and project work would be emphasized. Several lab projects were scheduled, some of which involved interfacing external hardware. Lecture time would be minimized, and most of what there was would feature guest lecturers and cover applications and related topics such as microprogramming and direct memory access techniques.

Unfortunately, only 15 students enrolled for the course. I attribute the sharp drop in part to graduation, but mostly to the fact that many students do not like to go to school in the summer. The students who did attend had an advantage though, because smaller class size gave them more opportunity to use the equipment.

The first part of the trimester was devoted to various number representations, conversion from one representation to another, and arithmetic operations in the representations. The first two lab exercises were the multiplication of two 8 bit numbers and the binary coded decimal addition or subtraction of decimal numbers up to four digits long. I scheduled these exercises first because my two technicians had graduated and nobody was available to assemble and test the hardware. I also thought that these exercises would accustom the students to writing fairly detailed programs. The students, however, had a difficult time with these programs. I found there were two major reasons for this.

The first was that there was no assembler available; all programs had to be written, assembled and entered into system memory by hand. This made for a lot of aggravating housekeeping and transcription errors. The second reason was that most of the students were electronic types and this was their first experience with programming.

Meanwhile, I decided that there would be three more lab exercises. The first would be storing data on a tape cassette using the Lancaster interface described on page 30 of March 1976 BYTE. The second would involve a row of 24 LEDs addressable as three memory locations. The third exercise could be analog to digital conversion using the circuit shown on page 70 of May 1976 BYTE.

By this time I had rounded up a technician, and he started to work about the fourth week of the trimester. The cassette interface was finished first, but we never got it working right. It took about two weeks to figure out that coupling capacitors were needed on the TTL circuitry. Then we found that the tape was position sensitive, even after we changed the delays from 2.5 and 5 seconds to 5 and 10 seconds, respectively. In addition, the entire thing was assembled on a super strip, and they just don't lend themselves to reliable operation. The analog to digital conversion and lights projects went very smoothly. The hardware worked right just about as soon as it was built. The students had less difficulty with these two projects, and had more fun playing with them than they did with any of the other three. Photo 2 depicts a typical class session during the second trimester.

The second trimester went fairly smoothly, and passed without much incident. We had one guest lecturer, and we spent one evening at Ohio State University watching a demonstration of a Motorola EXORcisor. The only problems during the second trimester were a few minor glitches in some of the external hardware and the lack of software development facilities.

It was finally over. The 30 week excursion into microprocessors ended. For me, it was a great experience. Most of the hard work and sweat came in preparing the lectures and waiting almost endlessly for the hardware to arrive. The actual teaching of the course and conducting of the class were a pleasure. The students were perceptive, cooperative and eager.

The total cost to Franklin for both trimesters was about $1,400. This includes six Motorola Evaluation Kits; discrete components, power supplies and extra programmable memory chips for nine kits; and a few miscellaneous components for the hardware labs. Not included in this figure is the cost of six brand new Teletypes.

I would like to express my gratitude to a few people whose contributions were invaluable. Dean Kelly provided his and Franklin's cooperation in the overall offering of the course. Mike Kabaleo, the Motorola sales engineer, gave us the hardware which was the foundation of our lab. Dr Tony Lucido showed us his EXORcisor and its software, and he also provided us with an excellent example of how not to fix a Teletype. Finally, Lee Sensibaugh and Tom Richards, my two ace technicians, through their enthusiasm and tireless efforts, were the key factors in getting the laboratory together and working.
The most cost effective products for your microcomputer.

THE RM64 MEMORY BOARD provides the most cost effective means for system memory addition in the industry. It comes in three configurations: 32K, 48K or 64K bytes and is completely assembled, checked out and burned in for at least 50 hours prior to shipment. This complete testing procedure enables EXTENSYS to provide you a one year warranty on parts, labor and materials (assuming no misuse of the board occurs).

- Individual memory bank address selection in 8K increments;
- Complete dynamic refresh logic without loss of processing efficiency while programs are running;
- Board select logic which allows more than one 64K byte board per system;
- S-100 bus compatibility including on-board voltage regulator;
- Memory overlap which allows memory sharing the same address space to coexist in the same system; and
- Write protection in 16K blocks

THE CGM77 COMPUTER GRAPHICS MACHINE is a fully tested system that provides the basis for developing the most sophisticated video graphics imaginable. The CGM77 board is S-100 bus compatible, making it usable on over a dozen different computer systems. The only additional components needed for a complete video graphics system are 8K bytes of RAM interfaced to the microcomputer system. The EXTENSYS RM64-32K RAM board is ideally suited for this.

Special control panels are available that provide universal control for interfacing with the graphics board. Output of the board is in the form of composite sync that can be used directly by a high resolution video monitor.

The heart of the system is the EXTENSYS GRAPHICS MACHINE. This is a sophisticated piece of software developed by EXTENSYS for the rapid implementation of video graphics. The GRAPHICS MACHINE permanently resides in PROM chips that are part of the board and therefore never need to be loaded. The GRAPHICS MACHINE software actually transforms the microprocessor into a much more powerful and sophisticated computer whose instruction set is ideally suited for the development of video graphics or video games.

Continued from page 32

tape consists of a start bit, 8 data bits and a parity bit. Parity of each byte is automatically checked when a cassette program is loaded into memory. A light and warning tone tell the user immediately if a parity error occurs. This makes cassette volume and tone adjustments possible. Another light provides a visual indication of tape data. This lets the user manually position the tape when recording several programs on the same cassette. The last byte loaded into memory from a cassette is always displayed on the TV screen.

The graphic video display consists of an array of spots on the TV screen. There are 64 spots in the horizontal direction. The number of spots in the vertical direction can be varied, under program control, from 32 to 128. The normal display is 64 spots wide by 32 spots high. This array of 2048 spots represents 256 bytes. If a bit is 1, the spot is white; if a bit is 0, the spot is black. Changing the states of the memory bits with a program creates patterns, pictures or numbers on the TV screen. It is possible to create moving patterns by shifting the bit patterns around using a program. Switching between different display maps by changing the contents of a single address register allows very quick display changes.

This graphic display uses the RCA CDP1861 integrated circuit which was designed for use with the COSMAC microprocessor. It provides the lowest cost graphic video display currently available with any microcomputer. It is limited to fairly low resolution applications. Higher resolution requires larger refresh memory capacity and much more expensive circuits. In five years of experience I have found this resolution adequate for large numbers of applications. A very inexpensive color graphics add on is being planned for this display.

Physically, the COSMAC VIP consists of a single 8.5 by 11 inch (21.6 by 27.9 cm) printed circuit card that sits on rubber feet (see photo 1). The hexadecimal keyboard occupies the lower right hand corner of the card. The power pack plugs into the wall and is connected to the card with two wires. Three shielded cables are needed for connection to the video monitor, the cassette recorder mike input and the earphone output jack. These cables are readily available at local electronics outlets.

Assembly time for a COSMAC VIP kit is two to three hours. It involves soldering the components into the card. No individual wiring is required, other than the above external connections. The assembly instructions and printed circuit card were designed with the experienced kit builder in mind. If you have never built a kit you would be better off finding a friend with a sharp eye, steady hand and fine point soldering iron to help you out. Assembled versions will be available and a plastic cover for the card is planned. The printed circuit card can also be mounted in your own box with the keyboard, single operating switch and three LEDs remounted on the surface of the box. Only 19 integrated circuits are used in the 2 K byte standard system. A single +5 VDC supply comes with the kit and powers the computer. Only 350 mA, average current, is required with most of the current used by the NMOS programmable memory. The CDP1802 COSMAC microprocessor is the key to the low power and relatively few integrated circuits required for a system of this type.

System Expansion

The COSMAC VIP was designed as a complete, stand alone, graphic home computer. Hardware hackers will, of course, not be satisfied with the standard system and will want to add a variety of gadgets of their own. Expansion capability was therefore designed into the system. First, you can increase memory to 4 K bytes by just adding four ICs to the printed circuit card. This permits more sophisticated programs for a system of this class. A comprehensive, 44 line interface is provided that can be used to add almost anything to the system including up to 32 K bytes of programmable memory. This interface provides all the COSMAC microprocessor signals. A fair amount of technical skill is, of course, required by hackers who actually use these lines.

For novices who want to add existing IO devices such as relays, music synthesizers, printers, or an ASCII keyboard, an easy to use parallel IO port option is provided. Adding four readily available ICs to the printed circuit card provides an 8 bit output port and an 8 bit input port plus handshaking signals on 22 interface pads. A standard 22 pin card socket can be used for connecting external devices to these ports. The output lines can drive two TTL loads. The input lines are high impedance, 22 K ohms or more.

Software and Documentation

Two manuals are provided with the COSMAC VIP system. The COSMAC microprocessor user manual is for those who want to get involved with the details of machine language programming. The COSMAC VIP manual provides all the information required to assemble, run, program and troubleshoot the system. Every
THE LATEST IN TAPE SYSTEMS

MODEL CC-8 - $175.00

4800 BAUD CASSETTE RECORDER
An ASYNCHRONOUS NRZ type Recorder with remote motor start/stop. Error rate 10⁻⁸ at 4800 BAUD. Can be used from 110 to 4800 BAUD into a UART or "Bit Banger PIA" — no clocking required. This is not an audio recorder. It takes RS232 or TTL signals from the terminal or computer and gives back the same signals. No audio interface is used. Motor start/stop is manual or through TTL or RS232 signals.

Tape speed is 3.2"/second nominal; 1.6"/sec. optional. 110 volt, 60 Hz, 5 watts. (220 Volts on special order). Can use high quality audio cassettes (Philips Type) or certified data cassettes. Can be used in remote locations from a 12 Volt battery.

Recommended for DATA LOGGING, WORD PROCESSING, COMPUTER PROGRAM RELOADING and DATA STORAGE. Especially recommended for 6800 systems, 6502 systems, 1800 systems and beginners with the 8080 systems. Manual control except for motor start/stop. 6800 or 8080 software for file or record searching available on request with order. Used by major computer manufacturers, Bell Telephone and U.S. Government for program reloading and field servicing. AVAILABLE — Off the shelf.

MODEL 3M3A - $220.00

50 KILOBAUD CARTRIDGE RECORDER
This is a self clocking (1/1) high speed recorder. Loads BASIC in under 2.0 seconds. Recording is done at 19.2 Kilo baud. Playback at 30 Kilo baud. File or Record searching is done at 50 Kilo baud and loading is automatic. Worst case access time about 2 minutes for up to 2 megabytes on the 3M Data Cartridge.

Tape speed 10"/sec. on record, up to 30"/sec. on playback. Records one clock track and one data track on each pass (2 passes). Recording is NRZ unencoded from RS232 or TTL signals.

This recorder requires one Parallel port for motor control, and one serial port for data and clock. (Cannot be used with UART's or UART boards such as the 3P+). Used with USART's, ACIA's or other 1/1 clocking I/O devices under software control only. No manual controls. Software for 8080 and 8080 available. Power supply is built in, 110V, 60 Hz. 220 V, 50 Hz for export.

AVAILABLE — 90 Days

2SIO (R) CONTROLLER

PROVIDES MONITOR AND TAPE SOFTWARE in ROM TERMINAL and TAPE PORTS on SAME BOARD CONTROLS ONE or TWO TAPE UNITS (CC-8 or 3M3A)
This is a complete 8080, 8085, or Z80 system controller. It provides the terminal I/O (RS232, 20 mA, or TTL) and the data cartridge I/O, plus the motor controlling parallel I/O latches. Two kilobytes of on board ROM provide turn on and go control of your Altair or IMSAI. NO MORE BOOTSTRAPPING. Loads and Dumps memory in hex on the terminal, formats tape, cartridge files, has word processing and paper tape routines. Best of all, it has the search routines to locate files and records by means of six, five, and four letter strings. Just type in the file name and the recorder and software do the rest. Can be used in the BiSync (IBM), BiPhase (Phase encoded) or NRZ modes with suitable recorders and interfaces.

This is Revision 7 of this controller. This version features 2708 type EPROM's so that you can write your own software or relocate it as desired. One 2708 preprogrammed is supplied with the board, A socket is available for the second ROM allowing up to a full 2K of monitor programs.

Fits all S100 bus computers using 8080 or Z80 MPU's. Requires 2 MHz clock from bus. Cannot be use; with audio cassettes without an interface. Cassette or cartridge inputs are RS232 level.

AVAILABLE — Off the shelf.

OVERSEAS: Export Version 220 volt 50 Hz. Write factory or: Megatron-Datameg, 8011 Putzbrunn, Munchen, Germany; Nippon Automation 5-16-7 Shiba, Minato-Ku, Tokyo, Japan; Hobbydata, FACK 30012, Malmo, Sweden; G. Circle 129 on inquiry card.
program provided in this manual can be run on the standard 2 K byte memory system. Detailed, drafted logic diagrams are provided and a section of the manual is devoted to troubleshooting techniques.

The most important feature of the manual is the number of ready to use program listings provided. I am one of those people who find it hard to understand anything unless I can see some examples. I suspect that a lot of people are in the same boat but don't like to admit it. For this reason, plenty of actual programs are provided. You can enter these programs using the hexadecimal keyboard and record your own cassette library. These programs were developed and debugged using the COSMAC VIP system itself to thoroughly test the operating system. Most of the programs were written in the interpretive language provided with the COSMAC VIP system.

Several test programs are provided to help you identify and analyze hardware problems should they occur. A short test program that can be loaded from the hexadecimal keyboard allows recording of a test cassette for analyzing tape problems. A special memory test program is provided that will detect most types of memory bit failures and will inform you which circuit to replace.

20 video game programs are provided. These games include target shooting, number guessing, picture or pattern generation, shooting stars, etc. Let's be honest, a primary application for home computers is games. There is nothing to be ashamed of if that's all you do with your computer. Chess, Go, bridge, tennis and baseball players do not constantly apologize for playing games. The sales of commercial games and the newer video games show that games fill a real need. Many people spend most of their spare time watching people getting paid to play games on TV. Games are fun, educational and satisfy basic human needs. The computer is a super toy. Why not relax and enjoy it? The COSMAC VIP game set permits the whole family to enjoy it with you. Starting with games may even develop latent programming interests that solving equations won't.

Designing Programs

This is where the frustration starts for many beginners. A number of high level languages have been developed to make computers easier to program. These are invariably English language oriented. This is nice in theory but uses up a lot of memory in practice. The more popular languages are also aimed at math and data processing applications rather than control, games and video graphics. A unique numerically oriented interpretive language is provided with the COSMAC VIP.

This language looks a lot like machine language. It provides 31 elementary instructions. Each instruction is two bytes or four hexadecimal digits. Single instructions permit generating a random byte, reading in a hexadecimal keyboard digit, displaying a pattern on the TV screen, sounding a tone, incrementing a variable, setting or testing a real time clock, etc. Sixteen 1 byte variables are provided. Subroutine nesting and machine language inserts are permitted. The interpreter for this language only occupies 512 bytes of programmable memory. Programs written in this language are extremely compact. A programmed video kaleidoscope requires less than 64 instructions. A rocket launching space ship intercept video game only requires 104 instructions including on screen decimal scoring. It is possible to play tic-tac-toe against the computer using a 235 instruction program that includes random mistakes by the computer. There is space for programs containing up to 592 instructions in the standard 2 K byte system.

I've been using this type of hexadecimal interpretive language programming for a number of years. It has been learned and used by children, engineers and programmers with no difficulty. An occasional professional programmer may grumble about the lack of self-documentation and the need for patches, but the money that these features cost isn't coming out of his pocket. Newcomers to computers might even find this COSMAC VIP language somewhat easier to understand than conventional high level languages. This is particularly true if they come from a hardware background. It is certainly cheaper to implement this type of interpretive language. Ease of understanding is difficult to measure since everyone is different. What's easy for one person may be difficult for another. Newcomers may welcome a programming approach that simplifies programming without straining their memory budgets. The home computer field is still young enough to tolerate experimenting with a variety of languages.

Some home computer users will want to get involved with machine language programming. They may be interested in developing their own languages or learning microprocessors at the detail level to enhance their careers. The COSMAC VIP can be directly programmed in machine code from the hexadecimal keyboard, and machine language programs can be saved on cassettes. The operating system permits examination of the
processor's registers to facilitate debugging machine code programs. The external interface permits substituting a user's read only memory based operating system for the standard one, if ever required.

Summary

COSMAC VIP is a complete computer on one printed circuit card. It is oriented toward control and video graphics. In price and performance it fits in between low priced machine language trainers and more expensive high level language oriented systems. It is ideally suited to personal use at home and educational use in schools.

COSMAC VIP is being made available by RCA. It is the result of five years of development effort in my laboratory which was aimed at producing a cost effective hobby computer. A low level interpretive programming language, test programs and 20 video game programs are provided with COSMAC VIP as it is coming to market for the first time. Assembled and covered up versions are planned. Add ons such as color graphics are being developed. Family fun, low cost, and flexibility were primary design goals, which I believe we've accomplished with this product.

Circle 131 on inquiry card.

No bells or whistles...just performance, a warranty and a low price.

For $107.00 take your choice; the 4K RAM board or the alpha video board. For $137.00 the video graphic board can't be matched. (4K RAM and much more on the way.)

These are not kits, but completely assembled, burned-in, tested boards with a 1 year warranty. No soldering, no messing, no chance of mis-connections...just plug 'em in and you're ready to go.

The 4K RAM has the same features and speed as what you're used to (500 nsec, no wait states) but with a couple of extras you might not expect. Like a mechanical write protect switch that gives you positive memory protection. And Visaddress*, an easily accessible switch on top of the board for easy to read address selection.

The alpha video board offers Visaddress address selection and displays 128 ASCII characters: both upper and lower case. A standard 16 line by 32 character format with character selectable video reverse and socketed ROM are standard features. (Character generator ROM available with standard graphics characters. Optional Greek or ASCII control characters available.)

And our video graphic board gives you an exceptionally easy approach to computer animated dynamic displays.

Our matrix approach allows direct addressing of each dot in an 128 by 96 array, simplifying dynamic movement. And unlike DMA displays, our on-board RAM allows your CPU card to do other work during display time and with no dynamic RAM problems. And like our other boards, it has Visaddress address selection.

Quality, assembled boards at less than kit prices. But what else would you expect from a company whose prime product is electronic test instrumentation and microprocessing components?

Order direct, by check, BankAmericard or Master Charge. (Add $1.50 shipping, credit customers give us all the card numbers, please and Ohio residents add 4½% sales tax) or contact us for more information. Kent-Moore Instrument Company, P.O. Box 507, Industrial Ave., Pioneer, Ohio 43554. (419) 737-2352.

Kent-Moore INSTRUMENT COMPANY
It's a brand new show (in the world's biggest economic center) specifically for manufacturers, buyers and those providing services to the personal computing enthusiast. For the first time, this booming field will have a New York Coliseum showcase. It is planned as the largest public show of its type and will attract attendance from the huge population areas of Boston, Washington, Philadelphia and Baltimore.

New York's is the world's communications focal point, the one place that will put personal computing in a significant spotlight. New York is surrounded by people who work in the computer field, by computer learning centers, universities, personal computing clubs and thousands of others whose lives are affected by computers.

More than 100,000 paid subscribers of BYTE magazine will be urged to view the exciting exhibits and to attend the BYTE-sponsored lectures. Circle the dates: October 28, 29, 30 — and make your plans now to be there when Personal Computing Expo comes to New York!

"Personal Computing: An idea whose time has come!"*

**Tutorials by the IEEE Computer Society, Mid-Eastern Area**

Personal Computing Expo is also joined by the Institute of Electrical and Electronics Engineers Computer Society, Mid-Eastern Area Committee, whose experienced staff is presenting six day-long tutorials at a modest charge. If inconvenient for you to attend a tutorial during the show, simply sign up for follow-up tutorials on weekends after the show.

Whereas the lectures will provide you with information, the tutorials will teach important skills enabling you to use your own computer at home or at work.

**TUITION:**

The tuition fee for the tutorial program includes a one-day admission to the Personal Computing Expo.

Tuition includes hand-out material, including text and/or hand-out materials. Participants will also receive a certificate of participation.

**REGISTRATION:**

In order to provide an interactive, learning environment between the participants and the lecturers, the number of registrants is limited. Registration is accepted on a first-come, first-served basis. Early registration is therefore suggested. Cancellations received before September 15, 1977 will receive a full refund.

To register, make your check payable to the IEEE COMPUTER SOCIETY, and mail to:

Daniel R. McGlynn, Ph.D.
Tutorial Program Chairman
IEEE Computer Society
329 - 84th Street
Brooklyn, N.Y. 11209

**FOR FURTHER INFORMATION:**

on the technical content of the tutorials, technical background suggested to derive maximum benefit from the program, or information on the IEEE Computer Society, call

Cary Ringel
Chapter Chairman
IEEE Computer Society (212) 460-4600

**TIME AND LOCATION:**

The tutorials will be held from 9 AM to 4 PM each day in the New York Coliseum, at a location to be announced and posted. Participation in the tutorials also includes a one-day admission to the exhibition area and other lecture programs.

**EXPO TICKETS:**

Will be sent to tutorial registrants about three or four weeks prior to the show.
Portia Isaacson Ph.D. . . . Saturday 11 AM and Sunday 12 Noon
Co-owner of the Micro Store, a personal computer store, in Richardson Texas actively engaged for 12 years in the computing field in industry and at universities.
Member of the ACM and IEEE, and chairman of the 1977 National Computer Conference.
Author of many articles in professional journals and magazines.
Received a Ph.D. in Computer Science from the Southern Methodist University.

Personal Computing: An Idea Whose Time Has Come
A review of what has happened so far in the personal computing field, and an outlook into future developments, including those in the computer assisted home. Slide demonstration.

Sol Libes . . . Friday 6 PM and Saturday 10 AM
President of the Amateur Computer Group of New Jersey
Teacher of electronics and computer programming at a community college
Author of 10 books (working on the 11th) and several hundred magazine articles in electronics and computing
Received an award for “The Outstanding Amateur Computer Hobbyist of 1976” in Atlantic City by Personal Computing 1976 show, and BYTE.

