Computers and the Professions
Introducing Macintosh.
What makes it tick. And talk.

Well, to begin with, 110 volts of alternating current.

Secondly, some of the hottest hardware to come down the pike in the last 3 years.
The garden variety 16-bit 8088 microprocessor.

Macintoshes 32-bit MOS88000 microprocessor.

Some hard facts may be in order at this point:
Macintosh's brain is the same blindingly-fast 32-bit microprocessor we gave our other brainchild, the Lisa™Personal Computer. Far more powerful than the 16-bit 8088 found in current generation computers.

Its heart is the same Lisa Technology of windows, pull-down menus, mouse commands and icons. All of which make that 32-bit power far more useful by making the Macintosh™Personal Computer far easier to use than current generation computers. In fact, if you can point without hurting yourself, you can use it.

Now for some small talk.
Thanks to its size, if you can't bring the problem to a Macintosh, you can always bring a Macintosh to the problem. (It weighs 9 pounds less than the most popular 'portable'.)

Another miracle of miniaturization is Macintosh's built-in 3½” drive. Its disks store 400K—more than conventional 5¼” floppies. So while they're big enough to hold a desk full of work, they're small enough to fit in a shirt pocket. And, they're totally encased in a rigid plastic so they're totally protected.

And talk about programming.
There are already plenty of programs to keep a Macintosh busy. Like MacPaint,™ a program that, for the first time, lets a personal computer produce virtually any image the human hand can create. There's more software on the way from developers like Microsoft™, Lotus™ and Software Publishing Corp., to mention a few.

And with Macintosh BASIC, Macintosh Pascal and our MacintoshToolbox for writing your own mouse-driven programs, you, too, could make big bucks in your spare time.

You can even program Macintosh to talk in other languages, like Yiddish or Serbo-Croatian, because it has a built-in polyphonic sound generator capable of producing high quality speech or music.

All the right connections.
On the back of the machine, you'll find built-in RS232 and RS422 AppleBus serial communication ports. Which means you can connect printers, modems and other peripherals without adding $150 cards. It also means that Macintosh is ready to hook in to a local area network. (With AppleBus, you will be able to interconnect up to 16 different Apple computers and peripherals.)

Should you wish to double Macintosh's storage with an external disk.
drive, you can do so without paying for a disk controller card—that connector's built-in, too.

There's also a built-in connector for Macintosh's mouse, a feature that costs up to $300 on computers that can't even run mouse-controlled software.

One last pointer.
Now that you've seen some of the logic, the technology, the engineering genius and the software wizardry that separates Macintosh from conventional computers, we'd like to point you in the direction of your nearest authorized Apple dealer.

Over 1500 of them are eagerly waiting to put a mouse in your hand. As one point-and-click makes perfectly clear, the real genius of Macintosh isn't its 32-bit Lisa Technology, or its 3½" floppy disks, or its serial ports, or its software, or its polyphonic sound generator.

The real genius is that you don't have to be a genius to use a Macintosh. You just have to be smart enough to buy one.

Soon there'll be just two kinds of people. Those who use computers. And those who use Apples. 🍎

The BYTE Reader: Who You Are

We do a lot of research about our readers and your interests, and we thought you might enjoy knowing more about the group you join when you subscribe to BYTE.

You are very well educated. More than 93 percent have gone beyond high school, with about 78 percent completing college, 23.5 percent holding master's degrees, 10 percent holding Ph.D.s, and 2.8 percent holding professional degrees. In all, about 40 percent have some graduate education.

Your fields of study in college are varied. Almost 25 percent of BYTE subscribers majored in electrical engineering, 5.2 percent in mechanical engineering, and 7.8 percent in other engineering specialties. Another 15 percent majored in sciences, 78 percent in computer science, and 6.8 percent in social sciences.

Of those BYTE subscribers who did graduate work, 14.8 percent studied business administration, 10.7 percent pursued electrical engineering, and 13.8 percent explored other areas of engineering, while 9.2 percent studied computer science, 13.5 percent physics or chemistry, 7.7 percent mathematics, 4.6 percent social sciences, and 9.2 percent other sciences.

Your occupations reflect your high levels of education and skills. About 15 percent of you are engineers in computers or electronics, 17 percent are engineers in other fields, 5.5 percent are computer scientists, 8 percent are in other fields of science, 13 percent are computer analysts or programmers, 11 percent are managers or administrators, 4.5 percent are students (though this number is growing fast), 4.5 percent are self-employed, and 6 percent are educators.

Some 47.3 percent of you have responsibilities including management and administration, 39 percent have responsibilities in product design and development, 37 percent in research and development, 37 percent in data processing, 14 percent in purchasing.

You use computers in many ways. About 75 percent of you use computers for personal, nonbusiness purposes, and 83.5 percent use microcomputers for business. As to your primary involvements with computers, some 23 percent cite involvement in hardware or software technology, while 20 percent cite use of computers as a management tool or in business applications. Half of you plan to buy a personal computer for nonbusiness purposes in the next year. In personal, nonbusiness use, the leading applications are programming (72 percent), word processing (70 percent), designing hardware or software (68 percent), followed by games, databases, personal finance, and spreadsheets (43 percent). In business, some 80 percent of you or your businesses use microcomputers for word processing, 63 percent for engineering or scientific applications, 63 percent for accounting, 38 percent for industrial control and processing, 37 percent for sales and marketing, 34 percent for electronic mail, 30 percent for investment management, and 28 percent for tax management.

Your favorite articles are about new technology, new hardware, new software, software applications, new peripherals, programming languages, operating systems, telecommunications, and computer graphics. You are also fond of hardware and software reviews.
68000-based systems. Just tell us what you need.

68000-based systems to fit your application.

Right from the pages of our catalog, we can deliver 68000-based supermicro systems to match virtually any application. Including yours.

Here's how.

Built on the IEEE-696 (S-100) bus, Cromemco systems offer up to 21 board slots. And a family of 35 boards — CPU, memory and specialized I/O — to fill the slots any way you choose.

At the heart of each system is our 68000/Z-80 dual processor. Backed by as much as 16 Mb of error-correcting RAM. Full multi-tasking capability. I/O to handle up to 16 terminals.

And that's just the beginning. You can select single or dual floppies, 5 1/4" or 8" A 21 Mb 5 1/4" Winchester hard disk. And a nine-track tape drive.

We can accommodate your taste for the exotic, too. With boards like our SMD interface that supports up to 1200 Mb of disk storage. An NTSC standard color graphics interface. A TV camera digitizer. A/D and D/A converters. An IEEE-488 bus interface. Communications. And more.

Intelligent workstations.

Then, if you're designing a distributed processing system, you'll want to take a look at our C-10 personal computer. The Z-80-based C-10 can serve our 68000-based systems as a powerful intelligent workstation in a distributed processing mode. Or as an independent personal computer with its own floppy storage.

High-level languages and applications software.

That brings us to software. It starts with CROMIX, our UNIX-like operating system that you're free to tailor to your application. CROMIX can execute both 68000- and Z-80-based programs. So right along with your 68000-based packages, your system will accommodate a wide selection of CP/M software written for the Z-80.

And our high-level language support is second to none. From a 68000 Macro Assembler. To 68000 FORTRAN 77, PASCAL, GSA-certified high-level COBOL, C and BASIC.

Cromemco means business. Your business.

You see, when we say, "Just tell us what you need," we're not kidding. You won't find another family of 68000-based microcomputers that can fit your needs as exactly as ours.

So if you're in the business of providing specialized computing solutions, you really should be doing business with Cromemco.

For a copy of our Systems Catalog, contact: Cromemco, Inc., 280 Bernardo Avenue, P.O. Box 7400, Mountain View, CA 94039. (415) 964-7400.

Circle 117 on Inquiry card.
Not surprisingly, you know a great deal about computers and have valuable information to share (if you want to share your knowledge by writing for BYTE, see the text box below). Almost 50 percent of you describe your skills in personal computing as advanced, and another 40 percent call your skills intermediate; the remaining 10 percent are college students and other bright novices who want to learn a lot fast.

You cite the comprehensiveness and depth of BYTE's coverage of personal computing as distinguishing it from other magazines. We consider that the supreme compliment.

We do research in order to make sure that BYTE continues to focus on your interests and needs. Since our staff shares your interests and matches your profile, we hope not only to do a good job, but also to enjoy it.

A Note on the BYTE Computer Shows

The first BYTE Computer Show takes place May 10 through 12 (Thursday through Sunday) at McCormick Place in Chicago, with the second to follow on June 14 through 17 (Thursday through Saturday) in Los Angeles. BYTE shows won’t be industry exhibitions where manufacturers and distributors make deals, but regional gatherings for users of personal computers, and especially for BYTE subscribers (who get an all-day pass to all exhibits and conferences for $7.50, as opposed to $15 for nonsubscribers).

At the BYTE Shows, you will have the chance to meet Steve Ciarcia, Jerry Pournelle, Gregg Williams, Rich Malloy, Mike Vose, Richard Krajewski, and other BYTE editors. You can attend conferences on subjects of greatest interest to personal computer users, such as 32-bit microprocessors, languages, graphics, programming environments, personal robots, notebook computers, idea processing, AI gateways to natural languages, and voice recognition. You can share information with other subscribers (users' report on low-cost 1200-bps modems, languages forum, home-brew databases, etc.) and get more involved in BYTE by participating in meetings on reviewing and writing for BYTE.

Equally important, the BYTE Shows are not just tempting “don't touch” exhibitions; they are fairs at which you can buy products from exhibitors if you find the machine of your dreams or the board, peripheral, or program you’ve been living without for too long.

We think the separate elements assembled under one roof—the conferences, the equipment and software on exhibit, the chance to meet fellow subscribers, and the opportunity to shop for a variety of personal computer products—will combine to make the BYTE Shows enjoyable for all BYTE subscribers and others who find personal computers as fascinating as we do.

See you at the Shows.

—Phil Lemmons, Editor-in-Chief

Writing For BYTE

BYTE continues to solicit and publish articles and reviews that keep you informed about what’s new and important in microprocessor-based technology, and many of our articles are still written by you, the people directly involved with the field we report on. Details on querying us about article, product-review, and book-review ideas are listed below. We also welcome submissions (typewritten and double-spaced, please) to our Letters to the Editor column. Please contact us, via the appropriate department at:

BYTE
POB 372
Hancock, NH 03449
(603) 924-9281

You may also want to call or write us (send a stamped, self-addressed business envelope) for our current author guidelines.

Articles

Because our editorial needs are very specific and subject to change, we prefer receiving query letters instead of completed articles. A query letter should contain one or two pages explaining the subject to be covered, its importance to the BYTE reader, and the focus of the proposed article; it should also contain a one- or two-page outline and a tentative first two pages of the proposed article. Query letters should be addressed to the features editor.

If you send us a completed article, we need double-spaced printed versions of the main text (up to 25 numbered pages) and all listings, figures, and tables; please label all items and place all captions on a separate page. Photos should be 35 mm (or larger) transparencies or 5- by 7-inch (or larger) prints. If possible, we would also like to receive magnetic copies of the text, listings, and tables on Apple DOS, IBM PC, Kaypro, or 8-inch CP/M disks; we will pay an additional $20 for this. The files should be standard ASCII text files and should not contain any nonprintable characters; we prefer files that use carriage returns only at the end of each paragraph. You should also include a stamped, self-addressed return envelope of the appropriate size. Address these to the features editor.

Product Reviews

We frequently need good product reviewers and sometimes accept unsolicited reviews. BYTE product reviews must be fair, accurate, and comprehensive. Reviewers must have considerable experience in the microcomputer field. Writing experience is preferred but not required, and reviewers must have no financial connection to the company whose products are being reviewed. If you are interested in becoming a BYTE reviewer, send a letter to our product-review editor stating what computer products you own, what products you are interested in, and what writing experience you have.

Book Reviews

BYTE is always looking for qualified book reviewers. Submit queries and proposals accompanied by a resume, writing samples, or a list of computer-related interests and expertise to the book-review editor. Unsolicited book review also will be considered.

We pay competitive rates for articles and reviews and offer you the chance to share your expertise with hundreds of thousands of BYTE readers. Your comments and submissions are always welcome.
Now, translate your integrated software into integrated hard copy, with the TI OMNI 800™ Model 855 printer. So versatile, it combines letter-quality print, draft-quality print and graphics as no other printer can. It prints letter-quality twice as fast as comparably priced daisy wheel printers, yet gives you characters just as sharp, just as clear.

It prints rough drafts ten times faster than daisy wheel printers... faster than most any other dot matrix printer. Only the TI 855 has snap-in font modules. Just touch a button; change your typestyle. The 855 gives you more typestyles to choose from than ordinary dot matrix printers. It makes them quicker, cleaner, easier to access than any other dot matrix or daisy wheel printer.

The 855's pie charts are rounder... all its graphics are sharper than on other dot matrix printers, because the TI 855 prints more dots per inch. As for daisy wheel printers... no graphics.

For under $1,000 you get twice the performance of typical dot matrix printers. Or all the performance of a daisy wheel printer, and then some, for half the price.

So get the best of all printers, and get optimum results from your integrated software. With the TI 855. See it at your nearest authorized TI dealer. Or call toll-free: 1-800-527-3500. Or write Texas Instruments Incorporated, P.O. Box 402430, Dept. DPF-182BY, Dallas, Texas 75240.

The TI 855 Printer
The printer for all major PC's
Paying $4000 for an IBM PC could make a tramp out of anyone.

Presenting the IBM® Compatible Chameleon for just $1995.

The Chameleon by Seequa lets you run popular IBM software like Lotus® 1-2-3™ and dBASE II.® It gives you a keyboard just like the IBM. A disk drive like the IBM. And a bright 80x25 character screen just like you know who. And it all comes complete at a price that isn't at all like an IBM.

But the Chameleon's $1995 price tag isn't its only advantage over its famous competitor. The Chameleon also has an 8 bit microprocessor that lets you run any of the thousands of CP/M-80® programs available. It comes complete with two of the best programs around, Perfect Writer™ and Perfect Calc.® It's portable. And you can plug it in and begin computing the moment you unwrap it.

So before you spend all your money on an IBM, consider the IBM compatible Chameleon by Seequa.

It's a tool for modern times that won't set you back a fortune.

The Chameleon by

Seequa Computer Corporation
8305 Telegraph Road
Olenton, MD 21053

Chameleon shown with optional second disk drive.

To learn more about Seequa or for the location of the Seequa dealer nearest you, call (800) 638-6066 or (301) 672-3600.

BYTE May 1984

Circle 343 on inquiry card.
AT&T UNVEILS COMPUTERS

AT&T announced a line of computers in late March, ranging from a $9950 multiuser microcomputer to a $340,000 supermini. The computers use the UNIX System V operating system.

The 3B2/300 microcomputer uses Western Electric's WE 32000 CMOS microprocessor and includes one 720K-byte 5½-inch floppy-disk drive, a 10-megabyte hard-disk drive, 512K bytes of RAM, four expansion slots, and ports for two users. Optionally, the computer can be expanded to 2 megabytes of RAM and a 32-megabyte hard disk. AT&T's optional I/O expansion card includes a parallel port and four RS-232C serial ports (which use an 8-wire modular jack), so that up to 18 terminals and four printers can be attached. While the base price of $9950 doesn't include a terminal, AT&T will sell its 5410 "dumb" terminal for about $600. AT&T's $6100 5620 terminal, which allows up to six windows to operate concurrently, can also be used, though a maximum of three can access a single 3B2. The 3B2 does not support color graphics.

AT&T also announced a PC interface, allowing the IBM PC to act as a workstation for the 3B2 using RS-232C, Omninet, or Ethernet communications. It also announced that its 3B Net will be available for any of its computers.

While some details and pricing were uncertain at the time of the announcement, AT&T said it would publish the bus and interface information for its computers and would encourage third-party hardware and software development.

AT&T also introduced larger computers. The 3B5 Models 100 and 200 include four to eight WE 32000 microprocessors and are priced from $57,000 to $73,000. The 3B20A, 3B20S, and 3B20D superminicomputers, priced from $230,000 to $340,000, use a real-time version of UNIX and have microprogrammed CPUs, using WE 32000s only for I/O and memory management.

ASHTON-TATE ANNOUNCES INTEGRATED SOFTWARE

Ashton-Tate, manufacturer of dBASE II, has unveiled an integrated software package called Framework. Using an outline structure with multiple frames (windows), the program allows elements of the outline to be spreadsheets, graphs, databases, text, or other outlines. Numerous functions are available throughout Framework. Print enhancements such as boldface and italic can be used in the spreadsheet or database as well as the word processor. Because the program includes its own programming language, programmers can develop specific applications using Framework. The program was developed by Forefront Corp., but Framework will be distributed by Ashton-Tate, beginning in July, for $695.

OLIVETTI, SORD INTRODUCE NOTEBOOK-SIZE COMPUTERS

Olivetti Corp. will begin selling its M-10 notebook-size computer in the U.S. With 8K bytes of RAM, a built-in 300-bps modem, and an 8-line by 24-column LCD that tilts for easy viewing, the M-10 will sell for $799; a 24K-byte version will cost $999. This computer is made in Japan by Kyocera, which also builds the Radio Shack Model 100 and the NEC 8201. Previously, the M-10 had been available only in Europe, due to a patent dispute among Olivetti, Kyocera, and Radio Shack.

Sord Computer also introduced a notebook-size computer, the IS-11 Consultant, which includes 32K bytes of RAM (expandable to 64K), a CMOS Z80A processor, and an 8-line by 40-character display. Integrated software for word processing, spreadsheets, graphics, communications, and window-management features is included on a 64K-byte ROM chip. The IS-11 will be available this month for $995; a version with a built-in 300-bps modem will cost $1095 later this year. Sord plans to offer 64K-byte ROM-pack-based applications software later as well as external monitor and disk-drive options.

TWO COMPANIES SEEK TO SELL AI-BASED SOFTWARE TOOLS

Texas Instruments announced it will license the NaturalLink Software Technology it used to develop software to access Dow Jones News/Retrieval, using plain English instead of complex codes. TI hopes software developers will pay $8000 to use the natural-language software technology to develop programs for the TI Professional Computer.

Expert Systems Inc., New York, and Jeffrey Perrone & Associates, San Francisco, are selling Expert-Ease, an expert systems generator. After information is entered into the system, the program makes decisions based on that information, ideally simulating the thought process of the “expert” who entered the information. Expert-Ease sells for about $2000.
MICROBYTES

PLASMA DISPLAY UNVEILED BY FORMER BURROUGHS DIVISION

Plasma Graphics Corp., Warren, NJ, a joint venture of Burroughs Corp. and Telex Computer Products, has introduced an 80-character by 25-line plasma display. The 3-pound unit has a 7.2- by 3.7-inch display, the equivalent of a CRT display with an 8.1-inch diagonal measure. Plasma Graphics says the display's current $1795 evaluation price should drop to a volume price of $300 to $400 in a few years.

CORVUS, AST ANNOUNCE CHANGES TO THEIR LOCAL-AREA NETWORKS

Corvus Systems Inc. announced Omnishare, a program allowing computers networked with Corvus Omninet to share the hard disk on an IBM PC XT. Previously, Omninet required a separate Corvus hard-disk file server. Corvus also introduced its new OmniDrive line of hard-disk drives with a built-in Omninet connection. Prices range from $1995 for a 5.5-megabyte drive to $4995 for 45.1 megabytes, plus $495 for Corvus Constellation II network software.

AST Research introduced PC-Net II. The twisted-pair network can use an XT or Tallgrass hard disk for shared files and includes a print-spooler feature. A starter kit, with manuals, cables, and two cards for the IBM PC, costs $1290; additional PC-Net II cards are $595.

Microsoft is also reportedly developing a new version of its MS-DOS operating system with multiuser/networking features.

BASIS GETS NEW DISTRIBUTOR, INTRODUCES LOW-COST VERSION OF 108

Basis is introducing a lower-cost version of the Basis 108 (reviewed in the January 1984 BYTE). The computer will include 128K bytes of RAM, Z80 and 6502 processors, and two 5½-inch disk drives for about $1500. Basis is also preparing a hard-disk version of the Basis 108 as well as 16- and 32-bit systems. (Communal Inc. [1400 Grant Ave., Novato, CA 94948, (800) 421-6594 or (408) 892-7139] is now the U.S. representative for Basis.)

NANOBYTES

IBM announced Displaywrite, a word-processing program for the IBM Personal Computer. An abridged version is available for $95, or all features are included for $299. IBM also announced a $13,000 low-end version of its System 36 computer with a 30-megabyte hard disk. . . . Both IBM and Commodore have been licensed to produce Intel's 8088 processor. . . . International Data Services Inc., San Jose, CA, has announced Unx-II, a $900 version of UNIX System III for the IBM PC. . . . Uniform Software Systems Inc. plans to introduce a version of the UNIX operating system that can run MS-DOS and UNIX software concurrently. . . . Zilog has licensed NEC Corp. to produce Zilog's Z80000 microprocessor. . . . IBM has made a grant to University of New Hampshire professor James Weiner to convert a Prolog interpreter developed at UNH to run on the IBM PC. Weiner predicts the interpreter will be available by August through UNH for less than $300. . . . Macrotech International Corp., North Hollywood, CA, introduced a $1395 S-100 processor board using Intel's iAPX286 and Zilog's Z80B. . . . Casheab, San Francisco, CA, introduced a music-synthesizer board for the IBM PC. The board will sell for $795 in late summer. . . . Daisy Systems Holland, Torrance, CA, introduced the QuietWrite printer, which it says is quieter than other daisy-wheel printers. . . . Capitol Data Systems, a division of Capitol Records, has entered the premium-quality disk business with a line of 5½-inch floppy disks. Capitol plans to add 3½-inch disks soon. . . . Synetix Inc., Seattle, WA, announced the PC-Handler, an expansion card for the IBM PC, allowing up to four IBM PC or Apple II computers to share files and peripherals. A Z80 processor, two serial ports, four parallel ports, and 64K bytes of RAM are included for $795. . . . Information Appliance, a Palo Alto firm headed by Jeff Raskin—originator of Apple's Macintosh—is developing a new product of its own. . . . Borland International, Scotts Valley, CA, has introduced a version of its $49.95 Turbo Pascal compiler for the IBM PCjr. . . . Atari has dropped its Atari Program Exchange, through which it sold third-party software. . . . Apple Computer will rely on third-party vendors to introduce peripherals for its Applebus low-cost local-area network for the Macintosh and Lisa 2. While Apple plans to introduce shared hard disks and laser printers, it does not presently plan to introduce additional low-cost Applebus peripherals. . . . A number of colleges are now offering course credit for TeleLearning's "electronic university" courses, which download and upload course materials, exams, and teacher-student messages. . . . Workman and Associates is finally shipping WRITE for CP/M-86. . . . Creative Solutions Inc., Rockville, MD, has announced MacForth for Apple's Macintosh. MacForth Level 1 costs $149; Level 2, with an assembler and additional functions, is $249.
Get A HeadStart On The Other Guys.

HeadStart Features:
Size: 15" wide, 11" deep, 10 1/2" high.
Weight: 25 lbs.
Processors: Z80A (8 bit) and 8086 (16 bit).
Memory: 128K to 1MB depending on model. All models are expandable.
Disk Storage: 500K to 1MB (unformatted) on a 3½" Micro-Disk.
Display: 12" (diagonal) phosphor non-glare screen. 25 lines x 80 or 132 columns.
Keyboard: Detachable with 105 total keys. An optional portable version snaps onto the front screen area for easy transportability.
Disk Operating Software: *CP/M 80 for 8 bit.
**MS DOS for 16 bit.LAN DOS for multi-user 8 or 16 bit operation.
Networking: Up to 255 HeadStart VPU's may be connected via coaxial interface into one of 2 optional data storage systems.
Optional Data Storage Systems: 2 models available. A 10MB, 5¼" system is expandable to 20MB. A 50MB, 8" system (25MB fixed, 25MB removable) is expandable to 200MB.
*CP/M is a registered trademark of Digital Research.
**MS-DOS is a registered trademark of Microsoft.

Intertec's HeadStart is the smallest, smartest, fastest, most powerful business computer money can buy. And the most expandable (it's networkable up to 255 user stations).

Great Ideas Come In Small Packages.
Instead of three bulky components, HeadStart needs only two—the keyboard and CRT. There's no need for a cumbersome disk and processor cabinet. With HeadStart, it's all in the CRT enclosure.

HeadStart's small but powerful 3½" disk drive offers as much storage as larger 5¼" disks. Its 8 and 16 bit processors make software availability no problem.

And HeadStart's small size permits easy transportability with no sacrifice in performance. Each Video Processing Unit (VPU) comes with its own easy-carrying handle. A portable keyboard option is also available.

How Fast Is Fast?
HeadStart's RAM Disk, an electronic emulation of the typical second drive, responds up to fifty times faster than conventional microcomputers.

Depress a key and you get a response within a split second. Literally before your finger leaves the key.

And HeadStart is incredibly powerful, too. Up to one megabyte of internal memory can tackle even the most sophisticated applications.

Some Ideas Are Bigger Than Others.
Because HeadStart is designed to be both a single and multi-user computer, you buy only as much computer as you need today.

But as your business grows, it grows with you.
Each HeadStart Video Processing Unit comes with its own memory, processors, disk and multi-user interfaces.

Just add a 10 or 50 megabyte Data Storage System and up to 255 users can share a common data base in an incredibly powerful, multi-user network.

HeadStart is available in three different models. All offer full performance, transportability, and are easily expandable.

Unlike conventional, single-user-only computers, HeadStart is here today with the designed-in technology to be here tomorrow.

So get a HeadStart on the other guys. For more information, call (803) 798-9100 or write: Intertec, 2300 Broad River Road, Columbia, SC 29210.
A picture worth $111,000,000.
Not long ago, three businessmen met in a coffee shop to talk about an idea for a new personal computer. They made a rough design on the back of a place mat.

A lot of companies were already making personal computers, but they thought theirs just might work better.

The next year, they sold $111 million worth of their new computers. the COMPAQ Portable and the COMPAQ PLUS™. No company in America had ever grown that fast. Why?

Simply because they offer, in a rugged, portable package, more capability than most other PC's. They're truly IBM-compatible, so all the most productive software runs as is. They display high-resolution text and graphics on the same screen. And they grow. Expansion slots take IBM-compatible boards, and a kit converts the COMPAQ Portable into the COMPAQ PLUS with its integrated ten-megabyte disk drive.

How does the future look? We look at it this way: If we came this far on the back of a place mat, just think of what we can do now.

For the location of your nearest Authorized Dealer, call 1-800-231-0900.

*From COMPAQ Computer Corporation. COMPAQ® is a Registered Trademark and COMPAQ PLUS™ is a Trademark of COMPAQ Computer Corporation. IBM® is a Registered Trademark of International Business Machines Corporation.
A User Looks at Mac

As an old-school microcomputer person (my first experience with a micro was in December 1977 on a Commodore Pet 2001), I’d like to give a more jaded view of the Apple Macintosh computer.

First, the Mac is an IBM PCjr competitor, not a PC competitor, as Gregg Williams states in "The Apple Macintosh Computer" (February, page 30). Compare both machines’ capabilities. The Macintosh has a maximum of 128K bytes of memory, one internal minifloppy drive, and a monitor. It is lightweight and portable, has no hardware expandability, and its software is upwardly compatible to the Lisa 2. The PCjr also has a maximum of 128K bytes of memory and one internal floppy drive. It is too lightweight and portable, has minimal hardware expandability, and its software is upwardly compatible to the PC.

On the other hand, the IBM PC (and variants) have 64K to 128K bytes of memory (expandable up to 640K bytes), massive hardware expandability, and multiple floppy and hard disks.

Second, anyone who has worked seriously with computers knows that if speed is the top priority, then tight assembly language is required—but you pay for that speed by having code that is virtually incomprehensible to anyone who did not write it. Forcing software developers to write tight assembly-language code (just to fit memory limitations) will slow the amount of software reaching the market—and raise its price. As Steve Jobs points out ("An Interview: The Macintosh Design Team," February, page 58), once software is developed, it is paid for. So, if Apple plans to sell 10 million Macintosh computers, it obviously expects to sell 10 million copies of Mac BASIC, Mac Paint, and Mac Write. If Apple makes $50 profit a shot, then the company makes at least an extra $500 million. (Who said there’s no attention paid to quarterly profits at Apple?)

My third complaint is that the Mac is not expandable. What do I do when I outgrow my machine? I would have no choice but to scrap the $2500 machine and buy a $3500 system. However, Apple will point out that you get to keep your software.

I know everybody will complain that I am ignoring the wonderful software that makes Mac the machine it is. But how much are you willing to pay for that software? The Mac is potentially more powerful than the PC, but Apple has so hobbled it that it is not much more powerful than the PCjr.

For the record, I think Mac and Lisa 2 have some wonderful software; but if you really want the software, buy the Lisa 2. At $3495, it is probably the best mass-produced high-end computer on the market today. For only $1000 more than you would pay for Mac, you get the expandability that was cut out of Mac (such as large memories and hard disks). In addition, you get another 384K bytes of memory thrown in (the price differential is only what IBM would charge for 384K bytes in chips). As a final bonus, you can get either Mac’s or Lisa’s operating system. However, you should buy a Lisa 2 quick, because once the differences become evident, Apple will probably raise the Lisa 2’s price because of the skyrocketing demand.

George Snoga
1910 Harpers Ferry
San Antonio, TX 78245

Gregg Williams replies:
Your points about the Macintosh’s similarities to the IBM PCjr are well taken; however, I am puzzled by your insistence that the Macintosh is not expandable. My article speaks of the “virtual slot” scheme that makes future peripherals possible and announces the availability of a keypad, a second disk drive (soon), and a 512K-byte memory update (by the end of the year). These alone make the Macintosh more similar to an IBM PC than a PCjr. At the Macintosh announcement date, about 30 third-party vendors announced dozens of software and hardware packages, including two hard disks, two telephone/modems, a printer buffer, and numerous software packages; other vendors have joined since, and some products are already available. Once the Macintosh has 512K bytes of RAM, the powerful operation set of the 68000 and the 128K-byte “toolbox” of routines make it possible to argue that the Macintosh is computationally superior to an IBM PC with 640K bytes of RAM.

I agree with you, though, that I’d rather have a Lisa 2 than a Macintosh for my office. Whatever expansion the Mac has, the Lisa 2 will have more, and its ability to run all Macintosh software ensures its vitality.

Letters

More Mac Reactions

After interminable months of speculation and rumor, the Macintosh has arrived. Apple’s “secret weapon” has been released with a flurry of expensive prime-time advertising touting the Macintosh’s icon-oriented, mouse-implemented user interface. With the introduction of the Mac has come a plethora of new terminology to be added to the already burgeoning inventory of high-tech buzzwords. In the wake of Macintosh, words such as “icon,” “desktop metaphor,” and “pull-down windows” are becoming ever more common.

As is to be expected with any new product, especially one that promises to turn the increasingly staid world of personal computing on its ear, the Macintosh has not been uniformly well received. One prominent and oft-repeated criticism is the Macintosh’s lack of “compatibility.” This indictment, of course, refers to Apple’s deliberate choice not to give the Macintosh the capability to run software that is currently in vogue. Several reviewers, most notably Peter McWilliams, have cited this “problem” and stated that the Macintosh is doomed to failure because of it. To dismiss Macintosh for this reason is to sacrifice utility at the altar of uniformity.

It cannot be denied that CP/M and its progeny have carved out a substantial following. Likewise, no one can question that the IBM Personal Computer has become the de facto standard by which all other hardware is measured. Assuming all of this, one nagging question remains: why have these products become so prominent? The answer lies in the meaning of the phrase “de facto.” CP/M and the IBM PC have literally stepped into the breach. They have created a standard through blood, sweat, and tears. Quality and performance have been cast aside in the search for conformity. The fear of being different has seized the personal computer industry and has transformed innovators into imitators.

Instead of being ostracized, the Macintosh should be welcomed as a breath of fresh air in an atmosphere that has become cloistered and stagnant. Were it not for the people involved in developing the Macintosh, personal computer users would still be mired in a swamp of incomprehensible keyboard sequences
Introducing... SixPakPlus™, the refreshing new 384KB multifunction card! In response to the changing needs of the IBM PC and PC-XT marketplace, AST Research, Inc. is proud to announce the latest addition to our line of multifunction enhancement products, the SixPakPlus! This new product is the result of extensive marketing research into the needs of IBM PC users whether they have the original 64K system board, the newer 256K system board, or the PC-XT. The SixPakPlus has been engineered to meet these needs at a competitive price while main-
taining AST’s high standards for quality and reliability.

The SixPak, as we like to call it, could have been named for the six banks of RAM on it. However, we like to think that it was named for the six functions of the card. The features of the SixPak include:

1. RAM memory starting at 64K, user-expandable in 64K increments to 384K. This makes the SixPak ideal for the PC or PC-XT with a 256K system board; 384K on a SixPak added to 256K on the system board yields 640K, the maximum addressable user memory in these systems.

2. One Serial (async) communications port, configurable as either COM1 or COM2, for use with serial printers, modems, a "mouse," and other serial devices. The serial port has on-board jumpers for easy management of the RS-232C lines, simplifying the wiring of cables in many installations.

3. One Parallel (printer) port, configurable as LPT1 or LPT2 (LPT2 or LPT3 when the IBM monochrome card is installed), for use with the IBM/Epson and other compatible printers. The port is compatible with IBM diagnostics.

4. A Clock-Calendar with battery backup, featuring an easily replaceable Lithium battery and a quartz-controlled timebase for a high degree of accuracy.

5. An optional IBM-compatible Game Adapter port, for use with an IBM-type joystick. In conjunction with application programming, this game port may be used for cursor control, in generating graphics or for playing games at the end of your work day!

6. Every SixPak comes with an AST SuperPak utility diskette which includes SuperDrive and SuperSpool, the most powerful disk emulator and print spooler software you can get. These programs will greatly enhance the throughput of your PC or PC-XT by emulating disk drive and printer access at RAM speeds rather than the normal slower speed of mechanical devices. SuperPak is the first of such software to be compatible with both DOS 1.1 and DOS 2.0.

Most important of all, the SixPak comes with the AST "Plus," AST’s unsurpassed reputation for quality, reliability, after-the-sale support, and overall design excellence that gives our products the best price/performance ratio in the industry! Hence the name, SixPakPlus!

AST products are available from Computerland, Entré, ComputerMart, and selected dealers worldwide. Call factory if your dealer does not have the AST products you want.

“Point and click” has become the means by which everyone can enjoy the versatility and power of state-of-the-art microprocessor technology.

Ideally, hardware manufacturers and software developers should be oriented toward a common goal. The goal is simple: to put the greatest amount of information-processing power in the hands of the greatest number of people. This objective will not be achieved without a drastic restructuring of the status quo. To the vast majority of this country's population, personal computing remains a dark art. Perpetuating the existence of this arcane science will only benefit those who seek to monopolize and, therefore, control the flow of information in our society.

When Apple first began to advertise the Macintosh, they used a “1984” theme, with Big Brother obviously being played by IBM. In fact, the theme that was used might not be too far from the truth. With the follow-the-leader approach that is being taken by nearly everyone in the personal computing industry, there is a very real chance that the vitality and creativity of that endeavor may be extinguished.

This cannot be allowed to happen. Instead of being criticized for refusing to follow the crowd, Apple Computer and the developers of Macintosh should be commended for their efforts. People can only remain a slave to their machines for so long.

Chicago, IL 60613

The Apple Macintosh, previewed in February, looks like a fine computer with its powerful 68000 microprocessor and sophisticated system software. However, I think the Macintosh development team committed a fundamental design error when, having exhausted ROM space, they placed their floating-point software in RAM. Software running out of RAM executes approximately 25 percent more slowly on the Macintosh than does software running out of ROM.

It would have been more appropriate for them to have moved some of their user-interface or I/O software to RAM instead. Software that deals with mice, keyboards, and printers can run more slowly than 6 MHz (the effective RAM-based clock rate) before there is any perceptible loss in speed of a program running on a single-user system.

As for the floating-point software itself, I inquired whether Apple had implemented the complete IEEE double-precision package. The answer I got—after cross-country phone calls to five different offices—was to send $150 for a draft copy of Apple's manual Inside Macintosh, plus another $100 for the first bound edi-

The new 384K Quadboard by Quadram is the most comprehensive board you can buy for the IBM PC or XT. Now with added hardware features and advanced software. But at a very low price.

**NEW EXPANDED QUADBOARD**
Quadboard now delivers 9 of the most needed PC functions/features. To let you get the most out of your Personal Computer. And help you work better and faster.

All of these features are standard on the new Quadboard:
- **Parallel Port**: With the new Quadboard, you get a Parallel Port. Perfect for operating most printers and other parallel devices.
- **Serial Port**: There's a Serial Port, too. Fully programmable, use it to connect to plotters, modems, and other serial devices.
- **Chronograph**: And Quadboard's Chronograph (Real-time clock/calendar) keeps your system's clock up-to-date.
- **Game Port**: The new Quadboard has an IBM compatible Game Port. Plug in a joystick or game paddles, and fire away.
- **I/O Bracket**: Quadboard now comes with a special I/O bracket. Use it to organize your expansion port connectors. Snaps right onto the back of the PC.
• Expandable to 384K: The new Quadboard is expandable in 64K increments for up to 384K additional RAM. With full parity checking standard. With the new Quadboard and a fully populated system board, you can take your PC's memory up to the 640K limit.

• QuadRAM Drive: Plus, with Quadboard you get advanced QuadMaster Software. Including the QuadRAM Drive program. Use it to set up multiple RAM Drives in Quadboard memory. Solid state drives that let you store and retrieve data quickly and easily. Or take advantage of QuadMaster disk caching. To access frequently used data whenever you need it.

• MasterSpool: QuadMaster Software also includes MasterSpool. Use it to set up a software print buffer quickly and easily. This advanced spooler lets you pause at any time, back up or move forward in a file. Choose just the amount of buffer space you need and stop waiting on your printer.

• Qswap: Another feature of QuadMaster Software is Qswap. With Qswap change line printers 1 and 2 back and forth, with just a few keystrokes, as often as you like.

QUADBOARD STANDS OUT FROM THE PACK

Now more than ever Quadboard is the first and only board your IBM PC or XT may ever need. No other board even comes close. Because Quadboard is designed for performance. Engineered for dependability. And built in the continuing tradition of Quadram Quality.

Compare. See why more Quadboards are bought than any other multifunction board...

Morristown, NJ 07960

I found Mr. Williams’s article on Apple’s Macintosh disturbing because of the unfeathered and naive enthusiasm displayed toward the product and, for that matter, the manufacturer. This material would be expected from a manufacturer or his representative but not from a member of your editorial staff. Journalism of this type severely reduces the credibility of your magazine in presenting unbiased and knowledgeable reviews of new products.

I have 25 years of professional experience as an end user of computer equipment, and I arrived at a considerably different picture of the Macintosh than the one described in your article. Some of the Macintosh’s features are more in Apple’s corporate self-interest than the user’s. Others represent questionable design criteria, and some are just plain “gee-whiz” features with no more substance than tail fins and chrome. Obviously, if I had written the article, a somewhat different story would have been printed.

My negative opinion of the Macintosh may be as unfair as Mr. Williams’s positive appraisal. The microcomputer marketplace is a jungle with many pitfalls for both neophytes and pros. It behooves any widely circulated publication like BYTE to make every effort to provide balanced and objective reviews of new products. Your less-sophisticated readers need all the help they can get.

Gerald I. Evenden
POB 1027
N. Falmouth, MA 02556

Gregg Williams replies:

Permit me to add some perspective to your evaluation of my article. In many ways, I have an enviable job that I have been able to review some of the best products our industry has produced. Because of this, they get largely positive reviews (less worthy products would not deserve to be on the cover of BYTE and other magazines). Still, I did point out a number of important areas of dissent: the single built-in disk drive, the unbundling of Macintosh prices, and the “hype [of] a machine that easily stands on its own merits” in calling the Macintosh a 32-bit machine. In addition, the article took over weeks to research and write and contains much technical information and commentary that has not been included in any other Macintosh article. For further perspective on the Macintosh, see my article, “Update on Apple Macintosh and Lisa 2,” on page 339.

I was disappointed that your industry-leading magazine missed what nontechnical magazines such as Time and Rolling Stone reported about the origins of the Macintosh computer. As they pointed out, the Macintosh concept—a low-cost, monochromatic bit-mapped, small, and extremely friendly computer—was my creation.

The original team that I put together to build it included Burrell Smith, hardware designer, Bud Tribble, software designer, and Brian Howard, an unsung hero of the project who contributed to the concept, software and hardware design, and the overall feel of the project. Brian (who, for some reason, was not mentioned in your article) and Burrell are still with Mac, but Bud went back to school and got his M.D.

I became C.E.O. of Information Appliance Inc.

I also gave the Macintosh its name. The change in spelling was not an error as you reported, but done deliberately to avoid potential conflict with the electronics manufacturer named "McIntosh.”

Interestingly enough, Steve Jobs actively opposed the project at its inception, and only after we had proved the concept did he become the Macbooster that he now is. Reading the BYTE article one might get a very different impression and would not give credit where it is due.

I am writing in regard to “The Apple Macintosh Computer” by Gregg Williams (February, page 30). In his article, Mr. Williams points out that although Apple refers to the MC68000 as a 32-bit processor, he believes that it is generally regarded as a 16-bit processor.

Although no one has been able to come
tion (publication date uncertain), plus another $50 for updates.

Apple is promoting the Macintosh as an “open” system (the meaning of this term seems to be deteriorating with time), but it sure is charging a lot for the key.

THE PRINTER TO PICK
WHEN THE PACE QUICKENS.