How to Get Started
A discussion of typical home computer systems and their essential hardware and software components.

John H. Dilks III . . . Saturday 1 PM and Sunday 2 PM
President of Personal Computing Inc. and tradefair director of the Personal Computing shows in Atlantic City in 1976 and 1977.
Experience with various computer systems since 1962.
Employed by Western Electric Co. Inc., division of the Bell System.
Member of the Amateur Computer Group of New Jersey and of the Philadelphia Area Computer Society.
Teaches microcomputer courses in an adult evening program at a vocational school.

Innovative and Unusual Computer Applications for the Home.
Discussion of “far-out” applications of microcomputers and electronic technology for home use, such as a child locator and warning device, a home security system, etc. Slide demonstration.

Robert S. Jones . . . Friday 7 PM and Saturday 2 PM
Publisher of Interface Age Magazine
Prior experience in sales and marketing for the semiconductor industry, including Intel, National Semiconductor and Analog Devices Inc.

Personal Computing for the Business Man
Evaluating business applications for micro computers, including slides showing selected applications.

Louis E. Frenzel . . . Saturday 3 PM and Sunday 3 PM
Director of Computer Products at Heath Company, involved in the planning of new computer products.
Prior to Heath, with McGraw Hill in product planning and design of educational electronic kits.
Prior experience including computer engineering for eight years
Author of several books, home study courses and numerous magazine articles in electronics and computers.
Received a BS in electronics from the University of Houston and a MEd from the University of Maryland

How to Build Personal Computer Kits
Tips for successful kit construction. Benefits of kit products for the personal computer user. Including slides showing selected computer kits.

Carl Helmers . . . Saturday 4 PM and Sunday 4 PM
Editor-in-Chief and co-founder of BYTE magazine.
Obtained computing experience as a personal way to accomplish artistic and technological goals in music.
Graduated in 1970 with a BS in Physics from the University of Rochester, NY.
Worked for several years at Intermetrics, Inc. in Cambridge, Massachusetts on the NASA Space Shuttle Project.
Prior to working with BYTE, publication of a small computer newsletter on a part-time basis.
Computers and Music
How to create music with computers. Problems of performing electronic music, music under computer program control and computer music in conjunction with traditional instruments. Illustrations and examples from personal experience.

Jack L. Davies . . . Friday 8 PM and Saturday 5 PM
President of Pan Atlantic Computer Systems GmbH, a distributor of various micro computer systems in Europe.
Extensive experience in using minicomputers and microcomputers in the US Military Schools in Europe. Designed and developed numerous games and educational programs for students in these schools.

Microcomputers in Education
Discussion of the many possibilities of using microcomputer systems in schools. Effect of personal computers on students.

David Fylstra . . . Saturday 6 PM and Sunday 5 PM
Member of the research staff of the Telecommunications Sciences Center at Stanford Research Institute for more than two years. Specialized in microcomputer software and computer simulation of speech processing systems.
Graduated in 1974 with a BA in English and Psychology, Stanford University, Phi Beta Kappa.
Active in the research on communication systems and devices for the deaf.

Speech Analysis and Synthesis for the Amateur
Using the personal computer as a device to analyze the acoustical foundations of speech and to formulate rules for the control of the speech synthesizer.

Max Mathews Ph.D. . . . Friday 9 PM and Saturday 7 PM
Director of Acoustical and Behavioral Research, Bell Labs
Author of The Technology of Computer Music, and numerous articles.
Scientific Advisor to the Institute for Research and Coordination of Acoustics and Music (IRCAM)
Dr. Mathews is often regarded as the “Father of Computer Music”

Pure Digital and Real Time Music Synthesis
The use of the digital computer as a musical instrument with which composers and performers create and play music. Slide and tape demonstration.

Carl L. Holder . . . Saturday 8 AM and Sunday 6 PM
Director of Product Management, Planning and Communications at Information Terminals Corp. for five years.
Prior experience, including Memorex Corp., in the area of magnetic media development and testing.

Present and Future Storage Devices
Survey and discussion of current devices and media, including latest technological developments like the charge coupled devices and magnetic bubble memories. Costs, advantages and disadvantages of these devices for the personal computer user. Accompanied by slides.

---

**DAILY TUTORIALS**

There will be two tutorials offered each day, one aimed at those participants who have little or no experience with microprocessors, and the other for those already experienced with microprocessor systems.

**BASIC COURSES**

1. Development of Microcomputer Systems for Business Use
   - S. Rayner, Citibank, N. A.
   - System design concepts
   - Economic efficacy of microcomputers versus large centralized computer systems
   - Distributed processing definitions
   - Advantages and problem areas
   - Network design and architecture
   - Data communications aspects
   - Case study: design of a stand-alone workstation for data entry and retrieval

2. Development of Microcomputer Systems for Home Use
   - Cary Ringel, Con Edison
   - Survey of simple microcomputer control systems for home use
   - Selection of hardware: IC's, boards, kits, development systems
   - Programming and software aids
   - Interfacing: A/D and D/A conversion
   - Examples: design of a home control system: microcomputers for a music synthesizer: computer TV games.
   - Case study: use of the Motorola 6800 in design of a microcomputer system

3. Survey and Comparison of Microprocessors
   - Donald Lewis, Standard Microsystems Inc and other speakers
   - Definitions and distinctions between ALU-chips, controllers, microprocessors, microcomputers
   - Current applications
   - Microprocessor architectures (bit-slice, 4-bit, 8-bit, 16-bit, minicomputer-type)
   - Vendor survey
   - Performance evaluation and criteria for selection

---

**INTERMEDIATE/ADVANCED COURSES**

4. Microprocessor Interfacing
   - Donald Lewis, Standard Microsystems Inc
   - Interface components (peripheral interface chips, UARTs, etc.)
   - Interfacing standards (IEEE 488, EIA 232C, S-100, etc.)
   - Interfacing to keyboards
   - Interfacing to cassette and floppy disk drives
   - Interfacing to display devices
   - Case study: how to design a CRT terminal

5. Microprocessor Programming and Software
   - Donald Lewis, Standard Microsystems Inc.
   - Software design: flow-charting, setting breakpoints, documentation, etc.
   - Assembly language for the Intel 8080, 8085, 8086, Motorola 6800
   - Instruction types and addressing techniques
   - Use of the stack
   - Interrupt handling and direct memory access (DMA)
   - Software development aids
   - High level languages for microcomputers

6. Technology Analysis and Forecast of Future Microprocessor Structures
   - Daniel R. McGlynn, U.S. Philips Corp.
   - Will Mathys, MOS Technology Inc.
   - Emergence of specialized computational elements (SCE)
   - Architectural evolution (stock processors, reconfigurable architectures, multi-level logic)
   - Resource management techniques
   - Software evolution (narrow-programming, extensible instruction sets, structured programming modules, very-high-level languages)
   - Evolution of semiconductor technology of microprocessors
   - Microprocessor architecture at the chip level
   - Case studies: design of MOS Technology’s new 8-bit and 16-bit processors
Personal Computing Expo to be produced by
H.A. Bruno & Associates

H.A. Bruno & Associates, Inc., has been prominent in the exposition and promotion fields since 1923. Highly skilled in the production and promotion of consumer and trade shows, the company currently promotes the American Energy Expo, the National Boat Show, Auto Expo/New York. Promotion assistance also is currently rendered to the National Computer Conference and the Triennial IFIPS Congress in Toronto.

The show producer has promoted successful shows in the New York Coliseum every year since the building opened in 1957. Staff personnel are thoroughly familiar with the building, its services, management and labor.

Interesting, educational exhibits of Personal Micro Computers

The lectures and tutorials are not just theory! You will be able to see a multitude of micro computers. Try out various demonstrations: fascinating games, even in color; small business applications; computer produced speech; music; color graphics; and many more. Micro computers are not only small and portable, also you will need only a "micro budget" to be able to take them home.

Show Hours and Admission

Personal Computing Expo hours are as follows:
Friday, Oct. 28 — Noon to 10 p.m.
Sat. Oct. 29 — 10 a.m. to 10 p.m.
Sunday, Oct. 30 — Noon to 7 p.m.
General Admission: $5.00 (includes free BYTE lectures) per day.
Two-day Tickets: $9.00 (advance sale only)
Three-day tickets: $13.00 (advance sale only)

General Information

You may find it advantageous to purchase two or three-day admission tickets in advance. These are available by mail only, no later than October 10, 1977. Use coupon below.

Group rates (10 or more persons) qualify for $1.00 off regular prices. Arrangements must be made by mail prior to October 10, 1977.

Special arrangements have been made if you desire to stay overnight. Our headquarters hotel, the Barbizon-Plaza, is located on Central Park South, two blocks from Columbus Circle. Single rooms available at $34.00 per night; $40.00 double, plus tax. There's a weekend plan: $22.95 daily, plus tax per person, double occupancy... includes breakfast (brunch on Sunday) and meal gratuities. Children under 14 in same room with parents, free.

For hotel reservations and information, call toll free (800) 223-5493. From New York State call (800) 223-5963.

For those traveling to New York by air, American Airlines offers a convenient service through arrangement with Personal Computing Expo. For information, call toll free (800) 433-1790. In Texas the number is (800) 792-1150. From the West Coast, round trip fare via American is only $227.00.

20,000 persons are expected to attend and view the more than 200 exhibits by personal computer manufacturers and retailers.

Personal Computing Expo will occupy the 4th floor of the New York Coliseum. It is located on 59th Street and Columbus Circle — the geographical center of New York City. Garage parking in the building is available.

For answers to any questions pertaining to your attendance at Personal Computing Expo, contact the Show Manager, Ralph Ianuzzi, at Area Code 212/753-4920.

Advance sale of tickets available . . . Three days '13
Two days '9 . . . General Admission '5
MAIL THIS CONVENIENT ORDER FORM NOW!

Personal Computing Expo admission is $5.00 per day. Advance reservation eliminates waiting in line. Order advance tickets with this coupon. Admission ticket includes access to exhibits, lectures and tutorials.

Please send me ____________ advance registration tickets for three days, October 28-29-30. Total cost $13.00 per person.
Please send me ____________ advance tickets for two days, October _____ and October ______. Cost is $9.00 per person.
Please send me ____________ advance tickets for one day, October ______. Cost is $5.00 per person.

A Note About Prices in This and Other Book Reviews

Readers should be aware that publisher's prices are subject to change without notice. While we check the accuracy of prices at the time book review copy is prepared, occasionally prices may have changed by the time subscribers receive their BYTES.

Expanding Your Computer Library

What do you do with your system? Where is all the applications software? These are questions frequently posed by people who are trying to find out about small computers. Aside from games, which are a challenge to write as well as play, applications software seems somewhat scarce. In this article, I recommend some books that can introduce you to the world of computer applications. Most of the books discussed below contain program listings in BASIC or FORTRAN. Others do not, but are useful for the wealth of ideas or methods presented.

At the head of my list is a remarkable book, Scientific and Engineering Problem-Solving with the Computer, by William Ralph Bennett Jr (Prentice-Hall, NJ, 1976, hardcover, $17.95). Based on a computer course which Dr Bennett taught at Yale, the book introduces you to BASIC programming, then rapidly branches out to explore many unusual, but highly fascinating problems in various areas. Chapter headings include "Plotting and Graphic Display," "Dynamics," "Random Processes," "Wave Motion and Fourier Series," "Electronics and Communication," and "Language" (a singularly intriguing subject; ciphers, random text generation, and computer identification of authors are some chapter subheadings). Program examples introduce you to computer applications in these areas, and there are do-it-yourself problems to solve. References are given at the end of each chapter to facilitate further research. A reasonable knowledge of mathematics, such as college level calculus, is useful, but certainly not necessary to enjoy this text. Dr Bennett's writing style is refreshingly informal, and quite humorous in places. A word of warning: You will be extremely frustrated if you buy this text and do not have a machine on which to experiment.

Numerical methods are the mainstay of programming. Unlike analytical methods, which yield answers in terms of symbols or equations (the way you did things in algebra, trigonometry, etc), numerical methods are computer oriented, and yield digital answers. Typical numerical algorithms (a prescribed step-by-step way of carrying out calculations) are used to approximate functions (trig, log, etc), solve equations, find areas and volumes (integration), or the inverse, rates of change (differentiation), solve differential equations, manipulate matrices, and numerous other procedures.

Though Bennett describes some numerical methods, there are more detailed books on the subject. Two of the best I have encountered are Numerical Methods for Scientists and Engineers, by Richard W Hamming (McGraw-Hill, New York, 1962, hardcover, $18.50) and Numerical Methods for Digital Computers, Volumes 1 and 2, by Anthony Ralston and Herbert S Wilf (Wiley, New York, Volume 1, 1960; Volume 2, 1967, $17.25 and $19.25 respectively). Both of these cover algorithms for numerical procedures mentioned above, and considerably more. Hamming's book is a text, with descriptive chapters on each major subject. There are no program listings, but the algorithms are not terribly difficult to translate into a computer acceptable form. The book can be used for self-instruction, and a knowledge of calculus is helpful. Ralston and Wilf's books are more reference-oriented. It is easy to find the algorithm for your particular need. The first (earlier) volume does not contain specific program listings, though flowcharts are abundant. The second volume does have listings, mostly in FORTRAN and ALGOL. This volume also includes an introduction to programming in both FORTRAN and ALGOL, though it is somewhat out of date. Ralston and Wilf's volumes are more useful once you have some experience with numerical programming.

A very fine text in numerical methods is Applied Numerical Methods, by Brice Carnahan, H A Luther and James O Wilkes
Talk to your computer for $299 with SpeechLab.

Use SpeechLab to directly control any S-100 Bus Computer such as Sol, IMSAI, Altair and so on. SpeechLab can teach you almost as much as the Bell Laboratories know about voice recognition, voice control and computer input.

SpeechLab digitizes and extracts data from speech wave form and applies pattern matching techniques to recognize the vocal input. Response is real time. The system features 64 bytes of storage per spoken word and can handle up to a 64 word vocabulary. And recognition after very little practice is 95 percent or better.

$299* assembled and tested

When we talk price everybody's skeptical. And why not? We give you a complete hardware/software system, a 275 page laboratory manual, 95 page hardware manual and high fidelity microphone.

The lab manual includes 35 graded experiments with over 100 tables and graphs. In fact, it's the only introductory volume on speech recognition currently available.

Software includes SpeechBasic Basic programming language in source and

paper tape, assembly language speech recognition program in source and paper tape, hardware self-test program in source and paper tape. SpeechBasic plot, correlation, recognition and advanced recognition programs are offered in source.

Hard to believe, you bet. True? A Los Angeles customer says, “I love your kit!!! I have 40 boards and 2 IMSAI's and your kit was the best documented of them all. I love the way you integrated the software and hardware together. I love your lab manual.”

We loved those comments. They tell the story better than we ever could. The LA customer did ask who the founders of the firm were so he could relate better. They're a couple of gifted young engineers who got tired of the big firm, big technology trip and decided to take a chance with a better idea.

You can't get better quality
You can't get more performance

Sure, more complex, higher price equipment is available for about 50 times more money. It won't do much more than you can do with SpeechLab. And the quality and state-of-the-art engineering can't be any better. We use CMOS design for low power and ultimate reliability.

See SpeechLab at your nearby computer store

Selected computer stores have SpeechLab on display. Visit your nearest. If he doesn't have it, ask him to contact us or simply write us directly.

Heuristics, Inc., Box B, 900 N. San Antonio Road
Los Altos, CA 94022, Phone (415) 948-2542

*Available in kit form for slightly less.
(Wiley, New York, 1969, hardcover, $21.95). This book uses solved and unsolved problems to illustrate the major concepts of numerical problem solving. Numerous useful program listings are given in FORTRAN, along with sample computer runs. Like Hamming's book, this is a text, but is less general in scope. The programs, however, make it most attractive, as it is sometimes easier to understand an algorithm when presented in coded form. The problems chosen as illustrations are engineering oriented. For example, the book uses radiant interchange between plates, displacement of a cam-follower, flow in a pipe network, member forces in a plane truss, and transient behavior in a resonant circuit. The programs are organized as subroutines which you can easily use for other purposes.

Graphical presentation of data is discussed in Bennett and Carnahan et al, with some program examples. For those of you with some sort of computer graphics facility, or an interest in graphics, Mathematical Elements for Computer Graphics, by David F Rogers and J Alan Adams (McGraw-Hill, New York, 1976, paperback, $9.95) provides an excellent software "how-to" (unless you have a system with hardware graphics functions). The book has chapters for each major graphic function: rotate, translate, reflect, project, perspective and stereo view. A major bonus is a complete set of program listings for use in any BASIC that has true subroutine call capability (like FORTRAN). They can easily be rewritten to accommodate other dialects of BASIC. The book is an excellent reference and text. Some knowledge of analytic geometry and trigonometry is helpful.

While Carnahan et al briefly examine chemical engineering, a more thorough book on programming in chemistry is FORTRAN IV in Chemistry, by G Beech (Wiley, New York, 1975, hardcover, $23.50). In addition to programs for simulation of lab problems on the college level, there is much material on theoretical chemistry (quantum and classical mechanics), as well as practical lab problems. These problems are complemented by FORTRAN listings and sample runs. This is a specific text, and if your interest is in chemistry, you might easily find a computer application based on the material in this book. Topics include: numerical methods, kinetic and thermal problems, spectrometry, atomic and molecular orbital theory, and data acquisition in chemistry. Familiarity with the noncomputer approaches to chemistry problems and a knowledge of FORTRAN are useful in reading this book.

Bennett, Carnahan et al, and Beech have chapters devoted to statistics, an area in which the computer has proved of inestimable value. Market analysis, reliability testing, election results projections, and even stochastic testing would be nearly impossible without the computer. The basic programs are relatively easy to write, but the more advanced techniques, including analysis of variance and factor analysis, are considerably more complex.

Two books serve as excellent guides to statistics by computer. Biometry, the Principles & Practice of Statistics in Biological Research, by Robert R Sokal and F James Rohlf (W H Freeman, 1969, hardcover, $18.50) is a textbook of statistical methodology. It is well written and clear, and as an added feature includes a complete library of statistics programs in FORTRAN. These are all subroutines which you can assemble to perform the task at hand. The book is oriented to biological research, but the methods are easily adapted to other situations.

FORTRAN Programming for the Behavioral Sciences, by Donald J Veldman (Holt, Rinehart and Winston, New York, 1967, paperback, $5.98) is not as thorough as Sokal and Rohlf, but is more concise. It has a chapter devoted to learning FORTRAN, and a set of statistics programs in FORTRAN. These two books assume a knowledge of mathematics through elementary calculus, but the mathematical difficulty varies with the particular topic. These texts have served me well, and I have even been able to earn some extra income by doing statistical analysis on research data. Believe it or not, there is a large number of people who still do statistical calculations on nonprogrammable calculators.

A book related to my field of endeavor is Computer Techniques in Biomedicine and Medicine, edited by Enoch Haga (Auerbach, Philadelphia, 1973, hardcover, $24.95). This collection of articles is divided into two major parts: simulation and modeling, and data acquisition and management. The articles vary in complexity and specificity. Topics include simulation with applications in cardiovascular and pharmacologic research, data base accumulation, image processing, and the role and potential of minicomputers in medicine. Some topics contain sample program listings and flow diagrams. Other topics, especially those on data base management, are quite general, but applications would be highly dependent on the particular data base. The book serves as a good starting point for exploring the rapidly growing field of biomedical computing.
This has been a brief introduction to selected books on application programming. Because my involvement in computing is oriented to scientific applications, the books I've covered here are mostly science and engineering tomes. The amount of FORTRAN usage in these books is also large, but it has been my personal experience that FORTRAN and BASIC can be directly translated, if attention is paid to proper language rules. An elementary text on FORTRAN is always handy to have as a reference for syntax. If you know BASIC, FORTRAN is not at all difficult to learn.

The books mentioned are not inexpensive, but they serve as good investments if they help you solve a problem, or pose a problem you become interested in solving. I would encourage you to examine these books, if you can, before you buy them. A well stocked college science or engineering library should have many of them available. This review might also serve to encourage you to write about your favorite computer books.

ation returns the result 75. This dual use of a symbol, like the concept of valence applied to functions, may seem strange and even confusing upon first encounter. Familiarity soon reveals that adoption of this procedure is a source of considerable economy in the language. There are only a few operators in APL so far, but they impart great power to the language. Implementation of new operators will likely highlight subsequent development of this exciting language.

Some insight into the evolution of APL has been provided by the innovator of that language, Kenneth Iverson, and his collaborators. When the history of its development is widely appreciated, APL will be seen as one of the great intellectual achievements of this century. Iverson is a mathematician who is keenly aware of inconsistencies that have long plagued his discipline and is eager to avoid those blemishes in APL. Nevertheless, the distinction drawn here between function and operator was not made in the earliest versions of the language. Only after operators were recognized as "composite functions" did the matter receive the attention that brought it into line with the generality that is a basic theme of the language.

Arnold certainly is not alone in using the older terminology. He cites a widely used textbook that deals rather lamely with this point. A more recent textbook on the language (one author a mathematician and prominent user of APL) uses the terms function and operator interchangeably and appears determined to promote the confusion that originators of the language have been at pains to dispel.

An anonymous contributor to Scientific Research (1969) posed two interesting questions: "To what extent are scientists beginning to use programming languages to describe or model their problems in preference to normal mathematics?" "Is it possible that researchers will some day automatically think in FORTRAN or BASIC instead of algebra or calculus?" Positive answers to those questions could scarcely have been framed then, even by enthusiastic users of those languages. If those enquiries now be made of APL, there can be little doubt of affirmative answers.

As Forsythe (1968) pointed out, "The most valuable acquisitions in a scientific or technical education are the general-purpose mental tools that remain serviceable for a lifetime." APL certainly fits more comfortably into that category than does any other language by which we now try to instruct computers. APL is sometimes referred to as Iverson's notation; hence it is appropriate to recall a remark attributed to Bertrand Russell: "A good notation has subtlety and suggestiveness which at times make it seem almost like a live teacher." That notion seems to have been crystallized in APL. Iverson will eventually be recognized as the teacher of the century.

The story of APL includes a lesson that our overstressed society might do well to ponder, namely the importance of providing some shelter from expediency for the development of any significantly new idea. The small team initially involved in design and implementation of APL were not subject to strong duress to get their kite in the air. They did not have to settle for the compromises by which committees have produced such regrettable languages as say PL/I. Instead, they were able to indulge the luxury of Quaker consensus in reaching important decisions. Our greatest debt to earlier computer languages may well prove to be the lebensraum they provided for the development of APL. This remarkable language will undoubtedly undergo considerable further evolution, some of which will surely be influenced by its use with microcomputers. It must be implemented throughout the computer world. Those involved with its development and implementation should consider its history very carefully.

Our thanks to Mr Anthony for his comments about Mark Arnold's article and about the present and future status of APL.

Why People Get Hooked on APL

APL, A Programming Language, is one of the most powerful interactive languages in use today. Its rich set of operators is oriented toward operating on groups of data with the same freedom that other languages operate on single data items. These operators give the language the breadth to handle an amazingly wide range of computing problems. This article explores APL’s applicability to personal computing, and looks at some of the ways that APL can be practically implemented on the small system. Particular attention is given to the problem of storage management. References in the article to the internal workings of an APL interpreter for a microcomputer pertain to the APL interpreter currently under development by the Microsoft Company for use with the Intel 8080 chip. This interpreter (being implemented as this is written) will include a significant subset of APL, designed to contain most of the features available on large APL systems, except for those parts of the language which pertain to a multiuser environment.

The first question one must ask when thinking about the implementation of a new language is whether or not the language is capable of solving the problems commonly solved on that machine. With APL, the answer is a qualified yes. Since the language is interpretive, it will never be as fast or as efficient as assembly language or a true compiler; one would not want to refresh a display from memory using APL. On the other hand, APL is a far less cumbersome programming language than assembly language. Clearly then, APL can be used to solve the problems (and play the games) that are presently implemented with BASIC, an area where APL excels. As an interactive system, like BASIC, APL is easy to program with and debug, and it is also considerably faster than BASIC.

The heart of APL’s speed lies in the ability to express highly complicated algorithms with a few keystrokes. This gives the language a double advantage over BASIC. Part of the speed improvement will come about simply because APL programs are shorter than their BASIC counterparts. The interpreter wastes less time analyzing the program and spends more time manipulating the data. The other, more subtle, speed advantage lies in the speed of the functional subroutines that are built directly into APL. As an example, consider this BASIC routine which calculates the average of the data items in the N element array A:

```
1000 S=0
1010 FOR I=1 TO N
1020 S=S+A(I)
1030 NEXT I
1040 S=S/N
```

The routine exits with S being equal to the average of the N items in the array. Now compare that with an APL routine that performs the same function:

```
1000 S←0
1010 FOR I←1 TO N
1020 S←S+A(I)
1030 NEXT I
1040 S←S/N
```

Notice that the entire loop, lines 1010 thru 1030, is reduced to the expression +/. Thus BASIC, while summing up the array elements, must go through great convolutions to achieve the desired result, including performing the subscript calculation A(I) N times and storing the temporaries S and I in memory each pass through the loop. This involves considerable overhead, including looking up S in the symbol table every time through the loop, skipping over any remark statements left inside the loop, calling the formula evaluator to analyze the LET statement in line 1020 each time through the loop, etc. The BASIC routine is also fairly cumbersome to use as a subroutine, because one must be sure that the loop variable I is not confused with some important piece of data (with the same name) in the calling program.
APL, on the other hand, does the entire calculation in a very fast loop internal to the interpreter, keeping the sum in a special memory location (or possibly an 8080 register, depending on the magnitude of the temporary). Not counting the time spent lexically analyzing the line, one would be hard pressed to write an assembly language program that performs the summation faster than APL does. The time overhead of analyzing the line, while measurable, is a fairly insignificant percentage of the total time spent, both because it is only done once, and because the line is only nine characters long. APL also relieves the programmer of the possible variable conflict between the loop variable I, and another use of I in some other part of the program, since it does not use a named variable as a temporary.

APL's operators can be used in combination to perform considerably less trivial tasks than averaging an array. Consider the following APL function called SORT. This function sorts an array of alphanumeric strings into an order specified by another string, called an "alphabet" string. SORT takes two arguments: the string array to be sorted, and the alphabet to be used during the sort. As an example, we first assign the string 'ABCDEFGHIJKLMNOPQRSTUVWXYZ' to the variable ALPHABET.

The request:

```
ALPHABET SORT FOO
```

would then cause APL to type the string array FOO sorted into normal alphabetical order. Other common permutations are easy to achieve; one could use the reverse operator (φ) to get reverse alphabetical order. In this case, the proper APL incantation would be:

```
φ ALPHABET SORT FOO
```

Well, what does it take to write this magical SORT in APL? The function sort is defined as follows:

```
109
```

In the first line (often called the function header) the function is declared as having two arguments which are assigned the values ALPHABET and LIST during the execution of the function. TEMP is declared as a temporary variable, used only inside the function, and R is declared as the value variable of the function. Thus, when the function is exited the value returned will be the value of R. All four of these variables are local to the function; that is, they will be cleared. Thus any space they use will be reclaimed upon exiting the function. Also, if there were any variables with these names already in existence, the old values are pushed onto the 8080 stack to be restored on exit from the function. (Actually, a pointer to the old value is pushed onto the stack, not the value itself.) This guarantees that there will be no conflicts between the function and the environment from which it is called.

Consider the deepest level of nested parentheses in line 1: The variable ALPHABET has a string composed of one space concatenated in front of it. This new string is first reassigned to ALPHA, and then used as the left argument of dyadic iota, with the right argument being the array (LIST) that we want to sort. This function returns a numeric array having the same number of rows and columns as LIST, and whose every character is replaced by the index of the matching character in ALPHA. A space would thus become a 1, because the first character of ALPHA is a space. This new numeric array is assigned to LIST, and then the shape function p (the greek letter rho), is applied to it. This returns a two element vector whose first element is the number of rows in LIST, and whose second element is the number of columns. The second element of the vector is selected by the indexing brackets, and is assigned to TEMP. TEMP thus points to the last column of LIST.

Lines 2 and 3 perform the actual sort. In line 2, the entire column pointed to by TEMP is extracted by the expression LIST [ , TEMP], and sorted to produce a vector of indices used to index LIST again. This has the net effect of sorting LIST based upon the column pointed to by TEMP. In line 3, TEMP is decremented and its value tested. If TEMP is nonzero (indicating that the array has not been sorted on every column), control is transferred back to line 3 for another pass. If TEMP is equal to zero, then the interpreter proceeds to line 4 where LIST is used to index ALPHA and produce a character array sorted in the proper order. When the end of the function is reached, the old values of ALPHA, LIST, TEMP and R are restored, and the last value assigned to the sorted alphanumeric array R is returned.

Because the bulk of the sort is done by the grade up and index bracket operators, the algorithm is fairly fast. It is also quite short, being less than 120 characters. When compared with a BASIC routine that performs a similar function (see listing 1), the APL routine seems quite short indeed. The
Listing 1: A BASIC string sort. This routine is designed to take a string of characters and arrange them in alphabetical order. Compared with the corresponding APL string sort (see article) this routine will typically take longer to execute and is more cumbersome to write. One of the drawbacks of APL, however, is that it invariably takes more memory space than other high level language interpreters.

BASIC sort, incidentally, is written in Altair extended BASIC; in standard BASIC it would be longer yet.

This routine also demonstrates one of APL’s losing features: its memory inefficiency. APL tends to use memory in large quantities, reflecting its origins on the IBM/360. The cause of this weakness is unfortunately also the source of APL's strength: its ability to operate on groups of data. Instead of having single numeric temporaries inside a formula, as BASIC might, APL often designates entire arrays as temporaries. (Although BASIC can generate large character temporaries during string operations, they are limited to 255 bytes in implementations such as Microsoft’s Altair BASIC.) These temporaries can consume significant amounts of memory, especially if they are numeric. APL requires at least 16 decimal digits of precision in its numbers, which in turn require eight bytes of storage per number.

The problem is aggravated by the size of the interpreter itself, which we expect will occupy around 24 K bytes if all the features of the language are implemented. Clearly, if APL is to become popular as a language among personal computer users, some way must be found to implement a practical APL interpreter on a small system.

The simplest way to solve the problem is to streamline the language, eliminating features until the interpreter will take up no more than 8 K bytes or so. One could limit the size of floating point data to four bytes rather than eight. Limiting arrays to one dimension, and thus eliminating most of the operators designed to operate on multidimensional arrays, would be a big saving. Eliminating the composite operators (except for the most important one, reduction) would save a lot of storage in the interpreter.

Once this point is reached, it would probably be better to forget about APL entirely and go back to BASIC, because all that remains is a simple desk calculator style language with a strange character set and a peculiar order of evaluation. The heart of the language is its ability to manipulate arrays, and when this feature disappears the language loses much of its usefulness.

It might seem more reasonable to eliminate only those operators, like matrix inner and outer products, which appear to be useful only to mathematicians; but as one becomes more familiar with APL, these functions become increasingly more useful in everyday applications. Matrix inner product, for example, is one of the most powerful tools in the language for extracting information from a stored array. Using matrix inner product, the entire APL sorting function can be reduced to only one line of code:

```
VR=ALPHA SORT1 LIST
```

This algorithm (from Gillman and Rose, APL 360: An Interactive Approach, John Wiley and Sons, New York, 1970) performs only one numeric sort, as opposed to SORT, which performs a numeric sort for each column of the array. Although this code is fairly obscure (especially to a person used to BASIC or FORTRAN), one becomes more comfortable with this sort of coding through time.

I feel that the efforts of an implementor of an 8080 APL interpreter should be directed toward writing a full set of APL that is reasonably memory efficient. This is not as hard as it seems: There are a few features that can be built into the interpreter which can reduce the memory requirements of an APL function down to a reasonable level.

The first problem to solve is the number of bits of resolution needed for accurate data representation. If a person is doing floating point calculations, he or she should have a full 16 digits of precision available (ie: eight bytes of information per numeric value). On the other hand, it is quite extravagant to use 64 bits for storing Boolean or character data. Also, operations on integer data (such as loop variables, counters, etc) should be carried out using a small, reasonably fast integer format, rather than a slow floating point format.

For example, in Microsoft’s upcoming APL interpreter, we have chosen to store data in four different formats: 1 byte unsigned integer, 2 and 4 byte signed integer, and 8 byte floating point. These types are transparent to the user, and any necessary
AUERBACH Publishers, exclusive distributor for INFOTECH INTERNATIONAL introduces the

COMPUTER STATE OF THE ART REPORTS

1977 Series

a unique blend of theory and practice in computing

Computer professional . . .

Keeping up-to-date and in touch with your ever-changing technology is as close as the COMPUTER STATE OF THE ART REPORTS from INFOTECH INTERNATIONAL.

These unique publications are:

• Complete in-depth surveys of all current, critical and dynamic areas of computing
• Capable of influencing the nature and direction of computing throughout the next decade
• Seminal works in their own fields

Drawing on the finest and most erudite sources in the world, each INFOTECH Report is a comprehensive, analytical study of the most current and critical technical information in the data processing field today. The new 1977 Series covers . . .

33. Minicomputer Systems
34. Software Engineering Techniques
35. Microprocessors
36. On-Line Data Bases
37. Software Reliability
38. Future Systems
39. Distributed Processing
40. Performance Modeling and Prediction

Emanating from international conferences on advanced computer technology, each Report includes . . .

A unique method of Analysis — a distillation and synthesis drawn from formal presentations and question and answer sessions of in-depth seminars.

Invited Papers — especially commissioned from worldwide leading experts in their fields — which have been selected to give comprehensive coverage to each Report’s area of expertise.

Bibliography and Indexes.

Published in one calendar year, these eight information-filled Reports are just $1295 . . . individual Reports are $215 each. Also available at these prices are the 1974/5 Series and the 1976 Series.

AUERBACH Publishers Inc., a leading source of data processing and data communications material and information, is proud to make these Reports available to you, and urge you to join most major computing organizations worldwide who are taking advantage of the valuable information service.

Save money and time and stay right up-to-date with INFOTECH INTERNATIONAL’S COMPUTER STATE OF THE ART REPORTS.

To order your Reports or receive your free 28 page catalogue . . . fill out this coupon and mail to . . .

Peterborough NH 03458

Conversions between types are performed automatically. If one adds two arrays, for example, there is no need to worry about the best format for the arrays or for the result. This multiformat scheme will also tend to increase the speed of the interpreter, since operations between integers are much faster than operations between floating numbers.

For this multiformat scheme to be effective, the interpreter must be as stingy as possible in converting to a larger format when deciding on the size of the result of a calculation. If two arrays are being multiplied, for example, the interpreter will assume that the size of the resulting array will be the same as that of the larger operand. Only when this assumption fails (i.e. when the product of two elements of the arrays overflows the result type) does the interpreter increase the size of the result.

As careful as the interpreter is, occasionally a variable is stored in an overly large format. This can happen if the square root is taken of an array whose elements are all perfect squares, for example. To solve this problem the interpreter scans all data during terminal input waits and converts each one to the smallest format that can hold it.

Another storage saver that can be built into an interpreter is a careful examination of each statement to eliminate unneeded temporaries. For example, consider this APL statement:

\[ Z \leftarrow X \times Y \]

The simplest way to operate on this statement would be to make copies of both \( X \) and \( Y \), multiply them, and then store the result in a new location pointed to by \( Z \). While this is an acceptable way of handling scalars, it is wasteful to the extreme if \( X \) and \( Y \) are large arrays. This statement should use only enough memory to hold the result and the two operands. No temporaries are necessary. Accomplishing this is not difficult when the interpreter knows how large the result will be; it is a more difficult problem when the type of the result is uncertain. If both \( X \) and \( Y \) are stored in a 1 byte format, for example, \( Z \) might require either one or two bytes per value depending on the contents of \( X \) and \( Y \). Since the final size of the result cannot be determined until the last elements of the arrays are multiplied together, it might seem necessary to go back and start again using a 2 byte multiply routine. A more sane solution, though, is to go back and convert all previous results from 1 byte to 2 byte format, and then continue from
the point of overflow using 2 byte multiply. Since upward type conversion is very fast, the overhead on overflow will be small.

Two other ways of saving storage are worth mentioning: data sharing between variables, and the overwriting of temporary results. Data sharing, the more difficult of the two to implement, is a method of saving storage by keeping as few copies as possible of any one set of data. For example, if A is an array, then the statement B ← A should not copy any data: B and A should point to the same array in memory. The sharing will continue until either A or B is modified, at which point the interpreter is forced to make an extra copy of the data. Although this example is rather contrived, the technique can be of great value when calling functions. Only rarely does a function modify its arguments (SORT being a notable exception), so there is little point in making unnecessary extra copies of them. Data sharing has the additional advantage of requiring very little overhead, just one byte per data structure counting the number of variables pointing toward it.

The technique of overwriting previous results can also be a big scratch memory saver. Consider this APL statement:

\[ B ← 1 + A \]

Let us assume that A is an array stored in floating point format. Working from right to left, the interpreter adds 1 to A, then takes the reciprocal of that result and assigns it to B. At first glance it might seem that this statement requires two temporaries: a place to store \( 1 + A \), and a place to store the reciprocal of \( 1 + A \). The interpreter can avoid creating the second of these temporaries by writing the result of the reciprocal operator over the \( 1 + A \) temporary. The only remaining problem is finding a quick way to distinguish between a "true" array, pointed to by a named variable, and a temporary array. The solution is to look at the reference count of the array: If it is zero, then no variable is pointing toward it and it can be safely destroyed.

No matter how careful a programmer is, or how many tricks he or she builds into an interpreter, there is no way of avoiding the fact that implementing a powerful language like APL on a small computer will take a lot of memory, certainly more than a BASIC interpreter. As I consider all of APL's useful features (and the plummeting of memory prices), I feel sure that APL will become one of the most popular languages among small system enthusiasts. APL programs are short and easy to understand once you are familiar with the Greek character set.
An 8 Digit Hexadecimal Readout

While working or playing with a microprocessor the logic state of many lines must be studied simultaneously in order to understand and debug the system. Typically, 16 address lines, eight data lines and possibly some 10 lines are of interest. Each line can be individually checked with a meter or oscilloscope, but it is much more convenient to measure the states of the lines in parallel. Most microprocessor front panels have many LED indicators to simultaneously read out the address and data lines.

Since microprocessors are byte oriented machines, hexadecimal digits are often used when writing code. After countless mistakes decoding data and address lines, I knew I needed an automatic method to translate the many ones and zeros to hexadecimal. The 16 hexadecimal digits 0 to 9 and A to F can be displayed in a directly readable format using a 7 segment readout. A check of the data sheets for the common TTL binary coded decimal to 7 segment decoders, such as the 7447, showed none display the letters for inputs greater than nine. Although the display may be unique for each input, a directly readable digit is required or the system is not much of an improvement over individual lamps.

A simple solution is to build a custom decoder by burning part of an 8 bit by 32 word bipolar programmable read only memory. The hexadecimal digit to be displayed provides four of the five address bits that determine the decoder's output. Seven of the eight output bits are used to turn on or off the appropriate segments of an LED readout. Table 1 shows the truth table for the decoder. It can be programmed using methods such as those described on page 66 of the November 1975 BYTE or by the distributor at the time of purchase. The fifth input, highest order bit, is grounded since only half of the read only memory is needed to hold the hexadecimal 7 segment code. The eighth output bit is also unused. It could be used to light the decimal point during display of input values greater than nine to emphasize the hexadecimal nature of

Table 1: The truth table of the read only memory that is used for the display. With this table it is possible to have a separate, distinguishable character for each of the hexadecimal digits.
the readout. Since only minimal confusion is present (b could be read as 6), this was not felt to be necessary.

The circuit diagram is shown in figure 1. Since programmable read only memories are relatively expensive, the display is multiplexed to reduce cost. This also results in a power savings. A 555 timer oscillates at about 1000 Hz and drives a 7493 which is used as a 3 bit counter. Its output address determines which input digit is to be displayed by selecting the correct output from each of the 74LS151 multiplexers and also sets a 74154 decoder to drive the corresponding readout digit. Each 74LS151 multiplexes one bit of the eight different input digits. Low power or low power Schottky should be used to minimize line loading of the device under test. The four bits to be decoded, the outputs from the multiplexers, address the 82S23 decoder as discussed above. Common cathode 7 segment LED readouts are interfaced to the decoder outputs and to the 74154 outputs using PNP and NPN transistor drivers.

The component layout is not critical and the construction technique will depend on the use intended. The unit could be built as a dedicated front panel; however, since I feel that a microprocessor should be brought up with a monitor system that enables the system video display or teleprinter to serve as the front panel, I built the readout to be a stand alone tester.

The timer circuit, transistor and resistor networks, and the output leads from the

![Figure 1: This is the schematic diagram for the 8 digit hexadecimal readout. The output for the display is multiplexed to save on the cost of the relatively expensive read only memory. All resistors are .25 W and are measured in ohms.](image)
How to Make a Display Printed Circuit . . .

The pattern below shows the typical foils for two positions of hexadecimal display fabricated at home with printed circuit techniques. This double sided board can be made by first laying out all the holes for all the displays. (A template made by marking a section of "P" pattern Vectorboard can be used to guarantee the same pattern at each position.) Then using the template or hole locations marked without the template, the set of six holes for each position is drilled with a small (eg: #60) drill. After thoroughly cleaning the board, the pattern is laid out using printed circuit resist tape, a resist pen such as the Sanford's "Sharpie" marking pen available at stationery stores, or a resist paint. Both sides of the board receive this hand crafted pattern for as many positions as you care to wire up. When mounting the LED readouts, the b, c and cathode pins are bent outward to make contact with the pads on the top of the board. Due to the difficulty of removing the LED readouts after installation, testing the devices prior to soldering is a highly recommended procedure.

In this figure, the patterns for only two readout sections are illustrated; the hole and circuit pattern is repeated for each additional one required. The segments are lettered near the printed circuit paths which connect them. Both patterns are viewed from the top foil looking into the printed circuit board.

74154 and 82S23, as well as voltage and ground, were etched on a printed circuit board. The rest of the circuit was wire-wrapped. Two 16 pin dual in line package sockets were used for the input connectors.

Eight Fairchild FND-70 7 segment LED displays were mounted on a separate board in four groups of two to represent four bytes. The segments are wired in parallel. These readouts do not plug into a dual in line package socket and must be either point to point wired, or a printed circuit board must be made.

The readout is simply used by connecting it to the lines of interest. The data on the lines must be stepped slowly enough to enable the data to be read. For cases where this is not possible the data could be fetched on command by a strobe that selects the time of interest and then read out at leisure.

Besides serving as a temporary front panel during the period when a new microprocessor system is being brought up, the readout is useful for later use to monitor IO lines during program debugging sessions. It is also a very useful tool for general testing and breadboard development when several lines must be monitored. Example uses include deciphering read only memories made long ago, but left unlabeled, checking out surplus integrated circuits such as comparators, decoders, adders, etc. It can be attached to the switches of a manual read only memory programmer to give assurance that the switches have been properly set.

From my experience, it is well worth the few hours and few dollars to get together a hexadecimal readout. You will soon find it is one of the handiest tools on your bench.
You should subscribe to Creative Computing today! Here's why —

Creative Computing will help you decide which computer is best for you.
Creative’s no-nonsense equipment profiles arm you with the facts before you talk to the vendor or dealer. Whether you’re interested in a microcomputer kit, a mini terminal, or programmable calculator you’ll find the evaluative information you need in Creative. Indeed, one wise hardware decision could save you the cost of a lifetime subscription.