It's happening all over the PC and micro worlds.
You're getting hit with a ton of increased throughput requirements. Your applications are generating a deluge of paper. You need more printer speed. A lot more.

You're also looking for more professional-looking presentations so you need better print quality. A lot better.

Who's got the best of both worlds for you?

Okidata's Pacemark 2350 and 2410 dot matrix printers.

They'll not only help you keep pace with your world, they'll help you set new and exciting ones. In print speed. In print quality. And in vastly increased compatibility and capability.

Take throughput. The 2350 and 2410 can quickly get you out of the waiting game to where you're really cranking it out. And with flexibility, too: up to 5 pages per minute.

But wait. Cranking what out, you may ask? A single, restrictive printing mode? No way. The 2410 can give you DP, draft, and a correspondence quality that truly rivals the daisywheel.

And the 2350 and 2410 can both print at up to 350 cps. While producing 120 to 420 lines a minute for you. With bidirectional printing and short line seeking logic. And both high speed horizontal and vertical slew.

PC COMPATIBILITY.
SOFTWARE COMPATIBILITY.

The 2350 and 2410 use industry standard interfaces making them hardware compatible with most mini and micro-systems on the market today. In addition, they are supported on the menus of most of the important software being offered to microsystem users like Visicalc, Lotus 1, 2, 3, DBASE 2, Peachtree 500 and General Ledger, Multi-Mate WP, Wordstar, etcetera, etcetera.

But wait, there's more. Like an outstanding all points addressable graphics capability with 144 x 144 dots per inch resolution.

Two color printing for highlighting. Down line loadable font sets for flexibility.

Subscripts and superscripts so your scientific and technical usage won't bog down. Six-part forms handling. The capability to print 132 columns on eight-inch paper using 17.1 characters per inch to save paper costs and make output easier to handle.

And—so that you can depend on getting all that good stuff, all the time—a mean time between failure of 2200 hours. A mean time to repair of only 30 minutes. An average printhead life of 500,000,000 characters. And an industry low warranty claim rate of less than 2%.

No doubt about it, the quicker the pace at your place, the more you need Pacemark from our place. For more information, call toll free 1-800-OKIDATA. In New Jersey, 609-235-2600. Or write OKIDATA, Mt. Laurel, NJ 08054.

We're keeping pace with your business.

OKIDATA
an OKI AMERICA company

up with a concrete way to determine the bit size of any given processor, there are two commonly used methods. The first is to rate the processor by the width of the external data bus, and the second is to rate it by the width of the internal data bus. Mr. Williams makes the assertion that the correct way to determine size is to rate the processor by the maximum size of a multiplicand in arithmetic operations. Let me address each of these methods individually.

Determining the size by examination of the external data bus was, until IBM entered the microcomputer marketplace, the most commonly accepted method of rating processor size. It is still probably the best way because most microprocessor systems’ speed is limited by the data bus bandwidth (memory accesses per second times size of data bus).

IBM, through its PC advertising, has endorsed rating the processor size by using the internal data bus size. This allows them to call the 8088, which has an 8-bit external data bus, a 16-bit processor. It is interesting to note that Intel, the designer and manufacturer of the 8088, refers to this processor as an 8-bit unit (source: 1982 IC Master, page 1083).

Mr. Williams’ contention that the size is determined by the maximum multiplicant size is absurd. Rating a processor by this method results in both the 8080A and 6502 processors being 0-bit micros, which I am sure even Mr. Williams will admit is untrue.

Comparing the sizes of some common microprocessors using the above criteria brings about the results shown below.

As I stated, I believe that the measure of the external data bus is the most valid method of determining processor size. Using the width of the internal bus results in the 8088 and 8086 being the same size, which, although true from a software point of view, is not true for the hardware. Because most people use the processor size as a relative indicator of computational speed, the external data bus width is the measure that has the most bearing. Unfortunately, IBM has set the (de
in this age of information processing, perhaps the most important information processing occurs between your eyes and your monitor screen. An unclear on-screen image can visually distort the most accurate information, leaving valuable information lost somewhere between the lines.

You won’t take that chance with a monitor from Roland DG. For us, clarity is not just a good feature, it’s our most important feature.

We designed the Roland DG monitors as if a sharp image was all that mattered. Then we started adding on the extras—like easy plug-compatibility, non-glare screen and other features. Then we styled them so that they look sharp from any angle—not just the front.

Roland DG makes a broad range of monitors, to suit any personal computer and to please any computer’s person. From high resolution RGB and Composite Color monitors to Monochrome Composite or TTL signal (IBM-PC) in either Amber or Green.

If accuracy is important to you, you shouldn’t settle for anything less than a Roland DG monitor—the clear choice. Because the most important information processor is you.

Roland monitors are available at fine computer dealers everywhere. Roland Digital Group, 7200 Dominion Circle, Los Angeles, CA 90040 (213) 685-5141.

there’s a Roland DG monitor for every computer’s person!
Today, you have to live in two different worlds. One belonging to IBM. The other to everyone else.

With that in mind, companies have come along with a variety of products that attempt to link the two together. The AVATAR Protocol Converter is the most intelligent way to bring personal computers, portable computers, or low-cost ASCII terminals into the IBM coaxial environment. For the first time, overburdened DP/MIS executives can look forward to truly smooth integration, minimal confusion, and fewer demands on their time. And users can get an affordable, easy-to-use way to tap the riches of their IBM mainframes.

So if you’re looking for the best of both worlds, keep reading. And you’ll see why the AVATAR PA1000 can out-think any product on the market.

First of all, the AVATAR PA1000 is an almost universal link. With no modification, it connects to virtually any personal or portable computer you have: IBM, Apple, DEC, TRS 80, Kaypro, COMPAQ, NCR, and others.

The AVATAR PA1000 also connects to the DEC VT100, IBM 3101, LSI ADM5, Televideo 910, ADDS Viewpoint or other compatible terminals.

The PA1000 connects coaxially to an IBM 3274/3276 cluster controller, so whatever personal computer or terminal you use will perform all the functions of an IBM 3278-2. The coaxial connection also means you won’t be in for a future shock: ever-changing IBM protocols will be no problem.

The AVATAR PA1000 compares to the IRMA LINE™:

Two hosts are better than one. So in addition to the coax connection to IBM, the
AVATAR PA1000 gives you an extra RS232 port. That gives you access to other local or remote asynchronous host computers or local printers. HELP! If you need it (and who doesn't) you have help screens to put you back on track. The PA1000 also has easy-to-use, English language commands. With a few simple keystrokes, you can switch from your IBM to the extra RS232 port, giving you access to private data networks and public databases like Dow Jones. And when you switch back, the AVATAR PA1000 is smart enough to remember your IBM screen. In a distributed terminal network, remote dial-in from personal computers or asynchronous devices is increasingly important. You can dial into your PA1000 at the nearest cluster controller, and reduce communications costs dramatically in the process. Just by typing "1-2-3" (how much simpler can you get?), the PA1000 automatically determines the baud rate of the attached device and is ready to go. In just five minutes (no kidding) you can install the AVATAR PA1000. And you don't need to be a computer operator. The AVATAR PA1000 even gives you a file transfer option that lets you transfer information back and forth between your personal computer and an IBM mainframe. What will AVATAR think of next? The latest news is our PA1500, a link that lets you print the output from your IBM host on a low-cost ASCII printer. It supports high-speed dot-matrix, letter quality, and line printers. It's very simple to install. And it will save you a bundle.

To find out more about the AVATAR PA1000, our company, our distributors and dealers, or our plans, just call us. In Canada or Massachusetts: 617-435-6872. Everywhere else: 800-828-2004 Ext. 600.

The Link That Isn't Missing Anything.

data the microprocessor works on at a time. Does this help us? Hardly, because once we get to this level of detail, the philosophies of chip design muddy the water. The NS16000 family has 32-bit ALU buses. The Motorola family is more complex: the 68000 (16-bit external bus), 68008 (8-bit), and 68010 (16-bit) have three 16-bit ALUs, while the 68032 (with a 32-bit external data bus) has three 32-bit ALUs.

Finally, to complicate the issue even more, let me relate another possible descriptor mentioned by our editor in chief, Phil Lemmons. Things change if you look at the problem of describing the "power" of a computer from a user's point of view. A user doesn't care what operating system is running or whether the microprocessor has an 8- or a 16-bit data bus—this person just wants to know, "Will it run fast enough so I don't have to wait too long?" and "What software does it run?" Computation speed can often be improved by using a chip with a higher clock frequency, but software complexity is determined by the address space of the microprocessor—a feature that is usually fixed, especially on 8-bit chips that are not part of a family of similar products. (We are assuming that software is easier to use if it has Help screens, a sophisticated user interface, and other features that make programs more complex and, therefore, larger.) From this reasoning, we can argue that the address bus, which measures the total amount of memory that a microprocessor can address, is a good descriptor of a microprocessor's power. Many popular programs need more than 64K bytes to run in the limit of traditional 8-bit microprocessors. As memory gets cheaper and we find ways to fill it up, there may be a very real difference between microprocessors that can address 1 megabyte of memory (20-bit address bus) and 16 megabytes of memory (24-bit address bus). In addition, if a microcomputer has been designed to use less memory than the microprocessor itself allows, we should make note of that fact as well.

As a result, in BYTE we will state both bus widths—for example, we will describe the 8088 as a "16/8-bit microprocessor (16-bit internal data bus, 8-bit external)" and the 68000 as a "32/16-bit microprocessor." In recognizing that the value of a commercial product is determined by more than just these descriptors, we will try to give all the information that presents a product in the most accurate way.

In the "At a Glance" text boxes that accompany our reviews, we will place more emphasis on the internal and external data paths and the maximum amount of memory the computer can address.

**Clock-Time Benchmarks**

I generally enjoy benchmark articles and thus found the February BYTE full of interesting comparisons. I feel compelled to comment on one aspect of Avram Tetewsky's article, "Benchmarking FORTRAN Compilers" (page 218). The author goes to great lengths to obtain "true" results for the larger multiprocessor systems in the comparisons, the VAX 11/780 and the IBM 3081D. Thus, Tetewsky reports only CPU time, runs benchmarks in the early morning hours so there won't be other tasks slowing the system, and

Kentwood, MI 49508

Gregg Williams replies:

Thank you for your letter. It summarizes discussions that have gone on here at BYTE since I wrote the Macintosh article. We have decided that the situation is too complex to be accurately specified by one descriptor: the multiplaned does not describe the Intel 8080 well, nor does the internal-bus descriptor describe the 8088 (which runs 10 to 40 percent slower than an equivalent 8086—see my article, "Benchmarking the Intel 8086 and 8088," July 1983, page 147) well. In addition, even the external-bus descriptor falls short.

Consider the National Semiconductor NS16008; even though it has an 8-bit external data bus, it is a 32-bit architecture internally, including a 32-bit by 32-bit multiply instruction. Surely, this kind of power puts the NS16008 in a different class from, say, the 8080.

Another descriptor that I have just discovered is that of the bus width of the arithmetic logic unit (ALU), that area of the microprocessor chip that performs the arithmetic and logic functions that the chip allows. The ALU bus width feels intuitively right—it is the ultimate measure of how much
“Our business is wholesaling tropical fish to pet stores. We’re not a large-sized company, but we have one whopper of an inventory-control problem. That’s where dBASE II® comes in.”

The one that didn’t get away.

“We needed a fast program, and dBASE II, the relational database management system from Ashton-Tate, gave us the speed we needed to quickly log in our weekly live-fish shipment in terms of total numbers received, the kind and numbers of each different type, the cost per fish—all critical factors in determining our pricing and being able to pass along savings to our customers whenever possible without hanging us out to dry profitwise.

“We’re sure glad we bought dBASE II when we did. I think our customers are glad, too.”

Once you try dBASE II, you’ll be hooked.

If you’re up to your ears with data that has to be managed quickly and efficiently, dBASE II can really help you stay afloat.

For all the particulars, contact Ashton-Tate, 10150 West Jefferson Boulevard, Culver City, CA 90230. (800) 437-4329, Ext. 212. In the U.K., call (0908) 568866.
LOOK NO FURTHER! we'll get you low prices and fast service, or else!

even removes the I/O time of a slow terminal.

I wish to question the fairness of comparisons in which one class of computers is judged by clock time and another is judged by some mythical “true” time. As a computer user I go by clock time to measure job turnaround. If multiuser systems have a large overhead in dealing with multiple tasks, why shouldn’t that be reflected in the benchmark times?

I have a number of Pascal programs that I run on both an IBM 3033 and an Apple II using the UCSD p-System. I typically get results from my Apple 5 to 30 minutes faster than from the IBM. Admittedly, the IBM 3033 runs the programs in several hundredths of a second, but one can spend a long time in both the exec and printer queues.

I suggest that all future benchmark articles that refer to both microcomputers and mainframe systems use the same standard for judging both, namely clock time.

Philip B. Ender, Ph.D.
UCLA
Graduate School of Education
Los Angeles, CA 90024

Thinktank

I wish to thank Mr. Lemmons for bringing Thinktank to the attention of your readers in “Beyond the Word Processor” (January, page 53).

I used an early version of Thinktank on the Apple II, running under Apple Pascal. FYI, as it was called then, quickly became my most important program (after my word processor and spelling checker). I used it as a reminder program, an outline maker for reports and stories, and as a general aid to thinking. For people who think in headlines and fill in the spaces afterward, it is an idea database without equal. I highly recommend it if you have an Apple, a Macintosh, or an IBM PC.

My only regret is that Living Videotext chose to expand in the direction of MS-DOS, rather than modifying Thinktank to work under UCSD Pascal IV. I miss the program and wish it would run on my Sage II.

Gerald Perkins
643 Channing Ave.
Palo Alto, CA 94301
And it's happening again with our IBM compatible Rana 2000. This 320K double density drive offers a large centering cone for problem-free diskettes and our exclusive silencing mechanism to make it the quietest disk drive you can buy.

At Rana we know the key to our success is providing the highest technology, on the best possible products, while filling the most possible user needs. That is why we spend so much time on research and development. Our world-renowned engineers were the first to offer increased capacity. The first to design a write protect feature. The first to use a metal band positioner and get 100% data integrity, and a 3 to 4 times improvement in access speed. And, the first to bring you all this performance, quality and dramatic styling.

This is why our Elite One got the #1 rating from Softalk Magazine. And our Atari™ compatible Rana 1000 Slimline has turned a game computer into a sophisticated business tool. And soon we'll have a new Winchester drive and a new series of very high density miniloppies, for both IBM and Apple.

So call or write for the nearest Rana retailer or computer store. We're Rana Systems. And we know that to keep a step ahead, we have to put you first.

ANNOUNCING...

NOW WE'VE ADDED EVERYTHING TO TURBO PASCAL
(EVERYTHING EXCEPT A HIGH PRICE)

• WINDOWING!

...This is a real shocker. On the IBM PC or PC jr. you'll now have a procedure to program windows....Any part of the screen can be selected as a window and all output will automatically go to this part of the screen only. As many windows as you please can be used from the same program.

• AUTOMATIC OVERLAYS!

...No addresses or memory space to calculate, you simply specify OVERLAY and TURBO PASCAL will do the rest.

• GRAPHICS, SOUND AND COLOR SUPPORT FOR YOUR IBM PC OR JR!

• FULL HEAP MANAGEMENT!

... via dispose procedure.

• OPTIONAL 8087 SUPPORT!

... Available for an additional charge.
If you have a 16 bit computer with the 8087 math chip—your number crunching programs will execute up to 10X faster!

EXTENDED PASCAL FOR YOUR IBM PC, PC jr., APPLE CP/M, MSDOS, CP/M 86, CCP/M, OR CP/M 80

• Full screen interactive editor providing a complete menu driven program development environment.
• 11 significant digits in floating point arithmetic.
• Built-in transcendental functions.
• Random access data files.
• Program chaining with common variables.
• Dynamic strings with full set of string handling features.
• Full support of operating system facilities.
• And much more.
HERE'S WHAT THE REVIEWERS HAVE SAID ABOUT TURBO PASCAL

“What I think the computer industry is headed for: well documented, standard, plenty of good features, and a reasonable price.”
Jerry Pournelle, Byte, February 1984

“Finally, somebody has done it right. A powerful Pascal Z 80 or 8086/88 single pass native code compiler together with a full screen editor and error checking to make a super programming development package.”
David Carroll, Microsystems, February 1984

“The Perfect Pascal”
Alan R. Miller, Interface Age, January 1984

“It is, simply put, the best software deal to come along in a long time.”
Bruce Webster, Softalk IBM, March 1984

LEARN TO WRITE A SPREADSHEET
Our offer includes MICRO-CALC, a spreadsheet written in Turbo Pascal. It will be on your disk, and ready to run. And we’ve included the source code to show you exactly how a spreadsheet is written!
George Orwell and 1984

I am at a loss to understand why, in an otherwise balanced and penetrating article, G. Michael Vose would choose to "rewrite" the history of George Orwell and his most famous work ("1984 and Beyond," January, page 100). His description of Orwell (Blair) as a fanatic anticommunist conjures up a caricature, a half-baked mixture of Joe McCarthy and Doctor Strangelove. Mr. Vose then limits Orwell's portrayal of a dismal future to one dominated by "fascists." All of this implies that Orwell was an unbalanced individual, describing a threat from only one source.

Yet Orwell and his book were no such thing. He was anticommunist certainly, but also an idealist, humanist, and passionate socialist, and one who in no way considered himself part of the "right," fanatical or not. Neither did he take the easy way out in constructing the government of the future, one that would have conveniently ignored the tyranny growing beyond the Elbe. Orwell was opposed to any system that enslaved both the individual and society and labeled such systems with the more useful and inclusive term totalitarianism.

As Mr. Vose correctly notes, the personal computer may prove an aid in preventing such a future. You can bet computers won't be a mass-consumer item in any totalitarian society, fascist or communist.

FPO San Francisco, CA 96683

Penny-Wise

In the February BYTE, Jerry Pournelle's User's Column (page 113) addressed the use of the "Disk Doubler" to enable the use of the back side of disks on single-sided drives. I was glad to see that he recommended against using this tactic, but I feel that he left out the most important reason for not using it.

The inside of a disk jacket is lined with a porous material that both lubricates and cleans the disk as it rotates in the jacket. Many small particles are trapped by this material and held out of the way so the
In the Hard Disk Jungle
Tallgrass Clears
A Path

In today's hard disk jungle, Tallgrass clears a path by offering high performance, integrated mass storage solutions for the IBM® PC/XT, the T.I. Professional and related computers.

TALLGRASS INNOVATIVE FEATURES

MASS STORAGE SYSTEMS with formatted HardFile™ capacities of 6, 12, 20, 35 and 70 Mb, all with built-in tape backup.

CONVENIENT INTEGRAL TAPE BACKUP SYSTEM allows rapid tape "image" streaming, or incremental file-by-file backup and restore on ANSI standard inexpensive data cartridges, instead of the usual floppies, video cassettes, or low-capacity removable Winchester devices.

NETWORK READY and fully compatible with networks such as PCnet™ and EtherShare™

HIGH RELIABILITY with dual directory and read-after-write verify options. A dedicated landing zone, where the read/write heads reside when the disk is idle, provides data protection during powerdowns and transportation.

Follow the Tallgrass path to your local computer dealer and watch your personal computer transform into a powerful data processing system.

Available from COMPUTERLAND®, Entré®, Computer Centers, MicroAge®, Computer Stores and other participating computer dealers.

New!

disk will not be harmed. However, when
the "Disk Doubler" is used and the disk
is inserted in the drive upside down to
use the back side, the disk rotates in the
reverse direction. Thus, any and all par
ticles that were trapped during the original
rotation can be released back onto the
disk. Premature failure of the disk, or at
least loss of data, is virtually guaranteed.

I have long recommended that this is
not a worthwhile savings tactic; the poten­
tial of lost data far outweighs the small
dollar savings in disks.

"In Defense of Luddism"

I was disappointed to find that you felt
the editorial urge to reprint the narrow­
minded and reactionary opinion of the
Wall Street Journal article, "The Luddite
Answer to Unemployment," by Bruce
Bartlett, in your Editorial on page 4 of the
January issue. Mr. Bartlett may be an
economist with impressive credentials,
but he is no historian, and he seems to
be a poor social analyst as well.

It is a historical cliché, and an inaccurate
one, that the Luddites of early 19th cen­
tury England broke machines because
they were "afraid" of technology, or even
that they hoped to save jobs of workers.
The true mission of the Luddites was
pointed out clearly by MIT historian
David Noble in a series of articles entitled,
"In Defense of Luddism," that appeared
in the most recent three issues of the
political journal Democracy. Noble shows
that the Luddites were primarily con­
cerned with the control of the workplace
at the point of production. These skilled
English craftsmen were resisting the in­
troduction of machine technology that
made their skills obsolete, and which
forevermore turned over the control of the
production of their product to a capitalist
owner. The Luddites correctly perceived
that the industrial revolution was gener­
ing a two-class system of owners of
machines and laborers on machines, a
system that placed little value in skill or
in the relationship between a producer
and his product. Noble also pointed out
that the Luddites were not simple­
minded "machine-smashers" who
bashed looms and other devices out of
some irrational, primitive anger. On the
contrary, the Luddites chose their targets
carefully after some rather sophisticated
analysis on the social effects of machine

technology.

The issue that the Luddites truly ad­
dressed (not what Bartlett would have us
believe they represented) is still with us
today. The important issue that traces its
roots to the Luddites is not fear of tech­
nology, but the pressing question of who
controls the workplace. Are we to have
an economy that persistently excuses its
abuses of humans by saying that "tech­
nology is neutral" and "we can't stand in
the way of Progress'? What is progress
if it does not serve human needs? And
human needs are not entirely encom­
passed by employment. The Luddites
understood that the battle for control of
the workplace necessarily includes a bat­
tle for dignity, political rights, equality,
and freedom. And they were right—they
lost the battle, and the next hundred
years of the western world we remember
chiefly through the dark writings of
Buy it because it's the best buy:

At under $500 per node, OMNINET has the lowest cost per station of any local area network. Because an OMNINET Network uses simple, twisted pair wire. Which means that cabling costs one fifth of the coaxial alternatives, with none of the installation headaches.

Result? OMNINET is both easier and less expensive to install. Or expand.

Buy the system for unmatched flexibility:

From Apples to Zeniths, OMNINET handles more types of micros than any other network. So keep the DEC's in Data Processing and the PC's in Purchasing. OMNINET makes for great working relationships. And starting with options like electronic mail, your people can choose from over 500 different programs according to their needs. Not their network's limitations.

What's more, CORVUS can handle all your hardware needs. From 6 to 45MB hard disks through 200MB Random Access backup at an amazing $11 per megabyte. Both, with OMNINET servers built right in.

Buy the OMNINET Network for the most expandability:

If you’re just starting a network, consider OMNISHARE™ Software. It lets your regular PC’s or PC-compatibles make full use of the disk space on an IBM PC XT™.

When you want to draw on the resources of your central computer, you’ll want Corvus’s SNA Gateway. It lets your network’s micros tap into your mainframe’s information.

Whether you have 2 computers or 2,000, OMNINET can get the most out of them.

Buy us for our experience:

We pioneered local area networking for micros. And we’re constantly working on better ways to give you the system you need, with the versatility you want, at a price that makes sense.

With the result that 3 out of every 5 locally-networked micros in the world are connected to a CORVUS network*

Give us a call at 800-4-CORVUS to find out more.

Because when it’s all said and done, one of the best arguments for going with an OMNINET Network is really very simple.

Buy it for your peace of mind.

CORVUS
The Networking Company.

*59% of all locally-networked micros operate on a CORVUS network.

According to InfoCorp, CORVUS, THE NETWORKING COMPANY, OMNINET and OMNISHARE are trademarks of CORVUS SYSTEMS INC. and PC and PC XT are trademarks of International Business Machines. Apple is a trademark of Apple Computer Inc. DEC is a trademark of Digital Equipment Corporation. Zenith is a trademark of Zenith Corporation. TI is a trademark of Texas Instruments.
Dickens and the solemn warnings of Marx.

There are no intellectuals or pundits who are "creating unnecessary fears and anguish among workers," as Bartlett writes, as if workers were frightened children. Workers have legitimate grievances and demands of the system they have built, and they will deal with them as they see fit. They may be, and in some cases are, following the lead of the Luddites by smashing machinery. But this is no more an irrational response to technology than is putting millions out of work without knowing what to do with them. There has been and may always be an overtly political battle over the nature of work and its rewards. The Luddites were the opening volley of this battle in our time, and it may be time to listen to what they were really saying.

X-raying Disks

I am currently part of a team working on a large application project to run on an IBM PC. We have had to do a lot of traveling by air and, consequently, our disks have been sporadically "zapped.”

Based on my limited memory of high school physics, I do not think that X-rays could have damaged the disks. I believe that the magnetic fields of the X-ray equipment power supplies are the culprits. Although we remove the disks from our carry-on luggage prior to entering the X-ray machines, we still sustain occasional damage. I believe this happens at the entry point to the machines where we stop to unload the disks. That is, the magnetic fields extend a significant distance around the equipment.

Now my tactics are as follows: (1) I put each box of disks in a lead-foil film pouch (although I doubt that this really offers protection against magnetic fields). (2) I carry backup sets of disks. This has allowed me to recover on all occasions.

I would be interested to know how the hard disk will react to airport X-ray systems, and I would appreciate any information on this subject.

University Heights, OH 44118
Zenith introduced its first television receiver to a delighted America in 1948. It had single-knob tuning and an 11-inch porthole screen.

Earlier this year, Zenith made its sixty millionth television set. And every one has been built according to this credo: "The Quality Goes In Before The Name Goes On."

Zenith continues this tradition of video excellence with its extensive line of monitors. Monitors that will first dazzle you with their graphic display, then earn your admiration over time with their reliability. And surprise you with their very competitive prices.

There's a Zenith monitor for just about any personal computer, including IBM and Apple, with seven models offering everything from monochrome green or amber to high-resolution color. And some models can also be used with VCR or video disc systems.

Nobody understands video like Zenith. To find out more about their fine monitors, call 1-800-842-9000, ext. 1, for the name of your nearest Zenith Data Systems dealer.
We wrote the book on portability.
In nine different languages.
To every software developer who’d written off portability as an impossible dream, Digital Research humbly announces a few monumental breakthroughs.

We not only offer languages that are portable from 8 to 16 to the 32-bit chips of the future, they’re portable across all popular operating systems, too. What’s more, we supply the broadest range of quality languages and development tools available today. And will tomorrow.

So rest assured. Whether you design applications at a major corporation, plan to become a major corporation or just qualify as a hobbyist, you only have to write it once.

Simply pick the Digital Research language that’s right for you. From Personal BASIC™ to Digital Research FORTRAN-77™. The newest member of our remarkable family.

To complement languages, we offer a complete workshop of development tools. Our Display Manager™ and Access Manager™ simplify the design of screen displays and data bases. So you spend less time and effort.

If you write in COBOL, our Animator™ source level debugger will get your software running in record time.

And for programmers skilled with IBM mainframe SPF, we offer micro/SPF™. An editor that helps turn your invaluable experience into valuable new software applications.

At Digital Research, we work as hard for you after the sale as we do to get the sale. With backup like quality documentation, software updates and a phone line to our technical support team.

With so much productivity and service to draw on, it’s small wonder IBM chose our languages for its IBM® PC, XT and the new IBM 3270/PC.

For more information, call your IBM representative.

Or, for the Digital Research retailer nearest you, call 800-227-1617, ext. 400. In California, 800-772-3545, ext. 400.

Circle 133 on Inquiry card.
When asked what computer language I prefer, I generally reply, "Solder." This response is not an effort to be cute but rather to express a preference for dealing in the terms I know best. I don't avoid software. I just try to minimize my involvement.

When it is necessary to write simulation and test programs, I bite the bullet. Unless the function is time-critical, I most often choose BASIC because it comes closest to being a universal programming language. Virtually all personal and business computers support it, and if I confine my command choices to the more common instructions, the demonstration programs that I compose on an IBM PC should also run on your Cromemco Z2.

With few exceptions, you can compute your accounts receivable or type in and play a game equally well with an Apple or IBM PC using BASIC. The fact that one has a 6502 microprocessor and the other uses an 8088 is irrelevant. The output will be the same.

The value of high-level languages is that they isolate the user from microprocessor peculiarities and facilitate transportable software. Unfortunately, the average ROM (read-only memory)-resident BASIC interpreter was never written with perfor-
mance in mind. Usually taking 5 to 10 milliseconds (ms) to execute an individual instruction, it can seem like forever when running long programs.

As a writer, I have grown to appreciate the universality of BASIC, even with its shortcomings. By treating the computer as a black box with I/O (input/output) ports and BASIC, I have been able to provide projects that can be implemented on most systems directly. As an engineer/designer, however, I am aggravated by its slowness and feel no animosity toward critics who have converted to languages such as Pascal or C to gain processing speed.

Rather than make further excuses, I decided to solve the problem in classic Circuit Cellar tradition—simply build a black box that improves system throughput and runs BASIC programs faster.

**Processors and Performance**

Generally speaking, most people confuse microprocessor benchmarks with system throughput. The comparison of microprocessor-instruction execution speeds is not really indicative of a computer's capabilities. Performance is more often governed by the operating system and magnitude of the application program. It is a false assumption that all software written for a 16-bit microprocessor will necessarily run faster than on an 8-bit microprocessor. Machine-language fast Fourier transforms (FFT) run quickly on a 6502, but an accounting package that has to constantly interleave a program into and out of disk may be encumbered by 64K bytes of operational memory in the Apple. In all likelihood, large spreadsheets and accounting programs will run more efficiently in the larger memory space provided on an 8088 system such as the IBM PC.

Raising the performance of a high-level language such as BASIC takes more than raising a microprocessor’s clock rate. Instead, it involves a combination of decisions that can ultimately affect the entire system throughput. We can expand the memory available to application programs in an effort to limit repeated disk accesses and configure a portion of memory as a RAM (random-access read/write memory) disk drive to expedite disk operations when they are required. We can optimize the effi-

[Photo 2: The rear of the Trump Card prototype. To save time, the memory section was laid out as a printed-circuit board, with wire-wrapping saved for the processor side. As shown here, the Trump Card is installed for testing in an MPX-16 computer, which has I/O slots compatible with the IBM PC.]

[Photo 3: Execution-time visual comparison. (3a) Without Trump Card—a two-second exposure of the display while running the BASIC program in listing 1. The program has executed the PRINT statement and still is dimensioning the arrays. (3b) With Trump Card—the same two-second exposure of the program execution (with PRINT statement added) shows the arrays have been dimensioned and the prime numbers are being overprinted so fast that they blur.]
ciency of the high-level language by operating it in a compiled mode rather than as a repeatedly interpreted task. Finally, if the functional throughput of a particular application becomes dependent upon direct microprocessor intervention, for those tasks, substitute a faster microprocessor or help it with a coprocessor.

A Black Box Called Trump Card

This article is not about building a classic speed-up board for the IBM PC. The word “speed-up” implies replacing the 8088 with an 8086 or 80186. Instead, visualize your PC as a black box with an input, output, and crank. Rather than simply turning the crank faster, think of adding another black box, in the same path between input and output, that performs selective tasks more efficiently and faster than the 8088 alone. To increase the relative throughput of the system, I have designated an alternate path for specific program functions.

I’ve named this separate box Trump Card. It is a functionally independent 10-MHz Zilog Z8001-based computer with its own 512K bytes of memory. Designed specifically as a compiled high-level-language computer, Trump Card is addressed as an I/O device that communicates through the expansion bus (see photos 1 and 2).

Among the specific functions that Trump Card supports are BASIC, C, CP/M-80, text editing, Z8000 assembly-language programming, and a RAM disk. It does not directly execute programs written in 8088 assembly code, such as Lotus 1-2-3. Instead, it executes programs written in high-level languages such as BASIC or C (a Pascal compiler and 8088-to-Z8000 translator are in the

Table 1: A comparison of execution times (in seconds) of the benchmark program in listing 1.

write your programs. Then run the same program using either Trump Card or BASICA. Depending upon the instructions you use, Trump Card provides a tenfold to hundredfold increase in program performance (see photo 3). Table 1 shows typical results of what Trump Card can do with the prime-number Sieve of Eratosthenes program (September 1981 BYTE, page 180) frequently used to benchmark computer systems (see listing 1).

Though I conceived of Trump Card initially as a BASICA enhancement, it didn’t take me long to realize that a Z8001 with 512K bytes of memory has some real computing power and deserves proper support. For that reason, the software supplied with this project is much more extensive than usual. With the utilities and languages included, you should have little trouble using the vast software base of Z80 and Z8000 programs.

Trump Card includes the following software:

BASIC Compiler—TBASIC is PC BASICA-compatible. The differences between the BASICA interpreter and the TBASIC compiler are minimal. Most instructions are implemented without modification.

CP/M-80 Emulator—Trump Card can run your CP/M-80 Z80 assembly-

language programs directly without special disk headers or translation programs. Simply download your Z80 programs and run them.

C-Compiler—Trump Card includes the industry standard version of C that is described in *The C Programming Language* by Kernighan and Ritchie.

Debugger—Intended to aid in program development. With it, you can examine and replace memory and register contents, set breakpoints, or single-step through programs.

Screen Editor—Incorporating many of the features included in word processors, the editor enables you to write or examine ASCII text files for either the PC or Trump Card’s use.

Multilevel Language Compiler—This is a structured assembler that allows Pascal-like control and data types, arithmetic expressions with automatic or specified allocations of registers, and procedure calls with parameter passing.

RAM Disk—Trump Card can allocate 128K to 387K bytes of its on-board memory to function as an intelligent RAM disk (DOS 2.0 only). This memory is separate from and in addition to any already existing on the PC bus. Trump Card’s other functions can run concurrently.

The Z8000 Microprocessor

A block diagram of the Z8000’s internal structure appears here as figure 1. As the programmer sees it, the Z8000 contains sixteen 16-bit general-purpose registers (for addresses or data) that may also be used in groups to form as many as eight 32-bit registers or four 64-bit registers. The low-order halves of the registers may be used for byte operations, thus the Z8000 is able to manipulate data in 8-, 16-, 32-, and 64-bit pieces.

The eight addressing modes are register, indirect-register, direct-address, indexed, immediate, base-address, base-indexed, and relative-address. The instruction set utilizes data types ranging from single bits to a 32-bit-long word. The processor executes 110 distinct instruction types that, when permuted by all the addressing modes and data types, create a set of more than 400 instructions.

The Z8000 has two different modes of operation: system and normal. Which mode of operation is in effect is controlled by a bit in the flag-and-control word (FCW). The main difference between the operating modes is that some of the control/interrupt and I/O instructions work only in the system mode. To simplify the design of the Trump Card, I chose to use only the system mode.

The Z8001 (see photo 4) is the memory-segmented version of Zilog’s chip; it comes in a 48-pin DIP (dual-
As CPU AO15 OS AOU

Figure 2: Pinout arrangement of the Z8001 memory-segmented version.

inline package), the pinouts of which are shown in figure 2. (The nonsegmented 40-pin version is called the Z8002.) By memory segmentation, the directly addressable 8-megabyte memory space is divided into as many as one hundred twenty-eight 64K-byte regions. Seven segment-selection lines coming out of the Z8001 control the high-order memory addressing. When the Z8001 is reset, the segment addressing automatically reverts to segment 0, the lowest 64K-byte block of memory. Transfer of control between segments is done by jumps, calls, and returns.

Inside the Trump Card

The schematic diagram of figure 3 shows the Trump Card's circuitry. It can be plugged into any expansion slot of an IBM PC or into any other computer with compatible I/O slots and operating system.

Five of the Z8001's seven segment-selection lines, SN0 through SN4, are used in the Trump Card to decode addresses for up to 1 megabyte of RAM (512K bytes fit on the board) and 4K bytes of ROM (read-only memory). Segment line 4 selects between the ROM, mapped into segments 0 through 15, and the RAM, residing in segments 16 through 31. The states of the segment lines are latched by IC3; segment line 4 is named RAM/PROM.

Address/Data Bus

The address/data lines coming from the Z8001 (AD0 through AD15) are a time-multiplexed address and data bus, which can address a range of 65,536 (64K) bytes of memory or a like number of I/O addresses. Since the Z8001 can form addresses at either word or byte boundaries, the least significant bit AD0 is used in byte operations to determine if the upper or lower byte is to be operated upon. The address on the AD lines becomes valid when the Z8001 asserts the AS (address strobe—active low) line; it remains that way for a short hold time after AS returns to its idle high state. The address from the Z8001 is latched by two type-74LS373 transparent latches, IC5 and IC6, that are always enabled. The use of transparent latches allows for maximum address-setup time to the memories.

The latched addresses (LA0 through LA15) come out of the 74LS373s with LA0 combined with the signal B/W (byte or word address) to form the EVEN or ODD byte-bank-select signal for memory. When B/W is low, it signifies that a 16-bit memory word is being referenced; this causes the outputs of the two AND gates at IC8 pin 3 and IC8 pin 6 to be active irrespective of the state of LA0. By doing byte operations in this manner, it is possible for the Z8001 to do single-byte memory writes without first reading an entire word location.

The Trump Card contains a pair of type-2716 EPROMs (erasable programmable read-only memories),
Figure 3. Schematic diagram of the Trump Card Card. Support is provided for 512K bytes of dynamic RAM in the form of type-4164 chips. If a 6-MHz Z8001A is used, the crystal frequency must be reduced to 12 MHz.

There is no need to use the LAll routines. Address lines LAl through or EVE'N bank-select lines since no cold-start-up and system-diagnostic data (OE or output enable) of the 2716s, to inhibit the possibility of bus contention. The Z8001 is also connected to pin 18 which contain a bootstrap loader for multiuser type of environment to segregate system functions and memory. The line is unused in the Trump Card.

**Status Signals**

Various status signals tell the rest of the system about the processor's condition and the type of information that is appearing on the address/data bus. The status signals are as follows:

**Read/Write:** The R/W signal is used to indicate the direction of the current bus transaction. When high, the direction of data is toward the Z8001. Data is clocked into the processor at the occurrence of a positive-going pulse on DS (data strobe). When DS is low, data flows from the processor outward.

**Normal/System:** The N/S signal indicates whether the processor is operating in the system (supervisory) mode or normal (user) mode of operation. This control line is used when there is a multitasking and/or multituser type of environment to segregate system functions and memory. The line is unused in the Trump Card.

**Byte/Word:** The B/W line is provided to enable the Z8001 to perform byte operations on memory. When high, it indicates that a byte operation is to take place; a low state indicates word operations. This signal is also used in the ODD or EVEN memory-select logic.

This port is not used for data transfer by the Z8001. A write to this port by the 8088 will issue a reset to the Trump Card.

**Clock Generation**

The basic clock rate for the Z8001 on the Trump Card is provided by IC2, a Zilog Z8581 clock generator and controller (CGC). The Z8001's clock-input maximum voltage must come within a certain range of the power-supply potential (precisely $V_{CC} - 0.4$ V) and have a maximum rise and fall time of 10 nanoseconds (ns). Such requirements are difficult to meet with standard oscillators and
TTL (transistor-transistor logic), but they are easily met by the CGC. The Z8581 also provides an easy and effective means of adjusting the processor's bus cycles to the speed of available memory devices.

The CGC is used on the Trump Card to stretch specific bus cycles. As used on the Trump Card, the Z8001 does three different basic categories of operations: internal operations, memory access, and input/output operations. The timing of the ZCLK signal emitted by the CGC depends on which of these bus activities is taking place. The Z8581 can be configured to add wait states that enable the use of 150- and 200-ns RAM chips.

**Trump Card/Host Communication**

The "bucket" is the communications interface between the PC and Trump Card. This FIFO (first-in/first-out)-type dual-port memory configuration consists of a 6116 static memory (IC24), an 8-bit address counter (IC25), two data-bus buffers (ICs 23 and 26), and the necessary control logic to arbitrate access. Programs and instructions are passed between the two computers via this FIFO circuitry. As far as the PC is concerned, the bucket appears as two I/O port addresses. A system of software handshaking between the computers determines which has reserved and is using the bucket. Table 2 shows the port addresses and their functions.

It is not possible for both processors to have use of the bucket at the same time. With the processors running asynchronously, arbitration is necessary. It is provided by four D-type flip-flops: two for access requests and two for access reservations. The two access-request flip-flops are clocked by the transition of an access-request signal from either processor (IORQ for the Z8001 and PCSEL for the 8088). The preset inputs of these flip-flops are connected to the HOLD signal, which is active whenever one of the processors has succeeded in reserving the use of the bucket. When HOLD is active, it prevents the other processor from gaining access.

The Z8001 communicates through the bucket for all its normal I/O by activating the IORQ line. The 8088 selects the bucket when it performs either an IOW (I/O write) orIOR (I/O read) in the range of the IBM's regular memory-address space from hexadecimal 03E8 to 03EE. Accesses to these addresses are decoded by IC28 to generate the Trump Card's PCSEL signal.

The two access-reserve flip-flops sample the output of the request flip-flops 180 degrees out of phase with each other. This is done to prohibit simultaneous requests from being honored. These flip-flops are cleared by a reset command issued from the reserving processor.

The Q outputs from these flip-flops are combined by a logical AND function with the processor request to form the active select states used by the bucket: Z ANDed with DS for the Z8001 and PC for the 8088. Whenever either request flip-flop is active, the HOLD signal is active and is used as the chip-select input on the 6116 memory. The FIFO memory, however, is written to by the Z8001 only when a "write bucket with increment" command is used.