Creative Computing discusses computer applications in non-technical, understandable language.
Business people who want to know what’s going on in the EDP department, students who want to learn about microprocessors, hobbyists looking to make good use of home computers, or anyone concerned about the effect of the computer on society will find there are many many, many, many more mind-expanding topics covered on the pages of Creative.

Creative Computing carries outstanding fiction every issue.
One of the best ways of exploring future scenarios of computer usage is through fiction. So Creative features our material from the best authors: Isaac Asimov, Frederick Pohl, Arthur C. Clarke to name just a few, as well as many others who are destined to be the best of the next generation.

Creative Computing’s book reviews are honest and timely.
We’re not owned by a big book publisher to whom we owe loyalty. We don’t depend upon advertising for our revenue. Hence not only do our reviews pull no punches, but we also rank order similar books (like all 34 books on the BASIC language which we reviewed last year). Creative reviews virtually every computer book of interest to educators, hobbyists and general laypeople, even including vendor manuals and government pamphlets.

An extensive resource section will save you time and money.
Every issue of Creative carries 60 or more short resource reviews, evaluating periodicals, booklets, hardware terminals, calculators, peripherals software packages, organizations, dealers and much more. Every entry has a brief description, evaluation and the name, address and phone number of the vendor. You’ll save valuable time sifting and sifting for information, much of which you’d possibly never come across.

Creative Computing will provide hours of mind-expanding entertainment, even if you don’t have a computer.
Creative Computing carries 10 or 12 pages of games and puzzles every issue. Most of the puzzles don’t need a computer or calculator to solve. Some do. Naturally, the 4 or 5 new computer games (in Basic, Fortran, and APL) in every issue require access to a computer.

Creative Computing gives you things to actually do with a computer.
Home computer kit mini, timesharing terminal — whatever your access to computer power. Creative provides thoroughly documented programs with complete listings and sample runs that you can use with minimum effort. Games, simulations, CAI, computer art — whether education or recreation, your bag. You’ll find programs which you can use in Creative.

A no-compromise policy of editorial excellence means every issue is of value to you.
We firmly intend to be around a long time and we believe the way to do that is to publish only material of the very highest quality. We believe our readers are among the most astute, intelligent, and active people in the world. You can’t afford to waste time reading imprecise, opinionated, or wordy articles and you won’t find any in Creative.

The price is right — only $21 for 3 years.
That same $21 will buy you a pair of Star Trek walkie talkies, six direct dialled 10 minute calls between New York and Boston, 3 tankfuls of gas or 10 cocktails at a Hilton hotel. Wouldn’t you rather have 18 issues of Creative Computing each containing over 85 pages of solid editorial material (including advertising over 100 pages per issue) compared to the editorial pages in any other hobbyist or special interest magazine and compare it to Creative? Any other 1 year subscription $8. Lifetime $380.

NO RISK GUARANTEE
You may cancel your subscription at any time for any reason and we will refund the balance without question.

Computerland stores are exciting, enjoyable places to visit. From the striking decor to the fun and challenge of the Computerland Game room, you'll find Computerland stores a completely new shopping experience. You can count on Computerland stores for total professional support whether your needs are those of a computer hobbyist, education, science or business user. The skilled, management-trained staff offers knowledgeable service, expert maintenance, and software guidance.

Every store is completely stocked with tools, books and a broad range of accessories.

breadth of products

At Computerland stores the emphasis is on quality products. Major brands like Apple Computer, Cromemco, DEC, Diablo, IMSAI, Lear Siegler, Polymorphic Systems, TDL and Vector Graphic to name a few.

begins welcomed

Do you want to get started with microcomputers? Are you seeking expert guidance on computers, peripherals, software? The place to visit is your nearest Computerland.

Look What You Can Do...  

...with an Edge as a Cue

There are hundreds of digital integrated circuit functions, some highly specialized and others perfectly general. So long as simple digital functions are involved, logic cookbooks, truth tables and functional descriptions explain what various integrated circuits do and show how to apply "standard" solutions to problems. But it is often possible to combine integrated circuits and other components to provide clever solutions to various problems, taking advantage of the characteristics of the integrated circuits. In this article, we concentrate upon several different ways to generate pulses or time delays on cue, using analog, asynchronous and synchronous (clocked) digital methods.

Exploring the Schmitt Trigger

Schmitt trigger integrated circuits are available in both the TTL and CMOS logic families, and share a common characteristic: A property called hysteresis has been incorporated in the circuitry between input and output, which leads to a useful time delay effect with signals that are slowly varying compared to logic speeds. This action can be illustrated by comparing a linear amplifier's response with the response of a Schmitt trigger. Figure 1a shows how the linear amplifier responds to an input waveform: It simply amplifies the signal but otherwise makes a faithful copy. In figure 1b, the response of the Schmitt trigger to the same type of input waveform is illustrated. Note how the Schmitt trigger output makes no change until the input crosses a threshold V1, then makes no further change until the input voltage has dropped to a lower threshold, V2. The hysteresis property of the Schmitt trigger is this difference between the rising (V1) and falling (V2) change thresholds. The use of this hysteresis to reduce noise on a signal is illustrated graphically in figure 2. The analog input signal in figure 2 would cause problems if applied to a TTL gate input. By simply taking advantage of the hysteresis levels V1 and V2 using a Schmitt trigger, the input signal is transformed into a much more usable signal with clean (ie: the typical 10 ns) transitions.

Because the Schmitt trigger's hysteresis rejects noise so readily and has a rapid response once the threshold has been crossed, it is often used to accept slow waveforms for input to normal logic cir-
cuitry. With proper external circuitry, the Schmitt trigger will also accept capacitively coupled waveforms. Due to this property, the Schmitt trigger is a very versatile device.

An example of the Schmitt trigger's application is the generation of a trigger pulse on an "edge" of another waveform. Figure 3 shows two different edge detectors made with the 7414 circuit as the key Schmitt trigger element. Figure 3a shows the positive edge detector, and Figure 3b shows the negative edge detector. The Schmitt trigger's properties of hysteresis allow the reliable use of long time delays in the RC network driving the device; use of an ordinary TTL gate would not be reliable due to the optimization of TTL devices to standard TTL transition speeds. The timing diagram in figure 3 shows the relationship of the two edge detector outputs to a common driving waveform. How about pulse delays? Cascading several such edge detectors gives a series of delayed pulses as shown in figure 4. The timing is determined by the RC components used, and is thus called "asynchronous" since it has no dependence upon a regular clock period and can vary with the temperature and other physical parameters which affect resistors and capacitors.

The Schmitt trigger also interfaces with the real world outside digitland. Figure 5 shows two ways to create what is called a "power on reset." Such a reset function is used to clear digital logic such as counters, sequencers, controllers, and microprocessors which must start from a predetermined state following the application of power to the system. A typical rule to thumb is to choose the RC time constant to give a reset delay at least three times as long as the power line takes to come up to full voltage.

Figure 2: One of the principal uses of the Schmitt trigger circuit is to convert slowly varying analog signals into the nearly instantaneous transitions of digital logic — and at the same time to filter out minor variations. This example illustrates how an arbitrary analog input is converted into a digital signal by a Schmitt trigger with thresholds V1 and V2. Changes only occur at V1 when the input is rising, and V2 when the input is falling.

Figure 3: By using an RC network to differentiate a logic signal, the analog signal which results can be used with a Schmitt trigger to generate pulses at "edges." The positive edge detector (a) and negative edge detector (b) here use the Schmitt trigger version of an inverter, the 7414.

Figure 4: A cascading series of positive edge detectors can easily be made using several Schmitt trigger stages. Each stage uses the logic signal generated by the previous stage, resulting in a series of pulses with progressively longer delays relative to the input signal's rising edge.
Figure 5: Using the time delay properties of a Schmitt trigger with an RC network leads to this technique to produce a power on reset signal. A master system enable (a low state) is delayed by the RC time constant of C2 being charged by R2 after the power is turned on. During the time that normal system action is disabled, the power on reset pulse is created by the positive edge trigger of the upper Schmitt circuit. The RC constants are chosen so that the system enable falling edge follows the rising edge of the power on reset by a good margin.

Figure 6: The time delay properties of a Schmitt trigger and RC networks can be used to debounce switches. The common approach is to use a flip flop such as the circuit at (a). However, by using a Schmitt circuit, it is possible to get away with an SPST switch instead of the SPDT switch required for the flip flop technique. Two versions of SPST switch debouncing are shown at (b) and (c).

Figure 7: An inverting Schmitt trigger can be used as an oscillator by feeding its output back to its input with an RC network as shown at (a). If a Schmitt trigger NAND gate is used instead of the inverter form, the extra input can be used to gate the oscillator on or off.
One of the most troublesome real world logic interface problems is switch debouncing. Any switch contact bounces, a little or a lot depending upon many factors. A typical way of debouncing a switch is to use two NAND (or NOR) gates in a set-reset flip flop circuit as shown in figure 6a. However, this circuit requires a single pole, double throw switch. The circuits of figures 6b and 6c show how the Schmitt trigger gate can be used to generate a debounced TTL signal from an SPST switch by using RC components to generate a time delay which is longer than the typical bounce interval for the contacts.

One other place the Schmitt trigger shines is in the digital oscillator as shown in figure 7a. Besides the 7414 hex inverter package, Schmitt triggers come in several other packages including a quad NAND package called the 74132. As an oscillator, the 74132's gating action can be used to gate the oscillator on or off using the second input as shown in figure 7b. (Note that any of the previous illustrations can be implemented with the 74132 or other gates in the 7400 series of parts with Schmitt trigger inputs.)

For those who may not have the appropriate logic handbooks, let’s note that the two Schmitt trigger integrated circuits mentioned above are functionally identical to their normal TTL counterparts, with the exception of the Schmitt input property. In figure 8, these pinouts are reproduced for reference purposes. If you need a spare inverter or NAND gate, the Schmitt trigger property of any extra active sections can be ignored without side effects in most cases.

The Schmitt trigger aspect of these gates is thus a useful bonus. Every digital kluge board will most likely require at least one Schmitt trigger integrated circuit on it for those unexpected noise and timing problems which crop up sooner or later. One other item should be noted about the TTL Schmitt triggers: Pull down resistors and feedback resistors (see the examples in the figures) should not be larger than 390 ohms. Pull up resistors can range up to about 2.2 k ohms.

A Schmitt trigger can be made using positive feedback around an AND gate.
If a delay network such as that in figure 10 is presented with a string of short pulses, there will be a certain minimum length input which will be recognized as a transition on the output. If the pulse is not long enough to charge the capacitor to the threshold level through the resistor, there will be no change at the output. Thus the Schmitt trigger with an RC network can be used to discriminate against short pulses.

Figure 9a shows the 7408 used as the basic Schmitt trigger in a circuit analogous to figure 1b. Figure 9b shows the 7408 substituting for the 7414 in a circuit like figure 3a. In both cases, except for the fact that the output is not inverted by the 7408, the effect is the same. Note that the unused input of the AND gate is tied to +5 V to enable the gate. Make the feedback resistor about 10 times the pull down or pull up resistor for best results. Use your own imagination to design all the previous functions (with the exception of the oscillator) using positive feedback and AND gates instead of Schmitt trigger circuits.

By reversing the resistor and capacitor at the inputs, a Schmitt trigger will delay a signal or discriminate against narrow pulses. Figure 10 shows the delay function, and figure 11 shows how narrow pulses (or noise glitches) can be filtered out of a pulse string.

Using Gate Propagation Delays

When gates are as cheap as they are, it is sometimes more appropriate to solve problems without resistors and capacitors. For example, the edge detector can be made using gate propagation delays instead of the RC time delays of a Schmitt trigger. Figure 12 shows such an edge detector. For those who may not be familiar with the principle, another common name for this circuit is a “delay oneshot.” The delay oneshot works this way (referencing figure 12): The input is initially low, which forces the output high. With three inversions, point C will be initially high. When the input goes high, the output will go low (after one gate delay) since point C is still high. Three gate delays after the edge, point C will go low forcing the output high again after one gate delay. A similar process takes place for the NOR gate version of figure 12b. The timing diagrams of figure 12 show how the gate delays lead to the pulse effect.

The name delay oneshot comes from the fact that an integrated circuit’s output does not change instantaneously with its input; rather there is a finite propagation delay shown as ΔT in figure 12. Therefore point C goes low three propagation delays after the input went high, and the output will then be low (for figure 12a) for a short time of about 25 to 35 ns with standard TTL parts. The exact time depends upon the particular integrated circuit, its current temperature, and other physical parameters. In many applications, the exact pulse width is not important; for it is wide enough to trigger clock and edge sensitive inputs of other TTL devices such as flip flops and counters. While figure 12a shows a positive edge detector, using a NOR instead of a NAND as in figure 12b yields the negative edge detector. The circuit of figure 12c completes the picture by using an exclusive OR gate to detect both edges of the input waveform. This exclusive OR circuit is also known as a frequency doubler since it produces two pulses in each period of the input waveform.

Digitally Controlled Delays

Is a longer pulse needed? Do you need a pulse with a programmable length? Is a special synchronous timing relationship needed? If the answer to any of these questions is yes, then use of clocked digital delay generation methods is a useful approach.

Figure 13 shows a combination synchronizer and delay generation circuit which uses a shift register. The input waveform falling edge can have any timing relationship with respect to the clock signal to the shift register. In the illustration, its change is shown occurring approximately in the middle of one phase of the clock cycle. Whenever it changes, the next active edge of the clock (marked by an upward arrow) will read the input data into the first stage of the shift register. Then seven clock periods later, the output stage of the shift register will change, since the 74164 used in this example has a total of eight stages. By using the NAND gate shown along with the inverter, the time during which the QH and QA outputs of the shift register disagree is detected to form the
pulsed output waveform shown in the timing diagram. Note that, assuming a 1 MHz clock, the width of the pulse generated by this circuit will be exactly 7 µs. The relative timing of the input change and the first clocked transition of the shift register determine the exact starting time of the pulse. By adding other NAND gates tied to different shift register outputs, it is possible to produce several different but synchronized pulses for the same input edge. Also, since the change information is passed from stage to stage by the clock, the output of any stage will have a change edge which is synchronized to the clock. The example of figure 13 uses a 74164 shift register; the same principle can be used with shorter or longer shift registers. Note also that to obtain a complete 7 µs pulse, the input must remain low for at least 8 µs (worst case relative timing).

How about a oneshot with a programmable pulse width? Figure 13 shows how the combination of a presettable counter with a latch gives a programmable oneshot. It operates this way: assume that no negative going input pulses have reached the circuit lately. The normal operation of the counter is to continuously count through 16 states, giving a borrow output (called the “end pulse” in the diagrams) whenever state 0 is reached. Thus after power is turned on, within 16 clock cycles the RS latch will have been reset such that the output line of the circuit is low.

Now suppose an input pulse of arbitrary duration reaches the circuit. This pulse forces the digital pattern on the four input lines (noted C3 to C0 corresponding to their binary weights) to be loaded into the counter. During the load pulse, which need not be synchronous with the clock, the counter is inhibited from counting and the RS latch is set so that the output is high. As soon as the load pulse ends, the counter can again count down, from the loaded state of 3 in the example. Eventually the counter reaches zero having exhausted the programmed count. This causes the borrow pulse to be emitted, resetting the latch again, thus ending the generated pulse. The net length of the pulse generated is equal to the length of the input pulse plus the delay between the end of the input pulse and the end of state 3, plus 2.5 clock periods. If the input pulse is restricted to a short width

Figure 12: Making use of the finite (typically about 10 ns) gate delays of logic circuits, it is possible to make edge detectors without any analog components such as resistors or capacitors; (a) is a positive edge detector, (b) is a negative edge detector, and (c) is a frequency doubler, which detects both edges of a repetitive logic waveform.
Figure 13: Use of digital circuits with clocked transitions enables delays, edge detection and other functions to be done with outputs synchronized to the clock. For example, this 8 bit shift register is used to obtain a pulse width of exactly seven clock periods, synchronized to the clock. If the input pulse is longer than the seven clock periods plus one clock period for relative timing slop, this circuit produces a digital negative edge trigger.

Figure 14: A programmable delay generator. This circuit generates a delay which is set by the inputs of the counter and the width of the trigger pulse at the input. The end of the pulse is synchronized with the clock, but the start of the pulse is synchronized to the input. Such as might be generated by the circuit of figure 12a, then the programmable delay is determined by the count entered but with an uncertainty of one clock period due to the possible variations in timing of the input pulse relative to the clock. This same circuit can be extended to arbitrary pulse widths by cascading the 4 bit counters. With a 1 MHz clock, for example, four 74193s could be used to programmably time periods of up to 65,535.5 µs.

Hopefully your imagination has been jogged a little by the discussion of these edge related phenomena. A number of circuits which treat edge related phenomena were made by using the characteristics of some integrated circuits and a little imagination. These particular techniques may not be immediately useful; but when you need one of the functions described, they will come in handy. In your spare time, remember to study the various integrated circuits, not just the cookbook applications, but any imaginative extensions you can dream up.
ANY NUMBER OF FILES MAY BE OPEN (IN USE) AT ONE TIME
THE NUMBER OF FILES AND SIZE OF FILES IS LIMITED ONLY BY THE SIZE OF THE DISC
MERGING FILES REQUIRES NO EXTRA DISC SPACE
NO WAITING FOR THE DISC TO RE-PACK
LONGER DISC LIFE — MORE EVEN DISC WEAR

Our Basic Floppy Disc System (BFD-68) must, in all modesty be called superb. It comes completely assembled with a disc controller that is plug compatible with the SWTPC 6800. In fact all our products use the 6800 standard SS-50 (Smoke Signal 50) bus used by SWTPC. The cabinet and power supply are capable of handling up to 3 Shugart Mini-Floppy Drives. One drive is included in the price of the BFD-68 and others may be added easily at any time. Or you may save money by ordering the dual-drive BFD-68-2 or triple drive BFD-68-3 (picted). Price: BFD-68 $795, BFD-68-2 $1169, BFD-68-3 $1539, SA-400 Drive $390.

The BFD-68 includes our Disc Operating System Software. Our software provides for a soft-sectored disc format consisting of 128 bytes per sector, 18 sectors per track and 35 tracks per disc. The software provides direct commands to name and rename files, transfer memory to disc and disc to memory and to automatically jump to the starting location of any program loaded from disc to memory. The direct command names are: RUN, GET, GETHEX, CLOSE, SAVE, DELETE, APPEND, RE-NAME, COPY, LIST, FIND, LINK and PRINT. In addition, the Disc File Management subroutines are available to create files under your program control.

A bootstrap PROM is included on the controller board to initiate the Disc Operating System which loads into a 4K memory board located at 7000 or optionally at D000. Thus, you can be up and running from a cold start in just a few seconds.

SUPER SOFTWARE
Free patches are provided for SWTPC BASIC version 2.0 and Co-Resident Editor/Assembler. These patches allow the SAVE and LOAD commands to work with the disc or the cassette at your option.

SUPER EDITOR: Smoke Signal Broadcasting now has its own editor. It is a content oriented editor with string search and block move capability. Changes may be made by referring either to line number or string content or a combination of references. Naturally, it is designed for file transfers to and from the BFD-68. Price: SE-1 $29 on diskette.

ALL OUR PRODUCTS EXCEPT THE PS-1 ARE COMPLETELY ASSEMBLED.

The Best of BYTE, Volume 1

The volume we have all been waiting for! The answer to those unavailable early issues of BYTE. Best of BYTE, edited by Carl Helmers Jr and David Ahl. This 384 page book is packed with a majority of material from the first 12 issues. Included are 146 pages devoted to “Hardware” and how-to articles ranging from TV displays to joysticks to cassette interfaces, along with a section devoted to kit building which describes seven major kits. “Software and Applications” is the other side of the coin: on-line debuggers to games to a complete small business accounting system is included in this 125 page section. A section on “Theory” examines the how and why behind the circuits and programs. “Opinion” closes the book with a look ahead, as to where this new hobby is heading. It is now available through BITS Inc for only $11.95 and 50 cents postage.

PAPERBYTES
Design and Implementation of a Tiny Assembler 6800 – Microprocessor Self Assembler

Originally described in the April and May 1977 BYTE, PAPERBYTES is now offering Jack Emmerichs’ Tiny Assembler 6800. This book contains the complete Tiny Assembler source listing plus object code in cross assembly format (space restrictions prevented printing of this material in BYTE). A bar code version of Tiny Assembler is included for convenience, as well as reprints of Jack’s two articles and additional user manual materials. Tiny Assembler will run on any machine with MIBUG and 4K of memory starting at address 0000, and is an excellent tool for the interactive development of functional blocks for a large structured program. Add it to your 6800 system and you’ll have a valuable programming aid which can free you from the drudgery of machine language. The best part is the price: only $7. Order yours today!

Getting Back to BASIC

If at first you don't succeed, try retooling your program! That was the order of the day at America's first large scale collegiate BASIC contest held at Taylor University, Upland IN, on April 23, 1977. Taylor hosted teams from almost 50 midwestern colleges during a four hour struggle to solve five problems using Taylor's DEC 11/40 timesharing system. Taylor's team came in first with DePauw University, Greencastle IN, a close second.

Additional competitions are planned for next spring throughout the country, all to be hosted by Taylor. Interested teams should contact Professor R Waldo Roth, Chairman of the Computer Science Department, Taylor University, Upland IN 46989.

Trenton Computer Festival

On the last weekend in April the Second Trenton Computer Festival was held at Trenton State College in Trenton NJ. The festival consisted of approximately 30 exhibitors, a large flea market, and a large number of technical talks which covered such varied subjects as robots, computer music, games and applications.

Several door prizes were given away; among these was a lifetime subscription to BYTE. The exuberant winner of this prize was Mel Richman of Philadelphia PA. Mel has homebrewed a 6502-based microprocessor on OSI boards. One of Mel's uses for his system is Morse Code transmission. The system is capable of sending Morse Code at four different speeds while displaying the characters being sent on a video screen.

An Intensive Short Course on Personal Computers and Microcomputer-Based Business Systems

The Evening Division and Department of Mathematics and Computer Science of St John's University, Jamaica NY, has announced a series of intensive short courses on low cost personal computing. Each course is designed to provide an understanding and a well rounded body of information on successful implementation and use of small computer systems. It reviews the state of the art in current microcomputer technology including both hardware and software design as well as numerous applications of personal computing in education, recreation, business, etc. No computer expertise is required. Any individual who has a common sense understanding of computers can actively benefit from the course. The course will meet every Tuesday from 6 to 8 PM, from September 27 through October 18, and it costs $20. For further information contact Dean Patrick Basilice, Evening Division, St John's University, Jamaica NY 11439.

Attention Computer Store Owners

WRC Smith Publishing Company will begin a new tabloid business paper to be known as Computer Retailing. A complete prototype was mailed to prospective subscribers in April 1977, with the first actual issue scheduled for July. The publication will reach retail stores selling microcomputers to individuals for personal use and for use in small business. Some 300 such stores exist today. This number is expected to rapidly escalate as miniaturization and cost reductions bring computers within the reach of the average person. Contact Walter Mitchell Jr, WRC Smith Publishing Company, 1760 Peachtree Rd NW, Atlanta GA 30357.

A New Toronto Store

A retail microcomputer store, Computer Mart, has opened at 1543 Bayview Av, Toronto, Ontario CANADA M1K 4K4. The store will feature computers for business and personal use. Systems will be available in assembled and kit form including spare parts and peripheral devices. The store will be stocked with tools and books, and demo systems will be up and running. Computer Mart will provide engineers and hobbyists the opportunity of putting their own systems together and will also offer inexpensive computing for small business.

$699 builds Equinox 100™

Equinox 100™ is the 8080 CPU/S-100 Bus computer kit that's years in front of Altair® and IMSAI in design, function and front-panel programming capability. Equinox 100™ is easier to build, easier to program, easier to expand in the future and completely debugged right now. After all, it's from Parasitic Engineering, the leading supplier of debugging kits for the Altair® 8800. Before you invest in any micro-processor kit, discover the new Equinox 100™! At $699, it's clearly The Frontrunner. Write for free specs to Parasitic Engineering, P.O. Box 6314, Albany, CA 94706.

Processing Logical Expressions

(Or, how an ingenious extension of the Bauer-Samelson Algorithm allows us to compile efficient code for expressions involving "and," "or," "not" and relations among operands.)

In a previous two part article, "Processing Algebraic Expressions," we presented the Bauer-Samelson algorithm and applied it to expressions involving the arithmetic operators and parentheses. Here we shall extend these ideas further and show how code can be generated in cases where relational operators ("greater than," "greater than or equal," and so on) and logical operators ("and," "or," "not" and so on) may be present.

Consider an IF statement (as in FORTRAN) such as:

IF (A-B .NE. C*D) GO TO 87

If we are compiling code for statements, the code we want to compile in this case, assuming we have a single register machine, would be:

1. Load A.
2. Subtract B.
3. Store in TEMP.
4. Load C.
5. Multiply by D.
6. Compare with TEMP.
7. On inequality, go to statement 87.

These last two steps are subject to a certain amount of variation depending on details of the computer involved. On machines with a condition code register (e.g., an 8080 or 6800), the steps will be as above. The comparison will set the condition code register, and the specific reference to the relation (.NE. in this case) that we are interested in is made only in step 7. On machines without a condition code register, but with a set of skip instructions, step 6 will be "skip the next instruction if the given register and TEMP are equal" and step 7 will be simply "jump to statement 87." If there are no skip instructions of this kind, then step 6 will be "subtract TEMP" and step 7 will be "if nonzero, jump to statement 87." In any case, we can represent these two steps by a single function, "if unequal to TEMP, go to statement 87." This function will always require two steps, as long as there can only be one address in each instruction, because we have to make reference to two addresses here, namely the address of TEMP and the address of statement 87.

Let us now consider the expression:

A-B .NE. C*D

as a logical expression. This means that it may include operators (such as .NE.) in addition to the standard arithmetic operators. It also means that it has the value "true" (if A-B is unequal to C*D) or "false" (otherwise). We would like to process this logical expression according to the Bauer-Samelson algorithm in order to generate code like that shown above. In the remainder of this article we will show how to do this.

What Precedence for Relational Operators?

Let us first consider precedence of operators. Recall that in typical algebraic expression processing, multiplication is defined as having a higher precedence than addition.
This means that in an expression such as:

\[ W \times X + Y \times Z \]

we perform the multiplications first \((W \times X\) and \(Y \times Z)\) before adding together the results. Because logical operations are defined as comparisons of values (e.g., the results of arithmetic operations) we must evaluate our arithmetic expressions first. Thus, it should be clear that any arithmetic operator \(+, -, \times, /\) has higher precedence than any relational operator \(.EQ., .NE., \text{and so on}\). Thus in our expression:

\[ A - B .NE. C \times D \]

we have to perform the subtraction \((A - B)\) and the multiplication \((C \times D)\) before comparing the results to see whether they are unequal.

There will never be any need to compare one relational operator with another with respect to precedence, and we can assume that all six relational operators \(.EQ., .NE., .GT., .GE., .LT. \text{and .LE.}\) have the same precedence. This allows us to start the process of generating code for our example expression. We recall that, in the Bauer-Samelson algorithm, we have two stacks, one for operands and one for operators (see figure 1). The process in this case proceeds as follows:

1. The A goes on the operand stack.
2. The minus sign goes on the operator stack.
3. The B goes on the operand stack.
4. Now we come to the \(.NE.\) which we cannot put on the operator stack because, as we mentioned before, the minus sign has higher precedence. Therefore, we must take the minus sign off the operator stack; take its operands, A and B, off the operand stack; perform the operation, which in this case means generating the code for "load A" and "subtract B"; and put the result back on the operand stack. In this case the result is simply the name of the register where the answer \((A - B)\) was left. Let us call this register AC.
5. Now we can put \(.NE.\) on the operator stack, since the operand stack is empty.
6. The C goes on the operand stack.
7. The \(*\) goes on the operator stack, since it has higher precedence than the \(.NE.\) operator.
8. The D goes on the operand stack.
9. Now we come to the end of the expression. First we must treat the \(*\) operator (at the top of the operator stack). We take it off the operator stack; take its two operands (C and D) off the operand stack; and perform the operation, which in this case means generating the code for "load C" and "multiply by D." In doing this, we will note (if we have a single register computer) that the register AC will be overwritten. Therefore, we will have to generate "store in TEMP" and put TEMP on the operand stack where AC was. Finally, we put the result back on the operand stack. This time the result is the register where \(C \times D\) is kept. Let us assume that this is again AC (although the method would work just as easily if it were some other register); then this is put back on the operand stack.
10. Finally, we come to the \(.NE.\) operator. Its two operands are AC and TEMP. Since we are only processing the expression \(A - B .NE. C \times D\), and not the whole statement in which it is contained, we don't know where to jump yet (in this case it is to statement number 87). Let us, therefore, generate code which will jump to a label called TRUE if the condition is satisfied, and to a label called FALSE if it is not. Later on,
Figure 2a: The basic block
diagram that will be used
to represent the different
logical operators; "alpha"
and "beta" represent
generated code whereby
either a true or false state
is possible, depending on
whether or not the con­
don in question is satis­
fied. Arrows in this dia­
agram indicate branch es
which might be taken.

Figure 2b: Generating
code for "alpha or beta."
If the first state is not tru e
then the second state must
be checked:

<table>
<thead>
<tr>
<th>Alpha</th>
<th>Beta</th>
<th>Result</th>
<th>Branch</th>
</tr>
</thead>
<tbody>
<tr>
<td>False</td>
<td>True</td>
<td>TRUE</td>
<td>TRUE</td>
</tr>
<tr>
<td>False</td>
<td>False</td>
<td>FALSE</td>
<td>FALSE</td>
</tr>
<tr>
<td>True</td>
<td>True</td>
<td>TRUE</td>
<td>TRUE</td>
</tr>
<tr>
<td>True</td>
<td>False</td>
<td>TRUE</td>
<td>TRUE</td>
</tr>
</tbody>
</table>

*State need not be checked.

These can be patched up: TRUE can be
changed to statement number 87, and
FALSE can be changed to be the next
statement after the IF statement. So, in this
case, depending on the computer we are
doing this on, we would generate:

"compare with TEMP; if unequal, go
to TRUE; go to FALSE;"
or "if equal to TEMP, skip the next
instruction; go to TRUE; go to
FALSE;"
or "subtract TEMP; if nonzero, go to
TRUE; go to FALSE."

We notice immediately that, no matter
which of these options we take, the last
instruction we generate is "go to FALSE;"
and this is unnecessary, because FALSE
corresponds to the next instruction follow­
ing the IF statement. In this case the final
"go to FALSE"can simply be thrown away;
however, in a more complex case we might
actually need the "go to FALSE." So for the
moment, let's assume that it is always
generated.

Logical Operators
We now pass to a consideration of the
logical operators "and," "or," and so on.
Just as before, we start by considering
questions of precedence. Suppose we have a
statement such as:

IF (A-B .GT. C*D .OR. E/F .LT. G+H) GO TO 87

It is now clear that we have three levels of
precedence. That is:

1. First we perform the arithmetic opera­
tions: A-B, C*D, E/F, and G+H.
2. Then we look at the relational opera­
tors (.GT. and .LT. in this case) and form
the expressions A-B .GT. C*D and E/F .LT.
G+H.
3. Finally, we look at the logical operator (.OR.).

From this it should be clear that, just as
arithmetic operators have higher precedence
than relational ones, relational operators
have higher precedence than logical ones.
Suppose that we have more than one logical
operator. For example, suppose we have a
statement:

IF (A.LT.B .OR. C.EQ.D .AND. E.GT.F) GO TO 84

Do we consider the .AND. first? Or do we
look at the operators from left to right,
which would mean considering the .OR.
first? The answer to this question is not a
natural result of the way we define logical
operations in the same way that it is for the
arithmetic operations such as + or *. In
algebra and arithmetic, when we look at
W*X+Y*Z, we know that by the ordinary
rules of algebra the multiplications are
performed first. But, there are no "ordinary
rules of algebra" for logical expressions. The
only clue we have is that "or" and "and"
are often called logical sum and logical
product, respectively, and are sometimes even
denoted by + and * in mathematical logic.
This would suggest that the "and," or the
logical product, be performed first; in fact,
this is the rule that is generally adopted. The
logical operator "not," when it is allowed,
has higher precedence than "and" and "or;" in
mathematical logic, while "implies," when it is allowed,
generally has lower precedence.

In order to see how to generate object
code when "or" is present, let us look at fig­
ures 2a and b. In accordance with what we
have just discussed, the code we are trying
to generate for an expression of the form
"alpha or beta" will have various jumps to
TRUE and FALSE. We do not care how
many jumps there are, and in a complex case
there may be quite a few of these. We
assume, however, that we have already
generated code for "alpha" and also code for
"beta," and that at this point we only wish
to take care of the "or" operator. The code
for "alpha" comes first, followed by the
code for "beta"; and the code for "alpha"
will have its own jumps to TRUE and FALSE, as will the code for “beta.” This means that there are four possibilities:

1. A jump to TRUE from “alpha.” If “alpha” is true, then clearly “alpha or beta” is true. So this can remain a jump to TRUE.
2. A jump to FALSE from “alpha.” If “alpha” is false, we still have to check “beta.” So this is changed into a jump to the start of the coding for “beta.”
3. A jump to TRUE from “beta.” If “beta” is true, then again “alpha or beta” is true, so this can remain a jump to TRUE.
4. A jump to FALSE from “beta.” We don’t check “beta” unless “alpha” is false, and we now know that both “alpha” and “beta” are false, so that “alpha or beta” is also false. So this can remain a jump to FALSE.

From this we can see that the only jumps we have to change (i.e., patch) are jumps to FALSE from “alpha.” Each one of these must be changed from a jump to FALSE to a jump to the start of the coding for “beta” (see figure 2b). We have shown only one jump in the figure; but, if there is more than one such jump, all of them must be changed.

Now let us look at “and” (see figure 3). The setup is exactly the same as before; we still have four possibilities; but the rules are a bit different. Taking the four possibilities one by one, we consider:

1. A jump to TRUE from “alpha.” If “alpha” is true, we still have to check “beta.” So this is changed into a jump to the start of the coding for “beta.”
2. A jump to FALSE from “alpha.” If “alpha” is false, then “alpha and beta” is false. So this can remain a jump to FALSE.
3. A jump to TRUE from “beta.” By this time we know that “alpha” is true, and if “beta” is also true, then “alpha and beta” is true. So this can remain a jump to TRUE.
4. A jump to FALSE from “beta.” If “beta” is false, then again “alpha and beta” is false, so this remains a jump to FALSE.

Thus, it is only the jumps to TRUE from “alpha” (rather than the jumps to FALSE) which have to be changed to go to the start of the coding for “beta,” as in figure 3.

In all cases of this kind, the coding for “beta” will immediately follow the coding for “alpha.” If A is the start of “alpha” and B is the start of “beta,” we only need to look through from A to B-1 in order to find jumps to FALSE (or, respectively, jumps to TRUE) that have to be changed to jumps to B. The start of each section of generated code for an expression is what goes on the operand stack to represent that expression.

A variable CREL (current relation) is kept at all times to indicate the start of the section of code generated for the current relation (e.g., A.LT.B). When we finish generating code for a relation, CREL goes on the operand stack, and the current position in the generated code, plus one, becomes the new value of CREL. At the beginning, CREL is initialized to indicate the start of all generated code.

Let us now look at “not alpha” (see figure 4). This seems easy: All the jumps to TRUE become jumps to FALSE, and vice versa. There is one exception, however. For any logical expression or subexpression, the generated code will end with something of the form “if C then go to TRUE; go to FALSE,” which we shall abbreviate as “if C then DECIDE.” This is clearly true of the code for relations, and it remains true when blocks “alpha” and “beta” are combined by means of “and” or “or,” because “beta” will not be patched up. When we use “not,” however, it would seem that “if C then go to
TRUE; go to FALSE" would be changed to read "if C then go to FALSE; go to TRUE." Instead, we will change it to read "if (not C) then go to TRUE; go to FALSE" (or "if (not C) then DECIDE"), so that the above mentioned property of generated code will be preserved. All other jumps to TRUE are changed to FALSE, and vice versa, when we produce "not alpha" from "alpha."

This property of generated code, namely, the fact that it always ends with "if C, then DECIDE," may be used to "optimize out" the last generated instruction for any subexpression. In generating code for "alpha or beta," the last "go to FALSE" in the subexpression of "alpha" must be changed to "go to the start of beta;" but this is the very next instruction, so that "go to FALSE" may simply be thrown away. Thus "if C then DECIDE." is changed, in this case, to "if C then go to TRUE." (see figure 5). In generating code for "alpha and beta," we can think of "if C then DECIDE" in the subexpression of "alpha" as if it were "if (not C) then DECIDE; go to TRUE." This time "go to TRUE" must be patched so that it goes to the very next instruction, and it may likewise be thrown away. Therefore, "if C then DECIDE" may be changed in this case to "if (not C) then go to FALSE."

We illustrate all these notions by generating code for:

\[
\text{IF} \ (\text{A.LT.B} \ .OR. \ C+.D.EQ.E .AND. \ .NOT. \ F.GT.G*H) \ \text{GO TO 87}
\]

The generated code is given in figure 6; it is generated as follows:

1. CREL is initialized to indicate step 1.
2. A goes on the operand stack.
3. .LT. goes on the operator stack.
4. B goes on the operand stack.
5. .OR. has lower precedence than .LT., so we cannot put .OR. on the operand stack yet. We remove .LT. from the operand stack, and we remove its two operands, A and B, from the operand stack. We generate code for A.LT.B, namely "Load A; compare with B; if less than B, DECIDE," and put the result back on the operand stack. This result is the current value of CREL, namely "step 1."
6. Now we can put .OR. on the operand stack, since that stack is empty.
7. C goes on the operand stack.
8. + goes on the operator stack, since it has higher precedence than the .OR. operator.
10. We cannot put .EQ. on the operator stack, because it has lower precedence than +. We take + off the operator stack, and its two operands, C and D, off the operand stack. We generate code for C+D, namely "load C; add D," and put the result, AC, back on the operand stack.
11. Now we can put .EQ. on the operand stack because it has higher precedence than .OR., which is at the top of that stack.
12. E goes on the operand stack.
13. We cannot put .AND. on the operand stack, because .EQ. has higher precedence. So we take .EQ. off the operand stack, and its arguments, namely AC and E, off the operand stack. The code we generate to compare AC with E is simply "compare with E; if equal to E, DECIDE." CREL, namely "step 4," goes on the operand stack, and since we have generated four steps since then, the next step would be number 8; so "step 8" becomes the new value of CREL.
14. Now we can put .AND. on the operand stack, because its precedence is higher than that of the .OR. operator.
15. .NOT. goes on the operand stack, since .AND. has lower precedence.
16. F goes on the operand stack.
17. .GT. goes on the operand stack, since .NOT. has lower precedence.
18. G goes on the operand stack.
19. * goes on the operand stack, since .GT. has lower precedence. The operator

Figure 5: Optimized code for "alpha or beta." The subexpression "if C then go to TRUE; go to FALSE" can be simplified to "if C then DECIDE"; decide whether the code satisfies the situation in question or not. But, if the first state of the "or" operator isn't satisfied, then "go to FALSE" in the subexpression must be changed to "go to beta" which is the next step in the procedure. In the optimized form, the "go to FALSE" has been deleted and the subexpression has been simplified to "if C then go to TRUE."

Figure 6: The steps involved in evaluating the FORTRAN expression:

\[
\text{IF} \ (\text{A.LT.B} \ .OR. \ C+.D.EQ.E .AND. \ .NOT. \ F.GT.G*H) \ \text{GO TO 87}
\]
as compiled using the Bauer-Samelson algorithm.
stack now contains .OR. (at the bottom); .AND., .NOT., .GT., and *. 

20. H goes on the operand stack, which now contains “step 1,” “step 4,” F, G and H. We are now at the end of the expression.

21. First we treat the *. We take it off the operator stack; we take its two operands, G and H, off the operand stack; we generate code for G * H, namely “load G; multiply by H”; and we put the result, namely AC, back on the operand stack.

22. Now we treat the .GT. operator. Its two operands are F and AC, not AC and F. The result is the same as if .LT. were the operator and AC and F were the operands. (If F is greater than AC, then AC is less than F, not less than or equal.) We generate “compare with F; if less than F, DECIDE” and put CREL, namely “step 8,” on the operand stack. As before, we have generated four new steps, so that “step 12” becomes the new value of CREL. Note that we have now generated all the steps of the compiled code shown in figure 6. The operand stack now contains “step 1,” “step 4,” and “step 8.”

23. The next operator to be treated is the .NOT. operator. Its operand is “step 8,” and “step 12” is the current value of CREL. This means that steps 8 through 11 have to be checked. In these steps, there are no jumps to TRUE or to FALSE (if there were, then TRUE would be changed to FALSE in these steps, and vice versa), but there is a reference to DECIDE in step 11. This step therefore becomes “if greater than or equal to F, DECIDE” and “step 8” remains on the operand stack.

24. Now we treat the .AND. operator. Its two operands are “step 4” (alpha) and “step 8” (beta), which means that we have to check from step 4 to step 7. Again there are no jumps to TRUE or FALSE. (A jump to TRUE would have to be changed, here, to a jump to step 8.) But there is a reference to DECIDE in step 7, which is changed to “if unequal to E, go to FALSE,” and “step 4” goes back on the operand stack, since this is the beginning of the code for “alpha and beta.”

25. The last operator to be treated is the .OR. operator. Its two operands are “step 1” (alpha) and “step 4” (beta), which means that we have to check from step 1 through step 3. If there were any jumps to FALSE in this range, they would have to be changed to “jump to step 4” (see figure 5). But, just as before, there are none of these; there is only the reference to DECIDE in step 3, and, again by figure 4, this is changed to “it less than B, go to TRUE.”

26. Finally, we read the “GO TO 87,” so that TRUE becomes statement number 87.

There are now two jumps to TRUE (in steps 3 and 11), and these must be changed to refer to statement number 87; there is one jump to FALSE (in step 7), and this must be changed to refer to the next step after the generated code, namely step 12. This completes the process of generating code for this statement.

As a final note, we may consider the “implies” operator of symbolic logic. The construction “alpha implies beta” is equivalent to “(not alpha) or beta.” Thus “implies” may be put on the operand stack, just like any of our other operators. It is treated in the same way as “or” (see figures 2 and 5), except that FALSE and TRUE are interchangeable in “alpha” just beforehand (see figure 4).
Interface any Selectric I/O Writer to S-100 computers with a TYPEAWAY Selectric I/O Writer Interface. TYPEAWAY is compatible with any model 731 or 735 I/O Writer, including versions with correspondence or BCD coding, 24 or 48 volt solonoids, and common anode or common cathode diodes. TYPEAWAY is a complete package of everything needed to interface any model 731 or 735 I/O writer to an S-100 computer, including:

- S-100 compatible PC board with solonoid drivers, input ports, and PROM memory.
- Complete cables and connectors
- Power supply for 24 or 48 volt systems.

Optional word processing software is also available.

Add professional, economical hard copy to your S-100 system with an IBM Selectric I/O Writer and a TYPEAWAY interface.

LAMENTS

I lament your loss of linkage on the 8008 update in April 1977 BYTE. The laborious data dependent search was eventually successful. Thus forced to acknowledge the anecdotal nature of this issue caused my correlator to flash Readers' Digest in red letters. Back to basics and I'll continue to sing your praise.

Frank Evans
Corvallis OR 97330

BEWARE OF PUNS

William Stock, in his letter ("What's New?", April 1977 BYTE), mentioned the sloppy disk, which was first introduced by our company in late 1976, as though he had never heard of it, not to mention our company. The unfortunate fact that many others are in the same position prompted this letter (which I am trying to key in slowly, as I know many "compunkils" are used to 110 baud and therefore cannot read very fast).