The WE signal, connected to the write-enable input of the 6116 memory, is active during either a Z8001 I/O request (with R/W low and DS active) or an 8088-generated write to the bucket (with PC and INC active and BIOR inactive). The INC signal is active whenever the processor that has control of the bucket sets bit 1 of the address low. The CLEAR signal is active when bit 1 of the address generated by the selected processor is high and a write operation is occurring.

A nonmaskable interrupt to the Z8001 is generated when the 8088

---

**Photo 5:** A typical display on the Tektronix 1240 logic analyzer: the column-address-strobe/row-address-strobe timing of the Trump Card.

**Photo 6:** To aid in my initial development, a Zscan-8000 emulator is plugged by a ribbon cable into the Z8001 socket on the Trump Card. In emulation mode, the Zscan-8000 can run diagnostic programs and exercise all functions of the Trump Card at 4 MHz. Hardware debugging is greatly simplified because all sections of the hardware need not be working to use the emulator.
performs a write operation to the bucket with address bit 1 and data bit 0 both low. This interrupt is latched in a D-type flip-flop and is not cleared until the Z8001 issues a Nonmaskable-Interrupt Acknowledge (status decode 5) or until the host computer resets the Trump Card. (See table 2 for more detail.)

**Booting Trump Card**

When you plug the Trump Card into a slot in the IBM PC and turn on the computer, the Trump Card automatically executes the bootstrap-loader routine contained on board in EPROM. The loader routine is only 31 words (62 bytes) long; its assembly code is shown in listing 2.

I used two 2716 EPROMs instead of bipolar PROMs to store the bootstrap loader because they are both cost-effective and easier to program than bipolar PROMs. Two byte-wide memory devices are required because the Z8001 is a processor with a 16-bit word length. Each machine-language instruction (expressed as four hexadecimal digits) is separated into high and low-order bytes (or “even” and “odd,” if you prefer); the high and low bytes are stored in separate EPROMs. When you examine a particular 16-bit memory location, you are actually viewing the information provided from two 8-bit sources.

**Using Trump Card**

Trump Card is transparent to normal PC operation. To start Trump Card, you run a program stored under PC-DOS called LDZSYS. This is the Trump Card communications software that runs on the 8088. If you always want Trump Card features available, you can add this program to your regular AUTOEXEC batch file. When LDZSYS has completed initialization, it returns to the PC-DOS A> prompt to wait further instructions.

At this point, I generally configure part of Trump Card’s memory as a RAM disk, using a program called SETRMDSK. This is done as follows:

```
A> SETRMDSK 4
A>
```

### Listing 2: Bootstrap initialization program for the Trump Card written in Z8000 assembly language.

The memory that I've set as a RAM disk is completely separate and in addition to the regular IBM PC memory. Even if you have a 640K-byte PC, up to 387K bytes of Trump Card's memory would be available as additional RAM-disk configured storage space.

I used the RAM disk to speed up the process of writing these articles. Many word processors, like the Volkswriter I use, make extensive calls to the disk for help files and command-execution files. After a while, the noise and delay get aggravating. To remedy this situation, I run the SETRMDSK 4 sequence just described to create the 256K-byte RAM drive C and then add the following:

```
A> COPY *.C:
A> C:
C> VW
```

This copies the entire contents of the Volkswriter distribution disk to the RAM disk, sets it as the default drive (C), and starts the word processor. When I now press a function key the action is instant and silent. To guard against power interruptions, drive B is designated as the hard-storage location and periodically I store the article file to it.

Trump Card’s other features are equally simple to use. BASIC, C, Z80, and editing files can be stored on the same disk and executed with similar ease. While I’ll explain it in greater detail next month, a possible sequence of Trump Card operations is shown in table 3.

### Rewarding Diligence

I've been having a lot of fun with Trump Card. I haven't done much assembly-language or C programming yet, but it has renewed my faith in BASIC.

Trump Card is not an easy project to build. Compared to other Circuit Cellar projects, however, it’s manageable. I was surprised at the number of readers who hand-wired the 121-chip MPX-16 PC-compatible computer that I presented last year. Their letters suggested that the motive was neither money nor masochism. In-
SBC-II A two user multiprocessing S-100 slave complete with a Z-80 CPU (4 or 6 MHz), 2 serial ports, 64K RAM, and 2K FIFO buffer for each user! A cost effective way to add users to your multiprocessing system.

HD/CTC A hard disk and cartridge tape controller combined together on one board! A Z-80 CPU (4 or 6 MHz); 16K ROM, and up to 8K RAM provide intelligence required to relieve disk I/O burden from host system CPU. Round out your multi-processing system with an integrated mass storage/backup controller.

Systemaster The ultimate one-board computer: use it as a complete single-user system or as the "master" in a multi-processing network environment. Complete with Z-80A CPU, 2 serial and

SBC-1 A multiprocessing slave board computer with Z-80 CPU (4 or 6 MHz), 2 serial ports, 2 parallel ports, and up to 128K RAM. Provides unique 2K FIFO buffering for system block data transfers. When used with TurboDOS or MDZ/OS the results are phenomenal!

2 parallel ports, floppy controller, DMA, real time clock, RAM drive disk emulation package, and Teletek's advanced CP/M BIOS or TurboDOS.

stead, building these projects enabled them to experiment with digital circuitry yet be secure in the knowledge that their project would work. I hope this project elicits a similar response, and I'd like to reward such enthusiasm in advance.

Isoteric peripherals such as Trump Card depend a great deal on sophisticated software to fully exercise their capabilities. Unfortunately, when experimenters build rather than purchase boards, they often have to use great ingenuity to obtain software.

More than five man-years of development effort went into the present support packages for Trump Card. Some, like TBASIC and the RAM disk, were contracted by me, while others, like the C compiler and Y (a Z8000 assembler), were written by Zilog. Combined with the CP/M-80 emulator, Z8000 operating system, and telephone-book-size documentation, it is a formidable package that is difficult to independently price.

I want to encourage you to build your own Trump Card if that is your choice. If you send me a picture of the completed unit, I will send you a copy of the complete software and the documentation (provided it is for personal, noncommercial use) for the cost of duplication and shipping.
The software houses and other parties in this project have waived all royalties as a gesture of support for the Circuit Cellar.

Next Month:
In June's article, I'll describe the software in detail and do a little benchmarking.

If you're looking for a way to get more performance out of your microcomputer, look no further than QuCe5.

With a QuCe5 HarDrive subsystem, you can make your micro behave almost like a mainframe. 10 to 114 megabytes of mass storage lets you handle data bases that would make the normal micro blow a fuse. And you can access, update, and process data so incredibly fast, you won't believe your eyes. A QuCe5 HarDrive with an optional 5 megabyte backup cartridge, also means you won't have to rely on a very unreliable storage medium for your crucial data—namely floppy disks—ever again.

Another QuCe5 plus is compatibility. It interfaces with most popular microcomputers like IBM, Radio Shack, Apple, DEC, Epson—you name it. Installation couldn't be easier, our software is easy to use, and each HarDrive is backed by a 1-year warranty.

The QuCe5 HarDrive. It will make your micro mightier and faster than ever before.

and has the standard—not optional—features you need to take full advantage of every job your software can do.

Study the chart at the left. It proves that TeleVideo—not IBM—offers the best hardware for the best price.

Note that TeleVideo's ergonomic superiority over IBM extends from fully sculpted keys and a comfortable palm rest to a 14-inch, no glare screen that tilts at a touch.

**THE BEST MICROCHIPS.**

What is perhaps most impressive about the TeleVideo IBM PC Compatible can be found deep within its circuitry. We use the same 8088 central processing unit that runs an IBM PC. But we also employ new VLSI (Very Large Scale Integration) microchips that are designed and built exclusively for TeleVideo. These interface more efficiently with the powerful 8088 and yield numerous benefits.

For example, our tiny custom chips do the work of many of the larger, more expensive circuit boards in an IBM PC. So we can offer a computer system that comes in one attractive, integrated case, is ready to run and occupies less desk space. A computer that edges out IBM's added-cost component system for reliability, ease of service and purchase simplicity.

Fewer circuit boards to cool also allowed us to eliminate the noisy, irritating fan IBM and most other PCs force you to put up with. And TeleVideo compatibles accept any IBM hardware options without modification.

**THE BEST LINE.**

But the Tele-PC is only one element of the TeleVideo IBM PC Compatible line.

The TeleVideo XT is the best hardware for users of popular IBM XT software who would appreciate an extra 10 megabytes of storage capacity along with the advantages listed on the preceding chart.

As the chart above demonstrates, our portable IBM compatible computer, the TPC II, is far and away better hardware than COMPAQ's. Better hardware—standard—at a better price.

**THE BEST MANUFACTURER.**

The TeleVideo IBM PC Compatible line is made by the world leader in multi-user computer systems and the number one independent manufacturer of terminals.

Our compatibles are available at participating ComputerLand and Entré (call 800-HI-ENTRE) dealers or you may call 800-538-8725 for the dealer nearest you. In California, call 800-345-8008.

Before you invest, make a few simple comparisons. You'll find that TeleVideo—not IBM or COMPAQ—has the best hardware for the best software. At the best price.

---

TeleVideo
Personal Computers
TeleVideo Systems, Inc.
Portable or desktop, you're way ahead when you pick up a **corona PC**.™ Because we give you everything you've ever wanted in an IBM®-compatible PC and more. For a great deal less.

**COMPATIBLE AND MORE.**
Our systems run all software that conforms to IBM PC programming standards. And the most popular software does.

We deliver twice the memory, with room for eight times as much.

We deliver a fast-access 320K floppy drive, a communication port and an improved IBM PC keyboard with indicator lights.

Our systems include high-resolution monitors (12" desktop, 9" portable) for crisper, cleaner displays, and both have built-in high-resolution graphics (640 x 325).

You get a complete system, ready to go to work.

**MORE SPEED.**
Our RAM-disk software gives you temporary disk-type storage that works many times faster than disks.

**PLUS SOFTWARE.**
Our systems come with the operating system: MS-DOS®. A programming language: GW BASIC®. A training course: PC Tutor.™ A professional word processor: MultiMate.™ Plus DOS utilities and demonstration programs. Or you can get the p-System® from N.C.I. and write or run portable Pascal packages.

**ALL FOR A GREAT DEAL LESS.**
Even with all the extra features and performance, our systems still cost significantly less than the equivalent IBM PC.

Drop by your nearest **corona PC** dealer for a very convincing demonstration. Or contact us at 31324 Via Colinas, Westlake Village, CA 91361.

(213) 991-1144 or (800) 621-6746 toll-free. Telex 658212 WSLK, in Europe 76066 CDS NL.

MORE VERSATILITY
With all the necessary features built into the main unit, the four expansion slots can be used for your special needs. For example, color or our optional 10MB hard disk.
Chaos Manor’s
Hard-Disk System

Dirty filters, 8/16-land, views of the future, and inevitably more

Jerry Pournelle
Consulting Editor

At Chaos Manor everything happens at once. I have 10 pounds of mail set aside because the letters raise questions better answered in this column than in BYTE’s User to User; from where I sit I can see a raft of new books; we’re getting to know and love the Di er machine; I’ve heard from the Modula Research Institute; and I’ve just returned from the Sage Faire, where I learned that the Motorola 68000 chip is alive and well and hiding in Reno, Nevada. Meanwhile, I’m working with the new Compupro 40-megabyte disk and 8/16 operating system, and I have word that Jim Hudson has his 8087 math-chip board for the Z-100. Clearly, the Intel 8086 and follow-ons are as healthy as the 68000 products.

So just where are we going? What will the supermicros look like when they arrive, and how can users be sure they won’t invest in dead-end equipment and software? Is it to be the 8086 or the 68000?

I’ll get back to that after we look at the latest hardware in Chaos Manor.

Compupro Hard Disk

For years I’ve resisted hard disks. Although faster than floppies, they just didn’t seem worth the effort. I’ve heard too many horror stories of how bad software managed to blow a hard disk’s directory, or how a sudden power failure brought on disaster. There seemed to be considerable risk, and the rewards just weren’t that great—until recently, hard disks didn’t hold that much more than my 1.1-megabyte 8-inch floppies, while RAM (random-access read/write memory) disk drives were faster.

From time to time I’d hear about a new hard-disk system and wonder if I ought to install one, but there was always some problem sufficient to keep me away.

That all changed a couple of weeks ago when the Compupro hard disk arrived. I love it, but Chaos Manor has been even more chaotic ever since.

First was the problem of where to put the new disk. The Compupro 40-megabyte system is physically the same size as the Compupro “boat-anchor” system: not small. One natural place to put it is to stack it with the main computer box, and most people will do that. Compupro normally packages an 8-inch doublesided double-density disk in with the hard-disk drive; this provides both backup and a way to get programs into the computer. However, I insist on keeping both of my 8-inch drives, so my hard disk arrived with a blank piece of metal instead of a floppy drive. Taped to the blank spot was a card that read “Five-inch drive goes here . . .”

A story goes with that. Compupro has the 5¼-inch drives, a controller to run them, and software to drive the controller; what it doesn’t have just at the moment is the black metal cutout to hold 5¼-inch drives in place. There are plenty of bezels for 8-inch drives, and by the time you read this I should have the 5¼-inch drive running; but for the moment that’s in the Real Soon Now category.

There was only one catch to the hard disk: Chaos Manor has become a test site for the new 8/16 software that drives it. Of course, that wasn’t supposed to be any real hardship. Tony Pie tsch had been running the new software with his hard disk for weeks. I was only supposed to be a sort of final test site, in case there were any minor bugs left.

It’s as well that Compupro is thorough. I do a lot of things that Tony doesn’t. There definitely were bugs. Some weren’t so minor, either; there was a time there when I was muttering that hard disks should be confined to hackers, who undoubtedly deserved them; they weren’t for ordinary users. However, as each bug showed up, Tony dug into the BIOS (basic input/output system) and other
esoterica, and pretty soon, lo! the system began to work quite well.
There are still some annoyances. Some are fixable, others probably are not. No matter: already the advantages outweigh the disadvantages by a lot.

I now keep my accounting system, editors, address book, mail lists, disk catalog, utility programs, CB-80 compiler, RMAC macro assembler, lots of program sources, spelling checker and dictionaries, and the entire text of the new Niven and Pournelle novel *Footfall* in various places on that hard disk. No more getting up to find the right floppy disk. It's all here. Sure, I have to find the right floppy to put safety copies onto—I don't feel my work is safe until I have a copy in a nonmagnetic box in the other room—but I can do that while The Word Plus is checking spelling or the compiler is compiling.

I find that I get a lot more done now. Example: I thought of a fast modification to the accounting program. Normally I wouldn't bother, at least not until I had the program sources out. With the source, text editor, and compiler already on line, it took only a few minutes to make the needed changes.

For the first time I find having an on-line address book worth bothering with. Oh, sure: I have always kept mailing lists and stuff like that on disks. Every now and then I get ambitions for a new name and address software, and there's a new flurry of activity; but, I blush to say, I've always gone back to a battered green address book held together largely with Sno-Pake and tape. The address book took less time than loading in the data-retrieval program, finding the data disk, and searching for the data. (Larry Niven stores his addresses and phone numbers in a text file and uses the Search function in WRITE; that works, but somehow I never got in the habit of it.) With data and the retrieval program all on hard disk, computer retrieval is faster than searching for the address book among the litter on my desk and credenza.

This gives me an idea for a new program: one that searches through all my electronic-mail files, extracts the names and addresses, and inserts them into a database. The only difficulty would be the machine to recognize what a valid name and address look like. This would be no problem for letter files; now all I have to do is figure out how to tell the machine which files really contain letters and which are something else hiding on the letters' disks.

I may or may not get around to such a program. The point is that the program would be valuable now, and it wouldn't have been without the hard disk.

**Want to Bet?**
When Tony installed the new Compupro hard disk and Disk Three controller, my 8085/8088 Dual Processor ceased to work. This caused considerable consternation.

The first supposition was that the disk itself had been damaged in shipment, and examination of the shipping box showed that it had indeed been dropped; some of the tape seams had split. However, it hadn't been damaged. Not only does Compupro lock the disk head in place, but on power-down it's retracted to a dedicated "landing zone" first. Those Quantum disks are rugged.

"We've overloaded the bus," Tony decided. We did, after all, have all 20 slots filled in my Compupro boat-anchor box. In addition, we have Jim Hudson's 8087 math-chip board piggyback on the 8085/8088 Dual Processor's processor board—and that's no ordinary 8087; it's an 8-MHz chip, which gets hot enough to fry eggs on.

Certainly the box was full. There were old memory boards, three different interface boards, and a mess of other stuff; although the Dual Processor has become the main computing machine here, it still retains some residual equipment from the days when it was an experimental system.

Tony removed a number of superfluous boards. A few minutes later Bill Godbout called about something else.

"We finally managed to overload the bus on a boat anchor," I said.

"Nope. Don't believe you," said Dr. Godbout.

"Eh? Tony says—"

"Tell him I'll bet him the value of his house," Bill said. "And I'll buy the system from you."

"But—"

"Have you looked at the fan filter?"

Sure enough, the filter was clogged with dust. I cleaned it. Just to see, I put all the extra boards back in: no problems.

"We've tried to overload the bus," Dr. Godbout explained. "I suppose you could do it, but the problem is usually the fan filter. Once we had a system failure just before tax time. There was a panic, but it was the filter."

Actually, I expect he doesn't have as much dust, now that Compupro has moved to modern headquarters in Hayward; but when the computer was in the old WW II "temporary" buildings at Oakland Airport, I well imagine dust would frequently clog the filters.

We even speculated about modifying the operating system so that on the second Wednesday of each month the system would display a "CLEAN THE FILTER" message, then cease to work for five minutes. After all, there is a real-time clock/calendar on the System Support Board. I doubt it will ever come to that, but do clean your air filters regularly.

**System 8/16**
One of the nice things about the new hard-disk system is CP/M-8/16. My Dual Processor now runs both 8-bit and 16-bit programs. Both varieties are present on the hard disk, and I don't have to worry about which ones are which; I just run the program I want, same as I always did. The computer figures out whether it's supposed to run this as 16-bit software under CP/M-86 or as an 8-bit program under CP/M 2.2, in which case it gets assistance in disk operations from the 16-bit 8088 chip. There's a large bonus for 8-bit programs. Disk operations are handled by the 8088 chip, leaving a great deal more free memory. In our case, the Temporary Program Area (TPA—the practical workspace for the program)
I

The printhead on a Datasouth printer is rated to live through 500 million characters. Even in the most demanding applications, this means years of service without an overhaul.

**HEAVY DUTY CYCLE**

For a Datasouth printer, "100% duty cycle" is something of an understatement. So far, over 35,000 Datasouth printers have hit the hard copy road, and so few have pulled into the garage for repairs, it's hard to say how close to forever any of them will last.

**MORE THAN THE HUM OF ITS PARTS**

There's less to go wrong with a Datasouth printer. With sophisticated microprocessor control and unusually efficient design, Datasouth printers have few moving parts. They also don't need add-on "personality boards" to accommodate different computers.

**TAKE YOUR CHOICE**

Datasouth reliability comes in two high performance models. The DS180 is a legendary workhorse that delivers crisp data quality printing at 180 CPS. The new multimode DS220 cruises at 220 CPS for high speed data printing and at 40 CPS for letter-quality word processing. Both models print precision dot-addressable graphics.

If you have a high performance printing need, Datasouth has a high performance printer to fill it.

**DRIVE ONE TO WORK**

Test drive a Datasouth printer at your nearest showroom today. Then put it to work. With a Datasouth racing beside you, there's no way to lose.
has increased by 25 to 30 percent. Floppy-disk operations are much faster, too. Meanwhile, hard-disk loads and saves are so fast that although I have a full 2 megabytes of RAM disk, I find that I hardly ever bother to use it. The hard disk is not much slower.

I don't entirely trust the hard disk: every now and then I transfer all the work session. So some difficulties are inherent in CP/M. User numbers are vital: without them, you'd never be able to partition a big hard disk into useful areas. That was the trouble with PC-DOS 1.1 on the Eagle 1620: no directory structure, so that everything was in one interminable directory listing. CP-DOS 2.0 fixed that for the Eagle.

User numbers control user areas on both floppy and hard disks. Each user area has its own directory. When you first log onto CP/M, the user number is 0, and if you ask for a directory, you'll get the directory for User 0 and no other. Each user area acts as a separate "logical disk," so that disk drive A: can be divided into "drive" A0:, A1:, A2:, etc., up to A15:

In addition, my hard disk is partitioned into five "logical" disk drives. That is, there's only one actual hard disk, but it acts exactly as if there are five, four of 10 megabytes each and a fifth of something less than 4 megabytes. These are designated drives A:, B:, C:, D:, and E:.

Keeping track of just which programs are in which disk area is no easy task, since under CP/M there's no global directory command. That is, if you have files on disk D: under User 13, you'll never be able to list them unless you specifically ask for the DB: directory, and even then you may miss it if you've designated those files as System or "hidden."

When we first installed the hard-disk system, we did a lot of tests, including exercising the random-access capabilities. One program that does very complicated random-access disk I/O is my accounting system, so we went to unused user areas and did a lot of journalizing and posting. When I was done, I had no idea of where we'd put those no longer wanted account files. I was prepared to log onto each logical disk and painstakingly go from User 0 to User 15 looking for directories, but that seemed a bit tedious. Better, perhaps, to read the instructions.

Alas, the Digital Research CP/M...
PC Owners . . .

That's right, partner. Now is the time to upgrade your PC with the Sundown™ disk. Includes controller. Installs right inside your PC in less than 10 minutes. Backed by our full one-year warranty.

But that's only half the story . . . The Sundown comes loaded with VenturCom Venix/36. This highly-acclaimed operating system is a licensed implementation of AT&T's UNIX and is the only MULTI-USER, MULTI-TASKING UNIX environment available on the IBM PC. Plus you can store and run your MS/DOS programs and files as well!

We offer immediate delivery. And our price . . . now that will blow your boots off! Need we say more? Reach for your phone and dial:

*UNIX is a trademark of Bell Laboratories.
 manuals say very little about user areas. There's no discussion, and what information that does exist is scattered through the USER, PIP, and STAT command explanations. The USER command discussion tells you that command STAT USR: will tell you which user numbers have files on a particular disk. Of course, since this is Digital Research documentation, the little CP/M-86 Command Summary book doesn't mention USR: in the USER command section, so I'd missed it. It was only when I sat down to write this that I discovered that the full DR CP/M-86 User's Guide does mention a command STAT USR:. It would have saved me considerable time if it had been in the Command Summary book.

That command is fine, except that apparently you have to log onto each disk in turn to find out which user areas have files. This isn't very convenient. In fact, it's even worse than you think.

CP/M-8/16 has one great feature. Command files that are stored on as System files on disk drive A: under User 0 are accessible to all disk drives and all user numbers. Thus, I can put XD.COM, WRITE.COM, and other programs I use all the time onto the A: drive, and even though I'm now working with data on the C: drive under User 3, I have immediate access to the A0 command programs.

Alas, the version of CP/M-8/16 that I have has one lousy feature: the "A: User 0" access feature works only with .COM, i.e., 8-bit command files. If I want to use a CMD (16-bit) command file, it must be present in user area 0 on the disk I'm logged onto. In particular, STAT.CMD must be present on disks B:, C:, D:, and E: if I want to log onto one of those disks and find out which user areas have files stored in them. Moreover, if PIP.COM isn't on each logical disk, I have to go back to logical disk A: to transfer files from one place to another.

It's no good using PIP.COM and STAT.COM either. They get confused easily in a 16-bit environment. It's best simply to erase them, because you should use PIP.CMD and STAT.CMD.

Sigh. I carefully transferred STAT.COM to each of the logical disks, then logged onto each in turn and did STAT USR:, which worked fine, although it wasn't very convenient. Then I had an idea. There was no entry under USR: in the index, but careful reading of Digital Research's User's Guide entries for STAT turned up the command syntax STAT {d:} USR:. Although there was no example, and I thought B:USR: a very strange command form indeed, when I tried it, I found it worked. Now I have a SUBMIT file called STATUS.SUB that does STAT USR: for all the logical areas of my hard disk. Wheee!

If I seem a bit sarcastic, BYTE's managing editor has just received a very biting letter from the manager of the Digital Research documentation shop, who says I'll have nothing to write about if I stop unjustly accusing DR of bad documentation. He invites BYTE to require me to look at the Digital Research CP/M-86 documents as a prime example of the new excellent documentation DR now produces. I have just spent several hours experimenting with ways of using PIP with user numbers. Although this is vital to hard-disk management, there are precisely three examples of user-number options with PIP, and one of them contains an unexplained * in the command option. There is no example of how to transfer files from one disk to another while changing user numbers when you're logged onto yet a third disk under yet a third user number. It turns out that can be done; but I've wasted hours trying to discover what DR could have told me. In 10 lines of text, and after that letter it sent. I'm not in a charitable mood.

Aside, for the record: as I've said more than once, Digital Research's documents have shown remarkable improvement. There's room for more. Some of the improvement is said to be due to my flaying of both its old documents and its rather horrible intermediate "improvements" by a group of technical writers. I'm aware DR has put a lot of effort into document improvement, and the com-
It's 11:00 P.M. Do you know where your files are?

It's great when multiple local and offsite users can run any 8- or 16-bit CP/M or MP/M™ program. It's even better when they can share expensive resources like printers, hard disks, and tape drives. Best of all is when they can share your most precious resource—data. Gifford has been delivering systems with all these features for over two years.

But sometimes data is sensitive. How do you keep people from taking more than their fair share?

Gifford adds a new dimension to CP/M security.

With our new security features, you can control what resources and data are shared.

Gifford's proprietary security enhancements include user login with encrypted passwords, control over access rights of modern users, secure electronic mail, and the ability to restrict users to specified terminals, programs, and directory areas. Plus, an audit log utility that keeps a permanent record of system activity. And you also get all the standard security features of Digital Research's MP/M-86™.

You select the level of security needed to get the best balance between file sharing and file safety.

Unleash productivity with Gifford's Virtual Terminals.

With our Virtual Terminals, each terminal on your system can monitor up to four different programs running concurrently. And at the touch of a key you can switch screens instantly from one program to another.

You could look up an address in dBASE II™ jump over to SuperCalc™ to make some projections, then switch instantly to WordStar™ to use this information to update a letter. If you forget what's on a screen, just touch a key to refresh your memory. You won't need to go through the distracting process of loading and unloading programs.

And since your Virtual Terminal can run any 8- or 16-bit CP/M or MP/M program, you can choose the best programs for your job from the biggest software library in the world. It's easier than 1, 2, 3!

The Gifford Security Blanket: Total Solutions.

Gifford delivers solutions. This means professional pre-sale consultation, expert system integration with 200 hour system burn-in, complete training, and full after sale support.

For example, our three user CompuPro® based system with a 21-megabyte hard disk costs just $9,990, and can be easily expanded for $500 per user. This includes MP/M-8-16, SuperCalc, and dBASE II.

Other Gifford solutions include systems with hard disks that range from 5 to 300 megabytes, 4 and 9 track tape backup, printers, plotters, and modems. Single- and multiuser 8086, 68000, and Z-80 based systems are available for immediate delivery, with 80286 and 16032 systems on the way.

Two year warranty protection.

In the unlikely event that you encounter a hardware related problem, we'll replace any defective S-100 part within 24 hours FREE for two full years. But chances are, it can be solved on the Gifford service hotline or diagnosed via modem. All at no cost to you.

Lock in on Gifford Security today.

If total support, training, on site service, obsolescence-proof upgradeable S-100 bus architecture, and complete system security sound appealing, cut the coupon or give us a call. We'll send you a free brochure that tells the whole story. Once you get it you'll see why Gifford has a lock on multiuser CP/M-8-16.

Gifford Computer Systems is a Full Service CompuPro® Systems Center.

The powerful Gifford System 321 shown with optional GCS-80 Virtual Terminals.
Podunk or Pebble Beach?

Golf at a world famous course is just one of the many rewards of investment success. Improve your chances for that success with Dow Jones News/Retrieval®.

Even if you're just starting out in the market, Dow Jones News/Retrieval can help compress hours of research into instantaneous, well-organized, well-timed reports and analyses you can use to pinpoint trends and opportunities and improve your chances for investment success.

Dow Jones News/Retrieval gives you more time to assess more of what you need to know: company and industry activity, economic and earnings forecasts, Securities and Exchange Commission reports, and electronic stock quotes that are continuously monitored for accuracy by our staff.

The wide variety of high-quality data bases accessible on most personal computers include Dow Jones Current and Historical Quotes, as well as exclusive access to The Wall Street Journal, Barron's and the Dow Jones News Service.

As smart investors everywhere have discovered, there's only one Dow Jones... and only one Dow Jones News/Retrieval. Invest a few moments right now and discover the difference it can make for you.

company has made great strides. I also realize that documentation is tough, and it's particularly difficult if you're writing for naive users about complex products like operating systems and compilers.

I've also said, repeatedly to the point of nausea, that examples and indexes will cover a myriad of sins. If USR had been an index entry, I might have had a chance. If there had been more examples of how to use PIP with changing user numbers, I'd have saved time. Please, Digital Research: you're much improved since the CP/M 2.2 manuals, but you have not reached perfection yet.

Back to hard disks and 8/16: I'm hooked. There are too many advantages to having that much data on line.

Alas, I don't yet have one of the advantages. That is, I've been using Ward Christensen's wonderful disk-catalog program to keep track of the myriad floppies I've collected since 1976. It's possible to use that program to locate particular files and particular disks, but the catalog-library file that the program must search is very large, and on floppies it was just too slow.

I wrote a program that prints out the master catalog on paper. (My printer program, Christensen's public-domain catalog program, and a bunch of other useful stuff are available from Workman and Associates as one utility disk.) Christensen unfortunately wrote his catalog program long enough ago that there was no possibility of disks beyond H:. Consequently, I can't catalog floppy disks with it unless I boot up the system under the old CP/M 2.2 BIOS.

However: I can do that. The hard disk is no longer available when I do that, but so what? I can catalog floppies, and when that's all done, reboot under CP/M-8/16, use PIP to put the master catalog onto the hard disk, and keep it on line. The catalog program will search the master file all right; it's only the disk-map utility that won't run.

The bottom line on hard disks and 8/16 is that there may be aggravations, but the advantages are high. After all, this is a test setup, and I did volunteer to be a guinea pig. By the

time you see this, much of what annoys me will be taken care of. Even if there were to be no more changes, I'd stay with it. There are enough advantages already.

**Sage Faire**

The Sage Computer Faire was held in Reno in early February at the MGM Grand Hotel, where they stage the San Francisco earthquake twice nightly. The MGM dinner show is the most spectacular live stage presentation I've ever seen.

That's not why I went. In the past two years, Sage Computer has taken the same commanding position with development systems based on the Motorola 68000 chip that Compupro holds with respect to the S-100 bus and systems based around the Intel 8086 and follow-ons. Apple will sell a lot more Macintosh 68000 systems, but the Sage is faster, more versatile, and has more software, including advanced languages, now. Moreover, I have it on good authority that there's more than one Sage being used to develop Macintosh software.

For those who don't know, we've had a Sage II since the very early days of that machine. It was the Sage and Volition Systems Modula-2 that got me interested in that language. We've never had a glitch with it, and our Sage II is even now being used by Dr. Michael Hyson to develop illustrative programs for the introductory Modula-2 book we are writing.

This year the company brought out the Sage IV, which is faster, has more memory, and has a hard disk. We'll be getting one this month. One reason I went to the Sage Faire was to look at software I might want for the IV.

I saw a lot of it.

Fewer than a thousand people attended the Sage Faire. It reminded me of some of the early micro conventions, the fun ones before they got so large. There was a difference, though: although there were enough hobbyists and hackers to make the conversations interesting, there were also a number of industry heavyweights to make it likely that what was said would have an effect. All told, I don't think I've more enjoyed a convention since the West Coast Faire in Los Angeles where Carl Helmers, my late mad friend Dan MacLean, and I invented this column.

There's now plenty of software for the Sage: decent text editors, FORTH corresponding pretty well to what's described in Leo Brodie's *Starting FORTH*, what looks like an excellent LISP, and an impressive micro APL (you have to buy a special terminal in order to handle APL's screwy squiggles); there's UCSD Pascal; and of course there's Modula-2 from Volition Systems, with the full Modula-2 compiler and operating system to be available from Modula Research Institute very soon.

There's a small but strong market in add-on packages, such as modems for communications and a rumor of an Omnimet retrofix for both IIs and IVs.

There are also application packages: business software that works. In as small a show as the Sage Faire, it's possible to look at everything in some detail. I liked most of what I saw. I was also able to talk to a number of publishers and their programmers, pointing out features I'd like to see and things I didn't care for. Some promised to make changes. We'll see.

I've purposely avoided specifics in the above, because I don't like commenting on things we haven't been able to run here at the Manor. Next month we'll have the Sage IV and whatever software I've been able to collect.

What's important is that the Sage looks to be here to stay. The factory in Reno is quite real, large enough for considerable expansion if the company needs it, and not so expensive that it will go bankrupt paying for it. There's an enthusiastic work force and a lot of in-house use of Sage computers.

I've long thought Sage had the best 68000-based computers on the market. Now I'm certain of it.

**Two Views of the Future**

Dr. William Godbout of Compupro and Rod Coleman of Sage are, in my judgment, two of a very small num-
GET YOUR MESSAGE THROUGH.

EVEN WHEN YOUR MODEM SENDS IT BY WAY OF THE OKEFENOEKE SWAMP.

When you send data by telephone through nasty environments like this, it can run into problems tougher than just alligators. Problems like impulse noise. Chatter from the switchgear. Static from the atmosphere or bad weather. Distortion due to crosstalk or just plain white noise.

To get your message through, your IBM PC or XT needs the advanced performance features of the PC: IntelliModem. It's got the best receive sensitivity available today—actually down below -50 dBm. So now you can achieve a high level of data transmission integrity. Even with bad connections.

Get patented modem technology. The PC: IntelliModem is elegantly simple. Its patented design does it all on a single microprocessor chip, with just one crystal. Other modems take two, four or more µPs (and even more oscillators), and still accomplish less.

How do we do this? By creating architectural innovations in firmware, and by pushing the chip to its limit, close to 12 MHz. Since it uses fewer parts, the PC: IntelliModem's no-compromise design offers higher reliability, a more compact form factor, and lower costs.

This design elegance leads naturally to more elegant performance. Take line status detection, for example. The PC: IntelliModem's adaptive, decision-directed logic monitors line status more closely than other modems. Even at weak or degraded signal levels. So it can make connections with less chance of error, by detecting signals for dial tone, remote ringback, busy and voice—some of which other modems ignore.

Plan ahead with integrated voice and data.

For opening up a whole new world of integrated voice and data applications, there's nothing like the PC: IntelliModem. Literally. Its easy-to-use software package—PC: IntelliCom™—lets you switch repeatedly between talking or listening and sending or receiving data. All at the touch of a single function key. That means now both you and your computer can talk on the same line. Without having to hang up, re-dial or plug and unplug a lot of cables.

So if you're designing microcomputer datacomm products—or just looking for a PC/XT modem for yourself, check out the PC: IntelliModem at your local dealer. You'll get the message. And so will they. Or contact: Bizcomp, 532 Weddell Drive, Sunnyvale, CA 94089; 408/745-1616.

BIZCOMP
We've got people talking.

ber of key people in microcomputer
development. Both sell topflight
development equipment. Both have
similar ideas about the future of com-
puters. Godbout and Coleman are
both after the business market,
because that's where the high-volume
sales are; but that's marketing
strategy, not love.

Their hearts are with the develop-
ment of high technology, largely for
its own sake. Each foresees dramatic
increases in computing power per
dollar, and each is obsessed with
building machines that access huge
amounts of memory and work at the
fastest possible speeds. The similarity
ends there.

Bill Godbout

Although Godbout's Compupro
company makes a 68000 micropro-
cessor for its S-100 development sys-
tem, there's little support for the
board, and if there are any plans for
follow-on developments, such as
adding the National Semiconductor
16081 floating-point math chip, it's
Compupro's best-kept secret. Dr.
Godbout is betting heavily that the
future of the micro lies with the Intel
iAPX286 and its follow-ons. In addi-
tion, he's made some hefty invest-
ments in technology based on the
National Semiconductor 16032;
there's already a Compupro 16032
microprocessor board for the S-100
bus. You might be able to buy one
about the time this is in print; about
the same time you can probably buy
a 286 system, but you'll pay a stiff
price for it.

Within a year, though, prices will
fall. They always do, and you'll be
able to buy working machines with
credible power at reasonable prices.
The trend toward more bang for the
buck will continue; meanwhile, if
you want to develop software for
future computers, you can get a ma-
chine to develop it on now.

Godbout's development systems
are based on the S-100 bus, which he
figures will last a few more years
before technology irrevocably passes
it by. Meanwhile, you can buy a com-
plete development system, with fast
memory, disk drives, system sup-
port, input/output, etc., and change
microprocessor boards as they arrive;
and you can have confidence that
Godbout will do his best not to leave
his customers hung out to dry.

Dr. Godbout likes to talk about
future computer technology. So do I,
which is a good thing, since when we
get together even on thoroughly
social occasions the conversation is
likely to get technical, to the extreme
boredom of the other guests. I have
notebooks full of his speculations
about the 16032, memory manage-
ment, math chips, and the future of
operating systems. In brief, he thinks
supermicros in the future will be built
around either the Intel 286 and
follow-ons or the National Semicon-
ductor 16032 and its upgrades; and
that the operating system of the future
will be multitasking Concurrent CP/M—which will be
compatible with, possibly based on,
and look an awful lot like Unix.

Secrets ...

Like Bill Godbout, Rod Coleman
likes to talk technology, and until
very recently his Sage Computer was
one of the most open companies go-
ing. Almost anyone could call him
and get him into a conversation on
his view of the future.

Lately, though, his marketing and
public-relations people have advised
him to be a lot more careful, and he's
reluctantly taking that advice: for ex-
ample, everything said about future
Sage products at Sage Faire was not
only off the record, but preceded by
a formal nondisclosure agreement.
Unlike Compupro, Sage doesn't have
multiple product lines. The Sage is a
great 68000-based development sys-
tem, but it also has to be Sage's busi-
ness system; and although the Sage
has been profitable from the first
month it began shipping computers,
the company is critically dependent
on shipping machines to maintain its
cash flow. There's no big wad of ven-
ture capital behind Sage; 90 percent
is owned by the three original
founders.

Thus, Sage is subject to the "Os-
borne phenomenon": announce-
ments of future machines killing sales
of present ones. I think the company
worries too much: the present Sage
The best ... for peanuts!

Get the most computing power from your IBM/PC Jr. with these exciting Amdek monitors.

The COLOR-I accepts composite video input for complete compatibility ... and it has a built-in speaker and quality resolution. It's the most popular color monitor in the entire world!

The VIDEO-300 with amber or green screen provides 80 column text or graphics display capability ... and its nylon mesh, non-glare screen eliminates distracting reflections.

Both monitors are backed with the best warranty in the business (2 years) ... and you won't have to shell out a lot of money to own one.

AMDEK
II and Sage IV are proven systems, with new software coming out every week, which is what business customers want. It's one of Pournelle's rules for users: the best computer to buy is a development system after it has been around a couple of years. You get state of the art with the bugs out.

I didn't really need a confidential briefing to know that Coleman is not standing still, and he was speaking on the record when he said that "the 68000 is a generation ahead of anything Intel is building." Obviously, Sage is going to track new 68000 and follow-on technology, and I must have a dozen letters from readers telling me the virtues of the 68010 and 68020 chips. It's also obvious that any dramatic improvement in 68000 speeds will require some kind of floating-point math chip. In answer to an audience question, Coleman said he expects 256K-bit RAM chips to be available at reasonable prices late in 1984; and everyone knows that really big hard disks are just now coming onto the market.

Put all that together, and lay a French curve through the speed, memory, disk capacity, and price of the Sage II and Sage IV plotted against their date of introduction.

Thus, the only real secrets Sage has are when it will bring out the new stuff and how much it will charge for it: and Coleman gave a clue to that when he said, in a nonrestricted speech that, he doesn't consider a new chip a real part until its price has fallen to 50 percent of the introductory price. "By then it's not only cheaper, it's more reliable. The bugs are shaken out, there's probably been a new mask, and usually there's a second source," Coleman said.

It doesn't take a very large computer to predict what Sage is doing. On the other hand, it doesn't take a market survey to know that business customers aren't interested in state of the art: they're interested in software, service, and reliability. Sage's business sales aren't going to depend on the ability of Coleman's marketing people to shut him up about new Sage products: they're going to depend on Sage's ability to market what I'm now willing to say is the best 68000 computer available.

Rod Coleman

Coleman believes in the 68000 chip as strongly as Bill Godbout believes in the Intel family. Where Godbout says that "unless you know what you're doing, don't fool around with 68000 machines," Coleman believes the 68000s are the real beginning of the supermicro.

Coleman spends more time worrying about software than Godbout does. Unlike Dr. Godbout—and many 68000 enthusiasts—Coleman rejects Unix as too big, too slow, and too incomprehensible. "Just how different is Unix from Adventure?" he asks. "You get to wander around in the Unix command structure and try to find out if you can make it do anything useful. Once in a while you get hints, like 'Volume not on line.' At least UCSD p-System puts seven words across the top of the screen. That's more than Unix—or CP/M for that matter—ever did."
He also points out that CP/M was designed to work with a Teletype (TTY), a device that couldn't transfer information with any speed at all. Now we have hardware that can store a lot of information and tell it to us quickly; why are we stuck with operating systems based on obsolete technology?

He also sees the future belonging to multitasking—and to integrated software, huge software projects that tie together spreadsheets, databases, word processors, accounting systems, calendars and all the other tasks we now ask computers to do one at a time. In Coleman’s view, future operating systems will do much of the work for the programmer. That means they'll be big, a full megabyte and more—which in turn means that the micro will have to work fast to make use of all that code.

Huge software projects are beyond human capability. Adding more people to the job eventually brings a point of not merely diminishing, but negative return; adding another person to the job requires enough man-

agement and training that the expanded team produces less than it did before the new people were put on the job. Since we will need huge integrated software packages, the only answer is modular software—which is what both Modula-2 and Ada were designed to accomplish.

Coleman’s only comment about Ada was that it was designed by a committee. Modula-2, on the other hand, was guided by single (and brilliant) mind. It can, perhaps, serve as a software bus, with new software making use of previous modules—but only if there’s some kind of standardization of the Modula-2 library.

At the founding meeting held in Zurich last March of the Modula-2 Users Association, all the major U.S. and European Modula-2 publishers agreed to work together in standardizing the Modula-2 library. Niklaus Wirth, Modula-2’s inventor, pronounced himself very pleased with the meeting.

One thing Coleman is certain of: the future doesn’t belong to obscurantists, but to people who can design systems—hardware and software—accessible to a lot of people. “It has to be simple, like a doorknob,” he’s fond of saying.

His picture of the future has many of the elements that Larry Niven and I put into the society of The Mate in God’s Eye. In our novel, everyone carries a pocket computer, which is used by asking questions in ordinary English. (Well, in our novel it’s English, since we set this rather far into the future.) The pocket computers are tied into enormous databases; anyone can get the answer to almost any question simply by asking.

In my speech at NCC last year, I said that by the turn of the century, anyone in Western civilization who seriously wants to will be able to get the answer to any question whose answer is either known or calculable. I see no reason to change that prediction. Neither does Rod Coleman.

So What’s Coming?

If you take what Coleman and Goodhew say and cancel out their dis-
Letter Quality
Say goodbye to correspondence quality and hello to Fancy Font's high-resolution, proportionally spaced, letter quality. Fancy Font provides fonts in sizes from 8 to 40 points; styles include Roman, Bold, Italic, Script, Old English, and more. All this on low-cost Epson (MX, RX, FX) and Gemini 10X printers. Fancy Font is an easy-to-use software package for CP/M and IBM PC compatible systems; no special hardware or installation is required.

Create Your Own Characters
You can use over 30 font sets in the Fancy Font package and furthermore, can create any new characters or logos you like, up to 1 inch by 1 inch. A database of over 1500 characters is included that makes it possible to print foreign languages and mathematical notations.

Font Style Samples
small medium large Bold Italic
Sans Serif Script Old English
\[ A = \int \sqrt{a^2 - x^2} \, dx \]

Numerous Applications
Fancy Font customers, numbering in the thousands, are constantly discovering new applications.
- Business and personal letters
- Custom forms, invoices, labels, signs
- Foreign Languages
- Mathematical Notation, Greek
- Super- and Sub-scripts
- View Graphs
- Custom Letterheads

To Unix or Not to Unix?
On Mondays and Wednesdays I'm sure Unix is the wave of the future. After all, IBM says Unix. AT&T says Unix. Digital Research is moving in the general direction of Unix and also getting closer to IT&T. There are indications that Microsoft is getting agreements, you still get a comprehensive picture of the new supermicro. It will have a bit-mapped screen and be able to do high-resolution graphics. There will be a good programming language integrated into the operating system, which will be enormous, Unix-sized even if it's not Unix. The machines will be fast. They'll have several megabytes of memory. They'll do coprocessing, which is to say they'll do several things at once. They'll have access to really large data storage, probably hard disks with 100 megabytes. They'll be able to talk to other machines and do it transparently so the user doesn't really have to know the difference between accessing his own hard disk and accessing one on the other side of the continent.

The operating system will be largely menu driven, and comprehensible to ordinary people. Both Godbout and Coleman have plenty of contacts within the software-development community; Bill Godbout often talks with Digital Research's Gary Kildall, while Rod Coleman's people work closely with Softech, Voluton, and the Modula Research Institute. Compupro and Sage are in a position to have major influence over software development.

However, their interests differ. Coleman worries about software development a lot more than Bill Godbout does. Although Compupro is a much larger company than Sage, Sage has more software people and works harder at integrating outside software into its bundle. Compupro tend to have software development done through outside consultants.

Both companies work at the frontiers of microcomputer development—and despite their different approaches, both seem to be headed toward the same place, the world of supermicros.
NEVADA SOFTWARE
FOR CP/M: TOP QUALITY, BOTTOM PRICE.

Nevada makes it easy and economical to get the software you want and need. Need a better BASIC? We've got it. Is BASIC not solving your business or engineering problems? Nevada COBOL or FORTRAN will. The media praises Nevada, and it's priced right: just $39.95—about 1/10 what comparable quality costs. For about half the price of one competitive package, you can own the entire Nevada Software library! So don't wait; order one or two or all of our bargains—today.

Finally, a better BASIC. This straightforward language lets beginners write useful programs without limiting them to simple programs. New Nevada BASIC's interpreter has Prof. Starkweather's great built-in full-screen text editor. You can define single- and multi-line functions. Plus there are full-matrix operations, Random Access and Serial files, program execution with a simple command, BCD Math—no round-off errors. With Nevada BASIC, micros can run like minis costing thousands more.

Whether you do business computing or learn computing for business, COBOL is the language; more business application software is in COBOL than in all other languages combined. Based on ANSI-66 standards, Nevada COBOL offers many advanced features: Random Access and Sequential files, debugging capability, COPY statement, character string, 16 bit binary and decimal data types. Colleges use the fine documentation as classroom texts. It's field-proven by 10,000+ worldwide business, government and education users. Join them.

COBOL Application Package—Book I
Superior user documentation that saves even experienced programmers many hours.

FORTRAN
"If you want to learn or teach someone FORTRAN, this is the package to buy." ACCESS, March/April 1983. For learning and teaching, for scientists and engineers, Nevada is the perfect FORTRAN. Based on ANSI-66 standards (FORTRAN IV), its advanced features include IF-THEN-ELSE constructs, COPY statement, CHAINing with COMMON, TRACE style debugging, and 150 verbal error messages. And you can intermix in-line FORTRAN and Assembly Language statements for special micro needs. Requires 48K RAM. If you're shopping for FORTRAN, look no further.

Perfect for training, testing, virtually all FORTRAN application packages, because it so quickly solves training and documentation problems. Nevada PILOT meets all PILOT-73 standards and has many new features including a built-in full-screen text editor. Prof. Starkweather's documentation is exceptional; the manual comes with 10 free programs. See MICROCOMPUTING review, January 1983, and you'll be convinced.

BYTE May 1984 77
Less for Your Money

If you do word processing on your personal computer, you probably know that there are many programs for sale to help you with your spelling. But the biggest spelling error you'll ever make is paying too much for your spelling correction software. The Random House ProofReader gives you less for your money - less trouble, that is, and fewer spelling errors. The Random House ProofReader is based on the world famous Random House Dictionary. It contains up to 80,000 words, depending on your disk capacity. You can add new words with the touch of a key. It shows you the error and the sentence it's in. It instantly suggests corrections. It even re-checks your corrections. And it costs half as much as other programs with far less power. The Random House ProofReader is compatible with all CP/M 2.2, MS-DOS® and IBM Personal Computer® systems.

The Random House Proof Reader

$50

For orders or information, see your local dealer or call 505-281-3371. Master card and VISA accepted. Or write Wang Electronic Publishing, One Industrial Ave, Lowell, MA 01851. Please enclose $50 and specify your computer model, disk size and memory.

heavily into the Unix game. Thus, the Intel chip family seems headed toward Unix.

Meanwhile, a good part of the 68000 chip community (with the notable exception of Sage's Rod Coleman) believes in Unix and thinks the 68000 has a better architecture for doing Unix-like things than the 8086 family does. It's even possible that Unix will bring about some convergence of software written for the 8086 and 68000 series; at least the source codes in higher-level languages ought to be transportable. It's vital to the micro community that we have as large a software market base as possible, so Unix may be a real boon to us all by allowing software developed on one kind of system to tap another kind of system's market, thus encouraging investment in really elegant programs. By Wednesday evening I can convince myself that Unix is a friend to all.

On Tuesdays and Thursdays I'm certain Unix is dead. It's enormous; Unix for the IBM PC comes on 15 floppy disks. You must have a hard disk before Unix even begins to make sense.

Unix is slow. It's designed for a multiuser situation, which violates the first principle of the micro world: One User, One Computer. I fervently believe in that principle, and thus I'm much more partial to communications and networking than to multiuser concepts.

Unix is incomprehensible. It tells you almost nothing and lets you guess what you did wrong. It can be modified, but I haven't yet seen one of those "easily constructed" user-friendly Unix shells that will be out Real Soon Now. By Thursday night I can convince myself that Unix is an enemy of the micro revolution. The rest of the week I refuse to think about it.

USUS

If we ever do develop truly modular software, some of the credit should go to outfits like USUS, the UCSD Pascal Users Society. USUS membership costs $25 a year, and if you've any interest at all in the future of modular languages, you should join if only to support the outfit.

At the Sage Fair, a number of USUS committees met continually. There was some nattering about USUS business, but most of the discussion was about standards. Since representatives of Apple and Softech, the two largest vendors of Pascal p-code, were present throughout the three days of meetings, there was at least a chance of accomplishing something useful.

A typical problem considered at the USUS meetings was version control for separate compilation. Separate compilation means that you write and compile your program in little chunks that never have to be recompiled. It saves a lot of time and work.

If we ever develop truly modular software, some of the credit should go to outfits like USUS.

Pascal was never designed for separate compilation. Indeed, it wasn't originally designed to be compiled at all; it was intended as a teaching language. After Pascal caught on as a production language, some compiler writers added a kind of separate compilation capability to the language. Alas, that has its drawbacks. In particular, the "modular" capability additions to Pascal have no provision for version control. This means that you can play holy hell with programs if you make certain kinds of changes and someone else comes along and writes procedures that depend on your not having made your changes. It happens more often than you think.

There was a lengthy USUS discussion on how to modify UCSD Pascal to give it version control. Modula-2 has rigid version controls, and Pascal needs them. Implementation would be simple. There are at least a dozen ways to do it—which, of course, is the problem. When I left there'd been no resolution, but they're trying, and that can benefit us all.

You can reach USUS at POB 1148, La Jolla, CA 92038, and you ought to.

In the world of business software, there's only one number one, 1-2-3™ from Lotus.

And it's been that way almost from day one. Since January of 1983, 1-2-3 has consistently been on the top of the software best sellers lists.

And it's the best selling PC software in the world, for one very good reason. It's the very best PC software.

The PC software that simply does more for you.

1-2-3 gives you the most powerful productivity software available today. An analytical tool that combines spreadsheet, graphics and information management into one incredibly fast, easy-to-use package.

With 1-2-3, you can analyze, interpret and report information in seconds with just the touch of a key.

And because it's all one program, you not only work faster and smoother, you work smarter.

But don't just take our word for it.

Take the word of the experts. The New York Times heralded 1-2-3 as "the wave of the future in business software."

And recently they wrote, "In scarcely a year, the Lotus Development Corporation has done for the world of personal computer software what International Business Machines has done for personal computers: it has created a product so widely successful that scores of other companies are scrambling to imitate or improve on it."

Software News said, "1-2-3 has more capabilities than any other program in its class."

"It is the one product that without doubt has single-handedly changed the face and direction of the personal-computer-software industry," was the way Info-World put it.

Softalk simply wrote, "Lotus's 1-2-3 is so dominant, it doesn't seem as though there's room for other software." And in 1983, 1-2-3 from Lotus was good enough to be named a "Product of the Year" by both Fortune and Info-World.

It's the difference between getting by and getting ahead.

What can 1-2-3 do for you?

What it's already done for hundreds of thousands of PC users. Give you a proven business software that can dramatically increase productivity for you and everyone in your company.

After all, when it comes to looking out for number one, going with number one is the only way to go.

To find out what 1-2-3 from Lotus can do for you just visit your local computer store, or call 1-800-343-5414. (In Massachusetts call 617-492-7870.)
1-2-3 from Lotus. Maybe the best way to look out for number one is to go with number one.
Pascal—and not one complaint. I also Turbo by mail and received it much.

I also know three people who bought the same day it gets the order.

Our own experiences have also been positive. Borland's Pascal certainly rivals Digital Research's Pascal and ease of use—and it sure costs a lot less. It's almost certainly better than IBM's Pascal for the PC.

It's also the only Pascal, including IBM's, that runs on the PCjr—and its built-in editor is nearly as powerful as IBM's Homework.

Recommended.

Games . . .
I always look forward to Avalon Hill computer games, largely because I've liked its board games for so many years. I'm also particularly interested in classical war games (I've got several bands of super-heavy cataphract miniatures). Thus, I was eager to get Avalon Hill's Legionnaire.

We received it with two other games; one would not work with Rana drives and Avalon Hill's copy-protection system. However, A-H will honor its lifetime disk guarantee, so if you get a game that won't work on your system, write the company. It will make the game work or give you your money back.

Another, Parthian Kings, has been really popular with the boys. It appears to be a form of chess, with "Hammurabi" economics, combat, and magic thrown in. I haven't had time to play it, but I note that the boys have spent a good bit of time playing, both against each other and against the machine. I expect I'll like it; I know they do.

Legionnaire gets mixed reviews. I hated it. It appears to be a game of strategy, but it takes place in real time, which in practice means that it's an arcade game masquerading as a game of strategy. You're supposed to give orders to your various Roman combat units, in much the same way that you might issue written orders to units in a miniatures game. It takes time for the units to get the orders, and meanwhile something may have happened to make the orders obsolete.

A miniatures game has rules concerning just how you might be able to cancel inappropriate orders and send in new ones and how much initiative the units are allowed to take. In Legionnaire, you have to move the cursor to the unit using a terrible control system if you have the Apple version; there's an Atari version that's said to use the joystick, which might not be quite so bad. Once you have the cursor over the unit, it no longer carries out orders, but you can cancel old ones and give new ones. About the time you do that, something has happened on the other side of the board, and you must race the cursor over there, at which point another unit is in trouble, and so forth. There's no time for strategy and not much time for tactical decisions.

I suppose this is intended to produce some kind of realistic "fog of war" effect, but it doesn't, because it

happens too darned fast. In the real world it takes minutes, not seconds, for a legion to turn and march. If you were to try to match actual real time, the game would take too long; but speeding it up the way the company has doesn't work either. Alas, there's no provision for changing the time-scale factor.

In addition, for reasons I don't understand, all the action takes place on a very small part of the screen. You see only a portion of the screen and have to scroll the map up and down and sideways in order to see the entire playing area.

The graphics are lousy, too. All the units look alike; the only way you can figure out which ones are which is to put the cursor over one, at which point the unit is "frozen" in movement and combat, but you can read its designation and strength until you take the cursor away.

Legionnaire has neither history nor realism nor playability to recommend it. Oddly enough, though, Phillip, who wants to be a navy jet pilot and has the family record for arcade game scores, likes it, largely because of its defects: it's really difficult to win, because not only must you be a good arcade game player, but also a good strategist. I notice, though, that he's taken to Parthian Kings again, and Legionnaire sits in its box.

Hide That BYTE
I have written a long piece of advice for minicomputer establishment managers who want to get along with micros. Alas, there's no room this month, but it's at the top of my notes.

However, I can't resist telling this story.

It seems that the manager of the electronic data processing (EDP) shop of a Fortune 500 company decided to buy a bunch of micros. (Smart move; micros can do things that minicomputers can't, not because the micro is more powerful, but because there's better software due to the larger micro customer base.) He made his choice and put in an order for about a hundred machines.

Naturally the supplier asked why he'd chosen its product.

"Read about it. Guy named Pournelle, writes in one of the computer magazines."

"Oh, you read it in BYTE?"

There was a stunned silence from the EDP man. Then he said, "Uh, look, uh, no, I didn't see it there—"

It turns out there's considerable prejudice against BYTE in certain circles. This chap was supposed to be reading Datamation or some other "professional computer" magazine, not BYTE for corn's sake . . .

I expect there's a moral to that story, but I'll leave it as an exercise for the reader.

Jerry Pournelle is a former aerospace engineer and current science-fiction writer who loves to play with computers.

Jerry Pournelle welcomes readers' comments and opinions. Send a self-addressed, stamped envelope to Jerry Pournelle, c/o BYTE Publications, POB 372, Hancock, NH 03449. Please put your address on the letter as well as on the envelope. Due to the high volume of letters, Jerry cannot guarantee a personal reply.
With Sharp's PC-5000 you can take your entire office with you, wherever you go. Do word processing on the train, order entry from a customer’s office or spreadsheet analysis in your hotel room. It goes anywhere.

It's small.
It weighs under 10 lbs* and fits in a standard briefcase.
It prints quietly, with an optional correspondence-quality printer.

It comes with software. Word processing and communications. Also available are spreadsheet, executive planning and scheduling.

It remembers over 80 (128K) typewritten pages. And can be expanded to handle over 500 (896K).

It's compatible with a wide array of 16-bit IBM® software.

It communicates with other computers and databases.

It's AC/DC with rechargeable 6-hour batteries.

It all means travel time and commuter time no longer have to be downtimes.

For more information call toll-free now 1-800-BE SHARP or send in the coupon.

* Without optional printer and modem.

Sharp Electronics Corp., Paramus, NJ 07652
One computer.
Two points of view.
The Epson QX-10 personal computer.
To many, the Epson represents the ultimate in simplicity.
Just press a single key for the function you require: word processing, scheduling, business graphics, address book or file management. One keystroke produces your program. There are no rigamaroles to remember. No disks to change.
The result: you start to work immediately. And you start being productive, immediately. With step-by-step prompts. In plain English, not computerese.
Simplicity itself.
Or is it?
The plain fact is that the ease of operation the Epson offers today is accomplished with a degree of technological sophistication most other computers can only promise for tomorrow—specifically, fully integrated software, operating in an interactive environment.
The few other computers offering such "simplicity" cost $5,000 to $15,000 more. And most other computers can't offer it at any price. Which makes one wonder exactly what they do offer, in terms of either simplicity or performance.

HOW MUCH CAN YOU DO ON THE EPSON? HOW MUCH ARE YOU READY TO DO?

The Epson's ease of operation may spoil you, but it certainly won't limit you.
Case in point: every Epson comes complete with an integrated software system—Valdoo*—to effortlessly provide the basic functions for which most people buy computers. The Epson also comes with CP/M®-80 2.2, so you can choose from the hundreds of programs in the CP/M library. And only Epson offers an exciting new collection of seven best-selling programs now specially enhanced to give you every powerful feature, plus Epson one-button simplicity. Included are dBase II®, Friday®, Microplan®, Graphplan®, WordStar®, SpellStar®, and MailMerge®. And the Epson also allows you to add MS®-DOS compatibility, so you have access to best-sellers like Lotus® 1-2-3®.

Best of all, you will run the software of your choice on the computer of choice. The high-performance Epson, with 256K RAM, 128K dedicated video memory, the breathtakingly sensible HASCII™ keyboard. Dual 380K double density disk drives.

Graphics capabilities unequalled in its price range. A high resolution monitor, 640 by 400 pixels, for clarity few computers in any price range can offer. Plus, an RS-232C interface, a parallel printer interface, and internal space for up to five peripheral cards so you can expand your Epson as your needs require.

One further point: all these features, and quite a few more, are included in the Epson's $2,995 price. Some com-
puter companies ask you to pay extra for features like these. Most can not offer them at any price.

That, too, is performance. The kind of performance that can make choosing a personal computer very simple, indeed.

EPSON QUALITY. OR, WHY WONDER WHAT TERRIBLE KLUDGES LURK IN WHICH SLEEK BOXES.

If you know computers, you know Epson. Epson printers set the industry standard for quality, reliability, and value. Rest assured, the same can be said for the Epson personal computer.

The satisfying silence of the slim, Epson-designed disk drives is one way for you to judge or, for an inside-out perspective, here is an excerpt from a review by Jim Hanson in the April, 1983 issue of Microcomputing.*

"The Epson QX-10 is soundly designed and executed. I looked hard and found no evidence of kludging or shorting out anything in the name of economy. All the connectors have gold on them and are of quality manufacture. The printed circuit boards are heavy, with soldermarks on both sides of double-sided boards. The circuit boards are completely silk-screened with component labels, and the layout is as professional and clean as you will find anywhere."

Isn't this what you expect? After all, it's an Epson.

A WORD TO THE WISE: GET YOUR HANDS ON THE EPSON.

Is the Epson a simple, easy-to-use computer for beginners? Or a sophisticated high-performance computer for the experienced? The answer is "yes." And when you think about it, aren't those two computers the one you need now:

For technical specifications, and the complete, 3-part Microcomputing review, along with the name of your nearby Epson dealer, call toll-free (800) 421-5426. California residents, call (213) 539-9140.

STATE-OF-THE-ART...SIMPLICITY.
Bulletin Boards in Space

Amateur radio pioneering promises low-cost global communications

John Markoff
BYTE Senior Technical Editor

The recent explosion of interest in personal computer communications using electronic bulletin-board systems (BBS) has been paralleled by a rise in interest in data communications among radio amateurs. Unlike their earthbound personal computer counterparts, hams are now raising the data communications ante both literally and figuratively.

Amateurs are seeking approval to be on board a space-shuttle mission to be launched from Vandenberg Air Force Base in Southern California sometime in 1986. If all goes well, the shuttle will carry an experimental amateur satellite system called PACSAT (packet radio satellite) into a low-earth polar orbit. Midway through the mission, a shuttle astronaut will push a series of switches ejecting PACSAT through the open shuttle payload bay.

PACSAT will be placed into orbit at the bargain-basement price of $10,000 as part of the National Aeronautics and Space Administration’s (NASA) "Get-Away Special." This program was devised by NASA to interest organizations that might not otherwise be able to participate in the space program. PACSAT will be contained in a 5-cubic-foot package weighing no more than 200 pounds.

When it reaches orbit, PACSAT will be the world’s first space-based multiuser BBS. With several CMOS (complementary metal-oxide semiconductor) Z80-based (NSC800) microcomputers and 4 megabytes of RAM (random-access read/write memory) disk storage on board, PACSAT will herald the arrival of a new era of global data communications.

PACSAT will allow licensed radio amateurs anywhere to transmit packet-switched digital messages at 9600 bps (bits per second) for delivery within a 12-hour time period. As the satellite circles the globe at an altitude of 250 miles, inexpensive earth-based gateway communications stations will be able to transmit electronic messages on several ham-band uplink communications channels. These messages will be stored for later retransmission by PACSAT to other hams around the world.

The architecture of the PACSAT communications network looks much like baseband LANs (local-area networks) that use a carrier-sensing, multiple-access (CSMA) scheme to share a single wire in an office setting. However, in this case, digital-data packet communications will share a part of the RF (radio frequency) spectrum using a set of packet-switching protocols that are, in effect, an extension of the X.25 protocols used in commercial packet-switching computer networks.

To make the PACSAT network more efficient, the satellite will communicate directly with network nodes rather than with all amateurs.

"The ultimate goal is for you to be able to connect your packet-radio (printed-circuit) board to a local-network node," says Harold Price, NK6K, an amateur-radio operator with a computer-science background who is serving as PACSAT’s full-time project manager.

"You could probably build messages off line," he adds. "You could use Wordstar to build your message and then tell your computer which amateur to send it to. What will actually happen is that your computer will connect up to the local network, put that message on there and say 'forward this,' and the network itself will take care of routing the message the best way. If the person the message is intended for happens to be local, it will keep it locally until there is a check-in. Or it will be sent by satellite if the person is located farther away."

Price admits, however, that the amateurs still have several years of development work before such a sophisticated network is in place.

Two aspects of the project will be of great interest to personal computer users interested in data communications. First, the PACSAT project will offer the first truly low-cost global-communications network. PACSAT will be visible to every portion of the globe each six hours, meaning that it will function as an electronic-mail carrier in the sky, taking data up on one side of the earth and transmitting it down to another point during a subsequent orbit.

The Radio Amateur Satellite Corporation (AMSAT) is now designing PACSAT earth stations that will cost less than $700. The stations will consist of a simple digital transceiver de-
signed to operate at the 70-centimeter (435-MHz) and 2-meter (146-MHz) amateur-radio frequencies, a terminal node controller (TNC) used to convert an asynchronous data-communication stream into synchronous digital packets, and a quarter-wave ground-plane antenna. These stations can be connected to virtually any personal computer.

"The antenna is extremely simple," says Price. "In my case, it is simply two bent coat hangers located in a high place out of the way of trees and other objects."

The second aspect is that the work radio amateurs are doing in satellite and packet-radio communications areas may ultimately find application in earthbound data-communications networks. Hams have begun implementation of several levels of the International Organization for Standardization's (ISO) open system interconnection model designed to standardize communications systems.

PACSAT is a joint project of AMSAT and Volunteers in Technical Assistance (VITA), a nonprofit organization spreading science and technology to poor countries. Inquiries have been received in most scientific areas. VITA will be the second PACSAT user, greatly accelerating the speed of communications between its projects around the world.

PACSAT will, in fact, have two separate BBSes, each with a series of data uplink and downlink channels that will be able to handle communications with multiple earth stations. AMSAT and VITA will each use a separate communication computer, known as a PEP (for PACSAT experiment processor), on board the spacecraft (see figure 1).

Each PEP consists of an applications processing unit (APU), a channel control unit (CCU), and 2 megabytes of system RAM, accessed by a bank-switching scheme, that will function as an electronic mass-storage system. A serial connection exists between the two PEPs to provide redundancy and to permit AMSAT to reconfigure the experiment if one unit fails.

The APU provides microprocessor-based control for the PEP. It is based on an NSC800 (a version of the Z80 microprocessor implemented in low power consumption CMOS) running at 4 MHz. This processor controls the BBS software and handles I/O (input/output) between two CCUs, each containing the modem hardware required to move data between the RF links and APU. Each CCU is also controlled by an NSC800 and supports two uplink and one downlink communications channels. The CCUs function independently and each contains its own programs in 2K bytes of PROM (programmable read-only memory) and 2K bytes of RAM.

What we'll have up there is a multitasking, multiprogrammed operating system," notes Price. "There will be many earth stations connected to PACSAT simultaneously, and PACSAT will have to keep track of multiple users."

To conserve processing power aboard PACSAT, ground stations will be able to request a file directory from the PEP on board the spacecraft and then search the directory for files on earth. Once a file is located, it can be requested and sent to the ground station at the same time new messages are being uploaded.

The spacecraft itself will be controlled by a microcomputer called the integrated housekeeping unit (IHU), which will keep the spacecraft healthy by handling navigation and attitude control, monitoring the solar cells, and collecting telemetry and sending it to the ground control sta-
Weight and power constraints are also forcing PACSAT's designers to create an extremely low power consumption hardware architecture for the spacecraft. The entire PACSAT spacecraft will run on less than 35 watts of power. On UOSAT B, launched in March, a smaller experimental communications processor that served as a prototype for the PACSAT PEP experiment used 0.75 watt.

"They said they could give us 1 watt," says Price. "They said that if we used a watt they would have to turn us off every once in a while. So we fought to keep the power real small so they would leave us on all the time." For reference, he points out that a standard non-CMOS Z80 microprocessor draws 150 milliwatts at 2 MHz. This is roughly equivalent to the power consumption of an entire PEP on board PACSAT.

The ground-station component of the PACSAT network is built around a simple TNC controller created by a group called Tucson Amateur Packet Radio (TAPR). The group has designed and made available in kit form a TNC that has software and hardware architecture organized in accordance with the ISO layer-by-layer network communication model. The TAPR TNC currently implements the first two layers of the ISO model: the physical layer and the data-link layer. The TAPR TNC, which is based on the 6809 microprocessor, can hold a total of 48K bytes of RAM and ROM on the printed-circuit board. It uses the Western Digital 1933 HDLC (high-level data-link control) chip (an LSI [large-scale integration] device that implements much of the ISO level-two standard in hardware) and has both serial and parallel ports. The TAPR TNC is a second-generation design that is an outgrowth of an earlier board built by a group of hams in Vancouver, British Columbia. (For more information on the TNC kit, available for $240, contact Tucson Amateur Packet Radio, POB 22888, Tucson, AZ 85734.)

Amateur packet radio is just beginning to come into its own in the United States. The first digital packet-radio repeater (called digipeaters by the Canadians) was established at the end of 1980 by Dr. Hank Magnuski, KAA6M, a data-communications professional and amateur-radio operator in the San Francisco area. Since that time, communities of interest have sprung up around the country as more radio amateurs begin experimenting with radio and personal computers. Currently, several amateurs are experimenting with packet radio in California.

Digital repeaters enable amateurs to send information over a wide geographic region. Several amateurs have set up repeater-based CP/M systems hooked into the network that function as packet-radio bulletin-board systems and permit file transfers as well. In this case, according to Harold Price, no error-checking software (such as the Christensen Protocol) is used at the personal computer level because that function is handled by the TNC.

"When a frame comes in, the TNC board error-checks it; if it doesn’t pass, then the frame doesn’t get acknowledged," Price says. "The sending station times out and then re-sends the packet. For file transfer, you do not need a higher-level error-checking protocol like Modem7 be-
If you order software from us, you're in good company.
You see, some of our best customers are America's biggest corporations.

Maybe they're attracted by our low, low prices (big companies are price-conscious too!). Or maybe when you're an "IBM", you're looking for something extra. Like the personal service, giant inventory, and in-depth technical support you'll find at 800-SOFTWARE.

You see, when you call us, we'll take care of you like your business depends on it. Because it does. Which means when you place an order, you can be sure we'll fill it promptly. And that our unique Order Tracking System is keeping tabs on your order every step of the way.

Most important, we'll be there if you need us after your software arrives. We'll make sure that you'll receive the finest technical support and customer service in the industry. And that's a promise.

Next time you're looking for low price and great service, do what IBM, General Electric, and a lot of other big companies do. Pick up the phone and give us a call.

We'll show you why some hard-headed companies buy their software from us.

OSCAR: The Amateur-Radio Satellite Tradition

PACSAT isn't the first amateur-radio satellite to be launched into space. Since 1961, OSCARS (orbiting satellites carrying amateur radio) have been hitchhiking into space aboard rocket boosters carrying commercial satellites.

On December 12, 1961, OSCAR 1 was launched and operated for 12 days. Its communications system was simple. A beacon continually transmitted the message "Hi" in Morse code. The number of "H's" transmitted within a 20-second interval was a function of the internal spacecraft temperature.

Since then, nine other satellites carrying communications and scientific experiments have been launched by amateurs based in different countries. One recent OSCAR included a video camera intended to beam television pictures of earth back to amateurs with special television reception equipment.

Like their commercial counterparts, radio amateurs also have occasionally been plagued with errant satellites. OSCAR 4 was launched on December 21, 1965, was the amateurs' first failure. It was supposed to attain a sun-synchronous orbit, but the third stage failed to ignite, leaving it in a highly elliptical orbit instead.

In recent years, OSCARs have been the product of international cooperation among radio amateurs. AMSAT-OSCAR 8, launched as a passenger on a LANDSAT C booster on March 5, 1978, was a joint project of amateurs in the U.S., Japan, and West Germany.

In June of 1983, AMSAT-OSCAR 10 was sent into orbit by the European Space Agency. It was a combined effort by volunteers in the U.S., West Germany, Hungary, Argentina, Japan, Canada, and New Zealand. This satellite, which is in an orbit that opens a window of communications between amateurs in North America and Europe, is powered by solar panels that generate 40 watts of power.

The next amateur launch, known as UOSAT-B, occurred in March. Designed as a small prototype of PACSAT, it carried scientific experiments on radio propagation and the magnetic and radiation environment in low-earth orbit. The satellite was constructed by scientists at the University of Surrey in England. It carried a "Digital Communications Experiment" that is a precursor of the PACSAT system. It will permit ground stations around the world to gain experience with an orbiting digital store-and-forward device. The UOSAT-B orbiting BBS included 196K bytes of storage and a single 2400-bps path.

cause the ACK function is taken care of at a lower level. I just spew data out. If my system doesn't get an acknowledgment to the packet, the system determines that either the packet didn't get through or there must have been a collision. One way or another, it retransmits the packet after waiting a random period of time for the channel to clear again."

Amateur operators already have begun experimenting with linking ground-based packet-radio networks via satellite. Recently, a data file was sent from Washington, DC, to Los Angeles via the OSCAR 10 satellite. OSCAR 10 (see the "OSCAR: The Amateur-Radio Satellite Tradition" text box) is a voice and data repeater in high-earth orbit. Shortly, Price and Dr. Tom Clark, W3WI, an amateur in Washington, DC, and president of AMSAT, plan to see if Clark is able to log onto a CPM system in California routing via OSCAR 10 and digital-repeater stations. Several stations in North America and a station in New Zealand already have exchanged data files.

To implement level two of the ISO model on board the TNC, amateur packet communications utilize a protocol known as AX.25. This protocol, agreed on at an AMSAT national meeting in 1982, is a variant of the X.25 packet-switching standard. AX.25 differs from X.25 principally in the structure and size of its address field. The AX.25 protocol includes both source and destination addresses while X.25 contains only a single address. This results in optimizing the protocol for "many-to-many" data communications, which is characteristic of amateur-radio digital networks. The selection of the format of the address under AX.25 is simple. Each amateur's packet address is his or her unique ham call sign.
You don’t need a computer to talk to another computer.

The new RCA APT (All Purpose Terminal) expands your data communications capabilities for a lot less money.

For business, professional and personal data communications, you'll find more user-friendly features and greater communications capabilities in the RCA APT than in other terminals selling for up to three times the price.

The new APT terminals are ideally suited to multi-data base time sharing and dedicated, direct computer-connected applications. They feature menu-controlled operation and a programmable "personality" to match specific communications requirements for your data bases.

A single keypress can dial a stored number, send the log-on sequence on the host computer, and return terminal control to the user. Password protection prevents unauthorized access to designated numbers. APT can also be used as an autodialer for voice communications.

Quite simply, matching features with price, there is no other professional quality terminal available today that can do as much at such low cost.

APT terminals list for $498, in your choice of full stroke or membrane keyboard versions. Either style is also available with a display monitor for $697 list. The display monitor alone, VP3012D, $199 list.

According to Price, AMSAT members also are working on an inexpensive transceiver that will transmit in the 70-centimeter range and receive on 2 meters as well as contain high-speed modem circuitry capable of exchanging data at 9600 bps. The receiver will be designed to handle only data communications by converting RF frequencies to the intermediate-frequency (IF) stage of 10 MHz.

"We are planning to build a receiver with just the RF and IF stages and no bells and whistles for less than $100," says Price. "We are going to come up with plans for a kit. You’ll feed RF into it from an antenna, and you’ll get a digital stream out. Data will never get translated to audio frequencies."

VITA is also considering its own low-cost, portable earth stations, currently planning between 6 and 20 of them. These stations will be fully portable and able to operate from solar power.

Today, low-cost satellite-communications technology is still in its infancy, yet the radio amateurs are exploring frontiers that may one day fundamentally change the basis of our communications practices.

"It's very significant," says Dr. Magnuski. "Here are individuals who now have their own satellite-communications ground stations. In the past, these have cost a minimum of $70,000 to $80,000."

"Now for the first time you have the potential for global person-to-person communication not based on commercial offerings. It's a tremendous equalizer. A person who lives in the mountains in the most remote area of the country has, in principle, as much access to information as someone like myself living in the heart of Silicon Valley."

Author's Note: For more information on PACSAT, send a stamped, self-addressed envelope to the Radio Amateur Satellite Corporation, POB 27, Washington, DC 20044.
A lot of people who've never heard of ACE's impressive record of firsts in multiprocessing are about to sit up and take notice. Why?

It's our latest wonder: Multiprocessor CP/M Plus*

ACE has developed a linkup between its powerful multiuser microcomputer, the Discovery, and the fastest and most powerful version of CP/M* ever marketed.

The result is a multiprocessor that does more than just emulate CP/M or rely on a lesser operating system that's "CP/M compatible." It actually delivers pure CP/M (either CP/M-86* or CP/M Plus) to any of Discovery's up to 16 on-line users.

With easy command line editing, quick file accessing through user-defined automatic search paths and comprehensive "help menus," CP/M Plus is as friendly as they come — and with big performance extras.

Like large files, directory hashing, data buffering, time and date stamping, and an extensive utility set that can accept English words.

All of which means that ACE's linkup with CP/M Plus will continue to give Discovery owners access to the largest selection of applications software in the world for years to come.

That's something to think about. Because who wants a multiuser system that's friendly and powerful today but unfriendly tomorrow when new software using CP/M Plus features hits the scene?

Our latest triumph is just one of a line of firsts.

ACE pioneered multiprocessing for microcomputers back in 1979 when we introduced a Discovery featuring what was then the revolutionary concept of dedicating a CPU to each on-line user.

Two years later, we moved further ahead of the pack with our next singular feat: the first user-processor on a single board, the dpc-180.

Everything was there: memory, CPU, serial I/O.

Nice.

Which made our 1982 breakthrough — the amazing 16-bit dpc-186*, mated with CP/M-86 — seem like business-as-usual to us even though it caught the competition flat-footed.

With room to grow from 128K to 1MB of expansion memory, and designed for systems also using our 8-bit board, this breakthrough let individual users tap into either 8- or 16-bit computing power with one central Discovery unit.

And because each Discovery system is controlled by our own dpc/os*, tried and proven in more than 10,000 Discovery and OEM installations around the world, any user on line can take advantage of interprocessor communication, file and record locking, fully managed multiple printers, private directories, plus many other features.

So what little wonder does ACE have up its sleeve now? Stay tuned. Because soon you'll hear the news about our Concurrent CP/M-86*, which will give the owners of our Discovery all the benefits of 16-bit computing power, CP/M's comprehensive software selection, and efficient multi-tasking capabilities.

So each user can get several projects underway with a few quick taps on the keyboard.

Meanwhile, it'll be business as usual for ACE, keeping ahead of the crowd while turning out the best multiuser multiprocessor micro on the market, backed by one of the best nationwide service networks you could hope for.

So if you're a computer dealer, distributor, or systems house who wants to join the group that scores high with a multitude of users, just give us a call at (800) 821-6596. (In California, it's (213) 351-5451.)

And do us a small favor. Tell us you've heard of us.
Now A 16-Bit Microcomputer Designed To Expand Your Knowledge.
Here's How You Can Learn 16-Bit Technology. And Graduate To One Of Today's Most Powerful And Advanced Microcomputers.

Now you can master 16-bit technology with an all-new Advanced Microprocessor course. And build hands-on experience with the only 16-bit microcomputer specifically designed for the hobbyist, working engineer and student.

Advanced Microprocessor Course
This all-new self-study course (EE-8088) provides in-depth coverage of 16-bit, state-of-the-art technology. You will gain a thorough understanding of microprocessors from this 1200 page course. In 10 easy-to-understand units, starting with microcomputer basics, you’ll cover all phases of 16-bit microprocessing. Assembly language. Program writing. Addressing modes. Dynamic and static RAM. And hardware interfacing.

And by using your 16-bit Trainer/Learning Computer for hands-on experiments (over 60 included), you’ll gain actual circuit interface and software programming experience with an 8088 microprocessor system.

Trainer/Learning Computer
A unique combination of design features makes this versatile microprocessor system much more than a "teaching machine." Use it as a trainer with the Advanced Microprocessor course. Use it as an experimental design computer. And use it to run a wide variety of 16-bit software—including Z-Dos, Multiplan, Z-Basic, Condor File Manager, and much more.

In its most basic form, the Trainer/Learning Computer is a 16-bit, cassette-based microcomputer. Its unique design features access ports and solderless breadboards to allow you to build interfaces, design and modify circuits, or simply experiment with the inner workings of the microprocessor system. The basic system has an 8088 processor, 32K ROM (including assembler, editor and debugger) and 16K RAM.

The unit also features a serial I/O printer port, cassette interface and a detached 95-key keyboard (including 16 function keys and a numeric keypad) which generates a full ASCII character set. It’s available either in kit form or factory assembled.

And you can take advantage of the system’s H/Z-100 computer design heritage by easily upgrading it to a disk-based, 16-bit microcomputer that will run H/Z-100 series software and many other forthcoming programs.

Fully Upgradeable
The powerful upgrade package and variety of accessories allow you to make the basic 16-bit system more powerful and versatile. You can add 128K or 192K bytes of RAM. Floppy disk controller, 48TP1 double-sided, double-density, single or dual floppy disk drive. Bit-mapped video graphics or full-color graphics. Two RS-232 ports. Programmable timer. And a Centronics-compatible printer port.

Learn on it. Design with it. Use it as a 16-bit computer.
It’s the only 16-bit microprocessor system specifically designed to integrate theory with a hands-on understanding of how 16-bit computers work. And it’s from Heathkit/Zenith Educational Systems, the world-leader in problem-solving courses, trainers and accessories to help you learn state-of-the-art technology.

In a future scenario, you might walk into a doctor's office, explain your medical problems to a computer, and get a diagnosis. The state of the art in microcomputers hasn't reached that level yet. But microcomputers are starting to take on part of the burden of running many types of professional offices.

Yet integrating a microcomputer into a professional work environment can be a particularly frustrating experience. Potential users raise questions concerning the dependability of software and hardware, the usefulness of available software, and how to select the best software to serve their needs. Our theme for this issue, Professional Computing, examines the problems and offers some solutions for introducing a microcomputer into a critical and demanding office setting.