M-Newmonics is currently based in Lawrence KS. The company made its start by marketing a small microprocessor, introduced soon after the popular 3000 series came out. By coincidence, our model is the MN1500, a 1 bit (not bit slice, but truly 1 bit) machine with two powerful instructions: 0 = NOP; 1 = HALT/CRASH. Although the actual fabrication is proprietary, I can say that it is a combination of the p-type and n-type bipolar (PPP, NNN) TTL components noted in William's letter. The device is capable of such extremely fast operation that we have developed a special dedicated clock for it, which allows four states per cycle. I won't divulge its secret, but it uses an in-house NLL (noise locked loop). We, too, have a WOM (write only memory), in 19 and 23 pin DIP formats. These are nicely complemented by our 64 K*1 static RMNs (read never memories), though some enterprising soul will probably soon discover that the same thing can be done with a 7404. Next, we have a RAM which covers several speed and power ranges. As we are a small company, we couldn't afford to support three chips differing only in speed, so we put the high, medium and low speed devices all in one package, and control them with an automatic gear shift, an industry first! The latest cheap,
I might add my objection to the Kansas City interface using the upper frequency as the resting point. As the cassette starts up on unmodulated 2400 Hz it must pass through the lower frequency to get up speed. I would have thought the lower frequency would be used to the interface would not put out a burst of garbage data each time it starts up. My software must ignore any data for about a second as the cassette gets up speed.

The phase inversion fix, if needed, is done with patch cords, not inside recorders!

ANOTHER COMMENT ON DEFINING THE BYTE

Not only does the quotation from Donald E Knuth published in the Letters column of April 1977 BYTE not address the question of the origin of the word "byte". It is not even intended to be a general definition. Professor Knuth was describing the basic unit of information on a particular computer, the MIX 1009. The passage quoted is taken from Knuth's The Art of Computer Programming, Volume 1. There he describes the mythical MIX computer, the machine language of which is used to illustrate the algorithms in the book:

MIX has a peculiar property in that it is both binary and decimal at the same time. The programmer doesn't actually know whether he is programming a machine with base 2 or base 10 arithmetic. This is done so that algorithms written in MIX can be used on either type of machine with little change; and so that MIX can be easily simulated on either type of machine.

An algorithm in MIX should work properly regardless of how big a byte is.

For those who may be looking for a general definition of "byte" I propose the following: A byte is the smallest directly addressable area of a computer's storage; if the smallest such area is the same size as the accumulator (or a general register) then it is more properly called a word.

Thus, an IBM 360 has an 8 bit byte size (smallest addressable storage location) and a 32 bit word (size of a general register). Operating under the above definition, each storage location of an 8 bit microcomputer would more properly be called a word than a byte.

Excuse me, chip, which we developed locally was our MK*N RMM (read maybe memory). Also, my (barely) capable VP, Mr John C Nunley, has recently closed a deal making us the sole supplier of a new thin-film technology memory device. At one point, he was so worried about the deal that we have dubbed the ultra thin film (10*-8 cm) chip the ANGST-ROM.

We are currently trying to get our corner on the market with the product. William mentioned, something we feel is a breakthrough for the microcomputer industry: the sloppy diskette. In passing, our prototype was made from a square piece of coated mylar housed in a circular sheath, which when placed in our drive sat motionless. Rather than the motor turning the diskette and a small flywheel, the entire drive began rotating with a negative frequency (another application of our dovetailed clock).

Also, we have in the works a device which was suggested to us by one of our company insurgents, Mr Craig Paul. The new device will be a yet smaller AC30 that Mr Bell mentioned. The face I've built which is on a 10 card in-

Mr John C Nunley, has bought from SWTPC. As he tells the problem I had, if I think of our diskette output since it is frequency dependent, not phase dependent.

Having read your reply to the letter by Warren Bell in the April 1977 issue I feel the problem was not clarified so that computer people out there don't start tearing into their cassette recorders needlessly. As I interpret Mr Bell's problem, it is unrelated to the phase of the tape recorder output, and reversing the output jack leads as you suggest won't help. The cassette recorder interface I've built which is on a 10 card inside my SWTPC 6800 is similar to the AC30 that Mr Bell mentioned. The incompatibility he experienced sounds like the problem I had with a prototype of my board. The SWTPC AC30 has 2400 Hz as the frequency that is recorded when there is no data coming out of the serial I0. I suspect that his interface rests at the lower frequency of 1200 Hz. My first board had the same problem. I could record and play my own tapes but it took several hours to find out why I could not read the BASIC I bought from SWTPC. As Mr Bell observed, you must invert the data before it is modulated to invert the frequency. My interface doesn't care if I invert the cassette output since it is frequency dependent, not phase dependent.

Also, we have in the works a device which was suggested to us by one of our company insurgents, Mr Craig Paul. The new device will be a yet smaller AC30 that Mr Bell mentioned. The face I've built which is on a 10 card in-

A New Computer Package from Polymorphic Systems

Santa Barbara CA 93111. The unit is a 16 K system featuring a high speed video display and alphanumeric keyboard. Cassette tapes are used for permanent program storage; a verify feature is included to insure correct loading of programs. A BASIC package is included which features formatting options and string manipulation. A program library is available to POLY 88 users. The price for the system as shown is $2250, assembled.

Make the HAL Connection

- 8080A MPU
- 1K Monitor/Debug Software in 2708 EPROM or 2-3624 PROMs
- On board space for: 4K ROM (2708), 2K RAM (2102A-4)
- TTY Current Loop or RS-232C serial I/O (8251)
- 24 lines of Parallel I/O (8255)
- Hardware “front panel” on board
- Optional Accessories: CRT Terminal Board, BASIC in EPROM, Audio Cassette Interface.

and solve your lab or OEM computer problems

1. Connect to the 24 lines of Parallel I/O and ASCII or Baudot Serial I/O.
2. Connect to processor bus to add memory expansion board/EPROM programmer, I/O devices, or our unique CRT Terminal Board.
3. Connect to our power supply or use your own.

Lab users and OEM’s alike will find solutions to their computer problems with the MCEM-8080 computer. All-essential computer system elements are incorporated in this fully assembled, tested single-board computer. Some unexpected features of the HAL MCEM-8080 are: hardware “front panel” which allows setting a breakpoint and manual control of the computer; 1K ROM Monitor/Debug Software (with user callable, Intel® compatible I/O routines) which greatly simplifies program development; Parallel and Serial I/O on the board; and very reasonable prices.

Call or write for further information on the HAL Connection.

You’ll be glad you did!

Parker Rolls into Microprocessor Games Market

Board game fans take note! Parker Brothers has announced a microprocessor-based board game called CODE NAME: SECTOR, a submarine pursuit game in which players compete with one another and with the computer as it moves an invisible submarine through 4800 possible positions under the sea. Parker Brothers expects that the price of this new product will probably be in the $30 to $45 range at department stores and other retail outlets this summer and fall. Significantly, there is no video screen involved with the game: a calculator-like module is used for both input and output, and apparently the entire game algorithm is built into read only memory parts with occasional inputs from players, through switches. For new players of the game, a unique “teach” mode is designed to give instruction regarding rules and operation. For more information, write Parker Brothers, Salem MA 01970.

A New Servocontrolled Cassette Transport

A new, patented, servodriven digital cassette recorder has been announced by Memodyne Corporation, 385 Elliot St, Newton Upper Falls MA 02164. The Model 764 consists of a tape transport attached to a card cage which contains the servocontrol electronics plus a read-write electronics card. Data can be recorded at up to 32 K bytes per second, and the transport search speed (forward or reverse) is 100 inches (254 cm) per second. (Thus a 300 foot
A Successor to the Teletype Model 33

Teletype Corporation, 5555 Touhy Av, Skokie IL 60076, has announced a new under $1000 Model 43 matrix teleprinter offering 30 character per second throughput, upper or lower case printing, and 132 column format capability on 11 inch wide fanfold paper. It features a 9 wire impact printhead mechanism. MOS technology is used throughout. The desk top terminal, which weighs approximately 30 pounds, is designed to be portable. Quiet operation makes it suitable for a variety of office environments. The 43 teleprinter is designed for interactive timesharing, data inquiry and response applications, and is interchangeable with the Teletype Model 33 terminal. It is available with an EIA or 20 mA current loop interface and is designed for use on the switched net-

Digital Equipment Corporation has announced a new 1200 bps keyboard terminal called the LS120 DECwriter III, designed for interactive communication with a computer or as a unit in a data, or message, communication network. Features of the DECwriter III include an 180 cps print rate, a 1 K character buffer EIA interface, an automatic "paper out" switch, last character visibility and self-test capability. The new terminal is compatible with full duplex and half duplex protocols. Optional features include an APL alternate character set, a compressed font and a 300 bps acoustic coupler.

Price is $2270 in quantities of 100, with deliveries to begin this summer. Contact Digital Equipment Corporation, Digital Components Division, 1 Iron Way, Marlborough MA 01752.

An APL-Compatible DECwriter
work and point-to-point private line facilities. The terminal includes operator controls for 10 or 30 characters per second, half or full duplex operation, parity checking and printer test. The terminal is comprised of five major pluggable components and features built-in self-diagnostics for troubleshooting. For further information call Tom Race (312) 982-3134.

VECTOR-PAK, a new line of enclosures from Vector Electronic Company Inc, 12460 Gladstone Av, Sylmar CA 91342, is designed to house laboratory equipment, instruments, development systems and computers. Internal structures such as optional card guides, brackets and straps permit installation of cards, modules and electronic components. The units are available in 17 sizes and ten colors. They are designed for the experimenter with a custom personal computer system, who wants a professional looking enclosure. Prices range from $65 to $95 without internal structures. Prices with the internal structures range from $125 to $185. Custom unit prices on request. Delivery is stock to four weeks.

Circular Reasoning

HEXADAISY™ is a new device which calculates the offset for relative addressing as used by the 6800, Z-80, 6502, SC/MP and F-8 microprocessors, adds and subtracts hexadecimal numbers, calculates 2's complements and converts decimal to hexadecimal numbers and back. All results within the range of 0 to 255 (decimal) can be read directly, while larger numbers are calculated two hexadecimal digits at a time. The device is made from plastic in the form of a circular "slide rule" with waterproof printing. Available for $3.95 postpaid, with instructions, from E & L Pfeiffer Computer Products, Box 2624, Sepulveda CA 91343, or from local computer stores.

MULTIPLE DATA RATE INTERFACING FOR YOUR CASSETTE AND RS-232 TERMINAL

the CI-812
The Only S-100 Interface
You May Ever Need

On one card, you get dependable "KC-standard"/biphase encoded cassette interfacing at 30, 60, 120, or 240 bytes per second, and full-duplex RS-232 data exchange at 300- to 9600-baud. Kit, including instruction manual, only $89.95*.

*Assembled and tested, $119.95. Add 5% for shipping. Texas residents add 5% sales tax. BAC/MC available.

PerCom "peripherals for personal computing"
Building a better computer wasn’t easy. But we did it.

Introducing the MSI 6800 Computer System

When we set out to build the new MSI 6800 Computer System, we knew we had our work cut out for us. It had to be at least as good as the now famous MSI FD-8 Floppy Disk Memory System which is also pictured below. So, the first thing we did was analyze all the problems and drawbacks we had encountered with other 6800 systems, and then put our engineers to work on solutions. The objective: Build a better computer.

We started with power supply. We had big ideas, so we used a hefty 18 amp power supply. You can run full memory and several peripherals without the worry of running out of juice. We also put it in the front of the cabinet so it’s out of the way.

The next step was the CPU Board. A separate baud rate generator with strappable clock outputs allows any combination of baud rates up to 9600. A separate strappable system clock is available and allows CPU speeds of up to 2 MHz. The new MSI monitor is MIKBUG software compatible, so you will never have a problem with programs. Additional PROM sockets are available for your own special routines and to expand the monitor. The CPU also contains a single step capability for debugging software.

When we got to the Mother Board, we really made progress. It has 14 slots to give you plenty of room to expand your system to full memory capability, and is compatible with SS-50 bus architecture. Heavy duty bus lines are low impedance, low noise, and provide trouble-free operation.

With all this power and potential, the interface had to be something special. So instead of an interface address in the middle of memory, we put it at the top . . . which gives you a full 56K of continuous memory. Interfaces are strappable so they may be placed at any address. An interface adapter board is compatible with all existing SS-50 circuit boards and interface cards. All MSI interface cards communicate with the rear panel via a short ribbon cable which terminates with a DB-25 connector. All baud rate selection and other strappable options are brought to the connector so they may be automatically selected by whatever plug is inserted into the appropriate interface connector. Straps may also be installed on the circuit board.

To complete the system, we used an MSI 8K Memory Board which employs low power 2102 RAM memory chips and is configured to allow battery back-up power capability. A DIP switch unit allows quick selection of a starting address of the board at any 8K increment of memory.

If you’re one of those people who understands the technical stuff, by now you’ll agree the MSI 6800 is a better computer. If you’re one who does not understand it yet, you’ll be more interested in what the system can do . . . play games, conduct research and educational projects, control lab instruments, business applications, or just about anything else you might dream up that a microcomputer can do. The point is . . . the MSI 6800 will do it better.

The MSI 6800 Computer System is available in either kit form or wired and tested. Either way, you get a cabinet, power supply, CPU board, Mother board, Interface board, Memory board, documentation, instructions, schematics, and a programming manual. Everything you need.

There is more to say about the MSI 6800 than space permits. We suggest you send for more information which includes our free catalog of microcomputer products.

Building a better computer was not easy. Becoming the number one seller will be.

See the MSI 6800 Computer System at Personal Computing ’77 - Atlantic City.

Simple Algorithms for Calculating Elementary Functions

Several years ago, shortly after obtaining an HP-35 calculator, I became interested in the algorithm utilized by Hewlett-Packard to calculate the sine and cosine functions. Upon looking through the literature I found that the simple elegant algorithm employed is based upon the CORDIC technique developed by Volder. The basic algorithm was first described by Henry Briggs in 1624 in *Arithmetica Logarithmica*. This algorithm, which does not seem to be widely known, should be easily implemented in a microcomputer. Further, a simple variation of the algorithm, described by Walther in "A Unified Algorithm for Elementary Functions" (see bibliography), allows the calculation of hyperbolic functions and, more interestingly, the exponential function. Inverting the procedure allows the calculation of the inverse trigonometric and hyperbolic functions and the logarithm. These algorithms are generalizations of the well known add and shift algorithm used for multiplication.

Trigonometric Functions

The flowchart for calculating the tangent of an angle is given in figure 1. The algorithm may be carried out in any radix, \( R \), generally the decimal (\( R = 10 \)) or the binary (\( R = 2 \)). The radix should be chosen so that the multiplication indicated in the iterative calculation of \( X_{j+1} \) and \( Y_{j+1} \) may be performed by shift operations only. Thus no multiplication or division is required until the final step of the algorithm is reached. The calculation may be in either degrees or radians, as long as either one is used consistently. \( a_j \) and \( \delta_j \) should be prestored in memory and called as a look up table. It is not required that the calculation be performed in the first circle (\( 0^\circ \leq A \leq 360^\circ \)); however, this is generally to be preferred. Care must be exercised if the final value of \( Y \) is very close to zero (\( A_0 \) is close to \( 90^\circ \)).
or 270°) since division by a very small number, or zero, is apt to blow up. A separate test for this condition should be included. Max indicates the number of iterations through the major loop and should be at least one larger than the accuracy desired. For example, if an accuracy of about one part in R⁻⁵ is desired, then Max should be about 6.

The final value of X obtained after exiting the major loop is proportional to the sine of A₀, and the final value of Y is proportional to the cosine of A₀, the proper signs being maintained. Thus having obtained the tangent of A₀, the sine and cosine may be obtained.

\[
\sin(A₀) = \frac{\text{sgn}X \cdot (\tan(A₀))}{\sqrt{1 + \tan²(A₀)}}
\]

\[
\cos(A₀) = \frac{\sin(A₀)}{\tan(A₀)}
\]

where \text{sgn}X is the algebraic sign of X.

**Hyperbolic Functions**

A strikingly similar algorithm may be used to calculate the hyperbolic tangent of a number. For most of us this does not seem to be a very useful function, and the need for calculating it may not be clear. Having tanh(A₀) we can calculate sinh(A₀) and cosh(A₀).

\[
\sinh(A₀) = \frac{\tanh(A₀)}{\sqrt{1 - \tanh²(A₀)}}
\]

\[
\cosh(A₀) = \frac{1}{\sqrt{1 - \tanh²(A₀)}}
\]

Having the capability to calculate the hyperbolic sine and cosine is something that most of us could get along without.

The next step provides the exponential function, which is often of interest.

\[
\exp(A₀) = \sinh(A₀) + \cosh(A₀)
\]

Using the identities

\[
\sinh(x) = -\sinh(-x)
\]

\[
\cosh(x) = \cosh(-x)
\]

we also obtain

\[
\exp(-A₀) = \sinh(A₀) + \cosh(A₀).
\]

**Figure 2: Flowchart for calculating the hyperbolic tangent of A. The value of A should be between 0 and 5 because the hyperbolic tangent rapidly approaches unity for values greater than 5.**

The hyperbolic tangent approaches unity rapidly for arguments greater than about 5, causing a loss of accuracy in the algorithm. Thus it is best to pre-scale A₀ to the range 0 ≤ A₀ ≤ 1. For pre-scaling, the following identity may be used.

\[
\exp(Q\logₐ(R) + D) = R^Q\exp(D).
\]

Powers to any base may now be calculated. Setting D to zero above gives

\[
\exp(Q\logₐ(R)) = R^Q.
\]
from which we can obtain, for example
\[ 10^Q = \exp(2.3025851 Q) \]
\[ 2^Q = \exp(0.69314718 Q). \]

Figure 2 shows the flowchart for calculating the hyperbolic tangent. Again \( \alpha_j \) and \( \delta_j \) should be prestored in memory and called by means of a look up table. It is relatively easy to combine these two algorithms into one. This saves some memory, but at the expense of control instructions. For this algorithm we again find that the multiplications carried out within the loop may be performed by shift operations only.

The Inverse Functions

Having implemented these two algorithms utilizing table look up procedures for the \( \alpha_j \) and \( \delta_j \), the inverse tangent and inverse hyperbolic tangent can easily be calculated with the same look up tables. Flowcharts are shown in figures 3 and 4. The arcsine and arccosine as well as the inverse hyperbolic sine and cosine may also be easily obtained. Another function of more general interest, the logarithm, is obtained from the inverse hyperbolic tangent \( (\tanh^{-1}) \) by making use of the identity
\[ \log_e (x) = 2 \tanh^{-1} \left( \frac{x - 1}{x + 1} \right). \]

The logarithm to any base, \( b \), may be obtained
\[ \log_b(x) = \frac{\log_e(x)}{\log_e(b)}. \]
When calculating logarithms, prescaling should be carried out so that only the mantissa is calculated.

Given the arctangent, the arcsine and arccosine may be calculated from

\[
\arcsin(x) = \arctan \left( \frac{x}{\sqrt{1 - x^2}} \right)
\]

\[
\arccos(x) = \arctan \left( \frac{1}{\sqrt{1 - x^2}} \right)
\]

If the argument of the arccosine is negative, 180° should be added to the result obtained from the above equation.

Given the inverse hyperbolic tangent, or logarithm, the inverse hyperbolic sine and cosine may be found.

\[
\sinh^{-1}(x) = \log_e (x + \sqrt{x^2 + 1})
\]

\[
\cosh^{-1}(x) = \log_e (x + \sqrt{x^2 - 1})
\]

Basic Program

A listing of a BASIC program which uses these algorithms to calculate the tangent and arctangent is shown in listing 1 to indicate the manner in which these algorithms can be used. The program was written in MaxiBASIC for the Digital Group Z-80 system but it should run on almost any BASIC with only minor modifications, if any. This program operates in radix 10 (R = 10). I also tested a version in radix 2 (R = 2) changing only statements 10 and 20 and the DATA statements.

This program will operate well in BASIC as listed, but the real power of the algorithms can best be obtained if a machine language version is utilized. The multiplication indicated in statements 220, 230, 380 and 400 consume much of the time. In a machine language version these may be replaced by shift operations which take considerably less time.

Comments

These algorithms could easily be used to augment the set of available functions written in BASIC as subroutines or they could be added as machine language subroutines for high speed operation. The accuracy can be made quite high. For the sample program seven significant digits will be obtained.

I do not know whether Hewlett-Packard uses algorithms similar to these for all of the functions described. Walther reports that Hewlett-Packard did construct a hardware floating point processor of a generalized version of these algorithms, and reports excellent performance.

Listing 1: A BASIC program for determining the tangent or arctangent of an angle. The program was written using the flowcharts of figures 1 and 3. The sample run gives a demonstration of the accuracy attained with these algorithms.