Two articles cover the use of microcomputers in legal and medical practices. Robert P. Wilkins, a practicing attorney, discusses the advantages of using a microcomputer in a legal office and how to select available software to handle an attorney's particular needs. Dr. Jonathan Javitt tackles the herculean task of how to computerize a typical medical office. His article helps the medical practitioner define his or her needs to make selection of the best hardware and software a less risky proposition.

William Hession and Malcolm Rubel describe a benchmarking approach to quantifying the performance of business-modeling software. The authors present an objective method for evaluating software. Peter Callamaras offers his ideas on how a businessperson can develop a decision-support system for assistance in making critical decisions.

William J. Raduchel strips away some of the confusion about the term "user-friendly" and explains what it really means for the purchaser of business software. Milos Konopasek and Sundaresan Jayaraman explain how the TKI Solver program can be used to develop the framework for an expert system for use in business and engineering.

Rounding out the theme is Dr. George Zucconi's description of how he installed a microcomputer in his waiting room. This is his practical response to providing medical information to his patients.

Illustration by Robert Tinney
The S100-PC by LOMAS DATA PRODUCTS: Offering high performance at a "low" price . . . and it's IBM-PC compatible.

The system offers the following standard features:
- 8 MHz 8086 CPU (8087 optional)
- 128K byte RAM (expandable to 1 megabyte)
- 2 RS232 serial ports and 2 parallel ports
- Battery protected clock/calendar
- CONCURRENT CP/M-86* and MS-DOS
- PERSONAL BASIC, CP/M-2.2 emulator and communications program.
- 2 double sided 5 1/4" floppy drives (720K bytes)
- Attractive 15 slot desktop enclosure

In addition to the above standard features many options are available: Winchester disk drives 10 to 40 Mbytes, 80286 microprocessor, and IBM-PC compatible graphics support (JUN84). If you're using an IBM-PC or other compatible and you want to improve the performance of your software, LOMAS DATA PRODUCTS is the solution.

S100 BUS boards products & support for the system integrator

- **LIGHTNING ONE*** 8086/8088 CPU
  8086 or 8088, with 8087 and 8089 coprocessors. Up to 10 MHz operation ........................... PRICE start at $425.00

- HAZITALL SYSTEM SUPPORT BOARD
  2 serial, 2 parallel ports, battery protected clock calendar, Hard disk controller host interface .................... PRICE $325.00

- LDP 128/256K DYNAMIC RAM
  Advanced dynamic RAM with LSI controller for failsafe operation, parity .............................. PRICE 128K—$495.00, 256K—$795.00

- RAM67 HIGH PERFORMANCE STATIC RAM
  High speed (100ns) low power CMOS static RAM. 128K bytes, extended addressing ................................. PRICE $995.00

- LDP72 FLOPPY DISK CONTROLLER
  Single/double density, single/double sided disks, both 8" and 5 1/4" inch drives simultaneously ...................... PRICE $275.00

- LDP88 8088 SINGLE BOARD COMPUTER
  8088 CPU, 1K RAM, 8 K EPROM, Monitor RS232 serial port, 8 vectored interrupts ................................. PRICE $349.00

- **LIGHTNING 286—80286 CPU BOARD**
  Offers 4 times the performance of a 5MHz 8086 CPU while maintaining software compatibility ........................ PRICE $1395.00

- OCTAPORT 8 PORT SERIAL BOARD
  8 serial ports 0 to 19200 baud operation real time clock interrupt. Ideal for multi-user systems such as MP/M-86.* ........................................... PRICE $395.00

A Professional’s Perspective on User-Friendliness

New systems are described as user-friendly—but what does that mean?

William J. Raduchel
McGraw-Hill Inc.

Computer software, to be commercially viable, must be user-friendly. And yet nobody can define what user-friendly means, although many claim to know it when they see it. One prominent software developer noted that since every piece of software is presumably friendly to its author, every piece of software can be described as user-friendly. It is primarily a problem of defining the user.

Is “user-friendly,” therefore, a tautology? At the other end of the logical spectrum, is it another equally useless “I don’t know how to define it but I know it when I see it” phenomenon? I would like to bring more rigor to this problem by offering a tentative definition of user-friendliness and then considering its implications for software development.

The Problem

Computers have a dramatic impact on the way we work and live. Raising the productivity of service industries and white-collar professionals is the management challenge of the 1980s. Personal computers and office automation are widely seen as the means of achieving this. For productivity to rise, millions of workers must accept computers as an integral part of their daily routine. Computers affect jobs in three primary ways.

First, they perform the often tedious and detailed text and data manipulations vital to modern business. Consider for a moment a world without computers. The airline and financial-services industries as we know them would not exist. Multinational corporations and large organizations would have to survive with primitive information systems covering only the most aggregate of concepts. Many routine transactions would cost significantly more than they do today.

Second, because they work rapidly and accurately, computers permit the use of new algorithms to solve problems. Trend forecasting with statistics has been understood for decades, but until computers became commonplace, these techniques were impractical and generally infeasible. Controlled-capacity airline seating is but one example of computers creating new commodities from old. And now, world weather models await even larger and faster computers.

Third, computers represent a watershed event that has irrevocably altered expectations. Computers can provide precise answers where before there was only vagueness, so precision becomes the norm whether or not each question actually deserves such careful consideration. (I have termed this Gresham’s Law of Answers; see “Economic Policy in a Media Age,” Journal of Business and Economics 13 (1982): 1-14.)

Personal computers are important because their low price permits computerization of tasks that are too small to be done on a mainframe but are tedious and time-consuming nevertheless. Because they can be tailored to individual needs and are priced low, personal computers are justifiable on a presumption of increased productivity.

Microcomputers have made significant changes in three areas. First, they can handle such tedious work as recalculating spreadsheets. Second, they permit broader use of such esoteric tools as graphics. Third, they have permanently altered our ideas on managing information. Timesharing had the same kind of impact when it made computers more accessible in the 1970s.

Mainframe computers have had massive influence despite the fact that only a fraction of workers understand them. But for microcomputers to have the same effect at least half of all white-collar workers will eventually have to become familiar with them. The personal computer and office-automation industries are staking their futures on making this happen.

The ostensible issue is price: costs have fallen and will continue to fall. Nevertheless, personal computers involve much more than microelectronics, and many of their components are not dropping in cost. The
Quantifying “User-Friendly”

We can quantify a definition of user-friendly as follows. Define $F(j, k)$ as the probability that a user of group $j$ can solve problem $k$ of $n$ problems in the set $Q(j)$ in one execution of the set of steps $S(j, k) = s_i(j, k), i = 1$ to $n(j, k)$. The probability that the user can perform steps $s_i(j, k)$ successfully is $p_i(j, k)$. This probability refers to logical steps rather than keystrokes and includes the user correcting input on the basis of system feedback (error messages). Finally, define $p_0(j, k)$ as the probability that the user can specify $S(j, k)$ accurately. (A more general model would recognize that most problems have multiple solutions, and we should average over these. However, little but complexity seems to be gained by explicitly incorporating this now.) Obviously, as $n(j, k)$ increases, $p_0(j, k)$ decreases. Then, $F(j, k) = p_0(j, k) p_1(j, k) \ldots p_n(j, k)$.

For simplicity and with little loss of generality, let’s assume that $p_i(j, k) = p_j(j, k) = \ldots = p_n(j, k) = p(k)$ so that

$$F(j, k) = F_0(j, k) p(k) = p(k)$$

Furthermore, we generally will not need the $(j, k)$, so we can use $F = F_0 p(k)$.

Now, define $F_0(j, k)$ as the probability that a user in group $j$ can solve problem $k$ using the best alternative system in terms of elapsed time and cost. Then, the system is user-friendly for group $j$ if and only if

$$F(j, k) > F_0(j, k), \text{ for all } k$$

for some prespecified set of $F_0(j, k)$. The value of each $F_0(j, k)$ depends on the frequency and complexity of the problem. Each $F_0(j, k)$ reflects expectations; for each generation of system, each $F_0(j, k)$ must be at least as large as in the prior

$F = 0.770$ for Standard PC

$F = 0.990$ for Script

$F = 0.817$ for Lisa

Table 1: Once created, the script approach yields the highest probability of a user completing a task successfully. However, script creation is complex and illustrates the difference between systems that are easy to use and those that are easy to learn. (CR) in the Standard PC column, designates a carriage return.
A Paradigm

Pure technology is abstract and sterile. It is of no value until it helps solve problems. Users employ word processors to communicate, not to oggle technology. This suggests the following definition of a user-friendly system: A user-friendly system helps produce accurate solutions in less time and at less expense than alternative systems.

Three important implications of this definition need special emphasis:

- the interface for the nontechnical user is only one factor in user-friendliness
- user-friendliness is relative to both the group of users and to the alternative methods; no software can be user-friendly across the board
- user-friendliness relates to solutions, not to tools

Together, these three points imply that no system can be user-friendly except in the context of specific problems for specific users.

Another implication is less apparent. A system that is easy to learn may not be easy to use; every user-friendly system faces a trade-off between these two goals. Visicalc is easy to use but not particularly easy to learn. After an application becomes routine, ease of use becomes more important than ease of learning. Thus, user-friendliness in one case may not be user-friendliness in another.

The text box entitled "Quantifying 'User-Friendly'" (beginning on the preceding page) presents an illustrated definition of user-friendliness, but I'll summarize the formal logic here. A system is user-friendly if it solves problems reliably. (This is an admittedly less comprehensive definition than the earlier one.) The probability of the solution, \( F \), is above some (high) threshold. \( F \) can be the result of three factors:

\[
P_0 \quad \text{the probability that the user will find the set of steps to solve the problem}
\]

\[
p \quad \text{the probability that the user can successfully ex-}
\]
Make your spooling network sing in six-port harmony.

Add MultiSpool—the hardware spooler that's truly flexible. Now, thanks to MultiSpool, there's no more need to buy individual spoolers, no more wasted computer time or memory. With its enormous memory-sharing power, this dynamic six-port switching device not only lets you network any combination of computers and printers; it also provides the spooling function within that network.

With its 60K of buffer memory, controlled by 4K of memory management firmware, MultiSpool can orchestrate up to five computers or five printers simultaneously. Only this degree of flexibility can meet the ever-changing port-expansion needs of today's multiuser environment.

Note, too, that MultiSpool mixes four serial and two Centronics-compatible ports. It also handles X-on, X-off protocols and DTR. So, with the unit's dipswitch, you can configure each port to accommodate either a computer or printer, and you can define the discipline of that port.

Best of all, MultiSpool sells for just $995.00—even less if you don't need all six ports. And that, we're sure, is music to your ears.

Formally, \( F = P_0 \times p^n \). The requirement of being user-friendly is that \( F \) be at or above some threshold probability value \( F_0 \), determined by the characteristics of the alternative systems.

The Implications

The preceding definition has implications for software developers. User-friendliness becomes a function of \( P_0, p \), and \( n \). The ideal system has both \( P_0 \) and \( p \) as close to 1.0 as possible, with \( n \) as small as possible (at a lower bound of 1.0 step). Unfortunately, software developers cannot freely choose these values.

Why not? Because \( P_0 \) has to fall as \( n \) increases, while \( p \) generally increases as each step is made smaller. The classic easy-to-learn system guides the user through hierarchical menus. As long as the user can easily identify where to begin, \( F \) will be very high for problems solved by that system. Such a system is inherently limited to the problems selected by the menu builders. Other types of problems may be solved by the system, but if they are not enumerated in the menus, their "\( F \) score" is likely to be very low.

The cost of increasing the number of steps is very high, even if \( p \) is 0.995 (an error only once in every 200 attempts). For example, \( p^n \) would be 0.975 for 5 steps, 0.951 for 10 steps, 0.905 for 20 steps, and 0.818 for 40 steps. This is where ease of use and ease of learning conflict. The user progresses from one level of ability to another through training and experience, and the steps can then be reduced but made more complex with little decrease in \( p \). A user eventually will consider a system with fewer, but natively more complex, steps to be more user-friendly.

The problems a user has change from day to day, and a user-friendly system must be able to easily accommodate this change. Therefore, the fundamental tools must be strong.

Because people make mistakes, \( p \)
When you visit your dealer and compare the Princeton IBM-compatible HX-12 side-by-side with the IBM color monitor, your eyes will see the difference.

The HX-12 gives you higher resolution and finer dot pitch (.31mm) than the IBM 5153's medium resolution (.45mm) for a cleaner, sharper image.

Compare our full range of colors and our crisp whites without red bleed. You'll also see a difference in our non-glare screen—a feature your eyes will really appreciate in a long work session.

The Princeton HX-12 comes with a cable that plugs directly into the IBM PC, ready to burst forth into 16 superb colors. All at a suggested retail price ($600) that's a pleasure for sore eyes and overworked budgets.

Apple IIe users: call us to learn how you, too, can now enjoy the visible superiority of the Princeton HX-12.

Ask your local dealer for a demonstration and let your eyes decide. Or call us at 800-221-1490 for more information and the name of your nearest dealer.

If you're ready to move up to color, graduate to the Princeton HX-12. It's right at the head of its class.

DON'T COMPROMISE:

OURS: .31 mm dot pitch, 80 column text.
THEIRS: .48 mm dot pitch, 80 column text.

THE PRINCETON HX-12
HIGH RESOLUTION RGB COLOR MONITOR

For the image your eyes deserve
has an upper limit regardless of the computer skills of the user group (probably not far above the 0.995 used in the preceding example). Although their computer skills cannot raise $p$ much beyond a certain level, more training may help a user group to execute substantially more complex steps with the same $p$.

This is a critical point. Any system designed for a mass market can be user-friendly only for relatively simple problems. If the problems to be solved are not simple, it is unlikely that any general, mass-market system can be user-friendly. Resolving this dilemma involves reeducating the user group. With better training and documentation, software vendors can increase the computer sophistication of their users (i.e., raise $p$ and lower $n$). In so doing, they also can increase the scope and complexity of problems for which their systems are user-friendly. Alternatively, by customizing the software to fit specific needs, software vendors can build user-friendly systems for users who have little computer sophistication.

Are integrated systems user-friendly? The answer is clearly “sometimes.” Let’s consider four major limitations:

1. There are limits to spoon-feeding. Lisa and Visi On succeed exceptionally well in packaging their capabilities in easily recognized, highly robust capsules. The effect of this is to raise both $p$ and $n$ by requiring many steps to do anything. These systems are user-friendly in much the same way as Tinkertoys. They provide easy-to-use building blocks, but you cannot create large, stable applications with them. This is fine because the goal of these systems is to let more people use personal computers and not necessarily to expand the scope of problems that can be solved with personal computers.

2. Current technology does a poor job of telling the user what to do as opposed to how to do it. Lisa and Visi On make spreadsheets, graphics, word processors, and similar tools easier to use. Unfortunately, they also assume that the user knows what data to obtain and from where, what transformations should be made, what other processing is required, and which report format or graphics should be used. In the real world, the user may need more help making these choices than using the software. This is the problem “expert systems” and artificial intelligence seek to address.

3. Much of the day is spent doing routine tasks, but it’s not necessarily these tasks that are simplified by using integrated systems. Lisa and Visi On may simplify each step of a task, but the user still has to remember, and then execute, each step individually. The user would much rather select one choice, supply the parameters, and then let the computer step through the various tasks. The popularity of keyboard macro packages, such as Pro Key, derives from the fact that they let users store their most common keystroke sequences.

4. Any integrated computer system is still but a component of a total business system. Merging integrated applications with existing applications likely will prove more difficult than many people expect because the businessperson’s tasks are so varied and the tools are so diverse. Meetings, telephone conversations, correspondence, publications, memoranda, calculation and dictates machines, as well as pencil and paper, are used every day; not all work can be done at a workstation. Moreover, professionals travel and go home—and they take their work with them. Integrated workstations can create as many problems as they solve by providing the user with so much power in an isolated environment. Lap-sized computers will help reduce this isolation, however.

To achieve their stated market goals, integrated systems must be perceived as user-friendly and cost-effective. Without question they achieve their integration at double or triple the cost of component-oriented alternatives, so the burden on user-friendliness is extreme. The challenge is great. Training, in-person support, and customization seem essential, yet their price may make these systems no longer cost-effective.

William J. Raduchel is vice-president of product development support at McGraw-Hill Inc. (222 Avenue of the Americas, New York, NY 10020.)

A Computer in the Doctor's Waiting Room

An Atari program that offers some of the capabilities of an "expert system" for one physician's patients

George Zucconi, M.D.
Private Practice

For the past year I've kept an inexpensive computer in my office waiting room for my patients to use. The computer, an Atari 400, runs programs that impart medical information to the user. Instructions appear on the screen so that anyone can use the system without any aid from the office staff. The three programs I have developed answer the medical questions most frequently asked by the patients in my obstetrical-gynecological practice.

One program elicits information concerning symptoms of abnormal uterine bleeding. According to the user responses, it will diagnose the seriousness of the condition and will recommend what course of action the patient should take.

The other two programs are somewhat different in nature. One contains information about birth control methods, including the effectiveness, advantages, disadvantages, and risks of each. The remaining program, Drugs in Pregnancy, presented in this article, outlines 15 classifications of commonly available drugs and their effects on the various stages of pregnancy.

Though not meant as a substitute for doctor-patient interaction, the patients' use of these programs saves time for more complicated questions by eliminating basic preliminary queries. My patients take readily to the computer and have found the programs to be helpful. For one thing, using the computer avoids any feelings of embarrassment when inquiring about intimate matters. Furthermore, the computer is tireless and never scoffs at seemingly dumb questions. Even computerphobes overcome their hesitancy after watching someone else use the machine. In fact, it's unusual to see the computer sitting idly when anyone is in the waiting room.

The Genie in the Lamp

The educational use of computers promises to open up the possibilities for conveying information to others. With the proliferation of small, inexpensive computers, many more people will be able to afford these instruments and experiment with devising new applications for them. No longer the exclusive tool of the few, the power of the computer has been released like the genie from the lamp, waiting to grant us whatever wishes we command. In order to effectively develop the powers of the microcomputer "genie," a concerted effort and sharing of knowledge are necessary.

The beauty of putting so many people in touch with computers is that by merely increasing the number of users, we will attain a "critical mass" wherein a breakthrough in learning is inevitable. Each new kernel of knowledge leads to another, building on the impetus of the previous one, all multiplying exponentially and cascading in a chain reaction.

This concept has long been the tradition in the medical profession. Scientific progress would be nonexistent without the dissemination of discoveries and information. Following in this tradition, I would like to share some efforts I have made toward devising medical applications for this versatile tool. I've provided the BASIC listing of the Drugs in Pregnancy program so that interested readers can use it or learn from its construction (see listing 1).

When the Doctor's Not In

You may not be anxious to expose a valuable computer to inexperienced hands or to children's sticky fingers. However, even if you do not give
Listing 1: The source code for Drugs in Pregnancy, a program written in Atari BASIC that explains the effects of various types of commonly available drugs on pregnancy.

Do you want to spend your time as intelligently as you spend your money? The decision may be yours, but your concerns are ours. We know you don’t want to spend more time learning business software than you do using it. So we provide the productivity tools you can bank on to INVEST IN YOURSELF, time and time again.

It’s no wonder over 50% of our business comes from repeat customers and referrals. For quality seminars, videotapes, books and software, you can count on Software Banc for a guaranteed return on your investment.

$ SEMINARS
As a full service organization, we provide fine professional training. Adam B. Green, well known dBASE II educator, uses a custom video presentation to highlight these invaluable lectures. $200/day

- dBASE II Fundamentals
- dBASE II Programming
- Advanced dBASE II Techniques

Atlanta: May 14-18

*Boston/Waltham: June 18-21

New York: August 13-17

Costa Mesa/Orange County: September 17-21

Toronto: July 9-13

$ VIDEOTAPES
Learn the basics of dBASE II in three hours with this professionally produced training package. We give you everything you need to reproduce Adam B. Green’s popular dBASE II seminar in your own home or office. You receive everything but the lunch!

- dBASE II Demo $25.00
- dBASE II Fundamentals (VHS or BETA) $295.00
- dBASE II Fundamentals (U-MATIC) $395.00

$ BOOKS
Built on years of practical experience in testing, supporting and teaching dBASE II, we take pride in offering you our accumulated knowledge. Interest adds up with new tips and techniques never before published!

- dBASE II User’s Guide $39.00
- Advanced dBASE II User’s Guide $39.00
- Report Writing in dBASE II $15.95
- 101 Questions in dBASE II Soon

$ SOFTWARE
As an authorized dealer of every product we sell, you are assured of expert technical support, knowledgeable salespeople and fast, dependable service with a smile!

- dBASE II with free dBASE II User’s Guide $439
- WordStar $369
- 1-2-3 with free 123 Trans $399

(Available at Software Banc Seminars)

Take stock in Software Banc! Call or write for the free catalogs which include our complete product line, seminar curriculum and unique services.

At Software Banc, a wise investor is our best customer.

To order, call (800) 451-2502 or (617) 641-1241 in Mass. Hours are 9 a.m. - 8 p.m. EST Monday - Friday and 9 a.m. - 5 p.m. EST on Saturday.

Payment may be made by: MC/VISA, MO, check or COD. Terms available to qualified customers. MA residents add 5% sales tax. Add $5 for S&H. Prices subject to change without notice. Dealer inquiries invited. Ask about our Discount Savings Plan.

What are the adverse effects of this compound?

Wouldn't it be great if you could use your IBM® PC to tap into vast resource libraries across the country? To transfer files to your partner, upstate? Or from your broker, down the street?

It's possible. All you need is a modem, to connect your computer to others. Down the hall. Or thousands of miles away.

Hayes Smartmodem. Think of it as your computer's telephone. Hayes Smartmodem 300™ and the faster Smartmodem 1200™ allow you to communicate over ordinary phone lines. But any modem will send and receive data. Hayes Smartmodems also dial, answer and disconnect calls. Automatically. And without going through the telephone receiver, making them far superior to acoustic coupler modems.

Choose your speed; choose your price. The lower-priced Smartmodem 300 is ideal for local data swaps and communicates at 300 bps. For longer distance and larger volumes, Smartmodem 1200 operates at baud rates of 300 or 1200. with a built-in selector that automatically detects transmission speeds.

Both work with rotary dials, Touch-Tone® and key-set systems; connect to most timesharing systems; and feature an audio speaker.

Smartmodem 1200B™ is also available as a plug-in board. Developed specifically for the PC, it comes packaged with Hayes' own communications software, Smartcom II™

Smartcom II. We spent a lot of time developing it, so you can spend less time using it. Smartcom II prompts you in the simple steps required to create, send, receive, display, list, name and rename files. It even receives data completely unattended—especially helpful when you're sending work from home to the office, or vice versa.

If you need it, there's always "help." This feature explains prompts, messages, etc. to make communicating extra easy.

With Smartcom II, it is. Case in point. Before you communicate with another system, you need to "set up" your computer to match the way the remote system transmits data. With Smartcom II, you do this only once. After that, parameters for 25 different remote systems are stored in a directory on Smartcom II.

Calling or answering a system listed in the directory requires just a few quick keystrokes.

You can store lengthy log-on sequences the same way. Press one key, and Smartcom II automatically connects you to a utility or information service.
Smart Industry Hayes provides excellent documentation for limited two-year warranty on leader in the microcomputer in isolation. Get a telephone for your deu the mod tm; •also _ the brulm• K'f"K(' m.u'k of Am.tnc.u,ll!r.rpbon .t.nd-n. l!!g,J.ph...

And in addition to the IBM PC, Smartcom II is also available for the IBM Personal Computer XT.

Backed by the experience and reputation of Hayes. A solid leader in the microcomputer industry, Hayes provides excellent documentation for all products. A limited two-year warranty on all hardware. And full support from us to your dealer.

So see him today. Break out of isolation. Get a telephone for your Personal Computer. From Hayes.

NOTE: Smartmodem 1200B may also be installed in the IBM Personal Computer XT or the Expansion Unit. In those units, another board installed in the slot to the immediate right of the Smartmodem 1200B may not clear the modem slot, and if this occurs, the slot to the right of the modem should be left empty.

And, in addition to the IBM PC, Smartcom II is also available for the IBM Personal Computer XT, COMPAQ Portable, Corona Portable PC, Columbia MPC, DEC Rainbow 100, Xerox 820-II, and Kaypro II personal computers.* Backed by the experience and reputation of Hayes. A solid leader in the microcomputer industry, Hayes provides excellent documentation for all products. A limited two-year warranty on all hardware. And full support from us to your dealer.

The p-System Improvement You've Been Waiting For... 

A Lower Price!

Compatible with the IBM PC, XT, Corona, Columbia, Compaq, Colby, Eagle, Hyperion and Texas Instruments' Professional

We've taken $245 off the price of the NCI p-System, the newest, fastest and most complete p-System for the IBM PC and compatibles. For only $595 the NCI p-System offers far more features than the comparably-priced version marketed by IBM. It uses the latest implementation and has been recognized by major software developers and reviewers as being the best version available.

The NCI p-System runs up to five times faster than IBM's and is the only p-System that lets you move files from PC DOS to the p-System and vice versa. You also get many exclusive utilities and the widest range of hardware support and compatibility. Only the NCI p-System includes technical support and new, easy-to-reference documentation.

Special discounts are available for users who have already purchased the IBM version and want to upgrade to the NCI p-System. For full details clip this coupon and send it to:

Network Consulting Inc.

Congratulations! You not only have a powerful new operating system in Apple's* ProDOS, you can now get an incredibly versatile Clock/Calendar card to use with it. PROCLOCK™.

PROCLOCK is the first Clock/Calendar designed for ProDOS-based systems as well as other Apples running DOS 3.3, CP/M**, Pascal, Applesoft*, and BASIC.

What's more, PROCLOCK fully emulates Superclock II, Thunderclock Plus and Apple Clock*. So programs written for these products can be used without any modification.

Of course, PROCLOCK will time-and date-coding files. And consider how much money you could save by timing your modem to transmit when the phone rates are cheapest. You can even use PROCLOCK as part of an automatic appliance control system.

Plus, PROCLOCK's powerful interrupt capabilities are invaluable to programmers working with time-sensitive routines and multi-tasking. It can generate interrupts at intervals of 1 millisecond, 1 second, 1 minute, 1 hour, or any combination of those. And all interrupts are software-controlled and handled through PROCLOCK's on-board PIA.

Speaking of software, you also get a diskette full of sample programs, utilities and applications like our Time-Clock II job/time logging program.

PROCLOCK even includes one feature we don't expect anyone to take advantage of—a 10-year lithium battery that keeps the clock running even if your computer is left off for long periods of time.

But just try to keep away from your Apple long enough to put that to the test! With PROCLOCK, you'll have a whole new world of applications to explore. And plenty of time to explore it. Because PROCLOCK is a reliable, well-built piece of hardware. So well-built, it's backed by a five-year warranty.

Ask your dealer about PROCLOCK! It's perfect timing for ProDOS users!

Another practical product from Practical Peripherals—makers of MICROBUFFER™, PRINTERFACE™, GRAPHICARD™, and SERIAL™.

your patients access to the computer, you may find this type of program useful in another way; it can be used by your staff to answer questions posed by patients.

Letting a nurse or receptionist handle simple medical questions is a common practice, but the aptness and correctness of the response may vary considerably depending on the training and experience of the person answering the questions. A program such as listing 1, used by the office staff to answer patient queries, can, in effect, make use of the expert knowledge and judgment of a physician, even in his or her absence.

In essence, the program and not the staff person supplies the answers. Through the program, the logic and rules of the expert applied to the base of medical knowledge control the response to the questions. The patients receive the answers you would have given, just as if you were speaking to them directly. Full diagnostic programs for large computers are already in operation in some medical centers. These programs, known as "expert" systems, function in much the same way. By interrogating for signs and symptoms and acting on these with rules devised by professionals, the systems arrive at the most likely diagnoses.

Adaptability to Other Computers

The Drugs in Pregnancy program was written in Atari BASIC and requires less than 13K bytes of memory. I chose the Atari because of its inexpensive price and rugged construction, and because it could be used without difficulty by anyone in the waiting room. The program can be easily rewritten in versions of BASIC for other computers. Instructions helpful for such conversions are given in the next section of this article.

The program structure is not limited to any particular field or topic. By changing the wording of the choices and the responses, you can change the topic to heart disease, exercise physiology, or any other area. By retaining its structure, the program will continue to operate as before, adapted to the new subject.

Converting an Atari Program

If you are converting this program for use on a computer other than the Atari, you need to change or eliminate some of the Atari-specific statements and commands. These are mostly graphic commands and symbols that differ from those of other computers. In the program listed, they serve to change the colors of the background and the borders of the screen display. You could delete all the graphic statement lines in the program, and it would still convey the information.

I chose the Atari because of its inexpensive price and rugged construction.

In designing this program, I devoted particular attention to making it user-proof. Envisioning the user as someone with no previous experience in operating a computer, and considering the environment for the program's intended use, I attempted to make it as difficult as possible to crash the program. The program had to continue operation, or right itself, if the user committed a mistake. This goal was achieved to a point.

Practically all the keys are rendered inaccessible except the few that are needed for the user to make choices in the program. Because the office computer does not operate with a disk system, I found no practical way to disable the Break or the System Reset keys other than to cover them with the message, "Do NOT press this key." All responses to the user choices are segregated into timed loops so that if a preset time limit is exceeded, the program will automatically restart at the beginning. This prevents the program from freezing at a particular place if the user abandons it before its conclusion.

Most of the PEEK and POKE statements are used to carry out the fool-proofing. Since the PEEKs and POKEs are peculiar to the Atari, if you need this kind of crash prevention, you will have to devise methods for your own computer. The following Atari commands and functions are explained in detail so that you can convert them to the equivalent functions on your computer.

The SETCOLOR statement chooses a particular hue and luminance. The question mark (?) is an abbreviated form of the PRINT statement. PRINT #6 is a graphic statement that produces enlarged characters on the screen. The GRAPHICS command selects one of various graphic modes. Since the Atari GRAPHICS command also clears the screen, whenever you see this command in the program you should substitute your computer's command to clear the screen. Another Atari command also clears the screen: a PRINT statement followed by an arrow between double quotes. However, since most printers cannot print this arrow character, another symbol for the clear-screen command appears in the printout of the program listing. That symbol is ""]" (right brace). Wherever you come across PRINT ""]" in program listing 1, you should also substitute your computer's clear-screen code.

Explanation of the Program

Atari BASIC requires dimensioning all string variables for the maximum length of the string. The DIM statement, line 1010 CLR :DIM K$(1), reserves a certain number of memory locations for the string variable K$. Each character in a string requires 1 byte in memory. CLR clears the memory of all previously dimensioned strings, arrays, and matrices.

Ordinarily, luminescence is reduced and the colors are rotated to protect the screen if no one accesses the keyboard after nine minutes. The POKE command, line 1020 POKE 77,0, disables this function since the keyboard frequently goes unused for this period of time. Instead, the program changes screens automatically every 15 to 20 seconds while unattended, so this protection feature is not needed.

Line 1080 sets up a loop to keep the display on the screen for 15 seconds and allows the user to break out of the loop to start the main program by
THE WHOLE ENCHILADA
$1575

Compare this system to any offered by any manufacturer, any dealer. A 16-bit, 128K 88888 MS-DOS system, in which by happy coincidence runs some IBM PC-DOS programs. The PC Deluxe includes the Sony MBC-555 computer with dual disk drives, MS-DOS, Sony Color Graphics Basic, Wordstar, Colastar, Mailmerge, Spellstar, Infostar. PC File, a 12" green phosphor Sony display with a 640x200 resolution, a printer cable, and your choice of a Monnassen Tally Spire 80, Gemini 10XL, or Scotsdale Systems new LTR-1 letter quality printer. All for $1575.

Of course you may not want the whole Enchilada, in which case we have other system packages based on the Sony 550 computer that may be more to your taste.

If you're thinking of buying the honest micro of 1984 give us a call. Find out why our prices, inventory, product knowledge, and an irresistible appetite for Mexican food have made us Sony's largest U.S. dealer.

PC PLUS™ $1099
PC DELUXE™ $1575

The Sony Plus includes MS-DOS. Sony Basic, Wordstar, Colastar, Easywriter, a CRT-36, and dual 160K drives.

No dealers please.

BYTE May 1984

117
pressing the Start key. The PEEK command in this line monitors the Atari console switches. When the Start key is pressed, the program branches to line 3000. If the Start key is not activated within 15 seconds, the loop terminates and the program goes on to the next statement.

Line 1160 performs the same function for the second screen display, and line 1170 returns to the first screen if the Start key is not activated. Lines 2000 to 2370 are subroutines and will be discussed in the sections of the program that call them.

Line 3000 is the beginning of the main program. A brief explanatory message is displayed on the screen followed by a menu of five drugs and an option to go on to a list of additional drugs.

Line 3132 calls subroutine 2290. (This input subroutine ends at 2370 unless an exit is made at one of the earlier lines.) The subroutine displays a menu of choices. A timing loop is set up as before, while the PEEK 764 statements read the value of the last key pressed. This function is similar to that of the INKEY statement in other versions of BASIC. The computer responds when the key is pressed; the user need not hit the Return or Enter key. The POKE statement restores the PEEK location to its normal value of 255, and the character entered is stored in the string variable K$. If the character "C" is entered, indicating that the user wishes to choose one of the drugs listed, the program returns to line 3132 and falls through the next two statements to line 3134, where the program control shifts to the subroutine starting on line 2120.

The subroutine at line 2120 prompts the user to enter a number and sets up another timed loop. The PEEK 764 statements that follow again scan the keyboard for the numbers 1 through 5, store the chosen number in the string variable K$, and then return the program to line 3134. Lines 2140 to 2172 will not respond to any entry except the numbers 1 through 5. This is a further safeguard against the program's being crashed by an incorrect keystroke. Line 2180 restarts the program if keys 1 through 5 are not pressed within 15 seconds.

The second statement on line 3134 calls the subroutine at line 2250. This subroutine checks to see if the keyboard entry was a number from 1 to 5. If not, line 2250 displays an error message and sets an error flag in variable K$; this returns the user to the menu again for another input in line 3140.

If all has gone well up to this point, K$ contains the number associated with the drug of choice. The conversion of this string value to a numerical value with the VAL function in line 3150 causes the program to branch to the appropriate routine with the ON GOSUB statement. If "R" was entered as a choice, the program will return to the previous menu. If "M" was the choice, the program will display the names of more drugs by branching to the next list of drugs.

The many subroutines, nested several layers deep, may make following the logic of the program difficult. However, the memory stack keeps track of all the subroutine calls and returns each one to the proper address. The advantage of such a method is that the user can move from the beginning of the program to the end in sequence, or jump back and forth anywhere in between, without being restricted to a one-way path.

The remainder of the program contains the text for the choices available to the user and further information on the topic chosen. By changing the textual content but retaining the form, structure, and logic of the program, you can rewrite the contents to deal with any topic that lends itself to a list of choices with a response for each one.

George Zucconi, M.D., has a private OB/GYN practice in San Diego, California. He has written numerous articles and delivered lectures on the topic of computers and medicine. He can be reached at 7808 El Cajon Blvd., La Mesa, CA 92041.
THE SMALL BUSINESS MAINFRAME
MuSYS NET/work 8816

Large Multi-user Capability

The NET/work 8816 is an 8/16 bit Multi-user, Multi-processor small business computer system that affords "Mainframe Power at a Micro Price". The major features of the system are:

- Expandable from 2 to 8 users, with 18 to 242 formatted Megabytes of reliable high speed storage. Each user has their own computer with a minimum of 128K RAM and access to a common database of information.
- Runs over 3,000 CP/M and MP/M software packages. The NET/work 8816 operates under an enhanced version of the TurboDOS operating system, providing each user with one of the industry's largest TPAs (minimum 63 KB).
- You won't outgrow this system! Room for growth without costly changes. Networking via ETHERNET links up to 16 systems to accommodate 256 users with 3.8 GIGABYTES of high-speed online disk storage.
- Easy to install, boots from the hard disk with a Menu driven System Configuration Program, and even easier to use.
- Plus, Cartridge or 9 Track Tape Back Up Subsystems are available.

The CompuPro H40 Disk Subsystem

When it comes to answering your data storage needs, CompuPro has the essential components. Like our H40 Hard Disk Subsystem with Disk 3™ controller and our Disk 1A™ controller. They’re the IEEE 696/5-100 products that will keep you and your system on the cutting edge of computing for years to come. Each reflects the most advanced technology available. And that’s what you’ve come to expect from CompuPro. Because we’ve built our reputation on quality components like these for more than a decade.

**DISK 1A™:** Our high-performance floppy disk controller handles any combination of up to four 8” or 5¼” drives. The Disk 1A is perfectly suited for the highest level single or multi-user microcomputer system. It features state-of-the-art LSI architecture, high-speed DMA interface, and complete compatibility with CP/M-80®, CP/M-86®, CP/M-68K®, CP/M®8-16™, MP/M®8-16™, and Concurrent CP/M®8-16™ operating systems.

**DISK 3™:** Our hard disk controller, which supports as many as four 5¼” Winchester drives, achieves new levels of performance for multi-tasking systems. The Disk 3’s many features include transfer of each disk sector using high speed “burst mode” DMA, and a channel processor for independent seeking, reading and writing, as well as the capability to transfer large blocks of data between disk and memory with a single command. Compatible with the same operating systems as Disk 1A.
HARD DISK SUBSYSTEM:
Here's the essential peripheral for your microcomputer. The H40 has a single 8" floppy drive—a Oume Trak 842™ that's double-sided double-density with 1.2 Mbytes of formatted capacity—and a Quantum O540™ 5¼" hard disk with 40 Mbytes of unformatted storage, allowing both floppy disk and hard disk operation in a single unit. Assembled in our famous disk enclosure, the H40 is compatible with the IEEE 696 standard.

You can learn even more about making the most of your microcomputer by sending for our free catalog. In it, you'll find components and systems that can improve the way you work. And why CompuPro is essential to you.

The Essential Computer™

The Microcomputer as a Decision-Making Aid

A computer can help you make decisions at work, but only if you know what to expect

Peter Callamaras
U.S. Air Force

The phrase "decisions, decisions, decisions," used either in jest or in response to real frustrations, bears special significance. It has come to be a common, sometimes satiric, way of identifying one source of our problems. In this case, the source of irritation is the fact that the decisions we have to make have a way of piling up, demanding our time and attention, and seemingly never becoming manageable. The average person takes for granted the ability to make complex decisions. From the time we get up (what to wear today?), through the morning (which route to work?), afternoon (what's for lunch?), and evening (more dessert?), we are presented with choices, and we constantly make decisions. Throughout the day we make simple decisions about our personal well-being, even while we are engaged in professional activities. At some point this constant decision making can cause "decision overload." We get tired, our concentration suffers, and we start making mistakes.

The Problems

The combination of being overburdened with decisions and making a series of bad choices will frustrate most of us. More important, when we're at work this problem can have consequences far beyond its effect on our emotional state. A classic example of decision overload and its possible dangers is a doctor's misdiagnosis.

A second problem related to decision making is the amount of time it takes. Assimilating all the information relevant to a decision can slow the whole process. Add to that the fact that the volume of information keeps growing. In fact, things change too quickly for many of us to keep up, especially in a busy work environment.

With the need to make more and better decisions, and because of the time involved in wading through so much data, we obviously need some way to reduce the burdens of professional decision making. Microcomputers provide a means of satisfying these needs.

Microcomputers can simplify decision making, speed up the process of choosing between alternatives, and help ensure the accuracy of each decision.

Levels of Decision Making

There are three levels of decision making: operational, managerial, and strategic. Microcomputers can be of great value at all three levels.

Most operational-level decisions involve the specific needs of the decision maker. These decisions make up the majority of our routine choices. They usually are standardized in our daily activities. Operational-level decisions require detailed information, but the data is readily available and its conversion into decision-making information is often subconscious. We have a set of "canned" responses for these decisions and we often can delegate their execution. The typical advice to a cold sufferer, "take aspirin and drink plenty of liquids," is a delegated canned decision.

Managerial-level decisions require a broader base of information. The decision maker must rely on his prior experience, training, and instincts. Managerial-level decisions cannot be delegated, but they can be substantially speeded up. For instance, a lawyer about to accept a new case may have a general idea of what it concerns. However, the lawyer can't give his client any legal advice until all the data concerning the case is in. The client can help the lawyer by giving him detailed and specific information.

Strategic-level decisions require a wide range of information. These decisions usually are made after long periods of thought and planning and they often require the generation of completely new data. For example, the chief space-shuttle program
freedom of creativity. The same holds true for a computer system.

It also takes time to enter necessary background information into your computer. Many ads for financial-management programs, for example, only describe the output you can generate and don't dwell on the time it takes to input the information you need to get those impressive print-outs. If it took you an entire year to spend the money you are now trying to account for, you can expect that it will take a great deal of time and effort to put your spending history into the computer.

Any professional who has to work with finances and is not using a computer system is wasting valuable time.

management information systems (MIS) and decision support systems (DSS). An MIS is a large data-gathering system. You define your data needs and set up a method of gathering it. The DSS is a refinement of the MIS applied to an individual's decision-making needs. An analogy can be found to a microcomputer if you imagine starting with a database management system (MIS) and then designing a set of tailored reports (DSS) based on the MIS data.

For another example, look at your annual tax return and your checkbook as an MIS and a DSS, respectively. Your tax return should contain all your financial data in one handy form. You can use it to gauge your financial health and make plans for the coming year. You use this MIS to create budget categories for the following year (checkbook/DSS). You then use these budget categories for specific financial decisions. Balancing your checkbook at the end of the month tells you how much you spent in relation to how much you had. You can then break out the totals for each budget category and take a detailed look at your spending for the month. Then, if necessary, you can make adjustments for the next month.

In the past, both MIS and DSS systems had to be implemented on large computers. Today, most professionals can obtain the benefits of an MIS/DSS with a good microcomputer system.

How the Microcomputer Helps

Any professional who has to work on finances and is not using a computer system is wasting valuable time. This applies particularly to professionals in business for themselves. When reviewing financial activities, the computer makes it easy to compare the money that is coming in with the money that is owed. If there are discrepancies, a computerized financial-management system allows you to go back and locate the source of the problem. If things are going well, you can use a spreadsheet program to speculate on possible future directions. A microcomputer also can make tax planning an easy, ongoing exercise that maximizes income and minimizes payments.

A computerized inventory system can also be of help to the professional. For example, you can establish a set of routine procedures for ordering supplies. If it takes a week to receive a high-consumption item, you can use the computer to determine when to place the order. One way this can be done is through the application of the economic order quantity (EOQ) method. With EOQ you create a model of your consumption patterns and compare them with your ordering/receiving patterns. The result is an indication of the best time to place orders. Accurate and timely order placement ensures that a minimum amount of inventory will be on hand to satisfy operating needs and that you will never run out of something. The stock stays fresh and storage costs decline. This also turns inventory control into a set of operational-level decisions that then can be delegated to a subordinate.

Microcomputers can perform complex statistical analyses. Engineers routinely perform statistical analyses of the failure rates of materials or
components they want to use. The results allow them to accept or reject the materials. Once the acceptance/rejection criteria are determined, materials selection can be reduced to a canned routine.

For professionals who travel a great deal, trip planning can be made easier with a transportation model (TM). The TM can also determine the most economical route for product deliveries. For those whose business it is to move people or things around the country, the decision again can be converted into a set of canned control types and delegated.

Another type of software can aid planning and scheduling. If events are determined, the computer generates a graph of the events along a time line. As time passes, the completion of a specific task can be tracked against the graph and corrective action can be taken as needed. One of the better known of these time-line graph programs is the critical-path method (CPM).

Teleprocessing through the phone system opens a whole new world to the microcomputerized decision maker. For those who need a great deal of information, the growing number of on-line data services can be a godsend. An on-line data service can be viewed as a specialized library in a computer. There are several medical libraries, for example, that allow doctors to make more accurate diagnoses or prescribe more effective medication.

On-line data services for lawyers, such as Westlaw, contain a vast body of judicial decisions. These services can reduce the drudgery of wading through all the material that is potentially applicable to a legal question. The search capability allows a lawyer to put in a set of key words and anything relating to those words is returned.

Conclusion
The more decisions you reduce, standardize, and delegate, the less time decision making will take. The more data you gather, the more information you will have available to make the best possible decisions. The microcomputer's ability to play "what if" gives you trial-and-error results without forcing you to live with the consequences of poor decisions.

The cost of microcomputers now is generally low enough to be affordable to most professionals. Learning to use one properly takes time, but it is worth the investment. The documentation that accompanies most hardware and software is getting better. With clearer instructions, it takes less time to get "up to speed." There is plenty of software available to support decision making, and there are more decision-making packages coming out all the time. The key question is, Can you afford not to start using a computer to aid in your decision making?

Peter Callanan, an Air Force officer, can be reached at AFFC/EPPB Scott AFB, IL 62225. He recently received his master's degree in systems management. He has been interested in computers since 1966 and was the service-department manager of a computer store.
WHY DEC AND INTEL CHOSE THE MARK WILLIAMS C-COMPILER.

DEC and INTEL wanted the best C technology available, with excellent code density, supporting the full C language and their specific operating environments—all at a competitive price.

They found it all at Mark Williams.

WHY YOU SHOULD CHOOSE THE MARK WILLIAMS C-COMPILER.

Our C-compiler supports the dominant 16-bit microcomputers—68000, PDP-11, Z8000, 8086—with a proven reliable, high-technology product. We are shipping versions of C for a large number of environments including CP/M and PC DOS. Both cross and native compilers are available.

Call us for the distributor nearest you. OEMs should contact us directly about their specific requirements.

The Wang PC.
The hardware that brings out the best in software.

The Wang Professional Computer runs hundreds of the most common business applications. And almost all of the most popular software programs—including Visi On, Lotus 1-2-3, TK Solver, Multiplan, and Peachtree.

And because the Wang Professional Computer is more powerful than most other personal computers—including the IBM PC—it runs all of these programs better. Applications are more responsive. Screens are faster. The graphics are sharper.

In fact, many software companies have told us they prefer to see their software demonstrated on the Wang Professional Computer. Which is only natural. Everybody likes to look their best.

For a demonstration of the Wang Professional Computer, call 1-800-225-9264. Or write to:
Wang Laboratories, Inc., Business Executive Center, One Industrial Avenue, Lowell, MA 01851.

Visi On is a trademark of VisiCorp. Lotus 1-2-3 is a registered trademark of Lotus Development Corp. TK Solver is a trademark of Software Arts Inc. Multiplan is a trademark of Microsoft Corp. Peachtree is a trademark of Peachtree Software Inc.
Benchmarking Business-Modeling Software

These guidelines will help you compare the functions and speed of business-modeling software

William Hession and Malcolm Rubel
Performance Dynamics Associates

When you want to fasten two boards together, you usually use a nail. To drive the nail through the boards you need a tool—preferably a hammer. The heel of a shoe might sometimes work, but it is hardly satisfactory where many nails are involved. You use a hammer because it is the best tool to perform the required tasks.

The process of selecting computer software, specifically business-modeling software (such as spreadsheet programs), can be likened to the hammer and nail problem. The software is your tool, but you need to have the right program to suit your modeling needs. Business-modeling software is a general-purpose tool; the added features of a specific program make it either more or less suited to different modeling tasks. Selecting business-modeling software is therefore complicated and prone to error. Benchmarks, or standard references, can simplify your evaluation of individual programs.

Alternative Selection Procedures

There are four distinct approaches to selecting software; each has its own strengths and weaknesses.

1. The "Dealer Demonstration" Approach. This involves going to a dealer for product demonstrations. While you can view excellent demonstrations at reputable dealers, you will be exposed only to the programs the dealer stocks and sells. These demonstrations will not necessarily be specific to your individual needs. When you go to a demonstration it is essential that you have a clear and concise idea of your needs, so that you can ask the salesperson to show you products that can meet your requirements.

One drawback to this approach is that the salesperson may be unfamiliar with all but one or two products. Thus the salesperson may try to "force fit" your needs to the products he is familiar with. If the salesperson can't tell you about alternative products, you may make a poor purchase decision.

You also should not be afraid to ask the salesperson questions. Although you may think your questions are unimportant, they can be vital. Unasked, they go unanswered.

2. The "Talk to a Friend" Approach. Probably the most common way to choose software is on a friend's recommendation. Many people evaluate business-modeling software by reading reviews on the different programs available. Most reviewers spend a considerable amount of time using the program they are reviewing and are truly knowledgeable about the type of software involved. However, the writer cannot help bringing personal bias into the review.

Each reviewer has preconceived ideas about what a specific type of software should include, and has his own approach to reviewing a product. A reviewer also has a set of problems that he wants the product to solve. Consequently, it is difficult to get an unbiased and comparable set of evaluations by reading a series of reviews by different authors.

One factor that reviewers tend to overemphasize is a product's "user-friendliness." To one person, "friendliness" could mean that the program prompts the operator at every command and asks for confirmation on every move. To another, this same "friendliness" could mean hours of tedium and frustration. "User-
"Friendly" is not an absolute term; it is relative to the user's experience, temperament, and environment.

The first three approaches to selecting software draw your attention to the product's capabilities, simplicity of operation, utilities, special features, and the number of tasks it can perform. Unfortunately, they do not take into consideration the tasks you need to perform and whether the product can accomplish them.

The fourth method of product evaluation and selection, benchmarking, enables you to consider your needs first.

The Benchmark Approach

To use the benchmark approach to choose your business-modeling software, start by defining the jobs you want done and then describe what you need in a product to perform these tasks. Once your needs are defined and you develop a suitable set of benchmarks, you can compare products based on your own specifications.

We use the term "benchmark" when evaluating software with a defined standard against which each software package is compared. Our benchmark is also split into two separate sections: functional comparisons and speed comparisons.

Functional comparisons, by far the most important, deal with the capabilities of a specific program to perform a specific task. Speed comparisons deal only with the individual program's speed and efficiency in performing a defined operational task. Speed comparisons are important only if the tasks defined involve massive data manipulations, substantial internal calculations, and/or many iterations. In general, this criterion becomes inconsequential when compared to the program's functional benchmarks and its simplicity of operation.

It is important to differentiate benchmarking from more traditional product-review techniques. Conventional reviews are characterized by implicit, rather than explicit, standards. You may not know why a reviewer gave a high or low mark to a specific capability of a program, you just know that he did. You are left to rely on the reviewer's judgment.

Conventional reviews traditionally cover only one product and, if any comparisons are made, they are usually ad hoc and do not have a valid foundation. Also, although reviewers' biases do exist, they are not annotated in the review.

Because different reviews are done by different people, it is virtually impossible to make comparisons of the products.

Benchmarking, on the other hand, is characterized by explicit standards. You may or may not be interested in the tasks being benchmarked, but you can at least see what the tasks do and weigh their importance.

Benchmarks make it easy to compare products and evaluate their differences in functionality and speed. Biases in a benchmark (which are certain to exist because the benchmark represents only one perception of what is important) are evident in the required modeling task. If the problem set does not adequately represent your individual needs you are free to ignore the comparisons.

Benchmarks are goal oriented. They are set up to determine whether a product can perform a predefined series of tasks. They are not set up to find out everything a product can do. As such, they are limited, but they are comprehensive within their own problem set.

To benchmark business-modeling software you must develop the benchmark and apply it to a specific product.

Benchmark Development and Use

You should begin your benchmark development process with a thorough examination of the broad spectrum of business-modeling software. Pay attention not only to what is being modeled but also to how it is being modeled; also note who created the software and for what purpose.

Business modeling can be broken into several different categories. These categories represent the different tools, or capabilities, the software makes available to you. To select software properly you have to be able to define the tasks to be performed.
The software must be able to perform those that are required.

A business-modeling tool kit comprises several groups of tools: simple models, advanced simulation models, statistical tools for analysis and forecasting, special mathematical and business functions for modeling and analysis, and a generalized programming capability for user-developed functions and applications.

Elementary applications using ledger-sheet formats for the analysis of business performance require basic spreadsheet-modeling capabilities. The spreadsheet model, with its row/column modeling and basic arithmetic functions, provides the tool for the “quick and dirty” analyses so often required in business. When combined with an ability to link or consolidate sheets, this tool proves useful in report and simple accounting consolidations.

More sophisticated applications, based on large, complex equation systems, require modeling tools explicitly designed for developing and solving these types of problems. Modeling software for these tasks should include the ability to automatically order equations for a solution and the ability to solve both recursive and more complex circular or simultaneous model relationships. In addition, “what-if?” and “goal-seeking” features should be supported to aid model analysis. A sensitivity analysis (what-if?) feature allows you to vary assumptions and provides the means to examine the model’s reactions to alternative assumptions. Goal seeking, also called backward solution, lets you determine what actions are necessary to achieve specified model outcomes.

To analyze past business patterns and to forecast future results, a basic statistical ability is required in modeling software. Minimum features should include basic statistics for analysis—mean, variance, standard deviation, simple correlation, forecasting tools such as linear regression, and simple time-series analysis functions such as moving averages or exponential smoothing routines.

Applications in business or financial analysis—for example, investment evaluation, capital budgeting, or profitability studies—are facilitated by special business mathematics functions. The calculation of net present values, internal rates of return, and depreciation and amortization schedules are a few of the more important business and financial functions. These functions may be tested directly in the problem set but must also be covered completely in a benchmark’s questionnaire section to ensure that they are properly highlighted.

Developing custom business models and modeling applications sometimes requires the use of special formulas and procedures not always available in business-modeling packages. To meet this need, modeling software often provides a high-level programming capability. The modeling language should provide a full range of conditional functions and the usual programming constructs. Features permitting user-definable functions and subprograms are helpful for the larger tasks.

If it is to be useful, the benchmark problem set must address all different types of modeling applications. Simplify the models you are testing to their bare minimum to ensure that you test only the program’s ability to perform a specific function, not its ability to perform a big job. If you keep the program simple you will also be able to apply it to your own needs more easily. The text box, “A Simple Financial Modeling Problem,” on page 130, shows an example of one problem from the benchmark problem set designed simply to test a program’s abilities.

From the range of business-modeling software that is available you can select those tools that are of primary importance to your work. From this list, you also can determine if there are other modeling tools you would like to have, given their availability. You can then go through the list of products available to you and discard those that do not meet your criteria. This reduces the list of possible purchases to a reasonable length.

At this point, you can examine each program’s support of its tools. The benchmark problem set and ques-
A Simple Financial Modeling Problem

The Universal Products Corp. wishes to develop a simple financial model of a pro forma income statement. The model will be simulated for five periods.

Exercise A

Develop and run the model, generating the pro forma income statement shown below. Please attempt to replicate the report format as closely as possible. Save the report to disk and print it. Label the model and printed output EXA.1. Label the command file and output EXA.2.

UNIVERSAL PRODUCTS INC.
Projected Income Statement

</table>

The relationships on which the model is based are given below:

\[
\text{REV} = 1.2 \times \text{lagged REV}
\]

\[
\text{CGS} = 0.8 \times \text{REV}
\]

\[
\text{EBIT} = \text{REV} - \text{CGS}
\]

\[
\text{INT} = \frac{\$30,000}{\text{in period #1}}, \frac{\$10,000}{\text{thereafter}}
\]

\[
\text{EBT} = \text{EBIT} - \text{INT}
\]

\[
\text{TAX} = 0.5 \times \text{EBT} \text{ if EBT is } > 0, \text{ otherwise } \text{TAX} = 0
\]

\[
\text{NET} = \text{EBT} - \text{TAX}
\]

Notes: Period 0 is 1983, period 1 is 1984 and so on. All lags are one-period lags. Initial revenue is assumed throughout the exercise to be $100,000. That is, REV for Period 0 $100,000.

Exercise B

Assume now that revenue growth is 30 percent in years 1984, 1985, and 1986 and 50 percent in 1987 and 1988. Retrieve the model from disk, run it, and generate a new income statement in the same report format. Save the new report to disk and print it. Label this EXB.1. Save the command file to disk and then print it. Label these EXB.2.

Exercise C

Assume now that interest expenses are $20,000 per year for 1984–1988. Alter the model to reflect this new assumption (while maintaining the assumptions of exercise B). Run the model and generate an income statement similar to the one above. Save the report to disk and output it to the printer. Label these files EXC.1. Save the command file to disk and print it. Label these files EXC.2.

Exercise D

This question tests your product's ability to perform goal seeking, or the backward solution of the model. Use the model saved in exercise A. Find out what revenue would have to have been in 1984 if the net income will be $25,000 in 1985. Run the report, save it to disk, and print it. Label these files EXD.1. Save the command file to disk and print it. Label these files EXD.2.

An example of part of a function questionnaire is given in table 1. The set of questions that you ask should be comprehensive. The more points of differentiation between the varying programs, the easier it will be to reduce the set of possible choices to a final few.

You should design the benchmark's questionnaire to answer these important questions: who is doing the modeling, and for what purpose? You must ask questions about the documentation and output presentation. If you want the product to be a personal productivity tool, you will not ask the same benchmark questions as you would if the product is to be used by several people of differing skill levels. Your questionnaire should consider the following:

- **Documentation**—Is it complete, easy to read, and indexed? Does it give operator instructions for novices? Is there a tutorial or a reference card? Does it offer on-screen help?
- **Data Input**—Can data input into a model be simplified so that it can be done by a third party? Can forms be designed for input on screen? What is data editing like?
- **Data Management**—Can specific information be changed, modified, or copied? How? Is information easily retrieved? Can models easily access data?
- **Functions and Utilities**—What tools, both arithmetic and statistical, are available to assist you in developing and running your models? Some programs provide many specific functions such as net present value or variance. Others may require the operator to define the functions with many lines of code.
- **Report Writing**—What capabilities does the program have to output the finished report?
- **Graphics**—Does the program have the ability to present your information graphically? If so, in how many ways? What output devices are supported? Can you do color work?
ADIT. There's nothing else like it on the market. It's an intelligent I/O board with its own operating system that lets you control up to 16 different terminals, modems or printers. Or link your local network up to four other systems simply and inexpensively. And all this from a single slot in your S-100 bus. Now that's efficient!

ADIT gives you many extras. It allows you to upgrade to a multi-user system and expand as your needs grow—without performance degradation. The on-board 6MHZ Z80B supports DMA operations to off-load the host CPU. Multi-tasking firmware supports UNIX, MP/M and AMOS operating systems. It complies fully with IEEE 696.

There's much more to tell you about ADIT than space allows. And it is only one of Macrotech's products designed to maximize the performance of your S-100 system. The MAX Dynamic Memory, for instance, gives you up to 1 Mbyte of memory for all your system memory and virtual disk applications—again from a single slot. And our newly developed dual-processor, CPU board. It uses a 16-bit 80286 and an 8-bit Z80B to provide unprecedented speed and power from a single slot. That's efficiency, too.

Call or write us today, and ask about these products.
Narrowing the Field
Once you have discarded programs that do not meet basic tool and function criteria, you must subject the remaining programs to “test drives.” At this point, you can profitably consult a dealer or friend who has the program.

When consulting a dealer about a targeted product, it is important that you ask specific questions about it and that you set up and solve specific problems. If the salesperson is reluctant to do this, ask if you can conduct your own demonstration. At this point, you should determine how well the programs you have selected work for you. Get as much hands-on experience as you can before making a purchase.

It may seem like we have made the process of selecting a business-modeling program overly complicated, but when you consider your investment in a program, not only in actual but also in implied dollars (learning the program, setting up data files and models, and getting used to working with the program), your time and effort spent researching and selecting it is insignificant. The benchmark process can help you compare programs objectively and arrive at the proper purchase decision.

Malcolm Rubel is president and William Hession is executive vice-president of Performance Dynamics Associates (305 Madison Ave., New York, NY 10016), a marketing-consulting firm specializing in software marketing. They are also the authors of The Performance Guides to Business Software, a series of books benchmarking word-processing, business-modeling, and database-management software. The books will be published by McGraw-Hill in 1984.

---

Sample Product Function Questions

Does the product have any of these Boolean and control functions:

- EQUALS (=)?
- GREATER THAN (>)?
- LESS THAN (<)?
- GREATER THAN OR EQUAL TO (≥)?
- LESS THAN OR EQUAL TO (≤)?
- NOT EQUAL TO (≠)?
- AND?
- OR?
- NOT?
- IF . . THEN . . ELSE?
- NESTED IF . . THEN?
- TRUE?
- FALSE?

Does the product have any of the following business functions:

- NET PRESENT VALUE?
- FUTURE VALUE?
- INTERNAL RATE OF RETURN?
- PAYBACK PERIOD?
- AMORTIZATION?
- DEPRECIATION?
- STRAIGHT LINE?
- DOUBLE DECLINING BALANCE?
- SUM OF THE YEARS DIGITS?

Does the product have any of the following statistical functions:

- MAXIMUM?
- MINIMUM?
- MEAN?
- MODE?
- MEDIAN?
- VARIANCE?
- STANDARD DEVIATION?
- CORRELATION COEFFICIENTS?
- SIMPLE LINEAR REGRESSION?
- MULTIPLE LINEAR REGRESSION?
- MOVING AVERAGE?
- EXPONENTIAL SMOOTHING?
- RANDOM-NUMBER GENERATOR?

Indicate any additional functions that are included in the product.

Table 1: Part of a questionnaire for evaluating business-modeling software.
Introducing the first computer shopping service that brings you convenience, savings and enjoyment.

Here's your chance to expand the practical uses of your personal computer. Sign up for CompuServe and shop in our new Electronic Mall. It's easy to use. It tells you more about the products you're buying. It lets you order faster. And it's totally unique.

CompuServe's new Electronic Mall offers you all these shopping innovations.

- It's enormous! So it gives you in-depth information on thousands of goods and services, and lets you buy even hard-to-find merchandise. - Its unique "Feedback" service lets you ask the merchants themselves specific questions. - It's incredibly efficient in ordering the products and services you want.

- Its special discount opportunities make it economical, purchase after purchase. - And its name-brand merchants assure you of top-quality merchandise.

The Electronic Mall, a valuable addition to the vast world of CompuServe.

CompuServe's Consumer Information Service brings you shopping information, entertainment, personal communications and more.

You can access CompuServe with almost any computer and modem, terminal or communicating word processor.

To receive your illustrated guide to CompuServe and learn how to subscribe, call or contact...

The Electronic Mall™ is a cooperative venture between CompuServe Inc., and L.M. Berry & Company.
Apple's® new baby has

It's called Macintosh™. And it has our brains and a lot of our personality.

We're called Microsoft®. And our part of Macintosh is five new programs that are bright, intuitive, outgoing, understanding and born to perform.

Our pride, your joy.

Taking advantage of Macintosh's mouse and rich graphics, we've designed software that works like you, even thinks like you.

All our programs share the same plain English commands. So what once took days to learn, now takes hours or minutes to learn with Macintosh.

Meet the family.

Our financial whiz is MULTIPLAN®, an electronic spreadsheet that actually remembers how you work. Even offers suggestions on spreadsheet set-up.

When it comes to writing, nothing travels faster.

Microsoft and Multiplan are registered trademarks of Microsoft Corporation. Apple is a registered trademark and Macintosh is a trademark licensed to Apple Computer, Inc.
our best features.

than our WORD. Using the mouse, it lets you select commands faster than you can say "cheese."

Our most artistic child is CHART. It gives you 40 presentation-quality chart and graphic styles to choose from.

FILE is our most manageable child, an advanced personal record management program. And BASIC, the language spoken by nine out of ten microcomputers worldwide, is the granddaddy of them all. Now enhanced to take advantage of the Macintosh mouse, windows and graphics. We'll be adding more to the family soon. So call 800-426-9400 (in Washington State call 206-828-8088) for the name of your nearest Microsoft dealer.
Now...Draw On Your Imagination

Introducing The Gibson Light Pen System™

The link between mind and machine has arrived. Suddenly you’re free...free to translate your every thought into professional quality computer graphics...just by touching your screen.

The Gibson Light Pen System software features icon menus that offer easy access to powerful graphics tools such as symbol libraries, geometric shapes, mirror-imaging, magnification and complete color and pattern editing. Even if you’re not a graphic artist, you can design, diagram and draw with precision at high-speed, in high-resolution, and in full-color...right on your screen.

COMPLETE WITH FIVE SOFTWARE SYSTEMS TO MAXIMIZE YOUR CREATIVE OPTIONS.
The Gibson Light Pen System comes complete with all you need to draw, paint, design, score music and learn animation.

DRAW FREEHAND WITH PENPAINTER™
A full range of drawing tools, shapes, patterns and colors to draw or paint virtually anything on your screen.

DESIGN PRECISION DIAGRAMS WITH PENDESIGNER™
Turn your computer into your own graphic design studio. A complete selection of templates make perfect business and architectural diagrams, technical drawings and engineering schematics a snap.

CREATE COMPUTERIZED ANIMATION WITH PENANIMATOR™
All that you need to learn the basics of animation. Develop your own animation sequences, and bring your screen to life.

COMPOSE MUSIC WITH PENMUSICIAN™
Score computerized melodies with incredible ease at the touch of your pen.

CREATE YOUR OWN LIGHT PEN APPLICATIONS WITH THE PENTRAK LANGUAGE SYSTEM™
Take advantage of the software features, and customize your own light pen programs.

NOW AVAILABLE FOR THE APPLE II™ SERIES
Coming soon for the IBM PC™ and PCjr.™

The Gibson Light Pen System

Expert Systems for Personal Computers

The TK!Solver Approach

Milos Konopasek and Sundaresan Jayaraman
Software Arts Products Corp.

Although some question the possibility of implementing expert systems on today's personal computers, the authors of this article wish to present a counterexample. This article will show that many characteristics of expert systems are present in TK!Solver and will describe a framework for building a variety of expert systems with quantifiable knowledge bases.

Historical Note

Early research in artificial intelligence (AI) was aimed at producing domain-independent reasoning techniques. General Problem Solver (GPS), a classic example, could prove theorems and solve a variety of problems and puzzles; however, it was inadequate for larger real-world problems. By the mid-1960s research efforts had shifted to the building of expert systems with large stores of domain-specific knowledge, such as Dendral at Stanford University and Macsyma at the Massachusetts Institute of Technology. This marked the beginning of increased research in the development of applied AI systems and into the philosophy behind them (the bibliography on page 154 refers you to publications concerning artificial intelligence and its history).

The fundamental issue of problem representation became more important in the context of these expert systems. Efforts were directed at determining the proper structures to efficiently represent the knowledge applicable to the problem domain, with the difficulty increasing as the domain broadened. These efforts represented a paradigm shift in AI during the 1970s.

The knowledge bases for the expert systems were hand-assembled—requiring many man-years of effort and mediation of a knowledge specialist. Some observers felt that this was the principal bottleneck in the development of expert systems (see reference 4), and that Tieresias was the first step toward the elimination of this bottleneck (see reference 2). Although it was limited to helping debug and fill out the knowledge base of Mycin, Tieresias separated the two basic components of an expert system—the knowledge base and the problem-solving or inference part. This also was a step toward domain independence, i.e., realization of the idea of removing the current knowledge base and "plugging in" a different one.

More recently, with expert systems development and experimentation costs increasing, a trend toward developing design tools to build expert systems is emerging. These tools also are designed to facilitate easy modifications of and experimentation with expert systems. Emycin, Ops, Age, Expert, and Hearsay III are some examples of this trend. TK!Solver is another.

TK!Solver is aimed at realizing many concepts expounded in AI research, human-computer interface design, and human problem solving. It has no built-in knowledge of any particular discipline, but it provides a framework to make it easier for the user with such knowledge to construct expert systems. The knowledge engineer—the bottleneck we mentioned earlier—is eliminated.

There are strong links between the prehistory of TK!Solver and developments in AI. Before detailing these links we have to mention the efforts outside the mainstream of AI aimed at creating special-purpose languages/frameworks for computer-assisted problem solving in specific areas. Ices, for civil engineering, SPSS, a statistical package, and GPSS, a simulation package, are typical examples. These programs lacked "knowledge" in the AI sense but they simplified the noncomputer professional's use of computers. They reflected the then state of the art in commercial hardware and software. Yet a large amount of domain-specific and mathematical knowledge went into the design of constituent subprograms and command structures. Running these programs was equivalent to accessing the embedded knowledge and using it for solving a variety of problems.

The development of these and scores of similar packages (for computer-aided design (CAD), operations research, forecasting, etc.) was facilitated by the application programmer's grasp of particular fields of expertise coupled with the expert's grasp of programming in high-level languages. The utility of these packages, their complexity, and their relative efficiency still present a challenge to mainstream AI tech-
Figure 1: A functional diagram of the TK Solver user interface. The arrows indicate the predominant flow of information but all links are bidirectional.

Figure 2: The "laws of electricity" knowledge base: rule sheet.

Figure 3: The R-graph for the equations in figure 2.

The expert then assigns the values of any combination of variables as input and lets the computer find a way to solve for the unknowns using either the consecutive-substitution procedure or iteration.

Interestingly enough, the intended role of QAS as an expert system brought about the separation of the knowledge base and control strategy—a key factor in the design of expert systems.

QAS's strong points were its fast response to any question, high power/resources ratio, and knowledge-carrying potential. Its weak point, especially in light of recent developments in human-computer interface, was the line-oriented dialogue.

TK Solver is essentially an enhanced implementation of the QAS system. Its development was made...
More For Your Micro

Qubie' offers a few select products at low prices, with service and support not available elsewhere.

1. Digital Signal Processing Modems
   The Qubie' modems provide a high level of performance and quality at a price unmatched by competing modems. This is made possible by four microprocessors which measure the tones being transmitted digitally, eliminating the need for expensive analog filtering devices. Both modems are Bell 212A compatible, and are capable of transmitting and receiving at 300 and 1200 baud. These auto-dial and auto-answer modems recognize the Hayes software commands. If you already are using a software package written for Hayes modems, like CROSSTALK or even Hayes' SMART-COM, you can use it on the Qubie' modems.

PC212A/1200 Internal Modem for IBM PC® and XT®

Includes: internal modem, modular phone cable, card edge guide, instruction manual, and the highly rated PC-TALK III communications software. Its low profile design allows it to fit in just one slot, even on an XT. For just $20 we can add an external serial port connector. This lets you use the serial port circuitry on the modem card to address external serial devices when you are not using your modem. PC212A/1200 $299.

The 212A 1200E Standalone Modem.
   The most economical way to get high speed data communications for any personal computer with a serial port. It supports all Hayes commands and can use any Hayes compatible software package. It comes standard with its own cable to connect it to your computer, a modular phone cable, and manual. $329.

Copyright Qubie' 1984

Circle 327 on inquiry card.

2. More Than Just Graphics on a Monochrome Monitor
   Now you can get graphics on an IBM PC monochrome monitor along with parallel port, serial port, and battery powered clock/calendar. It is the ideal solution for those who wish to do graphics using Lotus 1-2-3. The 720X24 Monochromer graphics adaptation provides a new 640x200 resolution. Graphics is just the beginning.
   We have added some popular features from the AST family of multifunction boards. Standard features include a parallel printer port, and a battery powered clock/calendar for automatic loading of the time and date. You can even order an optional serial port for a serial printer, plotter mouse, or modem. All functions are 100% IBM compatible. And of course there is a one year factory warranty from AST Research and the Qubie' Acid Test backing it all up. MonochromePlus $449. Optional serial port, $35.

3. 30 Minutes of Standby Power, with Surge and EMI Protection Tool
   Have you ever had the misfortune to have the power fail or the lights blink right in the middle of doing something really important? You could have missed out on the frustration of losing all that work if your micro had a Qubie' SB200 Standby Power Supply. It is ready on just 110Vth of a second notice to run your PC and peripherals. For up to 30 minutes after a power failure. It will also go into action should the power dip below the minimum required (a "brown-out"). An audible alarm warns you to save your work and shut down your computer, and manually. $329.

SB200 Standby Power Supply

SB200 also provides filtering of Electromagnetic Interference (EMI), and surge protection which can step havoc on your PC's internals or your data without you even noticing. SB200 200 watt standby power, $329.

IBM, IBM PC and XT are registered trademarks of IBM Corp.

Order Today!
All prices include UPS surface freight and insurance. Add $5 for two day air on modems and AST, $15 on SB200. For fastest delivery send certified check or credit card. Personal checks take 18 days to clear. Calif. residents add 6% sales tax. Corporations & institutions call for purchase order details.

possible by the rapid proliferation of inexpensive microcomputers with direct memory to screen mapping that facilitated screen-oriented dialogues and resulted in an improved human-computer interface. We view TK!Solver as an attempt to create expert systems to fit the mass-produced professional-class personal computers.

**Overview**

Figure 1 shows the architecture of TK!Solver. The domain-specific knowledge responsible for system performance is contained in the knowledge base. The problem-solving tools that contain the control strategy—the Direct and Iterative Solvers—use the knowledge base when solving particular problems. For interaction (or I/O) (input/output) TK!Solver provides "sheets" displayed through one or two windows on the screen.

The explicit division between the knowledge base and the control strategy is this architecture's main feature. Consequently, the expert/user deals only with issues of domain-specific knowledge and is insulated from the details of control-strategy implementation.

In the following paragraphs we will describe the four components of the knowledge base, the characteristics of a mode, and the problem-solving mechanism. We will try to illustrate these concepts with examples from a knowledge base of basic information about Ohm's law, Joule's law, and resistivities of materials. Obviously, the kind of interaction shown here is not restricted to this particular knowledge base.

**Rules**

Rules are the basic component of domain-specific knowledge. They express mathematical relationships in terms of the equality between left-hand and right-hand expressions.

**Equations, Constraints, or Definitions**

Equations, constraints, or definitions can all be represented as rules. Figure 2 shows the rule sheet for our sample knowledge base. The set of rules can be represented as a network of relationships called the R-graph (for relationships graph) as shown in figure 3. A variable is represented as a node and each polygon-shaped subgraph represents a rule.

**Unit Conversions**

Units of measurement are associated with most measurable quantities. Conversions between them are frequently encountered in problem solving and have to be defined in the knowledge base. Figure 4 shows the unit sheet with the unit conversions in our sample's knowledge base.

**Function Definitions**

Empiric relationships between sets of values are expressed as (user-defined) functions and make up the third component of the knowledge base. Figure 5 shows the user function subsheet, with materials and their resistivities, in our sample knowledge base.

**Built-in Knowledge**

Irrespective of the domain-specific knowledge, TK!Solver is designed to solve problems involving basic arithmetic operations and built-in mathematical functions. Standard varieties of those are supplemented by special ones such as "element" (for retrieving list components) and "apply" (for associating empiric functions with arguments). TK!Solver may, for example, associate the function defin-
When You Turn this Page
You’ll be Leaving the World of Ordinary Microcomputers
Introducing the MTX512

A World Apart from the Ordinary.

It begins with the sense of touch.
With the sleek black metal housing. Cool to the touch. Cool to the advanced circuitry and components contained within.
And the solid feel of people-sized keys set up in a field that gives you room to work and space in which to think.
But the difference only begins with what you see and feel. Where it ends...well, that's really up to you.
In a very practical sense, the only limits you'll experience with the MTX512 are those you choose to accept.

64K To 512K RAM — A Look On The Inside

Take a close look at the MTX512.
We could tell you it offers the greatest performance and versatility of any micro in its price range, but we think you're smart enough to draw your own conclusions.
The design is elegant in its simplicity. Remarkable for the power and complexity it represents. 64K RAM built in, with total expansion to 512K. And that doesn't include 16K of video RAM controlled by its own processor.
Speaking of video, keep in mind this is no ordinary monochromatic, single screen system. The MTX starts off where other micros end up. Delivering vivid screen capabilities with 256 x 192 pixels that clearly define interference-free high resolution graphics. 16 brilliant colors that can be displayed simultaneously. In a format powered by 32 easily movable, user-defined graphics characters.
Graphics capabilities you'd find impressive in a system that gives you a single screen to work in. With the MTX, you have eight.
Yes, eight.
Eight definable windows to operate independently or in tandem. And still maintain full screen capabilities. Thus, you can manipulate spread sheets on the MTX and see the impact of changing variables in graphics at the same time. Eight separate windows on the world. We call them Virtual Screens. You'll call them extraordinary.
Far from ordinary as well are the built-in system outputs that come standard on the MTX. The Centronics parallel printer port. The two industry-standard joystick ports. The uncommitted parallel I/O port. The Cassette port with 2400 baud. Separate TV and Video Monitor Ports. The 4-channel sound hi-fi output. We've even installed a ROM cartridge port for word processing and other dedicated programs.

Interactive Languages

Interactive Languages And Routines — A Look At The Way All Micros Will One Day Perform

Forget the way all other micros perform. This is the way they should.

Interactively.
With the MTX, you can create and manipulate programs using four different languages in dynamic interaction, all coordinated through the FRONT PANEL DISPLAY. Interweaving elements as you would in creating a symphony.
And take a serious look at the languages housed in the MTX's 24K ROM. MTX BASIC, a more powerful form of BASIC that allows you to use all standard BASIC programs. MTX GRAPHICS, with straight forward commands, eliminates the tedium and difficulty of creating complex graphics programs. NODDY, an 11-command "easy learn" language that can transform real world programming into a child-friendly activity. And MTX ASSEMBLER, which enables sophisticated programming in assembly language.
Something else the advanced programmer will appreciate is our ASSEMBLER/DISASSEMBLER, tied to BASIC, which provides unprecedented display and keyboard access to 280 CPU storage locations, memory and program.

If you're hungry for more, PASCAL and FORTH are also available as add-on ROM packs.

On the keyboard side of things, you'll find a number of operator-oriented features that speed up and ease up the operation of the MTX. The separate numeric pad with quadri-directional cursor control and full editing functions. The eight dual function keys.
The auto repeat function on all alpha-numeric keys. Add to this such programmer-saving features as the use of abbreviated BASIC commands, a built-in syntax verifier, automatic cursor-honing to errors, auto-line numbering and automatic scrolling, and you begin to see the MTX not only opens a lot of doors that other micros leave closed, but speeds you through them as well.

The 160 Megabyte Connection - A Look At The System

To build a good system, quality must be designed in at every level. We designed the MTX and its complete line of system peripherals using proven, standard components. Striking a strategic balance between power, versatility and dependability. Our Z80A processor, running at 4MHz, gave us the high performance characteristics we were striving for, plus the ability to expand into the MTX Hard Disc, MTX Silicon and Floppy Disc CP/M operated systems. Systems that could provide up to 160 megabyte storage capacity. More power than you'll probably ever need, unless you take full advantage of the MTX's impressive system capabilities.

Systems hookup is as simple as every other MTX procedure. By merely plugging in the twin RS232C Serial interfaces and the Node software, sold optionally, you're ready to create a disc-driven interactive communications network (OXFORD RING®) that can link up to 255 units.

Software! You'll never worry about software availability with the MTX. Dozens of MTX-dedicated programs have already been created, supplementing the vast landscape of CP/M applications software currently available. And advance word of the MTX's technical capabilities has precipitated an MTX software "push" on the part of many leading software manufacturers.

Word Processing For $999 - A Look At A Great Deal

Look first at the capabilities, then at the price. This is word processing the way it should be. Quick. Easy. Professional. A package that includes the MTX512; the powerful New Word™ word processing ROM cartridge; and the Memotech DMX80 correspondence quality printer*. An exceptional value! And that brings us to the bottom line.

A Look At The Price

There's a very simple equation that covers the pricing of the MTX512.

The more engineering you put in a system, the less it will cost to produce. As you've already seen, the MTX is a pure product of advanced, innovative engineering.

Which is why we can sell it for $595**

And why we can confidently back it up with a full one-year warranty.

Make no mistake. When you turn this page, you'll be returning to a world very different from this one.

A world in which all microcomputers will suddenly seem very different.

Suddenly very ordinary.

For more information about the MTX512, or to find out the location of the MTX dealer nearest you, contact Memotech Corporation, 99 Cabot Street, Needham, MA 02194; or phone (617) 449-6614.

The model encompasses the first knowledge base. Different models may be merged later by loading some or all of their components into TKISolver, thereby creating larger models capable of addressing more complicated problems. There are commercial versions of model sets, called TKISolverPacks, for such disciplines as mechanical engineering, financial analysis, and building design.

### Problem-Solving Mechanism

The Direct Solver is the workhorse of the problem-solving mechanism. It manipulates equations depending on the problem's formulation and solves for unknowns. The solution process goes through the R-graph and "fires" all polygons with only one unknown node. It continues until as many unknowns as possible are evaluated. This "propagation of solution" strategy simulates the consecutive-substitution procedure. If an inconsistency error or an illegal operation is detected, the solution process is terminated and the rule causing the problem is flagged with the appropriate error message. Because a problem's formulation dictates the solution path, the control strategy may be regarded as forward chaining or data-driven.

Whenever the Direct Solver cannot match the nature and complexity of a given problem, the Iterative Solver can be used. The heart of the Iterative Solver is a modified Newton-Raphson procedure that handles sets of simultaneous linear and nonlinear equations. It either can be invoked explicitly or automatically called when the Direct Solver fails to produce a solution.

### Examples

Figures 6 through 8 show variable sheets with formulations and solutions for a few problems concerning our sample knowledge base. The "calculation units" (i.e., units implied in figure 2's rules) are specified and used in figure 6 for all variables except t. In the next two figures the units for U, D, and A were changed respectively to kWh, cm, and cm², and the values were changed accordingly.

In figure 7 the user overconstrained the model by assigning U = 1.25 without releasing I from the set of input variables. The partial view of the variable and rule sheets shows the offending rule and related variables marked by >. Bringing the cursor over the > mark in the rule sheet causes the error message "Inconsistent" to be displayed in the status line.

The asterisk (*) in front of the last three rules in figure 7 indicates that

### Figure 7: What must have been the current if, in the example in figure 6, the energy supplied was 1.25 kWh? (See text for the explanation of the inconsistency.) The solution, after removing the value of I from input, is I = 5.68 A, R = 19.36 Ω (ohms) and P = 625 W (watts).

...ing the stored load-deformation characteristics with a given type of material.

### Model

The model encompasses the first three components of the knowledge base in figure 1 (rules, unit conversions, user functions) as contained in the rule, variable, unit, and user function sheets. It can be viewed as a compact, high-level representation of domain-knowledge structure, organization, and content. The model's content and structure allow for a control strategy that we feel is both simple and powerful. The model is also intended to serve as a user-friendly guide during problem solving.

The model usually reflects a specific part of a particular discipline's knowledge base. Different models may be merged later by loading some or all of their components into TKISolver, thereby creating larger models capable of addressing more complicated problems. There are commercial versions of model sets, called TKISolverPacks, for such disciplines as mechanical engineering, financial analysis, and building design.

"The office automation I bought for everyone in the corporation doesn't incorporate everyone."

Stop the shock...with the new Exxon Business Support System.

An office automation system that can't support everyone in your corporation can lead to some very shocking experiences.

The right power to the right people

That's why Exxon Office Systems now offers more practical office automation solutions that help everyone in the corporation to be more productive. With the Business Support System, Exxon extends its fully integrated line of office automation products to support managers, professionals, administrators, and secretarial staff.

Office automation for those who shape the corporation

The Exxon Business Support System features the new EXXON 750 Professional Workstation, designed with powerful, integrated software that lets you move instantly from text to graphics to data processing — without changing programs.