DO YOU WANT TAN (ENTER 1) OR ARCTAN (ENTER 0)? 0
INPUT X(0) > 0? .49423074
ARCTAN(.49423074) = 26.300001

```
---Problems for Computer Solution by Steve Rogowski, Teacher Edition. A collection of mathematical problems designed to stimulate thought and encourage research by students towards the goal of a final solution. The subjects range from arithmetic through calculus and on to problems that have yet to be resolved. An analysis of each problem provides ideas on logical approaches to a solution, and a sample program demonstrates one possible final solution. $9.95.

---Chemistry with a Computer by Paul A Cauchon. People are always looking for details of applications for the computer. It is one thing to say "gee whiz wouldn’t it be nice if . . ." but such thoughts are but the stimulus to action. One result of a "gee whiz" idea is a series of educational and tutorial BASIC programs for use by teachers of chemistry, invented by Paul A Cauchon and published by Educomp Corporation. This book contains a collection of tutorial, simulation and problem generation programs which can be employed to advantage by teachers in high schools or colleges wherever a BASIC facility is available. If you’re a chemistry professor or teacher by trade, or just a hobbyist interested in chemistry, this book will prove to be an invaluable tutorial aid. $9.95.

---Take a Byte of APL

---APL—An Interactive Approach Second Edition, Revised, by Gilman and Rose. Here’s an excellent way to introduce yourself to the APL language. APL is rapidly becoming one of the most popular high level languages in the computer field because of its clarity and conciseness. Gilman and Rose have extensively updated their popular book to include the latest information about the language and the various forms of it which are now in use. Since the examples are all carefully spelled out, APL—An Interactive Approach is particularly recommended for those who do not have access to an APL terminal. Answers to all problems are included. $11.95.

---The Underground Buying Guide, by Dennis A King. Here at last is a source book for all those hard to find suppliers! It’s designed especially for computer hobbyists, experimenters, hams and CB’ers, and can tell you where to buy items like connectors, discrete components, electronic music supplies, instrumentation, analog to digital and digital to analog converters, and synthesizers. The list goes on to include Teletypes, speakers, microcomputer software, cassette units, floppy disks and many other items. It will be an invaluable addition to your reference library. $5.95.

---PCC’S Reference Book of Personal and Home Computing. Ever try to find the addresses of some manufacturers of, say, tape cassette or floppy disk interfaces for micros? Frustrating, isn’t it? Well PCC has done something about it. This book lists hundreds of companies and stores selling hardware, software, and services. Survey articles on software, hardware, kits, applications and the future for the experienced and the not-so-experienced user of micros. Also included in this edition are bibliographies for further reference, book reviews, and an index of the articles from the major hobbyist magazines. $4.95.

Unofficial Cosmac Users' Newsletter

We recently obtained firm evidence of a group of strange beings in a remote corner of New York State. Their latest communiqué read very much like this:

There exist small groups of computer buffs who are not interested in buying a complete "off the shelf" computer system, or even a kit. These strange people would rather take a single microprocessor chip, study it, play with it and caress the documentation until they have learned about possible hardware options. These misfits in the world of printed circuit boards then dig out their wire wrap tools (which they use so that their wiring errors are only semipermanent) and have the audacity to build their first systems for less than the price of a good tape recorder. True, these systems are very limited, but they grow easily as cash and ideas become available, until they rival any of the ready-made systems at a fraction of the cost.

One such group of people, who happen to have chosen the RCA CDP 1802 as the basic building block for their systems, exists in Western New York.

Their interest in this chip was kindled by the Popular Electronics article on the Cosmac Elf. They have added hexadecimal keyboards, control systems, el-cheapo 6 digit displays and expanded memory to the tiny Elf. Some of these systems are capable of timing an egg, displaying the time of day, playing games and other vitally important things.

All letters containing worthwhile, workable hardware or software ideas for the CDP 1802, and a stamped self-addressed envelope will entitle their authors to receive a free copy of the Unofficial Cosmac Users Newsletter.

Future editions of this dubious technical publication may or may not be available, depending on response.

Walthourf NY 14568.

The West Virginia Computer Society, ... ...is off to a very fast start. Their first
What's Cooking?

... The Lancaster Series!

TV Typewriter Cookbook by Don Lancaster. A complete guide to low cost television display of alphanumeric data, several chapters of which were published ahead of the book in early issues of BYTE magazine. $9.95.

Active Filter Cookbook by Don Lancaster. The chief chef of electronics Cookbooks concocts another gourmet appetizer. Run to this book when you need to find a starting point for the design of a filter for use in an electronic application. $14.95.

The TTL Cookbook by Don Lancaster. Start here with Don's tutorial explanations of what makes TTL logic design tick. 335 pages, $8.95.

CMOS Cookbook. Don Lancaster has taken his highly successful TTL Cookbook formula and done it again. This bigger than ever (414 pages!) book tells you how to use CMOS, the exciting new power logic family. $9.95.

Practical Solid-State Circuit Design by Jerome E Oleksy. A self study course in the design of semiconductor circuits from the simple transistor to the complex operational amplifier. $5.95.

Fundamentals and Applications of Digital Logic Circuits by Sol Libes. An invaluable tutorial background volume on digital logic, arithmetic, IO concepts and interfacing to analog devices; written by one of the founders of the Amateur Computer Group of NJ. This book acquaints the reader with much of the terminology and background concepts of digital hardware, $6.95.

Modern Operational Circuit Design by John L Smith. An absolutely essential introduction to the use and application of operational amplifier systems. The book contains both theoretical background information and practical circuit suggestions which can be used to advantage by the experimenter. $23.25 (hardbound).

Linear IC Principles, Experiments, and Projects by Edward M Noll. From basic principles to complicated systems, from simple amplifier experiments to applications in radio, TV and control systems, this book can improve your knowledge of the way circuitry of the analog world really works. $8.95.

Clad Canada

Boards DO Something

CL2400

Real Time Clock

$98—Kit $135—Assembled

If your system needs to know what time it is, our CL2400 is the board for you. The present time in hours, minutes, and seconds is always available for input, and is continuously updated by the highly accurate 60 Hz power line frequency. Need periodic interrupts? The CL2400 can do that, too, at any of 6 rates. Reference manual with BASIC and assembly language software examples included.

PC3200

Power Control System

PC3232 $299—Kit $360—Assem. 
PC3216 $189—Kit $240—Assem. 
PC3202 $39.50—Kit $52—Assem.

If your system needs on/off control of lights, motors, appliances, etc., our PC3200 System components are for you. Control boards allow one I/O port to control 32 (PC3232) or 16 (PC3216) external Power Control Units, such as the PC3202 which controls 120 VAC loads to 400 Watts. Optimally isolated, low voltage, current-limited control lines are standard in this growing product line.

Vocal Input to your Computer

A new system compatible with all Altair (S-100) bus computers to provide voice input and control, and replacing keyboards in many instances, has been announced by Heuristics, a Los Altos CA speech research firm. Known as SpeechLab™, the system is available in selected computer stores and directly from the manufacturer for $249 in kit form or $229 assembled and tested. SpeechLab digitizes and extracts data from speech waveforms and applies pattern matching techniques in order to

**STATE OF THE ART**

**BOTH FORMS**

There are two forms of the “state of the art.” One form is the personal growth attained by most professionals who realize they must stay in step, intellectually, with new concepts and new techniques. Too often, a tragedy occurs when the professional neglects the second form, his career development. The fatal mistake occurs when working in an environment that provides a continuous parallel to industry but neglects to provide the professional growth that is necessary to insure career development and avoid potential future frustrations. To insulate yourself against this happenstance, check with our professional staff. They will advise you on your career development as it relates to your technical development.

Our areas of specialization are:

- Software Development
- Computer Graphics
- Data Base
- Computer Design
- Simulation and Modeling
- Telecommunications
- Hardware/Software Interface

Matrox Electronic Systems, located at POB 56, Ahuntsic Station, Montreal, Quebec CANADA H3L 3N5, has sent along some information on what has come to be called the ALT-256**2 Graphics System in their product line of display devices. The ALT-256**2, to which we alluded in a previous new product story (see November 1976 BYTE, page 60) is designed to plug directly into any Altair (S-100) bus compatible computer such as the IMSAI shown in the press release photo. The board interfaces to the host computer as a set of four peripheral ports. Two of the ports are used for storing the X and Y coordinates of a spot, and a third port is used simply to turn the dot on or off; a fourth port is dedicated to clearing or presetting the whole screen. It contains its own 65,536 bit refresh memory so that no address space in the host computer is used up for display purposes. This is an important consideration, since multiple copies of this 256 by 256 grid display can be plugged into the same computer and jumpered to use common recognize vocal input. Applications include computer input, games, research and vocal control.

In addition to Altair bus computers, SpeechLab can be used with any computer by using a separate power supply and connector.

Included in the price is a complete hardware and software system, a 275 page laboratory manual, 93 page hardware manual, high fidelity microphone, and three programs on paper tape. The lab manual includes 35 graded experiments with over 100 tables and graphs.

The recognition of spoken inputs requires 64 bytes of storage per word and a vocabulary of up to 64 words in memory. Other features include real time response, 95% recognition accuracy, automatic hardware self-test capability, and C-MOS design for low power dissipation.

Software includes the SpeechBasicTM BASIC programming language, assembly language speech recognition program, SpeechBasic plot, correlation, recognition, advanced recognition and hardware self-test programs.

For more information write to Heuristics Inc., 900 N San Antonio Rd., Los Altos CA 94022.

Circle 617 on inquiry card.
synchronization so that a color effect with 256 by 256 resolution and seven colors can be achieved by driving a commercial RGB monitor (red-green-blue guns on separate inputs with common synch). The board is not a kit, and is priced at $395 FOB Montreal, with delivery two to four weeks after receipt of orders. European readers will also appreciate the fact that the ALT-256 is also available in a standard version using the European television timing definitions.

Instrumentation and Test with the Personal Computer Bus

International Data Systems has announced an instrumentation module for the Altair (S-100) bus which allows the user to make measurements of frequency and period, formerly done with "dumb" uncomputerized measuring equipment. The product is the 88-UFC, a 9 decade universal frequency counter module. The design allows software selection of all functions and has capabilities said to have been previously available only on counters costing several times its $179 price. The 88-UFC has provision for four signal sources which can be selected under software control. Three of the inputs have general purpose analog or digital signal conditioning, and the fourth accepts TTL signals for use in debugging logic systems. One of the general purpose inputs includes a divide by ten prescaler which extends its input range typically above 600 MHz, and the other two general purpose inputs can count signals ranging typically up to 65 MHz. With one of these boards and the software provided, the user can in principle perform nearly all the frequency and time period measurements encountered in the typical electronics or scientific laboratory (to say nothing of the amateur radio station or electronics repair shop). The crystal controlled time base on the board can be selected in software to provide count periods from 100 ns to 1 second, with half cycle or full cycle counts. The board is said to allow measurement of a 600 MHz signal's frequency with ±1 Hz resolution, or two parts in 10^9.

Software included with the unit provides totalizing or accumulation of event counts, measurement of the period of a signal, measurement of frequency, computation of frequency ratios.

A Personal Computing Electronic News Service: the "Net" Worth of Space Age Journalism

We recently received a copy of the professional design engineers, the Modu-Learn™ course presents systematic software design techniques, structured program design, and practical examples from real 8080A micro-computer applications. All in a modular sequence of 10 lessons...more than 500 pages, bound into one practical notebook for easy reference. You get diverse examples, problems, and solutions. With thorough background material on micro-computer architecture, hardware/software tradeoffs, and useful reference tables. All for only $49.95.

For $49.95 you learn design techniques that make software work for you. Modu-Learn™ starts with the basics. Our problem-solution approach enables you to "graduate" as a programmer.

See Modu-Learn™ at your local computer store or order now using the coupon below.

Please send the Modu-Learn™ course for me to examine. Enclosed is $49.95 (plus $2.00 postage and handling) or my Mastercharge/Bankamerica card authorization.

BYTE's Bits

A Personal Computing Electronic News Service: the "Net" Worth of Space Age Journalism

We recently received a copy of the Washington Amateur Computer Society's Journal which contains news about the society, product reviews and speculative articles. In short, a very good example of the sort of journalism coming out of the local computer clubs.

What makes this particular issue so special, though, is that it is available via computer link to anyone possessing a computer terminal and telephone coupler! Members and nonmembers alike can dial (202) 635-5730 (for a 300 bps line) or (202) 635-5710 (for a 110 bps line) and start receiving the latest scoops from the Washington DC area.

The Journal is written and edited each month on a DECsystem-10 at the Catholic University of America; it is available as a "free access" text file (ie: no password or account number is necessary).

The procedure used to obtain the Journal is simple. After calling either of the two numbers listed above, the DECsystem will respond with its answer tone. Activate your modem and type "Control C." The computer should echo an up-arrow followed by "C." (If it does not, repeat the procedure several times. If you still have no luck, the computer is probably down.) Next, type "I" followed by a carriage return. The system will reply with the following response (there may be some slight variations in this response): "CATHOLIC U. 507820 19:39:01 TTY80 SYSTEM 95," followed by a period on the next line to indicate that you are conversing with the timesharing monitor and that it is waiting for your instructions. To get the Journal, type "HELP WACS" and a carriage return. The computer will then type out the journal text. The Journal is set up to fit in a format of 60 characters to the line and 66 lines per page. If you are going to read the text on a video display unit, it is a good idea to tape the output for later reference. To stop the output at any time, type "Control O."

It should be mentioned that the Journal is rather lengthy (16 pages for the April issue). The question of long distance phone charges for this type of service is not a trivial one. The following excerpts are taken from a letter sent to us by the directors of the club in which they discuss this and other points:

We believe that this is the first such electronic "mail service" or Journal. You will not be working with a recording but rather will be running a program on the timesharing system that moves information stored on a disk file to a serial communications port. We would not be able to share this new adventure in communications with you if it were not for the kind assistance of the computer center of the Catholic University of America. Since this service uses computer time, which shows the computer down slightly and ties up a communications port, we ask that you use it only during non-business hours: late at night or weekends would be ideal.

Our Journal is also available in printed form...We hope that this will be the first of many such computer hobbyist communication nets, and that the age of electronic mail and news journals will not be far off. We understand that long distance telephone rates will make our service rather expensive for the individual, let's say, in California. But perhaps that is where hobbyist clubs can show their worth and make use of unused business WATS lines late at night or on weekends...[Electronic journals] are just the kind of justification for the adoption of ASCII as a legal transmission code on the amateur airwaves that the FCC will recognize. We computer hobbyists need access to quick, efficient and up to date communications media to enable us to hang together.

Why can't we have access to radio communications in the code that is a national standard not only for our hobby but also for ANSI? Computer hobbyists unite! Petition the FCC to allow us to communicate in our "native tongue." Meanwhile, find those fellow WATS lines and make them serve our hobby.

A Trapping Technique for the 8080

Debugging 8080 Software?
How About a Trap Routine?

If you have got your 8080 system up and running and you are starting to write some programs for your system then the trap routine discussed in this article may be just what you need to assist you in debugging your own software or other software you have keyed in or relocated. This trap routine is in PROM in my system and has been invaluable in locating bugs in various programs.

This trap routine is a program that is written as a subroutine and is designed so that when it is called it will do the following:

1. Immediately save the machine state.
2. Print out the machine state on a television display.
3. Wait for a keyboard input so that the programmer can decide whether to examine or modify memory or to restore the machine state and resume execution of the program that called the trap routine.

A typical way to use this trap routine is to change one or more instructions in critical areas of the program being debugged to the 8080's RST 7 instruction (F7 hexadecimal). Note that this implies that your problem program is in programmable memory and that if a multibyte instruction is changed, the RST 7 instruction is placed in the first byte of the multibyte instruction. Several traps can be set at once since the trap location will be printed out each time the trap routine is executed. The trap routine is activated (called) whenever the 8080 processor encounters an RST 7 instruction. The RST 7 instruction assumes there is a trap handler routine beginning at hexadecimal location 0038 in memory, so if the trap routine does not start at this location then a JMP TRAP instruction must be present instead. If your PROM memory starts at location 0000 then you can fix the trap routine (or jump instruction and trap routine) into PROM and you are ready to go. If your PROM is in high memory, then you can fix the trap routine in high memory and you will have to remember to load the jump to trap instruction (three bytes) into locations hexadecimal 0038 thru 003A each time you initialize your system. An alternate way to get into the trap routine would be to use a standard three byte call instruction. (Here no jump instruction would be required.) I decided to use the single byte call (RST) mainly for convenience (one byte to change instead of three) and also because my PROM is in low memory.

The output of my trap routine is two lines of listing on a television display as shown below:

```
TRAP AT:xxxx:
Axxxx:Bxxxx:Dxxxx:Hxxxx:Sxxxx:
|A|B|C|D|E|H|L|SP|
```

Listing 1: Symbolic assembly language listing of the trap routine used by the author in his 8080 system. Detailed comments by line number are made in the text of the article. Note that in the author's system, a hardware vector to the monitor occurs if an ESC key is pressed on his terminal keyboard instead of some other character when the program is looking for input at line 36. The system routine referenced by this program are summarized in table 1.

The first line shows the memory location of the RST 7 instruction that invoked the trap routine and the second line displays the machine state (accumulator, flags, the registers B,C,D,E,H and L, and the stack pointer) at the completion of the last program instruction executed before the trap calling instruction (RST 7) was encountered.

The trap routine is shown in listing 1 and the auxiliary subroutines used by the trap routine are described in table 1. Listings of these auxiliary subroutines are not provided since most monitor programs will already have these routines and they most likely are peculiar to individual systems since they deal directly with IO devices. The stack data generated by the trap routine is shown in figure 1 and will help in understanding the operation of the trap routine.

When the trap subroutine is called by a RST 7 instruction, the program counter is automatically pushed onto the stack. The first four push instructions in the trap routine (listing 1, lines 1 thru 4) save the A,B,C,D,E,H and L registers and the flags in the stack. This machine state information will be used at the very end of the trap routine to restore the machine state just before the trap routine return instruction (line 42 of listing 1) is executed. The fifth push instruction (line 5) is used to provide a space in the stack for the value of the stack pointer when the trap routine was called. This value is calculated by adding 000E hexadecimal to the current stack pointer value at line 7 of the trap routine. The DAD SP instruction (line 8) does this addition and the desired initial stack pointer value ends up in HL after the DAD SP instruction is executed. Note that the DAD SP instruction affects the carry flag, and thus the PUSH PSW and POP PSW instructions at lines 6
Table 1: Summary of Auxiliary Subroutines. This table lists the symbolic name referenced in listing 1 and the corresponding functions of several monitor routines required. No listings of these routines are provided since the detailed code will vary from system to system.

<table>

</tr>
</tbody>
</table>

and 9 are required to preserve the flag byte.

The XTHL instruction at line 10 exchanges the most recent two stack bytes with the contents of HL. Thus after the execution of line 10, the initial value of the stack pointer is on the bottom of the stack (8080 stack grows downward) and the contents of HL have been restored to their initial values (the values they had when the trap routine was called). The next four push instructions (lines 11 thru 14) save the machine state a second time for the printing operation.

Lines 15 and 16 print the ASCII character string “TRAP AT” in preparation for the printing of the memory address that generated the trap. This information is highly desirable since several traps may have been set into the program being debugged and it is nice to know which trap was encountered each time the trap routine is executed. The trap subroutine return address (pushed onto the stack when the trap subroutine was called) is the key to determining the trap location. In order to access this information, line 17 and 18 cause the HL register pair to point higher up in the stack to the most significant byte of the return address. The return address is put into the DE register pair by the instructions at lines 19, 20 and 21. Note that the value of the DE register pair is decremented by one (line 22) in order to reflect precisely the location of the RST 7 trap generating instruction. This is due to the fact that the return address pushed onto the stack by the RST 7 instruction is the next memory address after the RST 7 instruction. The XCHG instruction at line 23 exchanges the register pairs DE and HL which puts the return address into HL so that the PTADR subroutine called at line 24 will print the return address. (PTADR prints out the contents of HL as four hexadecimal digits surrounded by colons.) A CRLF subroutine called at line 25 moves the output display device to the beginning of the next line.

Now things get a little tricky, but we are almost through so don't give up yet. The next ten lines of program (lines 26 thru 35) result in the printing out of the machine state in the form of five groups of characters on the display using the PRREG subroutine (lines 43 thru 47). Each group of characters consists of a single identifying alphabetic character, four hexadecimal digits, and a colon. Thus the printout of the machine state line takes 30 characters and just fits on a 32 character line.

Each execution of the PRREG subroutine results in the following operations. First the ASCII character in the D register is printed out on the display by the PRNT subroutine. Next the return address for the PRREG subroutine is popped off the stack into the HL register pair by the POP H instruction at line 44. This brings to the bottom of the stack one of the two byte values to be printed that was placed on the stack by the instructions at lines 10 thru 14. Now the PRREG subroutine return address is restored to the stack (two bytes up from its original position) and the two byte value at the bottom of the stack that is to be printed is put into HL by the XTHL instruction at line 45. (That XTHL instruction sure is nice!) Finally the four hexadecimal digit value now in HL is printed out on the display by subroutine PTADR (called at line 46). Each execution of the PRREG subroutine causes the stack to be reduced by two bytes and after the execution of the last PRREG call instruction (line 35) the stack has been reduced to the upper half of that shown in figure 1.

After the entire machine state line has been printed out, the trap routine waits for a keyboard input in the RDTTY subroutine (called at line 36). This gives the person debugging a program a chance to digest the trap information before proceeding. Any character other than ESC will return the processor to the trap routine and then to the program being debugged. An ESC will cause
the processor to return to the monitor program where the operator can examine and modify memory if necessary. If the character typed was not an ESC, a CRLF is generated and then the machine state is popped off the stack by the four pop instructions at line 38 thru 41. After restoring the machine state, the processor will now return to the program containing the trap (the program being debugged) and resume execution. Note that you can only use this technique if the program being debugged has the trap calling instructions (RST 7) located in program locations that originally contained NOPs. Most of the time I use the ESC monitor exit so that I can restore the original instruction and move the RST 7 trap calling instruction to a new location. Then another execution of the problem program can be initiated. This process will continue until the source of the problem is determined and then the program can be modified (or hopefully) correct the problem.

This trap routine (or a similar one) should make debugging much easier as it produces a

Figure 1: Stack Frame

Used by TRAP. This diagram shows the allocation of data in the 8080's stack when TRAP routine is executing line 15 of listing 1. Actual contents vary during the course of TRAP, and this particular frame represents the maximum stack utilization (ignoring the supporting subroutine return address) during the routine. When TRAP routine returns, the state of the processor including the stack pointer is completely restored.
between inputs, data storage and subsequent retrieval, ASCII binary and BCD conversion of outputs, and a general purpose intelligent counter program allowing user interaction and function selection.

International Data Systems Inc is located at 400 N Washington St, Suite 200, Falls Church VA 22046. The kit form of the 88-UFC is available for $179.

A High Resolution Text Display with Considerable Flexibility

Lorne Trottier, marketing manager for Matrox Electronic Systems, POB 56, Ahuntsic Station, Montreal, Quebec CANADA H3L 3N5, has sent us some information on a product which will be of great interest to users of many Altair, IMSAI, Poly 88 and other computers which have the Altair bus structure. This new product is the Model ALT-2480 text display, which produces a high resolution display of 80 character lines, 24 lines per screen. The character generator has several user selectable options including a reduced bandwidth mode with two pages of 40 character lines, 24 lines per page; 5 by 7 or 7 by 9 dot matrix character generators, upper or lower case letters, selectable reverse video or blinking, adjustable page boundary locations in address space, and either European or American standard television composite video outputs. By plugging it into an Altair or similar computer and running a coaxial cable to an appropriate video input, one can achieve a word processing output device with all the necessary features for text manipulation. In order to take advantage of the high resolution 80 by 24 character mode of operation, this display will require use of a relatively high bandwidth video monitor; it is not recommended for use with an RF converter and standard television set. This product is available in assembled form only, and is priced at $295, FOB Montreal CANADA. Delivery is quoted at two to four weeks after receipt of order.

Two New Memory Boards

Advanced Microcomputer Products has announced two new memory cards which plug into an Altair (S-100) bus. These are the Logos 1 8 K static low power memory board (photo 1) and the Model 801C 8 K memory board (photo 2). The Logos 1 board features switch selection of address space allocations at any 1 K boundary in memory address space, and has write protection options (1 8 K block, 2 4 K blocks, ... 32 256 K-rations for your computer

K-Ration™ 8Kx8 memory with SynchroFresh™.

$188 assembled and warranted.

Now you can load your Altair, IMSAI, Equinox 100 or other S-100 buss computer with 8Kx8 memory boards for just $188 apiece... and that’s assembled, tested and warranted for repair or replacement for 1 full year. It's possible because Morrow’s Micro-Stuff has developed SynchroFresh™, the first and only memory refreshing system that weaves itself invisibly into the natural timing of the S-100 buss. And that makes the K-Ration™ 8Kx8 memory refreshingly reliable and helps keep the cost down. Just $188 assembled with 1 year warranty, kit just $159 (Cal. res. add tax). Postpaid from ThinkerToys™.

K-Ration™ 4Kx8 MEMORY is now the lowest-cost 4K memory available for S-100 buss personal computers. A complete memory board kit, just $109 (Cal. Res. add tax). Postpaid from ThinkerToys™. Product of Morrow's Micro-Stuff
**NEW!**

**ELECTRONIC TOUCH ORGAN KIT**

Fantastic new design uses CMOS I.C. and a total of 39 semi-conductors to do the basic functions and to give a touch control keyboard, all on one printed circuit board. This organ is easy to build, yet has features like a full two-octave range touch keyboard, variable tremolo, two voices, Built-in I.C. amplifier with volume control, complete with speaker and a specially designed plexi-glass case.

**$24.50 ea.**

byte blocks), low 1.4 A power consumption and provision on the board for battery backup. Logos I is available as a kit for $248 ($31 per K block installed) and $298 in assembled form ($37.25 per K block installed). The Model 801C is a static memory board which can be placed at any 4 K boundary in memory address space, and trades a slightly lower price off against the lack of memory protect and battery backup features of the Logos I. The Model 801C is available in assembled form only, priced at $198 if 21L02-I parts are used, and $207.95 if 91L02APC parts are specified for the memory array. Advanced Microcomputer Products is located at POB 17529, Irvine CA 92713. Circle 622 on inquiry card.

A Frequency Meter Plug-In

The AIM-1005 is a novel Altair (S-100) bus interface which is an adaptation of a previously available industrial module to an Altair compatible 100 pin bus connector as seen in this picture. The AIM-1005 is primarily intended for use as a receiver of signals from transducers which generate frequency analogs of physical parameters for transmission to the computer over twisted pair wires. The precision of the measurement is 16 bits, and the company also provides the AIM-1000 transducer interface and a multiplexor for multichannel systems. This product was demonstrated to us on an Altair 8800 by Barry Hilton, its designer. He is also the proprietor of Automated Industrial Measurements Inc, POB 125, Wayland MA 01778. Circle 624 on inquiry card.

SOLUTIONS FOR SALE: OUR KITS SOLVE YOUR PROBLEMS.

**PROBLEM:** As you add more cards on to your buss, funny things start to happen ... data scrambles, bits drop, and programs crash for mysterious reasons.

**SOLUTION: ACTIVE TERMINATOR BOARD ($29.50)**
Plug into any S-100 slot to tighten up your machine by providing proper loading for TTL lines. Active terminations draw far less power than passive types, and provide superior data handling compared to unterminated lines.

**PROBLEM:** You have outgrown your CPU board, and are getting tired of talking to your 8080 in machine language.

**SOLUTION: 4K ECONOROM II™ SOFTWARE BOARD ($265)**
Our latest model offers improved listings that make this board even more flexible ... contains editor, assembler, and monitor routines for your 8080, implemented in erasable ROM. Very low power operations, S-100 compatible. Also available unprogrammed for storing custom programs and routines.

**PROBLEM:** You have no idea which RAM card to choose out of the many available.

**SOLUTION: 8K ECONORAM II™ ($169)**
Everything you want, from low power, to speed (zips along at 450 ns), to reliable technology (static RAMs with low power Schottky support), to convenience features (dip switch block selectors, ability to configure as 2 separate 4K blocks, and tri-state outputs that mate with the S-100 buss or bi-directional busses). In our years of experience selling RAM cards, we've learned how to do it right ... and how to do it inexpensively.

**PROBLEM:** You need a simple, compact, regulated supply that won't blow up your computer if something goes wrong.

**SOLUTION: SMALL SYSTEM POWER SUPPLY ($45)**
Delivers 5V at 4A with crowbar overvoltage protection, and ±12V at ½A per side. Also features an adjustable bias supply and compact design.

**PROBLEM:** You want to add more peripheral cards to an already overpopulated machine ... or start a stand alone system.

**SOLUTION: 10 SLOT MOTHERBOARD ($89)**
**or 18 SLOT MOTHERBOARD ($124)**
Not just another S-100 motherboard—includes all edge connectors, as well as our active termination circuitry and extra-wide supply line traces (go ahead ... fill all the slots, you won't get additional problems with additional cards). Starting a system? Start here.

A Noteworthy New Board

Mary P. Rezanow, production manager of Stillman Research Systems, POB 14036, Phoenix AZ 85063, sent along information on the new SRS-320 Generator Board. This music peripheral is used to create four distinct channels of output for an Altair compatible computer, with each channel consisting of a well tempered musical pitch timing signal set by a 4 bit note code and a 4 bit octave code. In the minimal music system represented by this board, the outputs of the four channels are summed as square waves and can be used to play four part polyphonic music [with a timbre most appropriate for baroque organ music]. The board comes with a complete manual, including two 8080 programs and hexadecimal music texts for “Joy” by J. S. Bach (one part only) and “Dona Nobis Pacem,” composer unknown (polyphonic). The two sample texts and the two different driver programs are intended for use on minimal systems. The company is designing a second module in this series, which will be called a Modifier Board and will take the pitch outputs of the Generator Board and process them in a manner similar to a conventional music synthesizer but with computer control of parameters.

Circle 526 on inquiry card.

Do You Have Some Data to Communicate?

D. C. Hayes, located at POB 9884, Altanta GA 30319, has introduced this Model 80-103A Data Communications Adapter for the Altair (S-100) bus. The product is fully programmable and implements automated dialing or answering, 110 and 300 bits per second data rates with character format and parity error detection, uses the standard US telecommunications modem frequencies, and is fully compatible with the Bell System when attached via a DAA device. The unit features crystal control and all digital modulation and demodulation, so there are no adjustments to be made. Users seriously interested in networking of personal computers will want to consider this product, which is available in several forms: fully assembled and tested at a retail price of $279.95, as a bare board (sans electronic components) with manual for $49.95, and as the manual alone for $7.50. Dealer inquiries are invited as well.

Circle 630 on inquiry card.

And Now, an IEEE-488 Standard Bus Interface

Pickles & Trout have announced this new peripheral interface for the Altair (S-100) bus which allows any one of the many computers which have copied the Altair design to talk to instruments and peripherals which use the Hewlett-Packard Interface Bus, now supported by the Institute of Electrical and Electronic Engineers (IEEE) as IEEE standard 488. While the 488 standard was originally intended for laboratory instrumentation, its generality makes it quite useful in personal computer systems. A number of commercial and industrial peripherals are already on the market which use this communications discipline.

Six of the eight ports on the Pickles & Trout BDPIO board (Bi-Directional Parallel Input and Output) are on the bi-directional IEEE 488 bus which includes six interrupt lines and an uncommitted line for power or other user selected functions. This bus allows a small number of lines (25) to service devices which require several ports, such as the Digital Group cassette controller. The six ports require only one cable assembly and use a single 25 pin D style connector. An external junction box also available from P & T is used to decode addresses on the 488 bus at the peripheral, and provides additional signal buffering for systems with long cables. For more information on this interesting peripherals interface feature, contact Pickles & Trout at POB 2270, Goleta CA 93018.

Attention Altair Bus Experimeters . . .

Here is an interesting new product which allows the experimenter, or systems consultant, to completely start from scratch in the selection of Altair (S-100) bus compatible peripherals and system components. This new product, called The Mainframe, is the physical starting point for such a system with its essential physical and electrical characteristics. The Mainframe includes a heavy duty vented aluminum cabinet finished in blue color, a 12 slot Altair compatible mother board (with 100 pin connectors inserted, soldered and checked out), a front panel which includes an indicating AC switch and a reset switch, a unique power supply which includes a constant voltage transformer for brownout protection, better than 100 db isolation of the DC supply voltages from AC line transients, and a capacity of 17 A at 8 V and 2 A at +16 and -16 V. A muffin fan rated at 115 cubic feet (3.26 cubic meters) per minute air flow is mounted in the cabinet. All wiring of the kit version is precut and prelugged for ease of assembly.

No price was given in the press release information we received, so potential users should contact CMC Marketing Corporation at 7231 Fondren Rd, Houston TX 77035. Specify either Model MCS-112K or MCS-112A for the kit or assembled versions, respectively. This product will prove useful to people who want to select a processor board from manufacturer X, a systems software read only memory and terminal interface board from manufacturer Y, main volatile memory boards from manufacturer Z, and whiz-bang peripheral board from manufacturer Q. The result can be a completely custom selection of boards.

FOR SALE: Complete Visual System 21 with communications adaptor (missing UART); includes all data and about six Vastapes, $375. Printing robot and interface to Viatron, $175. IBM Selectric Model 77 typewriter, $300. Will take $270 for all or make offer. All in perfect operating condition. Write: Jim Tegeler WP5551U, POB 65, Alma AR 72921, (501) 322-2852 after 6 PM.

ATTENTION HAMS: I have vintage QST and CO magazines, 1930's through 1966, and I will swap ten for one BYTE issues #2, 3, 8, 9, 14. Don Lasky, 3135 St. John St., Memphis TN 38117. (901) 423-8226.

FOR SALE: Two complete CDC, RPC-4000 computers, each includes CDC paper tape reader, Friden paper tape punch, Royal McBee console typewriter, 8000, 32 bit drum memory, second generation computers, with discrete transistors, etc. Both are running. With the above goes one Friden Facsimilier, an extra Friden punch, a Soroban high speed punch, and several other peripherals. Sold as scrap value for parts. Each computer was $8000 when new. Will sell the works for $2,500 including a compiler, some utility programs and debugging software program. Walter E. Page, 3560 S Marginal Rd, Cleveland OH 44114.

WANTED: DECSuper read write head in usable condition preferably with cable and Amphenol connector intact. Also CBS/IBM card reader with manuals and engineering drawings if possible. Double print on any or all as well at other PDP-6 peripherals, memory, paper can you wish to put out into our kindly "old horse" pasture. FREE: copy of Mave 8 Construction booklet for 10 by 12 inch SASE. Bro Felix Neunendorfer, Calegio San Antonio Abate POB 729, Humacao PR 00681.

FOR SALE: Typograph Terminal I modified Model 3, 64 character display board, with microprocessor, Full print reading capability. Will make beautiful curves. Can make 1/50 inch incremental movements in any direction. Also has paper tape punch and reader. Two electronic modules with instruction manual and documentation $190. Call Nancy Daedone (408) 271-2737.

FOR SALE: Brand new MITS 8K-54K synchronous dynamic memories, professionally built by electronic company, $130 each. Call days, Marco Lanza (611) 244-3216.

WANTED: Schematic or technical assistance on interfacing with MITS Model 500 to an IMSAI 8080. Would like to be able to use the Fruden in both local or remote mode. The IMSAI has both serial and parallel ports. Write John Gill, RT 5 Box 370, Bloomville TN 37617.

FOR SALE: Portable TV, modified for TV input only. $55, MITS K static assembled, best offer; 4 K static $95; MITS 4 K static $125. HP 85 printer 11 columns, digits only, needs interfacing $40 Charles Zalesni, POB 92, Junction City NY 13750.

FOR SALE OR TRADE: One SIO IMSAI board, two 101's, power supply, 64K memory card, 2500 incremental moves. Will make excellent graphic printer. $150. Jiri Gobara, POB 356, Ewerth MN 5534, or call (218) 741 6638 after 7:00 CST.

WANTED: Portable TV, modified for TV input only. $55, MITS K static assembled, best offer; 4 K static $95; MITS 4 K static $125. HP 85 printer 11 columns, digits only, needs interfacing $40 Charles Zalesni, POB 92, Junction City NY 13750.

ARTEC Introduces
The Expandable 32K Elephant

The 8K-32K Expandable Memory That Grows With Your System

Now, for the first time, you can have a reliable true static memory that will grow with your system. Start with the board and 8K memory. Then add one, two or three 8K increments of memory up to 32K. 250 ns access time. The Artec 32K Expandable Memory allows you plenty of room for memory and all necessary support hardware.

For five years Artec craftsmanship and reliability has been proven in tough industrial use. Now, you too can enjoy breadboards and memories that will work time after time. Boards like the GP 100 and the wire wrap WW-100. Send for an Artec Board, your order will be sent the same day as received.

Board & 8K of memory—$290.00
8K add on kits—$255.00 ea.
Full 32K board—$1,055.00

GP-100—$290.00
Maximum design versatility along with standard address decoding and buffering for S—100 systems. Room for 32 uncommitted 16 pin IC's, 5 bus buffer & decoding chips, 1 DIP address select switch, a 5 volt regulator and more. High quality FR4 epoxy. All holes plated through. Reflowed solder circuitry.

WW-100—$20.00
A wire wrap breadboard, similar to the GP 100. Allows wirewrap of all sizes of sockets in any combination. An extra regulator position for multiple voltage applications. Contact finger pads arranged for easy pin insertion.

TO ORDER: Use your Mastercharge or BankAmericard. Or just send along a money order. Your order will get same day service.

FOR MORE INFORMATION: For more information about these or any of Artec's complete line of circuit boards or for either industrial or personal use, please call or write. A catalogue will gladly be sent.

Circle 191 on inquiry card.
From the same people who brought you the $89.95 4K RAM Kit. We were not the first to introduce an ImnsAltair compatible Z-80 card, but we do feel that ours has the best design and quality at the lowest price! The advanced features of the Z-80 such as an expanded set of 158 instructions, 8080A software compatibility, and operation from a single 5VDC supply, are all well known. What makes our card different is the extra care we take in the hardware design. The CPU card will always stop on an M1 state. We also generate TRIP SYN on card, to insure that the rest of your system functions properly. Dynamic memory refresh and NMI are brought out for your use. Believe it or not, not all of our competitors have gone to the extra trouble of doing this.

At always this kit includes all parts, all sockets, and complete instructions for ease of assembly. Because of our past experience with our 4K kit we suggest that you order early. All orders will be shipped on a strict first come basis. Dealers' inquiries welcome on this item. Kit includes Zilog Manual and all parts. Kit shipped with 2 MHz crystals.

**Z-80 CPU KIT**

For ImnsAltair

**$149. kit**

Z-80 Chip & Manual $49.95

---

**THE WHOLE WORKS**

**$89.95**

4K LOW POWER RAM BOARD KIT

Imns and Altair 8080 plug in compatible. Uses low power static 21L02-1 500 ns. RAM'S. Fully buffered, drastically reduced power consumption, on board regulated, all sockets and parts included. Premium quality plated through PC Board.

For 250 ns RAM's add $10.00

NEW COMPUTER INTERFACE BOARD KIT

Our new computer kit allows you to interface serial TTL to RS 232 and RS 232 to TTL. There are four of these supplied with the kit, so you can run up to four devices on one TTL or four separate TTL to RS 232 devices. Typical use: You can use your computer ports to run an RS 232 printer, video terminal and two other RS 232 devices at once, without constantly connecting and disconnecting your terminals.

Example: Out store to printer — Voltage requirement +5V and ±5V or ±12V depending on your RS 232 device.

We supply — board, connectors, documentation and components. Sorry, we do not supply case or power supply.

$49.00

GENERAL PURPOSE COMPUTER POWER SUPPLY KIT

This power supply kit features a high frequency torroid transformer with switching transistors in order to save space and weight. 115V 60 cycle primary. The outputs with local regulators are 5V to 10A, in one amp increments, -5V at 1A, ±12V at 1A regulators supplied 6 340-5T supplied.

$79.00

UNIVERSAL 4K MEMORY BOARD KIT $74.50

This memory board may be used with the F8 and with minor modifications may be used with KIMMUP-32 2102-1 static RAM’s, 16 address lines, 8 data lines in, 8 data lines out, all buffered. On-board decoding for any 4 of 64 pages, standard 44 pin .156" bus.

FOR FAIRBUG 4K F8 BASIC ON PAPER TAPE $25.00

PRINTED CIRCUIT BOARD

8 WATT D-LENS LASER DIODE 1B $19.00

TANTALUM CAPACITORS

FULL WAVE BRIDGES

NATIONAL MOS DEVICES

FOR FAIRBUG 4K F8 BASIC ON PAPER TAPE $25.00

F8 EVALUATION BOARD KIT WITH EXPANSION CAPABILITIES $99.00

A fantastic bargain for only with the following features:

• 20 ma or RS 232 interface
• 64K addressing range
• Program control timers
• 1K of on-board static memory
• Built in clock generator

• 64 Byte register
• Built-in priority interrupts
• Documentation
• Uses Fairbug PSU

To get further information on the products advertised in BYTE, fill out the reader service card with your name and address. Then circle the appropriate numbers for the advertisers you select from this list. Add a 9 cent stamp to the card, then drop it in the mail. Not only do you gain information, but our advertisers are encouraged to use the marketplace provided by BYTE. This helps us bring you a bigger BYTE.

BOMB—BYTE's Ongoing Monitor Box

Defused

This month, there is no BOMB analysis for May BYTE. The BOMB got defused by the late delivery of the May 1977 issue due to the strike at our printer. As a result, we are holding the analysis until next month when a double BOMB will report the results of May and June reader response together.

176
Micromind is an incredibly flexible, complete and expandable, hardware/software, general purpose computer system. You won't outgrow it.

Hardware includes an 80 key, software-definable keyboard, I/O interface board, 6500A-series microprocessor (powerful enough for advanced computing), a high-detail graphics and character display processor, power supply, enclosure and connections for up to 4 tape recorders plus TV or monitor. An interconnect bus permits 15 additional microprocessors, parallel processing and vastly increased computing power.

System software—including ECD's own notsoBASIC high level language, on advanced error-correcting tape cassettes—provides a word processing editor, a powerful assembler, a debugger, a file system, graphic routines, and peripheral handlers. We also include dynamic graphic games: Animated Spacewar and Life.

ECD's standard Micromind µM-65 supplies 8K bytes of memory. Additional 32K byte expansion boards and a mapping option give Micromind expandable access to 64 Megabytes. Utilizing software-controlled I/O channels, Micromind's advanced encoding techniques load data from ordinary tape recorders at 3200 bits per second.

Micromind comes to you ready-to-use, factory assembled and fully tested. Among microcomputers, it has the largest memory capacity and the fastest storage. You're looking at the work of the finest display processor on the market. You won't find a microcomputer with a more powerful CPU.

So, quit the kluge scene and key into Micromind. You'll be a main frame performer, with all the comforts of home. We're not fooling...this is the cat's µ!

Powerful in computing muscle, yet small in physical size, the Altair* 680B offers many special features at an affordable price. Based on the 6800 microprocessor, the 680B comes with 1K of static RAM, Serial I/O port, PROM monitor and provisions for 1K of PROM as standard components. It's good thinking, when you're interested in making a modest investment on a highly reliable computer, to consider the Altair 680B.

Our PROM monitor eliminates the necessity for toggling front panel switches to load bootstraps or manipulate memory contents. Only a terminal and programming language are required for complete system operation. With Altair System software—Altair 680 BASIC, assembler and text editor—you may begin problem solving immediately with ease.

By adding the 680b-MB Expander card, many options are currently available:

* 16K Static Memory Board—Increase your system memory with 16K bytes of fast access (215 ns), low power (5 watts per board) static RAM. 680 BASIC and assembler/text editor are included free with purchase.

* Process Control Interface—A PC card that uses optically isolated inputs and relay outputs that transmit sensory information to and control signals from the computer. A diverse world of control applications is opened up with the Altair 680b-PCI.

* Universal Input/Output Board—If your I/O needs exceed the serial port already on the main board, augment your I/O channels with the 680b-UI/O. By implementing the optional serial port and two parallel ports, you can simultaneously interface to four terminals.

* New Addition—Kansas City Audio Cassette Interface—Use the 680b-KCACR to interface your Altair 680B with an audio cassette recorder for inexpensive mass storage of programming languages, programs and data. Available in either full front panel or turnkey models, the Altair 680B presents many computing capabilities at a low cost—without skimping on performance. See it today at your local Altair Computer Center or contact the factory for further details.

Good Thinking.