Tying everyone together

At the core of the Business Support System is the EXXON 8400 Series controller. With its UNIX*-based operating system, it can integrate all levels of workstations to share information and programs. Everyone can keep track of schedules and meetings with time management and calendaring functions, whether their workstation is an EXXON 500 Series Information Processor or a new EXXON 750 Professional Workstation.

The future...without the shock.
Newton-Raphson iterative procedure when the consecutive-substitution procedure fails (Iterative Solver) (4) searches through tables of data and evaluates either unknown function values or arguments when required in the process of (2) or (3) (5) performs unit conversions (6) detects inconsistencies in problem formulation and domain errors (7) generates a series of solutions for lists of input data and outputs results in tabular and graphic forms.

However, we also consider TK!Solver to be a general framework for setting up expert systems in a whole class of disciplines. A class is defined by the heavy dependence of human experts on the use of mathematical and logical skills. See the text "Attributes of Expert Systems" on page 152 for a comparison of TK!Solver and the typical characteristics of an expert system.

We experimented with TK!Solver by using it to build expert systems in a variety of disciplines. For example, we were able to set up models and use them for solving whole sets of problems in Schaum's Outline Series books on physics, chemistry, finance, etc.

We also feel that the TK!Solver concept is useful in covering well-structured knowledge as embodied, for example, in The Engineer's Manual (see reference 5) consisting of 1029 "chunks" of knowledge and 30 accompanying tables of empirical relationships, functions, and unit conversion factors, etc. (with the exclusion of about 10 percent of the text).

Victory Computer Systems announces the FACTOR—the first 16-bit multi-CPU computer that gives you pure UNIX programming power with real-time response. We did it with a system architecture that simultaneously implements an entire array of 16-bit single board computers. Each SBC has its own MC68000™ CPU, 256 kilobytes of dual-ported RAM, and VRTX™—a rugged, real-time software-on-silicon operating system that switches tasks in as little as 100 μsec. So now you can run several UNIX programs at once. Or use your FACTOR to monitor automated equipment while simultaneously processing words and data for up to 24 fully supported users.

The VMEbus. Faster by a factor of 10.

The FACTOR’s CPUs communicate over the VMEbus—an advanced new backplane design with 6 card slots, 4 bus arbitration levels and 32-bit address and data paths. At 20 megabytes per second, the non-multiplexed VMEbus is an order of magnitude faster than the bus implemented in today’s most popular microcomputer systems. Even if you don’t run a factory, the FACTOR’s speed will mean faster throughput as your computing needs grow. And growth is what the Victory FACTOR is all about.

Exponential Growth. FACTORED-In.

The FACTOR’s expansion-oriented architecture will take you far beyond today’s performance horizons. In pro-
cessor power. In multi-channel industrial I/O flexibility. In on-board memory. In built-in mass storage options. In the number of fully supported users. And there's no end in sight.

In designing a multi-user system with real-time speed, you've always had many factors to consider.

Now there's just one.

We've got more to tell you about the Victory FACTOR. To get the whole story, give us a call today.

System Hardware:
- Each single board computer with 16-bit MC68000 CPU, 256 Kb dual ported RAM, VERTX real-time executive in PROM, 8 RS-232C serial ports, and a Centronics-compatible parallel port
- New international standard 20 Mb/sec VMEbus
- Optional 1 Mb RAM expansion board
- Mass storage: Hard disk, floppy disk, and removable cartridge hard disk built-in (29-104 Mb UF)
- Fully supports Motorola 2 MHz I/O bus and industrial control interface cards
- Alphanumeric terminals in green, international amber, or color
- Graphics terminals in monochrome or color
- Optional coprocessor board for concurrent execution of CP/M on four 280’s, each with its own 64Kb RAM

System Software:
- UNIX (UNIXPLUS) operating system (includes "C" language)
- VERTX real-time operating system standard in PROM
- Available languages: SMC Basic, Fortran '77, Pascal (IEEE Standard), RMCOBOL ANSI '74 Standard (Ryan-McFarland)
- Ethernet* local area network interface
- 3760, and 3270 data communications protocols

OEM QUANTITY DISCOUNTS AVAILABLE
My Programs Always Compile the FirsTime™

Yours can too!

FirsTime is an intelligent editor that knows the rules of the language being programmed. It checks your statements as you enter them, and if it spots a mistake, it identifies it. FirsTime then positions the cursor over the error so you can correct it easily. FirsTime will identify all syntax errors, undefined variables, and even statements with mismatched variable types. In fact, any program developed with the FirsTime editor will compile on the first try.

Unprecedented

FirsTime has many unique features found in no other editor. These powerful capabilities include a zoom command that allows you to examine the structure of your program, automatic program formatting, and block transforms.

If you wish, you can work even faster by automatically generating program structures with a single key-stroke. This feature is especially useful to those learning a new language, or to those who often switch between different languages.

Other Features: Full screen editing, horizontal scrolling, function keys labeled on screen, help screens, inserts, deletes, append, searches, and global replacing.

Programmers enjoy using FirsTime, because its powerful features allow them to concentrate on the program logic without having to worry about coding details. Debugging is reduced dramatically, and deadlines are more easily met.

The Spruce FirsTime editor is immediately available for FASCAL ($245) and C ($295) on the IBM Personal Computer and its compatibles. A demonstration disk is available for $26. (N.J. residents please add $6 sales tax.)

For programs that compile the FirsTime.

To order, or for more information, contact:

Figure 12: What are the elements of an isosceles triangle if side c and area A are the same as in figure 11 and no angle is given? Constraint a - b is added to the rule sheet. Guess the value for a arrived at by typing in (a + b)/2 (rationale: the expected value must lie between previous values of a and b). Values in output field left from previous solutions don't count.

Figure 13: The solution to the problem in figure 12.

Figure 14: The variable and rule sheets for the projectile model with the solution of the following problem: A baseball is thrown with an initial velocity of 100 m/s (meters per second) at an angle of 30 degrees. How far does it travel and how long does it take before it hits the ground?
In the world of emulating terminals... VISUAL is a world apart.

VISUAL 50/55 are low cost smart terminals. The VISUAL 50 emulates DEC VT52, Lear Siegler ADM3A, Hazeltine Esprit, and ADDS Viewpoint. VISUAL 55 emulates the same plus Hazeltine 1500/1510 and VISUAL 200/210.

VISUAL 102 is 100% compatible with the DEC VT100/VT102 and also emulates the VT52. A Graphics Option Card provides Tektronix 4010/4014 compatible graphics.

VISUAL 300/330 are versatile terminals that can be easily customized. The VISUAL 300 emulates the DEC VT100 and VT52. VISUAL 330 emulates the DEC VT52, ADM3A, Hazeltine 1500 and Data General D200.

VISUAL 500/550 are low cost, high resolution graphic terminals with powerful alphanumeric capabilities. The VISUAL 500 emulates the VT52, ADM3A, Hazeltine 1500, D200 and Tektronix 4010/4014. The VISUAL 550 emulates the VT100, VT52 and Tektronix 4010/4014.

VISUAL terminals feature extended ergonomics including tilt and swivel non-glare 12" and 14" screens, detached keyboard, large character size, menu-style setup, sculptured key caps and more.

VISUAL has earned for itself an exclusive place... a solitary niche... in the arena of emulating terminals. Four great terminal series offer a combination of advanced features found on no other terminals anywhere in the world. Each series delivers higher performance at lower cost for its particular market segment. And nobody else gives such a wide choice of emulations as VISUAL... the pioneer in the field.

So check the chart before you choose your next terminal. See for yourself why VISUAL stands alone as the first choice for emulating terminals.

Circle 397 on inquiry card.
dealing with concepts beyond the scope of the control strategy of the current version of TKISolver). This experience compares favorably with the domain limitations of systems like Mecho or Newton; the latter also faced difficulties in interfacing the quantitative knowledge with the mathematical expertise provided by Macsyma.

Further Developments

TKISolver in its present form provides a general framework for building expert systems in scientific, engineering, and other disciplines. In this sense it falls in the category of knowledge-representation languages like KRL, NETL, Klone, or Prolog.

It may be argued, however, that TKISolver falls short of learning capabilities, analogical reasoning, reasoning under conditions of uncertainty, and some other features stipulated by the theoreticians of expert systems or proclaimed for the Japanese fifth-generation computers. There are also other AI "standards" for the design of expert systems that TKISolver seems to ignore: natural-language interface, restriction to problems that are "not algorithmic or totally understood" (see reference 3), and "representation of symbolic knowledge for use in machine inference" (see reference 4). Finally, there is the implicit notion of the need to use a list-processing language for AI work (incidentally, TKISolver is implemented in a LISP-like language).

Although in fact all these advanced attributes are present in TKISolver to

Attributes of Expert Systems

Readers are invited to test TKISolver against each of the expert system characteristics listed here.

• The expert system has separate domain-specific knowledge and problem-solving methodology and includes the concepts of the Knowledge Base and the Inference Engine.
• The expert system should think the way the human expert does.
• An expert system tells the computer "what" the problem is rather than "how" to solve it.
• Its dynamic knowledge base should be expandable, modifiable, and facilitate "plugging in" different knowledge modules.
• The interactive knowledge transfer should minimize the time needed to transfer the expert's knowledge to the knowledge base.
• Addition of a new rule should result in a new competency for the system, and conversely, the absence of the rule should mark the absence of the related ability.
• The expert system should interact in the language "natural" to the domain expert; it should allow the user to think in problem-oriented terms. The system should adapt to the user and not the other way around. The user should be insulated from the details of the implementation.
• The principal bottleneck in the transfer of expertise—the knowledge engineer—should be eliminated.
• The control strategy should be simple and user-transparent, the user should be able to understand and predict the effect of adding new items to the knowledge base. At the same time it should be powerful enough to solve complex problems.
• Expert systems should be computationally fast and not demanding of resources, avoiding situations where interactive intelligent systems suffer from a basic conflict between their computationally intensive nature and the need for responsiveness to a user.
• There should be an inexpensive framework for building and experimenting with expert systems.
• Human engineering aspects are important for making the system understandable and for keeping experts interested and making users feel comfortable.
• The expert system should have provision for help and English-language dialogue.
• The system should have a display-oriented interface.
• It should be able to reason under conditions of uncertainty and insufficient information, and should be capable of probabilistic reasoning.
• An expert system should be able to explain "why" a fact is needed to complete the line of reasoning and "how" a conclusion was arrived at.
• Pragmatic systems are needed; they should be robust, general, and efficient for routine use.
• The expert system should be available to users in properly sized, properly packaged combinations of hardware and software; chronic absence of cumulation of AI techniques in the form of software packages that can achieve wide use; proliferation should lead to expert systems at everyone's disposal.
• The system should be useful, i.e., responsive to the practical needs of professional communities; real-world systems.
• Expert systems should be capable of learning from experience.

DATA TRANSFER PROBLEMS?

Your Simple Solution is REFORMATTER® Diskette Conversion Software

- Avoids serial communication protocols.
- Needs only one system to transfer data.
- Converts source code and data files.
- Allows 2-way transfer.
- Quick, reliable, and inexpensive.

Finally! A BASIC compiler that means business.

Microsoft® Business BASIC Compiler allows you to create professional applications for MS-DOS systems that are so fast your users will never know they were written in BASIC.

Because the compiler produces native code, your software will run three to ten times faster than the same interpreted programs.

But speed isn't everything. Microsoft's Business BASIC also has business savvy. Based on the de facto standard Microsoft BASIC, it includes a rich set of extensions:

- Decimal floating point arithmetic (14-digit precision-BCD format) for extremely accurate dollars and cents calculations.
- Two types of arrays provide maximum program flexibility: static arrays for speed, dynamic arrays for expandability.
- Over twenty string handling functions provide sophisticated character manipulation capabilities. Strings can be up to 32K bytes.
- Multi-line functions and subprograms allow you to define routines with local or globally defined variables.
- Separate module compilation means complex programs can be broken down into smaller units. Coupling multiple modules together permits creation of very large programs, up to one megabyte.

Call 800-426-9400 to order the better Business BASIC.

$600*

In Washington State, call 206-828-8088. Ask for operator A5, who will rush you your order, send you more information, or give you the name of your nearest dealer to see Microsoft Business BASIC in action.
a small or embryonic extent, it would serve no purpose to argue to what extent they have to be present in order to classify the system one way or another. We would rather point to what TKISolver can do in its present form and stress the fact that it provides a basis for implementing additional features and capabilities as the hardware permits and as the mass user requires.

In its future development TKISolver should look two ways: first, at concepts and tools emerging from AI, and second, at the time-proven "non-AI" program packages that have become a part of human experts' lives.

Capable COBOL.

For over twenty years, COBOL has proved it can handle the most awesome data handling requirements of the business world.

And Microsoft® COBOL brings this power to the MS-DOS environment in an even more flexible version. It's the ideal choice for transporting and adapting the thousands of mainframe and minicomputer programs now on the market.

Microsoft COBOL was designed after the ANSI COBOL standard. Its quality and performance has been fully certified by the GSA.

Microsoft COBOL includes a complete set of file handling facilities including support for sequential, line sequential, relative and B+ tree indexed sequential (ISAM) files.

The advanced screen handling features, compatible with Data General®, make it easy to create forms and menus for interactive user programs. Direct cursor positioning, highlighting, automatic format conversion, projected fields, and automatic field skip are just some of the capabilities.

An interactive source code debugging tool allows you to step through your program in symbolic form. There is no need to wade through object code and addresses in memory to see what is going on. It's a complete development package.

Applications developed with the compiler can be distributed without a runtime support charge.

Like all Microsoft languages, the standard linking interface makes it easy to combine assembly language subroutines.

Call 800-426-9400 to order the capable COBOL. $700*.

In Washington State, call 206-828-8088. Ask for operator A5, who will rush you your order, send you more information, or give you the name of your nearest dealer to see Microsoft COBOL in action.

Microsoft® Pascal may be the most powerful software development environment available for the MS®-DOS system. It combines the programming advantages of a structured high-level language with the fast execution speed of native code compilation.

And it exceeds the proposed ISO and ANSI standards with logical extensions that make the language more powerful and versatile. For example, programming capabilities even allow you to manipulate data at the system and machine level.

It gives you single and double precision IEEE floating point arithmetic. Numeric operations take advantage of the 8087. Or automatic software emulation is provided if the coprocessor is not installed.

Support for long heap allocation and separate module compilation gives you the flexibility to create large programs up to one megabyte.

And the standard linking interface makes it easy to combine Microsoft FORTRAN or assembly language subroutines.

Call 800-426-9400 to order the potent Pascal. $300*

In Washington State, call 206-828-8088. Ask for operator A5, who will rush you your order, send you more information, or give you the name of your nearest dealer to see Microsoft Pascal in action.

How to move with
and take your

Introducing the IBM Portable Personal Computer.

It's a complete PC. In a case. With a handle.
And a welcome addition to the family.
The IBM Portable Personal Computer is
the first IBM PC system you can pick up and
take with you. Across town or across the
hall. Or put away easily for another day.
It's a powerful system, with 256 KB of
user memory (expandable to 512 KB)
and a slimline double-sided 5½"
diskette drive (and room for
another). Plus a built-in
modern times
PC with you.

9" monitor with easy-to-read amber characters. Text and graphics capability. And an 83-key keyboard.

All fitted into a sturdy, transportable case that's easy to handle. And park.

The IBM* of portable personal computers. Make no mistake about it, this is a true IBM PC.

Which means it is part of the same dependable family as the IBM Personal Computer, the IBM PC/XT and the new IBM PCjr. And that means you can use many IBM Personal Computer Software programs to help you reach your goals.

All this and five expansion slots, ready to accept expanded memory, printers and other useful IBM Personal Computer options. Which should keep you rolling far into the future.

Pick one up at a store near you. You can see the new IBM Portable Personal Computer at any authorized IBM PC dealer or IBM Product Center.

To find the store nearest you, call 1-800-447-4700. In Alaska or Hawaii, call 1-800-447-0890.
How Lawyers Can Use Microcomputers

Cutting costs while upgrading legal service with the aid of microcomputers

Robert P. Wilkins, J.D.
R.P.W. Publishing Company

Microcomputers are a mystery to many lawyers because, too often, they try to learn about them in terms of BASIC programming, RAM (random-access read/write memory), ROM (read-only memory), bps (bits per second), and other foreign, often unnecessary technical terms. All lawyers need to know is how computers can improve the efficiency of a legal practice.

Reviewing the firm's needs is the first step in this analysis. Work in law offices is generally divided between administrative and substantive tasks—those relating to the actual practice of law.

Administrative tasks in the law office are similar to those in any other small business: bookkeeping, bank account reconciliation, payroll, calendar control, file management, information retrieval. One legal administrative task uncommon to most small businesses is timekeeping and billing. Most lawyers keep time records and either submit bills based on them or use them in determining what they will bill. This may be the most important administrative reason to acquire a computer.

Generally, legal services can be divided into broad categories. Lawyers prepare letters, opinion letters, memoranda of law, briefs, deeds, wills, agreements, and other documents. When everything else fails, they may go to court on the client's behalf. Before going to court, pleadings must be prepared, witnesses interviewed, depositions taken, and the paper associated with the lawsuit managed. In addition, there are some critical court-proceedings deadlines that must be followed and observed. In complex litigation many exhibits must be tracked.

Although some lawyers spend the majority of their time in court, most usually spend it in the office. Lawyers research and analyze problems, give advice, prepare documents, make mathematical projections, prepare tax returns, gather data, and analyze the information gathered. The practice of law involves much paperwork and includes a substantial amount of document preparation. Because of this, many lawyers have become interested in the use of computers. For the most part, however, lawyers have been slow to take advantage of new technology. Most lawyers in America practice in small firms; 70 percent practice in firms of five or fewer lawyers. Until recently, word processing was relatively expensive, and many small-firm lawyers did not feel they could afford it. The cost of a single, dedicated word-processing system dropped from the $12,000 to $20,000 range. Today, the cost can be as low as $2100. A very powerful microcomputer with letter-quality word-processing capability can be purchased for between $2100 and $7000. As a result, many lawyers are now using microcomputers, not for computing, but for low-cost word processing. Once they acquire the computer for word processing, they realize the tremendous potential of the computer to help in other ways.

It is interesting to note that the smaller firms have seemed to lead the way in the microcomputer explosion. Initially, many large firms with minicomputers and mainframes rolled up their noses at microcomputers. Now, large firms are waking up to the potential of microcomputers, and many are now buying them for their individual lawyers. The computers are usually used both as freestanding units and as terminals into the mainframe.

For the lawyer who has a microcomputer for word processing or one who is considering a first purchase, it is important to understand what a
computer does. Generally speaking, a computer can be used for: word processing; number crunching (including bookkeeping, payroll, tax projections); information or data management; communications; electronic spreadsheets; and specialized tasks to help in specific areas of the law. Let's look at each category and explore it as it relates to the practice of law.

**Word Processing**

The practice of law is ideally suited for word-processing equipment, and without a doubt, word processing is the legal profession's most common use of the microcomputer. The use of the word processor in the law office can be broken down into three major categories:

- Routine daily correspondence
- Long documents that require extensive editing
- Repetitive documents

It is important to understand that most lawyers are under pressure to cut costs and to price services reasonably. Because labor can be the highest single cost in a law office, efficiency is important. In the first two categories listed above the benefit of word processing is largely that it improves staff efficiency. The long documents may include agreements, briefs, and memoranda of law. In almost every case a draft of the document is prepared and input is received from other lawyers and the client. In some cases, such as a negotiated contract, input will also be received from the opposing lawyer and that lawyer's client. By using a word processor you will benefit by quick document turnaround after editing or preparation.

In the third category, where repetitive documents can be recalled from magnetic media and modified to meet a particular client's needs, a major benefit is the time saved. Examples of these documents are: wills and trust agreements; property settlements; pleadings in court cases; pension and profit-sharing plans; and leases. These do not have to be prepared from scratch and since the new draft of the document requires a minimum of keyboarding, another major benefit is increased productivity.

Merging variables and assembling separate paragraphs into one document are capabilities that make word processors especially useful in the legal profession. The footnote capability is especially helpful to lawyers who file a large number of briefs.

**Number Crunching**

I first began using word-processing equipment in 1964 when I bought a paper-tape Royal Typer, which used folded paper tape punched much like the scrolls of music for a player piano. Since that time, I have used word processors employing cassettes and disks, and I presently use a CPT 8000.

Next to word processing, the need for timekeeping and billing software is probably the most common reason a lawyer might want a computer. There are more than 120 companies offering software for timekeeping and billing, and this large number creates more of a problem than it solves. (For a list of them, see the March 1, 1984 issue of The Lawyer's PC, or contact POB 1108, Lexington, SC 29072, (803) 359-9941.)

Lawyers do not all keep time the same way, nor do we render statements the same way. There are many variations of timekeeping and billing techniques, as well as many differences between software packages and what they accomplish. Trying to match the two is a problem of some magnitude.

Before acquiring a timekeeping and billing package, it is extremely important to see the program up and running. It can be helpful to talk with a peer at a comparably sized firm who bills in a similar fashion and is using the program. Timekeeping and billing programs range in price from about $500 to $5000. The difference in quality is not necessarily represented by the difference in price. The size of the firm in many cases will be the determining factor. Packages designed for use by five or fewer lawyers probably will not work effectively for larger firms, and those designed for 15 lawyers may not be what the smaller firm needs.

Although we are discussing time-
keeping and billing systems as they apply to number crunching, a lawyer familiar with database managers can design a very simple timekeeping and billing system for a small firm.

In the number-crunching category, a system is also needed for keeping track of other people's money held in a trust. Under the Code of Professional Responsibility, a client's funds cannot be commingled with the law firm's, and the firm must be able to account for any client's funds held in a trust account. Software packages to handle trust accounts can be purchased or designed to include such features as: the ability to enter checks and deposits at random with an item description and an account number for the client; the ability to receive a printout at least monthly of the transactions in the entire bank account, with a total balance, together with an individual printout of each client's transactions and a balance of the client's account; and the ability to confirm that all clients' accounts equal the total amount in the bank account. This seems to be a relatively simple accounting procedure, but it is amazing how little software is available to accomplish it.

Information Management

Another category of computer use that is tremendously beneficial to people in the legal profession is information management. Database management programs fall into this category, as do a number of specialized information programs.

Information management, as I use the term, means the ability to keyboard certain information once and then sort, select, and use it effectively without having to rekeyboard. The most common uses of this technique are: maintaining client records, keeping a calendar and docket control system, file management, and litigation support.

There are many other information-management needs specific to a law firm's practice. Any of these can be handled with a database manager. For lawyers who use the IBM Personal Computer (PC) or compatibles, dBASE II is popular. For lawyers who use Radio Shack computers, Profile
Plus is probably the most commonly used.

With a program of this type, you can visualize how it works by imagining a page organized in vertical columns of information with horizontal lines representing a particular file. The vertical columns are called fields. Each field contains the same kind of information for every client. For example, last names would be in the same field for every client.

The horizontal lines that represent one client's information are called records. Once the information has been keyboarded, it can be massaged in many different ways without having to be keyed again. For example, if the client record consists of a name, address, telephone number, court in which the action is pending, and lawyer responsible, then by using the sort and select technique of the database manager the lawyer can print an alphabetical list of all clients by last name. It is also possible to sort, select, and print a sublist that, instead of including all clients, will only include those for a particular lawyer in a particular court.

The information in the database can be merged with form letters so that, for example, you can use the will-retrieval database to select the names and addresses, salutation, and date of the last will executed by the client. This information can be merged into a letter to the client in which the action is pending, and lawyer responsible, then by using the sort and select technique of the database manager the lawyer can print an alphabetical list of all clients by last name. It is also possible to sort, select, and print a sublist that, instead of including all clients, will only include those for a particular lawyer in a particular court.

The information in the database can be merged with form letters so that, for example, you can use the will-retrieval database to select the names and addresses, salutation, and date of the last will executed by the client. This information can be merged into a letter to the client indicating that the will needs review. These letters can then be printed automatically on continuous-run paper.

In larger firms, database managers can be used to manage records that only need to be keyboarded once and then accessed by using sort and select techniques. For example, the client database can be searched as each new client is accepted to make certain there is no conflict if a suit is begun against some other person. Firms with many clients and several lawyers must take this precaution to avoid suing one of their own clients. “Where is it? Why can’t we find it?” is a familiar cry in the law office. Lawyers manage a lot of paper and, therefore, filing is frequently a problem. The filing problem relates not only to where a particular document might be but, more importantly, where to find research information. We almost always can find material in a client’s file. The question is, in which case did we last handle a matter involving a similar dispute, e.g., the eviction of a tenant for damage to the premises?

Softshell (POB 18522, Baltimore, MD 21237, (301) 686-1213) offers a program called Mindex and Search that costs $25 and will solve most information-retrieval problems. Under the Mindex and Search program, entries of 255 characters are possible (about three typewritten lines). Each of these entries is considered a separate record. The 255 characters, of course, must contain the location of the basic information and the keywords to let you find it. In the previous matter, we would enter “eviction of tenant for damage or destruction of the premises” and the name or number of the file in which the research data and pleadings for that particular matter are located. We might (since we have not used the entire three lines) want to include the kind of research material to be found in that file. We can make thousands of entries of this type at random and then, using the Mindex and Search program, search for any three characters in a row. In most cases, we use the actual keyword; we might choose “eviction” or we might choose “tenant”. If we have a large number of eviction and tenant cases, we might want to search a combination of words connected by “and,” e.g., “eviction and destruction.” We can also search by using “or” as the connector, which will result in the program finding all records containing either word.

Communications

A lawyer can use the computer for electronic mail, bulletin-board reading, and access to on-line databases. When lawyers think about on-line databases, the first that come to mind are Westlaw and Lexis. These two legal-research databases have been available for many years. Only recently, however, could we access them via microcomputers. Westlaw

**IBM**

protects disks in sleeves of **TYVEK**.

Here's why.

Quality disks deserve a quality sleeve. Sleeves of TYVEK® spunbonded olefin provide unsurpassed data protection because

1. **TYVEK** is strong—won't tear like paper.
2. **TYVEK** does not lint.
3. **TYVEK** is smooth, non-abrasive.
4. **TYVEK** is chemically clean, has a neutral pH.
5. **TYVEK** reduces static problems.
6. **TYVEK** is unaffected by water.

Take the first step to maximum disk data protection. Call 800-44 TYVEK for the names of manufacturers who rely on sleeves of TYVEK.

*TYVEK is DuPont’s trademark for spunbonded olefin. DuPont makes TYVEK, not sleeves.*

MVP Books - A Series

- Volume 1, All about FORTH by Haydon
- Volume 2, MVP-FORTH Assembly Source Code, includes CP/M, IBM PC, Apple II, MS-DOS, Osborne, Kaypro, H89/289, Z100, TI-PC, MicroDialer, Northstar, Commodore, DEC Rainbow, NEC 8201, TRS-80/100
- Volume 3, Floating Point Glossary by Springer
- Volume 4, Expert System with source code by Park
- Volume 5, File Management System with interrupt security by Morton

MVP-FORTH Software - A Transportable FORTH

- MVP-FORTH Programmer's Kit including disk, documentation, Volumes 1 & 2 of MVP-FORTH Series (All About FORTH, 2nd Ed. & Assembly Source Code), and Starting FORTH. Specify: CP/M, CP/M 86, CP/M +, Apple II, IBM PC, MS-DOS, Osborne, Kaypro, H89/289, Z100, TI-PC, MicroDialer, Northstar, Commodore, DEC Rainbow, NEC 8201, TRS-80/100
- MVP-FORTH Cross Compiler for CP/M Programmer's Kit.
- MVP-FORTH Meta Compiler for CP/M Programmer's Kit. Use for applications on CP/M based computers. Includes public domain source.
- MVP-FORTH Fast Floating Point Includes 9511 math chip on Wintel.
- MVP-FORTH Programming Aids for CP/M, IBM or Apple Programmer's Kit. Extremely useful tool for decompiling, callfinding, and translating.
- MVP-FORTH PADS (Professional Application Development System) for IBM or Apple. An integrated development system with complete documentation for PC, XT or PCjr and Apple II, II+ and II+e. Will run on most IBM and Apple computers.
- MVP-FORTH Floating Point & Matrix Math for IBM or Apple.
- MVP-FORTH Graphics Extension for IBM or Apple.
- MVP-FORTH MS-DOS file interface for IBM PC PADS.
- MVP-FORTH Expert System for development of knowledge-based programs for Apple, IBM, or CP/M.

FORTH DISKS

- FORTH with editor, assembler, and manual.

Circle 281 on inquiry card.
can be accessed by almost any microcomputer. At this writing, Lexis can only be accessed by the IBM PC. These database services are relatively expensive, but accessing them through your own microcomputer gives you greater control over the costs.

There are a number of other on-line databases of possible interest to lawyers. The American Bar Association recently announced ABA/net. Using this service, electronic mail and bulletin boards can be accessed, in addition to the UPI news wire, the Official Airline Guide, and financial news from Unistox, for as little as $12 per hour. The American Bar Association publication and information database, Ambar, will go online with ABA/net in the near future and will cost $32 per hour in prime time and $22 per hour in nonprime time. (For details on ABA/net write: ITT Dialcom, 110 Spring St., Silver Spring, MD 20910 or call (800) 323-1717 and ask for operator 129. In Illinois, call operator 129 at (800) 942-8211.}

Dialog is probably the largest nonlegal database of interest to lawyers. It actually consists of more than 200 databases. The most common is the Legal Resources Index, which contains more than 660 legal periodicals, newspapers, and magazines published since January 1980. Other databases on Dialog include the Federal Register and a number of technical databases involved with medicine and other technical subjects. (For information write: Dialog Information Services, 3460 Hillview Ave., Palo Alto, CA, or call (800) 227-1927. In California, call (800) 982-5838.)

The General Electric database contains tax projection and other business accounting projection programs. Some of these programs were prepared by Arthur Andersen & Company, some by J. H. Cohn & Company, and some by Coopers & Lybrand. (For details write: General Electric Information Services Company, 401 N. Washington St., Rockville, MD 20850, or call (800) 638-8730. In Maryland, call (800) 492-8470.)

In time, the most frequent use of the microcomputer's communications feature may be electronic mail. By using electronic mail, you can transmit a document to another lawyer's computer for almost instant review and input. The document can then be retransmitted to you with changes. If acceptable, it can be printed out in final form at both locations. A third lawyer can review the document, since either office can send it anywhere over the telephone network. All the traveling lawyer needs is a portable computer (such as the Radio Shack Model 100) with a modem. This lawyer can make changes and send the document back to either office.

Communications make it possible for a branch office to function with limited support staff. Much of the heavy document preparation can take place at the home office and then be transmitted to and printed out at the branch.

Bulletin boards are available for almost any subject. ABA/net is expected to provide bulletin boards of specific interest. With a bulletin board, you can call the number and, by keyboarding instructions, select a substantive area to review. For example, you can call a bulletin board and review the particular substantive area on medical malpractice. If you see any information or inquiries of interest, you can write a response on the bulletin board or communicate directly to the other lawyer if a telephone number or address has been left.

Messages can also be left for others who read the bulletin board. For example, a lawyer can ask for information from other lawyers with experience in specific fields.

The introduction of ABA/net may have more influence on the use of databases by lawyers than any other event of recent years. The American Bar Association plans to actively solicit lawyers to join ABA/net. Since this database is relatively inexpensive, it gives lawyers a chance to overcome fears or hesitations at a low cost and for a useful purpose.

Many law book publishers are exploring the possible use of on-line databases to furnish their services. Looking far into the future, it is quite

---

**DYSAN® protects disks in sleeves of TYVEK.**

Here's why.

Quality disks deserve a quality sleeve. Sleeves of TYVEK® spunbonded olefin provide unsurpassed data protection because

1. TYVEK is strong — won't tear like paper.
2. TYVEK does not lint.
3. TYVEK is smooth, non-abrasive.
4. TYVEK is chemically clean, has a neutral pH.
5. TYVEK reduces static problems.
6. TYVEK is unaffected by water.

Take the first step to maximum disk data protection. Call 800-44 TYVEK for the names of manufacturers who rely on sleeves of TYVEK.

**Tyvek is a Du Pont's trademark for spunbonded olefin. Du Pont makes TYVEK, not sleeves.**

Dysan Corporation

Circle 145 on inquiry card.
Accounting software so perfect you’ll want to change it immediately.

It's perfect because you can change it. Which is one thing you can’t do with canned accounting programs. Instead, you’re stuck doing bookkeeping their way.

Well, rather than let your accounting software run your business, we suggest you run our business accounting software: Sensible Solution Management.

Straight out of the box, it's ready to get down to business with single-entry general ledger, accounts payable and receivable, payroll, inventory control and order entry.

Canned Accounting vs. The Sensible Solution

<table>
<thead>
<tr>
<th></th>
<th>The Typical Accounting Package</th>
<th>Sensible Solution Management</th>
</tr>
</thead>
<tbody>
<tr>
<td>Can the program be changed to suit special needs?</td>
<td>No</td>
<td>Yes</td>
</tr>
<tr>
<td>Can you use your business’s existing forms?</td>
<td>No</td>
<td>Yes</td>
</tr>
<tr>
<td>Is source code included in the program's price?</td>
<td>No</td>
<td>Yes</td>
</tr>
<tr>
<td>Can you easily transfer your data when you buy a new computer?</td>
<td>No</td>
<td>Yes</td>
</tr>
</tbody>
</table>

But instead of locking you in to our way of accounting, we also supply you with source code and The Sensible Solution Language so you can modify the program to take into account your needs.

You can change it to use your business forms and checks. Work in your company’s commission rates. Add space for your product codes. Or do just about anything else your way.

So if you’ve got accounting software you can’t change, change to the Sensible Solution. And kick the canned forever.

The Sensible Solution

The Sensible Solution Programming Language is $695 (single-user) or $995 (multi-user) with Accounting Modules at $250 each. For more information, write or call: O’Harlon Computer Systems, 11056 Main Street, Bellevue, WA 98004 Phone (206) 454-2261. Telex 152974. Dealer and distributor inquiries welcome.

Circle 297 on Inquiry Card.
possible that most legal-research needs will be met by on-line databases. Competitive pricing may speed this occurrence.

Electronic Spreadsheets

Use of electronic spreadsheets will depend on the kind of law practiced by the firm. Electronic spreadsheets allow mathematical projections to be made and manipulated. They can be useful in preparing budgets and cash-flow projections. They can be used to project earnings in damage cases, to perform a blood alcohol analysis in drunk driving cases, and many other tasks requiring mathematical projections and "what if" calculations. (For a template of the blood alcohol analysis program, see The Lawyer's PC, November 1, 1983, page 4, or write POB 1108, Lexington, SC 29072.)

Many publishers are producing inexpensive electronic spreadsheet templates that take much of the drudgery out of using these powerful programs. Quite a number of these templates can be useful to lawyers, since they deal with business calculations.

Specialized Software Packages

There are several specialized software packages that lawyers should know about. These software packages can be purchased and run immediately to accomplish specific tasks. For example: a long-distance analyzer is designed to allow the development of a directory of calls, date called, and amount of call, so this out-of-pocket expense can be charged to clients (Long Distance Analyzer, $195, Golden Braid Software, 1450 Ranchero Dr., Sarasota, FL 33582, (813) 371-0388). Estate tax projections are designed to allow the development of a directory of calls, date called, and amount of call, so this out-of-pocket expense can be charged to clients (Long Distance Analyzer, $195, Golden Braid Software, 1450 Ranchero Dr., Sarasota, FL 33582, (813) 371-0388).

Estate tax projections are designed to allow the input of information about the client's tax circumstances to make "what if" calculations. An example of this type program is Cal-Q-Tax (Cal-Q-Tax, $595, Tax Management, a subsidiary of Bureau of National Affairs Inc., 1231 25th St. NW, Washington, DC 20037).

Income tax projections allow for the input of information about the client's tax circumstances to make "what if" calculations. An example of this type program is Cal-Q-Tax (Cal-Q-Tax, $595, Tax Management, a subsidiary of Bureau of National Affairs Inc., 1231 25th St. NW, Washington, DC 20037).

There are numerous other income tax preparation packages. A list and analysis of them appeared in The Journal of Taxation, A Guide to the Practitioner's Selection of Tax Software for the Microcomputer, December 1983. The November 1983 issue contained a comparison of software vendors. For information, write The Journal of Taxation, 1633 Broadway, New York, NY 10019. The list is growing every day as new programs for lawyers are developed.

The computer is going to make the most significant change in the way law is practiced since the invention of the telephone and the typewriter. There is resistance, but strange as it may seem, there was also resistance to the telephone and typewriter.

In the long run, economic issues will prevail. There is no question that those of us who use the computer efficiently can practice law more efficiently and, therefore, can provide legal services to the client at reasonable cost. That is the name of the game.

Robert P. Wilkins (POB 729, Lexington, SC 29072) is a lawyer and the editor of The Lawyer's PC and The Lawyer's Microcomputer newsletters for lawyers using the IBM PC and compatibles and Radio Shack computers, respectively.

3M protects disks in sleeves of TYVEK.

Here's why.

Quality disks deserve a quality sleeve. Sleeves of TYVEK* spunbonded olefin provide unsurpassed data protection because

1. TYVEK is strong—won't tear like paper.
2. TYVEK does not lint.
3. TYVEK is smooth, non-abrasive.
4. TYVEK is chemically clean, has a neutral pH.
5. TYVEK reduces static problems.
6. TYVEK is unaffected by water.

Take the first step to maximum disk data protection. Call 800-44 TYVEK for the names of manufacturers who rely on sleeves of TYVEK.

*TYVEK is Du Pont's trademark for spunbonded olefin. Du Pont makes TYVEK, not sleeves.

We help a lot of different people solve a lot of different problems: from the simplest to the most complex...from mailing lists to integrated accounting, from preparing tax returns to order entry. Whether you need help saving money or making it, the Knowledge Manager can help you manage your information better than any other micro software package.

Quality Software for Quality Results
You can start just as simply as you want and grow just as fast as you like. The Knowledge Manager’s powerful commands are always ready when you are. You get quick results, improved productivity, accurate information, custom tailored to meet your needs. The Knowledge Manager lets you use your information, when you want it and in the way you want it.
intricate... or somewhere in between

Reliable and Comprehensive
The Knowledge Manager is built to last. You can start with the Beginner's Guide, or run right through the instruction manual to advanced data management commands.

Chances are you won't find a job the Knowledge Manager can't do.

Prices subject to change without notice. Current release is 1.06 as of 4/1/84.
Tek's best-selling 60 MHz scopes: Now 25 ways better for not a penny more!

Now Tek has improved its 2213/2215 scopes with brighter displays. Greater accuracy. And more sensitive triggering. 
At no increase in price.

The 60 MHz 2213 and dual time base 2215 have been the most popular scopes in Tektronix history. Now, Tek introduces an "A" Series update with more than 25 specification and feature enhancements—things you have asked for such as single sweep—all included at no added cost.

A brighter display and new vertical amplifier design provides sharp, crisp traces.

That makes the 2213A/2215A a prime candidate for tasks like TV troubleshooting and testing, where fast sweeps are typical.

New features include 10 MHz bandwidth limit switch, separate A/B dual intensity controls (2215A only), and power-on light: additions customers have suggested for giving these scopes the final measure of convenience.

Triggering, sweep accuracy, CMRR and many more major specifications are better than ever. Check the performance chart: not bad for scopes already considered the leaders in their class!

The price: still $1200* for the 2213A, $1450* for the 2215A. Or, step up to the 100 MHz 2235 for just $1650*!

You can order, obtain literature, or get expert technical advice, through Tek's National Marketing Center. Direct orders include operator manuals, two 10X probes, 15-day return policy, world-wide service backup and comprehensive 3-year warranty.

Talk to our technical experts.

Computerizing
a Medical Office

A physician's advice can be handy for other professionals needing tailored applications

Jonathan Javitt, M.D.
Computer Consultant for Medical Applications

As of July 1983, only 5 percent of the physicians in the United States owned microcomputers. Nevertheless, I believe physicians will no longer be able to maintain an uncomputerized office. Perhaps by the end of the decade all medical practices will have a computer. [Editor's Note: The trend may extend to other professional offices with an extensive but specific clientele. The following advice for physicians may well apply to any professional needing a tailored computer system.]

Why Computerize?

As medical practice costs rise and the supply of physicians increases, practices will need to pay increasing attention to economics and marketing. Most good office-management programs can generate productivity reports by practitioner, by procedure, or even by piece of equipment. Determining whether the practice is running a piece of diagnostic equipment at a profit or a loss then becomes a simple matter.

One of the most difficult aspects of practice management is patient follow-up and recall. With a computerized record-keeping system, however, mailing one or more reminder letters to patients and tracking those who don't respond can be done with ease. Such a system might also allow you to generate patient newsletters and health alerts. This contact can make a significant difference in a patient's satisfaction with your service.

A computer in a medical office can also be an instant link to a world of information, from the hospital records of one's patients to the extensive database of the National Library of Medicine. Up-to-the-second conferences on a variety of topics are available to anyone with a computer and a telephone. Within the next few years, electronic mail will be the most efficient way for physicians to share information about patients. Ordinary mail will then be as useful as bloodletting.

How to Computerize Successfully

1. needs assessment
2. system specification
3. software survey and selection
4. hardware survey and selection
5. vendor selection
6. office task assignment
7. software support

While these stages may seem obvious, system selection is far more expensive than any consultant's fee.

By a consultant I mean someone who is familiar with the medical-management programs on the market and with the computer systems needed to run those programs, rather than a programmer who offers to write a program for running your office. Custom software is not an ideal solution to medical-management needs because if you have a problem with the software, you have only the original programmer to rely on. If he or she is no longer available, then you're stuck, with no one else able to help you. With commercial software, however, you will have the support of a large company and access to successive revisions.

Seven steps for selecting a computer system for a medical office are listed below:

1. needs assessment
2. system specification
3. software survey and selection
4. hardware survey and selection
5. vendor selection
6. office task assignment
7. software support
at first, each one is crucial, and bypassing any of them is an invitation to disaster. If at all possible, do not change their order. Especially try to avoid allowing the vendor to be the determining force in system selection; the vendor’s priorities are clearly different from yours.

### Needs Assessment

Involving all office staff in needs assessment from the outset is imperative. A computer system is only as capable as those who use it. If the staff is unenthusiastic about the system, the chances of a successful transition are minimal. All too frequently, the office staff first encounters a computer system when it shows up in boxes. The other side of this caveat is equally important. Often the office staff knows far more about workflow than the physicians in the practice and will be able to spot inadequacies in a system while they can still be corrected with an eraser and notepaper.

"If only I'd known..." is an expensive utterance when it comes to computerizing a medical office.

### System Specification

What jobs do you expect the computer to do? Your answer should state exactly what information the system will be expected to store on any given patient, which report functions the software must be able to write, and so on. With this information, you will be able to choose software that will do the job that you want done.

How expandable should the system be? If the system cannot grow, then you will have to stunt your practice or get a new computer system—a costly way to do business.

How will the flow of information in and out of the computer be managed, and how many users will be on the system at once? These factors will determine the hardware that you’ll need.

How much can you afford? The only intelligent approach to budgeting for this project is to sit down with the practice’s financial advisers and determine the monthly cost of the system versus the projected return. In all likelihood, the calculations will justify a system large enough to handle the office’s needs. Once all the above questions are answered, you can start choosing the software.

### Software Survey and Selection

Currently, there are no microcomputer-based office-management programs that can store detailed clinical information for each patient. While the concept of a paperless office with all patient data stored electronically is highly attractive, it is not yet practical on microcomputer-based systems. At present, that level of data management is available only on minicomputers.

The reason for this situation is twofold. First, software development is driven by market demand. At this time, relatively few medical offices have state-of-the-art microcomputers, so why would programmers bother writing a complex clinical information-management system for such a small market? Second, the nature and structure of clinical information vary greatly from one medical specialty to the next. It is simply not possible to design a clinical database

What to do with your Apple II/UE® after you’re through playing games —

- Machine Tools with 2 or More Axes of Positioning Controls
- Robotic Development
- Laboratory Experiments
- Machinery Controls
- Process Controls

16 OPTO-ISOLATED I/O PLUG-IN BOARD (A16 I/O)
- Individually configurable I/O
- Compatible with solid state relay
- Interrupt inputs
- Software

2 AXIS STEPPER MOTOR DRIVER INTERFACE BOARD (A6 T/D)
- Compatible with translators
- Accepts encoder pulse inputs
- Positioning software with ramping

2 AXIS (35 oz. in.) PRIME MOVER SYSTEM (PMS 23)
- RIS23 dual axis stepper driver
- (2) size 22 stepper motors
- A6 T/D plug-in interface board
- Software, cable

32 opto-isolated I/O board (A32 I/O)
- Power supply for PMS 23 system
- 12/24V-2A/5V-1A reg. (PS 23)
- 2 axis (220 oz. in.) prime mover system (PMS 34)

ALSO AVAILABLE —
- Half height direct drive disc drive
- 9" or 12" multi case monitors, green or amber
- Bubble memory board 128K - Helix ABM with software

BASIC Discovers Shorthand.

Programming in BASIC just got smarter, easier, faster...and five great reviews. Before you write another program in BASIC, you might be wise to start with a little reading.

Five major computer publications have something good to tell you. About the BASIC Development System (BDS). And about making your programming in BASIC more efficient than you ever dreamed.

BDS is a powerful, integrated set of software tools that quickly gets you beyond the BASIC basics. It gives you everything from Cross-Referencing to Scrolling Keys that let you scroll by page or line. It gives you Compress and Uncompress commands, Variable Dump, Single Step Trace and more.

BDS also gives you something else. A 30-day money back guarantee.

Finally, BDS gives you great references. From reviewers who’ve lived with it and loved it. For example: “I wonder how I ever got along without it.” John M. Woram, PC Magazine, September 1983.

We’ll send you the reviews just for writing us. Or, for only $79, we’ll send you BDS itself. And a 30-day money back guarantee.

BETATEOL SYSTEMS

that is generic enough to be useful to a large segment of the market and yet specific enough to be perfect for the specialist.

However, packages have been created that accommodate specific items of clinical information. These programs allow a practice to designate 10 or 20 items that must be recorded for each patient and to configure data fields to store those items. Similarly, the programs enable a practice to store lists of diagnoses, medications, and allergies for each patient. Some packages allow visit notes to be entered as free text in addition to the structured data. In the long run, what is needed is a relational database that is able to track clinical parameters over time and correlate them with other parameters. This level of sophistication has not been developed under current microcomputer operating systems and is currently available only under Unix. As the base of computer users within the medical world enlarges and more powerful operating systems become available on microcomputers, undoubtedly specialty-specific clinical databases will be designed to run on microcomputers.

Even today, a microcomputer can do a vast amount of work in a medical practice. For instance, any good management program can maintain a general ledger for each patient. (But be sure that the program you select lets you perform a complete audit trail for each account.) By storing the insurance carriers for each patient, one or more carriers can be automatically billed for each account payable. Another major way the computer will rapidly earn its keep is by its ability to track and age accounts receivable. Further, by billing on a staggered basis rather than monthly, a practice can maintain a smoother cash flow. The availability of this ledger information makes it simple to develop management reports to determine the economics of the practice’s fee structure, particular pieces of equipment, or procedures. Look for a software package that not only offers these reports, but will allow you to devise your own reports as you go along.
People are going for Friday!™ like there's no tomorrow.

Friday! is the new electronic file handling system that has become an instant best-seller because it's so revolutionary.

Within two weeks, it broke into the Top 20 on the sales chart of Softsel, one of the country's leading computer software distributors.

And it's now well on its way to the top.

The Friday! phenomenon is simple.

Friday! uses simple menus and talks to you in plain English, so almost anybody can use it.

It's great for sales and commissions, clients and portfolios, mailing lists and labels, invoices, inventories, paychecks, reports and more. And it works with other microcomputer software like 1-2-3™ and dBASE II® (our own advanced database management system).

It comes with a complete, step-by-step tutorial, but you can set up an "electronic file" without even looking at the manual, then use it at the touch of a few keys.

Friday! finds any filed information in seconds. Computes totals, subtotals, commissions, etc. Prints form letters and mailing labels. Gives you quick reports from all or part of a file with a few keystrokes. Or if you need a special report for your bank or board of directors, just "paint" the format on your screen, then have Friday! do all the work.

And while Friday! does more than file handling systems selling for as much as $495, it's yours for just $295 (suggested retail price)!

For more information, contact Ashton-Tate, 10150 West Jefferson Boulevard, Culver City, CA 90230. (800) 437-4329 ext. 202. In Colorado, (303) 799-4900. In the U.K., call (0908) 568866.

Or for the name of your nearest dealer, just call 1-800-4-FRIDAY, ext. 202.

ASHTON · TATE

* Ashton-Tate 1982. Friday! is a trademark and dBASE II is a registered trademark of Ashton-Tate. 1-2-3 is a trademark of Lotus Development Corp.
Well-designed software can be an enormous asset in enhancing communication with patients. By combining scheduling functions with automatic patient recall, systematically sending reminder notices to patients before an appointed visit, test, or procedure is possible. This application makes it much easier to periodically recall patients with chronic conditions, such as hypertension or diabetes, for the appropriate clinical tests. This type of follow-up is nearly impossible using manual methods. The mail-merge functions of these packages also make it simple to generate a patient newsletter to report new services offered, important medical news, or other information of interest.

The program you consider should contain a good word processor or interface with one. If it doesn't, changing a form letter or recall notice will be difficult.

A major consideration in choosing software packages is that they be easy to use. Unfortunately, many packages on the market are adaptations of hospital mainframe computer packages. The mainframe programs usually run in batch mode, which means they are designed to run one function at a time on a large group of data, such as generating bills for all of your patients. This system doesn't work well if you want to run several functions on just a handful of data, such as entering a patient's account, posting a single charge, and generating one bill. Select a package that is primarily record oriented so that you are not constantly switching from one batch program to another.

On the other hand, batch mode is excellent for certain tasks. To be able to post the hospital charges for an entire hospitalization in one step or the charges for one day's rounds with a single command can be extremely useful. Similarly, printing all outstanding insurance forms at once is important. Therefore, look for a software package that can also operate in batch mode.

In evaluating software, pay little or no attention to the advertising for the product—the only valid data is provided by current users. Many software packages have attractive demonstration programs that dealers are only too happy to show. These demo programs accommodate a small number of patients, run fast, and never lose data. The story may be quite different when the software is loaded with information on 2000 to 5000 patients. Any reputable company should be willing to provide you with the names of colleagues who are successfully using its software. If it is not willing to do this, look elsewhere.

Installation of medical-management packages is time-consuming, and the length of time can vary greatly from one package to another. In the initial phase, the personal data on each physician in the practice must be entered as well as the particulars of each insurance carrier with which the practice deals. A complete list of diagnoses and procedures used in the practice must then be entered along with the appropriate procedure charges and standard diagnostic codes. The most painless way to do this part of the installation is to maintain a list of all diagnoses and procedures encountered during the month prior to installation. Try to find a program that can learn new diagnostic codes and procedures as it comes across them.

Instead of spending a lot of time designing billing forms and insurance forms, look for a program that has predesigned forms. Even better, choose a program that comes with the paper on which those forms must be printed. Predesigned forms can save 20 hours of installation time in a busy practice.

One misleading feature of several packages is that of electronic claims submission, that is, submission of claims via modem. Since insurance carriers have no standard electronic communications system, it isn't likely that your package will be able to communicate with all of the different carriers. As electronic claims submission becomes a reality, the big software publishers will update their packages to include this feature. In other words, shopping for software, do not be influenced by bells and whistles that you cannot use today. If the product is stable, these features will be added as they become practical.

**Hardware Survey and Selection**

Only after the software has been chosen is it reasonable to consider hardware. In a single-station, single-user system running under CP/M or MS-DOS, hardware selection is straightforward. More likely, however, a system will have several workstations—the issue then becomes complicated. The problem centers around the lack of standardization in multiuser or network operating systems. Software designers are struggling to keep their products compatible with these continually evolving operating systems.

Although I prefer not to make strong hardware recommendations in a topical essay, I have observed that medical-management software is currently easier to marry to network systems than to true multiuser systems. The distinction I am drawing is between a system in which each user is connected to a separate, dedicated microprocessor, sharing only mass storage, versus a system in which all users share time on one microprocessor. Examples of the first approach range from freestanding microcomputers linked together in a network to a micro/multi arrangement in which all microprocessors are housed in one box and each is connected to a dedicated remote terminal. Standard CP/M software tends to run exceptionally well in the micro/multi type of system but none as yet run MS-DOS. If you are committed to MS-DOS software and want to support several users, the only alternative is networked MS-DOS-based personal computers with a common file server. Be sure that the software publisher will support this.
Most printers make you fool with a messy ribbon. But with Digital's Letterprinter 100, all you have to do is snap in one of our replacement cartridges. You'll instantly get at least 5 million more characters' worth of ink. Easy, isn't it?

The fact is, everything about the Letterprinter 100 is easy. For example, with just a flick of a finger you can select up to five different typefaces. Or let your computer do it for you, automatically. If you can't find a typeface you like, we'll customize one for you.

Now why would the world's second largest computer company go to such lengths to make the Letterprinter 100 so accommodating? Simply so it can spend more time doing what you bought it to do in the first place.

And that's printing crisp, clear manuscripts and graphics. From letter-quality like you see here for word processing, to high speed printing so you can get a draft page in only 10 seconds.

The Letterprinter 100 works with any of Digital's personal computers or video terminals. And it's a snap to use. See the whole family of Digital's Printers, including the daisy-wheel LQP02 and the low cost Personal Printer, the LA50. For the distributor nearest you, call 1-800-DIGITAL, extension 700. Or write Digital Equipment Corporation, Terminals Product Group, 2 Mt. Royal Avenue, UP01-5, Marlboro, MA 01752.
network system before you make the commitment. A little bit of checking will tell you that the micro/mini approach is far cheaper than linking freestanding personal computers.

Before you buy a computer, you should determine the quantity of information to be stored on it. You can do this by multiplying the number of patients by the amount of information you need to store on each one. A practice that fills up its mass storage in two years and is then faced with a major financial expenditure for more disk space has clearly made some mistakes at an early stage of the selection process. The only intelligent solution is to determine the actual number of bytes needed per record stored and to multiply that by the projected number of patients over the next five years. One of the advantages of micro/mini computers is that they tend to support much larger hard disks than linked personal computers.

The companion question to how much mass storage is needed is how will it be backed up. The cost to a medical office of an unprotected hard-disk crash is incalculable. Discipline is required on the part of the office staff. Murphy's law guarantees that when backup is not performed the disk will crash. The only safety lies in iron-clad rules about daily backup, preferably with a tape streamer. Similarly, invest in a backup power supply in case the failure is on the part of the local electric company. In this environment the investment in security is well worth it.

In evaluating hardware, be somewhat conservative. The tested product is generally a safer bet than the newer release with that added feature. No shortage exists of maturing products that will provide all the power any office needs. Only through a year or two of experience in field situations can a manufacturer work out the final bugs that develop under the pressure of daily use.

Don't fall short when you choose the simplest and cheapest hardware device—the printer. Dot-matrix printers are getting less expensive and more reliable by the day. A medical practice needs to print on several types of paper, including insurance forms, demand statements, and letterhead or bond paper. A sensible approach is to purchase enough printers so that the office staff is not continually installing and aligning different types of forms in one overcrowded printer. The equipment cost is rapidly offset by the savings in staff time.

Vendor Selection
Although most vendors are honest and have good intentions, vast discrepancies appear in their abilities to follow through on promises regarding installation, training, and support. Because of the high cost of inventory in computer dealerships, cash-flow problems can be fatal, as is demonstrated by the rate of dealership failures. Carefully evaluate the business record of the dealer with whom you plan to undertake the project. Ask for bank references and for the names of satisfied customers. By all means, call the manufacturer's sales division and say that you are

**Modula-2. Simply Better.**

More and more software developers are finding a new language simply better than C or Pascal. They're finding Modula-2, by Niklaus Wirth, the creator of Pascal. For professional programmers, it's simply a better language.

Modula-2. Simple like Pascal (if you know Pascal, you can be writing Modula programs in hours) but with much more power and flexibility. Power to handle any professional application, so there's no need for extensions.

Modula-2. Better than C because it gives you strong typing and superior separate compilation facilities. That means you write cleaner programs, faster.

Only LOGITECH's Modula-2/86 system translates directly into high-speed native code for PC-DOS™, MS-DOS™ and CP/M-86™.

We offer systems for both PCs and VAXs. Get the Modula-2/86 system that runs your application. It's simply a better choice.

WE WILL BEAT ANY ADVERTISED PRICE
We make C easy... 

... and work!

Whether you're a seasoned pro or just getting started with C, our Eco-C compiler has everything you need:

- A full C compiler, including long, float, and double.
- A library of more than 100 functions for faster program development.
- The compiler generates assembler output (Zilog mnemonics) for processing with Microsoft's MACRO 80 assembler and linker, both of which are included in the price.
- Extremely efficient code (e.g., Knuth's "seive" executes in 15.8 seconds).
- For a limited time, we include a copy of the C Programming Guide. The Guide and the Eco-C compiler provide an excellent environment for learning C.

Perhaps the best news is that we've lowered the price of Eco-C to $250.00 and it includes a user's manual, the Guide and MACRO 80. Eco-C requires a Z80 CPU and CP/M (an 8088 version in the 2nd quarter). To order, call or write:

Eco-C

6413 N. College Ave.
Indianapolis, IN 46220
(317) 255-6476

Trademarks: Eco-C (Ecocsft), MACRO 80 (Microsoft), CP/M (Digital Research), Z80 (Zilog)

Circle 181 on inquiry card.
unrealistic to expect a dealer to know as much about a package as the company that developed it. Similarly, if the dealer does not sell more than a few copies of a product, he or she cannot afford the time to learn it inside and out, and your problems can further be compounded by the tendency of dealers to restructure, and go out of business. Therefore, unless the product is directly and completely supported by the publisher, that software is a risky investment. Regardless, the dealer should know the software well enough to install it competently and train your staff to use it. Ask him or her to supply you with the names of people to whom this particular product has been sold and make sure to call those people.

To expect full software support for free would be unreasonable; no company can afford to provide it. A company that guarantees to keep your software running, even if it has to put a support person on an airplane to do it, is entitled to charge a monthly fee. Any company that provides this level of service without charge is trying to finance the support out of future sales and is likely to be headed for serious financial trouble. More often, however, the company simply does not provide the support staffing that is promised. Full software support and revision is worth the price. Too many users have learned that lesson the hard way.

Conclusion

Although some warnings are expressed in this article, the process of office computerization is ultimately worthwhile and likely to be highly successful. If the above guidelines are followed, the chance of untoward surprises will be minimized and the most probable question to arise will be “Why did we wait so long to do this?”

Jonathan Javitz, M.D., M.P.H., is a Kellogg Fellow in Health Management at the Harvard School of Public Health. He has been a consultant in medical microcomputer and information systems for the past two years. He can be reached at 307 Park Drive, Boston, MA 02215. In July, Dr. Javitz will be joining the staff of Will’s Eye Hospital, in Philadelphia, Pennsylvania.

3¼-inch computing is ready when you are.

Media, drives, software. Everything you need is here now.

Dysan 3½" Flex Diskettes.
Reliability refined. Personal computing is getting more personal. Smaller, lighter, more portable.

How small will it get? Frankly, we don't know. But we're confident that 3½" is the next step on the way down.

Why?
Because everything you need to get the most out of 3½" computing is here now. In spades.

The story starts with our 3½" one megabyte Flex Diskettes. They're built on the same reliable technology as the larger Dysan diskettes you use today. But with some very interesting innovations.

Like a durable metal hub that provides long-term read/write stability and accuracy.

A flexible combination of media and jacket, free from rigid metal shutters and fragile plastic parts. So both diskette and data will survive the bending that comes with normal handling.

And our 3½" Flex Diskettes are packaged with hard plastic carrying pouches that hold and secure as many as five diskettes. So you can carry your work home. Or mail it across the country. Safely.

And, of course, all the quality you expect from Dysan has come down to 3½", too. Like our jacket liner material that cleans the diskette surface. Our superior magnetic coating. And our advanced burnishing techniques.

What does all this add up to?
Reliability. Dysan 3½" Flex Diskettes are guaranteed to be 100% bit error-free. And durability. They're backed by a five-year limited warranty.

3½" Floppy Drives. Plug in a smaller size. 3½" floppy drives offer all the reliability you’ve come to expect from 5¼" drives. Simply put, they’re 5¼" drives refined. And cut down to size.

They’re generally ¼ the size and ½ the weight of 5¼" drives. And they use less than half the power.

Yet the 3½" drives plug right into today’s personal computers. All that’s required is less space.

Dysan Series Software. Best-selling programs in 3½". There’s just one last thing necessary to turn 3½"
diskettes and drives into 3½" computing.

And Dysan has solved that problem by licensing and converting scores of best-selling programs to 3½". Programs from DRI, Microsoft, Sorcim, Peachtree, Pearlsoft, ADS, ADI America and more.

We call it Dysan Series Software. And it's here right now.

It's where personal computing is going. We'd be remiss if we didn't point out that 3½" computing isn't just Dysan's good idea.

3½" diskettes are being manufactured by several suppliers. So you're always assured of an abundant supply of quality media for your personal computer.

3½" floppy drives are being built by a number of leading manufacturers. Including Tabor, Seikosha, MPI and, soon, Seagate.

To ensure the serviceability of 3½" computing, Dysan has developed simple, portable tools to test and align 3½'' drives.

And we provide a duplication service to convert software from other formats to 3½''.

That's the 3½" story. Quality diskettes, reliable drives and a great selection of software.

It's where personal computing is going. And it's ready when you are.

Call Toll-Free (800) 551-9000 for complete information about 3½" computing.

Circle 149 on inquiry card.
I/O PROCESSOR increases your productivity by increasing your PC's capabilities. And I/O PROCESSOR offers you the convenience no other expansion board can.

I/O PROCESSOR is a multifunction board offering 2 parallel ports, 1 serial port, a 64K printer buffer and a chronograph. The key to I/O PROCESSOR's unique abilities is its on-board Z-80 computer.

INCREASED PRODUCTIVITY

I/O PROCESSOR's 64K buffer eliminates wasted hours of waiting for your printer to finish printing before you can use your computer. The buffer frees the computer for your use while the printer continues printing. You save time and increase productivity.

You can even use the buffer for TWO printers. Simply initiate printing instructions and I/O PROCESSOR's computer does the rest.

ADDED CONVENIENCE

With other buffer boards (spoolers), you must tediously enter programs or load disks to activate the printer buffer. Not only is this a time-consuming hassle, but it also ties up your PC's processor.

I/O PROCESSOR eliminates this inconvenience. The on-board computer handles the complete operation of the buffer. And you can use the buffer with all of your PC software — it's fully compatible. No special programs, disks or modifications required.

And I/O PROCESSOR's buffer doesn't tie up your PC's processor. It works independently, using the on-board computer, to increase computing speed and provide full software compatibility.

I/O PROCESSOR will provide you with years of reliable performance and is backed with an exceptional TWO YEAR warranty.

Let I/O PROCESSOR make your computing more productive and convenient. Isn't that why you have a computer in the first place?

I/O PROCESSOR is available now at your local computer dealer.
Reviewer's Notebook

Rich Malloy
BYTE Senior Technical Editor

Unfortunately, the Leading Edge word processor has a peculiar way of storing files on disk. Every file, no matter how small, uses up at least 6K bytes of disk space (128K if you don't turn off the backup provision). You can eat up a lot of disk space very fast. Also, files are stored in a very unusual format. An "end of text" character appears in the beginning of the files, which makes it impossible to get the operating system to TYPE out a file. And the filenames look like this: "F01D0002." If you accidentally alter one of this program's directory files, vast quantities of text may become relatively inaccessible. There is a way to access these lost files, but you'll have to call Leading Edge to find out.

Infoscope

The folks at Microstuf, who brought us the Crosstalk communications program, have recently come out with an impressive database manager for the IBM PC called Infoscope. For $225, this program has a lot of very novel features. First, it has the fastest sort capability I have seen. Second, it's one of the few programs that make full use of the IBM PC's memory. Third, it has its own windows. Fourth, it has a powerful "focus" command to focus in on data records that fit particular conditions. And Infoscope has a spelling checker that tries to guess what command you would have typed if you hadn't made a typing mistake.

Infoscope is not going to replace dBASE II or Microrim, but it is going to fill a big niche in the software market. A review of the program should appear in these pages very soon.

PC-Talk

The best communication programs are also usually the cheapest. For example, the series of MODEM programs originated by Ward Christensen for CP/M systems has set the standard for data transfer. Best of all, MODEM7 and XMODEM are available for free from several bulletin boards around the country.

For the IBM PC, a BASIC program called PC-Talk is available from a company called Freeware. Users are encouraged to copy the program and pass it on to their friends. There is no charge, but Freeware encourages customers to contribute $35 to the company.

PC-Talk version 3 is one of the best programs I have seen for any price. Some very good communication programs for the IBM PC cost much more and have more features. But for general-purpose communication, PC-Talk is hard to beat.

This Month

This month we're reviewing two Z80 machines. The first is the Kaypro 10, the economical Z80 machine with a 10-megabyte hard disk. Another Z80 machine with a hard disk, the QDP 300, is a high-priced, high-performance machine with a 192K-byte disk cache.

Last August we reviewed a group of compilers for the C programming language. This month we take a look at two more C compilers for Z80 systems.

We also review a computer-aided design system called CAD-1 from Robographics.

For TRS-80 Model III enthusiasts, we take a look at three CP/M boards and the LNW-80 microcomputer system. And for the IBM we have a review of Thinktank, a program that's supposed to help people write more clearly and coherently.

Rich Malloy is BYTE's product-review editor. He can be reached at POB 372, Hancock, NH 03449.
Have we got an ear-full for you.

Votrax voice synthesizers let your computer talk to you in a world of sound.

Now your ears are as important as your eyes when working with your computer. With a Votrax voice synthesizer your computer talks, and it talks to you in a world of sound you never thought possible.

Votrax was one of the first pioneers in the field. The Votrax SC-01A speech chip is state of the art, the one many other manufacturers use in their own equipment.

What it means to you is unparalleled speech capability. Votrax voice synthesizers pronounce words by using their basic building blocks rather than utilizing a vocabulary of a few hundred words. It assures you of an unlimited vocabulary. And an unlimited range of sounds: from jet planes to an advanced musical range.

Best of all, Votrax speech synthesizers are “smart,” requiring no computer memory for operation. Your computing capacity stays free for other tasks. Small in size yet surprisingly economical, Votrax voice synthesizers are sophisticated pieces of equipment that hook-up in seconds.

Mix speech or sound, program sound frequencies or amplitude levels, or compose your own music with either the Votrax Type 'N Talk™ or Personal Speech System. Ideal for business, school, handicapped use or the home, Votrax voice synthesizers put a world of sound in your computer.

See your local computer retailer or call toll free for more product, warranty or ordering information: 1-800-521-1350 (in Michigan call 313-588-0341). Dealer inquiries welcome.
Thinktank
An outlining and organizing tool
William R. Hershey
MITRE Corporation

In the same way that Pascal and other structured programming languages encourage a top-down approach to programming, outlining encourages a top-down approach to writing. The benefits are the same: The investment of a little time planning and organizing saves time in the long run and results in a more efficient final product. It's not surprising, therefore, that a couple of Pascal programmers, David Winer and Jonathan Llewellyn, have come up with a clever program for outlining: Thinktank, billed as the first "idea processor."

In the first part of this review, I'll discuss Thinktank's capabilities, its similarity to word processors, and some of its unique features. Many of Thinktank's commands are, after all, word-processing commands: INSERT, DELETE, COPY, MOVE, XCHANGE, etc. In the second part, I'll describe what it's like to use Thinktank. Learning and using the program is generally very easy. The documentation is top-quality but the program has some shortcomings. Thinktank also has several potential applications beyond organizing and writing text.

What Is an Idea Processor?

My first big question about Thinktank was, "What does this program do that a good word processor doesn't?" Thinktank's advantage is in its ability to display an outline at different levels of detail without modifying the contents. You can display the level of detail you need with two commands, COLLAPSE and EXPAND. These commands help you visualize how your writing fits together. You can see relationships you might have missed if you tried to absorb all the headings in a long outline.

Thinktank also lets you alphabetize the subheadings beneath a given heading at any level, which is very handy for certain file-management tasks. And it offers the options of generating section numbers and tables of contents with page numbers.

The Thinktank Environment

Thinktank reserves the bottom four lines of the screen for menus, prompts, and error messages. The top 20 lines constitute a text area that serves as a window into your outline. Headlines appear in the text area with pluses or minuses preceding them. A plus means additional subordinate headlines exist at deeper levels, and a minus means the headline has no subheadings. Thinktank automatically generates the pluses and minuses and indents the headlines appropriately on the screen. A headline can also have an optional block of text, called a paragraph, of up to 2048 characters in any format. The paragraph follows the headline in the outline; any subheadings follow the paragraph.

A bar cursor highlights an entire headline at a time. Move it up and down through your outline with the arrow keys; the location of the cursor determines where a command is to take effect.

The manipulation of headlines and paragraphs is similar to the manipulation of text with a word-processing program. Because headlines follow a structure, however, the commands are probably slightly more complex than the ones in a word processor. When you want to create or edit material, you have to specify whether you want to edit a headline or a paragraph. When creating a new headline, you need to indicate if it's to be positioned directly above the one highlighted, directly beneath it, beneath it at a higher level (to the left), or beneath it at a lower level (to the right). Similarly, moving a headline from one place to another in an outline can be an involved process, sometimes requiring multiple steps with several level changes. The DELETE command also operates in several different ways. You can delete a single character, an entire headline or paragraph, or a selected portion of a paragraph. You can also restore a previously deleted block of text.

In Edit mode, the bar cursor disappears, and a blinking character cursor indicates where the action is. To edit headlines, which is more limited than editing paragraphs, you enter Insert mode; the left arrow functions as a destructive backspace, and Ctrl-D deletes the character under the cursor. Paragraph editing includes automatic word wraparound, a Typeover mode, the capability to exchange one pattern for another, a FIND com-
mand, and SELECT, which highlights a section of text that you may then copy or delete.

Depending on the capacity of your disk (hard or floppy), you can create up to 10,000 levels of headlines with Thinktank. This permits a fairly robust outline. Each level is indented to the right of the next higher level, and the display automatically scrolls left and right to let you see all 80 characters in a headline.

If you don't want to see all the deeper levels in an outline, you can make them disappear by issuing the COLLAPSE command. EXPAND brings them back to any level you wish. The < and > keys represent EXPAND and COLLAPSE, respectively; the shapes of these symbols suggest the operations invoked. In their simplest form of usage, these two commands apply to both the paragraph and the subheadings beneath the highlighted headline; however, you can COLLAPSE or EXPAND just the paragraph or just the subheadings.

These two commands make Thinktank unique and give it capabilities not available in word-processing programs. You can experiment with how your ideas relate and test how each detail contributes to the whole. I like to COLLAPSE an outline so that just the highest-level headings show, then step down the subheadings and EXPAND each one to see how it relates to the whole piece. I can determine if a subheading really belongs where I put it and then COLLAPSE it again before proceeding to the next one.

The COLLAPSE and EXPAND commands may seem insignificant at first, but I recently found them invaluable in writing about a mazy systems-engineering problem. I ended up rearranging that outline many times.

Other Handy Features

Alphabetizing a list can be a tedious chore even with a word processor, but if your program has sorting capability, it's a snap. Fortunately, Thinktank can sort. When you issue the ALPHA command, the program arranges all the subheadings beneath the bar cursor in alphabetical order. You can also sort a list of numbers or numbered headlines or alphabetize the subheadings at any level. You can manage a simple database, like an address file, with the ALPHA command.

The PORT command directs Thinktank's output to a printer or to text files. Sixteen format settings offer lots of flexibility for printed listings. In addition to the usual capabilities for specifying line spacing, margins, page length, headers, footers, number of copies, and printer control codes, you can have Thinktank assign section numbers to your headlines (see figure 1).

You can also control indentation and the level to which headlines and paragraphs are printed, which enables you to generate one listing of just your outline (with the paragraphs suppressed) and another that shows only the major headings with all paragraphs. (Figures 2 and 3 illustrate these alternatives.)

Thinktank can be used to generate a final written product. If you need a table of contents, Thinktank will generate it, automatically inserting the proper page number for each headline. However, if you would rather use a word-processing program to polish up your final version, you can PORT the document to a Pascal text file and read it from there into your word processor. It is preferable if your word processor reads Pascal text files, but the utilities to translate them to text files for other operating systems are available from Living Videotext.

Learning Thinktank

Thinktank is easy to learn and use. A slash (/) produces a main command menu at the bottom of the screen, which is very helpful while learning the program. But after you learn the commands, you can optionally evoke each one with a single keystroke (M moves a headline, for example) without pressing / first. A hierarchy of menus leads you through all the choices, and the Escape key consistently operates as an exit from all menus. (If you are distracted by the clicking and squiring sounds, simply turn them off with Ctrl-Q.)

The 228-page manual, by John Unger Zussman, is well written and well constructed. The book starts with an introduction that describes Thinktank's philosophy and then covers the differences between the versions available for various Apple computers—the 64K-byte Apple II, II Plus, or IIe, or 96K-byte Apple III. (Your system must have two disk drives because Thinktank accesses program segments periodically from one disk while updating the outline file on a different drive.) Other chapters in part I deal with how to start using the
You come first.

With NEC's PC-8800 personal computer, you don't have to ask yourself which comes first, the hardware or the software. It's designed to be uncompromising in both areas. So you come first.

In the office or at home. The hardware lets you select from NEC's state-of-the-art processors, disk drives, printers, and monitors.

For $1,599 you get an 8-bit processor, 5½" dual disk drive, an NEC high-quality monitor and lots of free CP/M software.

You come first again with NEC's high-quality graphics and ultra-high reliability. The PC-8800 from NEC Home Electronics. It puts you first. So you can break out of your shell and grow.

Also available:
• 16-bit processor with MSDOS operating system
• 8" dual disk drive
• High-speed dot matrix or letter-quality printer

Free software with complete system:
• WordStar® word processing
• MailMerge®
• Multiplan™ spread sheet
• BASIC (two versions)
• CP/M®

Annoyances

Some of my complaints relate to command logic and are unique to the type of program Thinktank is. The MOVE command needs improvement. You can't move groups of headlines without moving the higher-level headline and all the subheadings under it. If, for example, you want to move 5 out of 10 subheadings to a different headline, you must move them one at a time. If you want to move a subheading so it falls under a different headline, you can't simply move it up or down: you have to move it left, then up or down, then right to get it back to the proper level. It is also difficult to move a piece of a paragraph so it falls under a different headline.

The COPY command is similarly limited. You can copy only one headline at a time, and the copy goes directly beneath the original. You then have to move the copy to where you want it.

Certain keystrokes should work at different menu levels, not just at the main menu. These keystrokes that are restricted include the up and down arrows for moving the bar cursor (Ctrl-O and Ctrl-K on the Apple II and the Apple II Plus) and the < and > keys when used for the EXPAND and COLLAPSE commands. It would be very helpful to have these operations available in the New, Edit, and Move modes. Such improvements would save many keystrokes and unnecessary menu changes.

Differences in the sequence of commands for creating and editing paragraphs is bothersome. Within the same paragraph, the New mode, for example, requires a different set of cursor moves than the Edit mode (which you can use after entering the text for the new paragraph). And why does SAVE require an extra step? Elsewhere, the program saves headlines automatically. After a save, you must answer the question, "Are you finished editing this paragraph?" Since the limit on paragraphs is only 2048 characters, repeated paragraph saves are a waste of time.

I originally intended to write this review entirely with Thinktank. But the editing routine for Thinktank paragraphs is so cumbersome that I decided to use the Word program. A tutorial uses a sample outline supplied on a separate disk. A chapter entitled "Notes and Suggestions" offers shortcuts; a glossary defines all the terms used in the manual; and appendices cover an introduction to the Pascal operating system, disk management, and other technical information.

Part II contains a reference guide with all the commands listed in alphabetical order. A section on error messages describes where an error may occur, the possible causes, and some suggested solutions. There's an extensive index at the end of the manual.

Technical notes describing how to link Pascal programs to Thinktank are available from Living Videotext for $5 each. Telephone support is excellent. When I called with questions, I received very helpful advice from one of the program's authors. Also, Thinktank's lack of copy protection makes it easy to create backups.
Time for your computer to make the telephone connection – with an intelligent, full 212A 300/1200 baud modem – with a real time clock/calendar – and with the capability to expand into a complete telecommunications system. It's time for PRO-MODEM 1200. Much more than just a phone modem.

When you're on-line, time is money. PRO-MODEM telecommunication systems help you save. By monitoring the duration and cost of your phone calls. And by sending and receiving messages, unattended, at preset times when the rates are lower. . . with or without your computer.

Compare the $495 PRO-MODEM 1200 with any other modem on the market. For example, you'd have to buy both the Hayes Smartmodem 1200 plus their Chronograph for about $950 to get a modem with time base.

PRO-MODEM 1200 is easy to use. A convenient "Help" command displays the Menu of operating command choices for quick reference whenever there's a question about what to do next. Extensive internal and remote self-diagnostics assure that the system is operating properly. Some of the other standard features include Auto Answer, Touch Tone and Pulse Dialing, and Programmable Intelligent Dialing.

PRO-MODEM does more. It lets you build a full telecommunications system with features like Auto Dialer, Incoming and Outgoing Message Buffering, Business/Personal Phone Directory, Programmable Operating Instructions, a 12-Character Alpha-Numeric Time and Message Display, and versatile PRO-COM Software. PRO-MODEM commands are Hayes compatible so you can use most existing telecommunications software without modification.

There's much more to the PRO-MODEM story. See your local dealer for complete details. He'll show you how to save time. And money.

Prometheus Products, Inc., 45277 Fremont Blvd., Fremont CA 94538, (415) 490-2370
Juggler program from Quark (2525 West Evans, Suite 220, Denver, CO 80219, (303) 934-2211), which now has me spoiled. I still believe, however, in the value of Thinktank for organizing information and writing outlines.

My remaining complaints have to do with Thinktank's implementation on the Apple III. Despite the 256K bytes of memory available, you must wait interminably for disk accesses—both for program segments and for data—because the program is really designed for a 64K-byte machine. It takes 5 to 10 seconds for most disk accesses, but I timed one at 25 seconds—25 seconds to delete just one headline.

You can redefine edit keystrokes with Thinktank, so I tried to make them the same as the Word Juggler commands, which are input with the Apple III's numeric keypad. Unfortunately, I found that the program did not have the logic to distinguish between the keypad keys and their main-keyboard counterparts.

Databases and Trees

Thinktank has database-management capabilities, thanks to the ALPHA command, and the ability to hide what you don't need to see. The manual has an extensive list of applications, including "to do" lists, telephone directories, and catalogs of collections. I've used the program to keep a list of publications that I need to refer to in my work. The table of contents lists the names of the publications (sorted alphabetically, of course) and their page numbers. The actual listing page contains a brief description of the publication, the author, and the date.

A topologist will tell you that Thinktank's data structure is called a tree, a convenient device for lots of mathematical endeavors. Computers use trees all the time in their internal workings. Users, however, are seldom aware of them because programs reveal only the forest. Sorting and other database-management operations, for example, use trees extensively. With Thinktank's tree structure out in the open, we can expect to see some very interesting uses made of this program (genealogy is one), and we can hope for improvements that will enhance its mathematical potential.

Conclusion

Thinktank is a refreshing new program, friendly to use and well documented. Because it is very important to organize ideas before writing, an idea processor can be as useful as a word processor. With a few improvements, Thinktank could be a total word processor that integrates the process of organizing thoughts with the art of writing.

William R. Hershey (MITRE Corp., 3820 Dolley Madison Blvd., McLean, VA 22102) is a systems engineer with a B.S. in engineering from Princeton and an M.A. in computer and communication sciences from the University of Michigan. He is chairman of an Apple III users group in the Washington, DC, area and an instructor in computer literacy at the University of Maryland's University College.
Now Taxan for IBM

RGBvision 420 features 640 horizontal line resolution with .38mm dot pitch, non-glare black face picture tube, 18 MHz bandwidth. Includes cable.

TAXAN Model 121 (Green) or 122 (Amber) are TTL, 800 horizontal line resolution, 20 MHz bandwidth.

The optional tilt and swivel base with LCD clock, model 110-12, is also available for Models 121 / 122.

Ask your dealer about TAXAN model 505, 256K RAM expansion card for the IBM PC.

TAXAN manufactures monitors for nearly every personal computer.

The QDP-300 Computer

A speedy Z80 at a premium price

Edward Joyce
Free-lance Writer

Line end to end all the Z80 systems on the market and you could almost circle the earth. From this conglomeration, eliminate the ones that run at less than 6 MHz and you narrow the field considerably. Of this group, isolate the systems costing more than $6000 and you'll probably end up with one machine—the QDP-300 from Quasar Data Products (QDP).

The speed and price of the QDP-300 distinguish it from most Z80 systems. The microprocessor hums at 6 MHz, compared with to 2 to 4 MHz for most Z80s. The price

Photo 1: The QDP-300 with a 10-megabyte hard-disk drive and one 8-inch floppy-disk drive.
of $6395 buys 192K bytes of memory, including cache. Take away 64K bytes and replace the hard disk with a floppy disk and you're looking at QDP's least expensive system—$3995. The QDP is intended for business users who can afford to pay a premium for more horsepower to crank through packages like Wordstar, Multiplan, dBASE II, and other software heavyweights of the CP/M-80 environment.

Photo 1 shows the $6395 hardware package. The top cover of the cabinet is attached to the body at the two strips of real wood that run the length of the chassis. Besides adding an aesthetic touch to the package, the wood slats provide a convenient handhold.

The single floppy-disk drive accepts 1.2-megabyte, double-sided, double-density, 8-inch disks. The drive also reads and writes single-sided, single-density disks.

Photo 2 shows the back panel. Serial ports A and B, which are driven by a Z80 SIO (serial input/output) device, connect to the system terminal and printer. A Z80 PIO (parallel input/output) device handles the bit-banging on the two Centronics-compatible parallel ports. The other seven ports are inactive stubs. Serial ports C, D, E, and F are for attaching terminals in an MP/M multi-user environment. (This article reviews the single-user version only.) The auxiliary ports, labeled "Aux. A and B," are available for user devices that may be plugged into the two open slots on the S-100 bus. Finally, the port labeled "Aux. Disk" seems to be designed to enable daisy-chaining of disk drives; however, QDP offers no hardware configurations other than the one-cabinet unit.

On the left side of the back panel is the fan. There must be an axiom in the computer-design cookbook that says "cool a powerful computer with a powerful fan." The QDP rivals the Digital Equipment Corporation (DEC) Rainbow as a candidate for generating jet streams in the wind tunnels of General Motors research laboratories. Any hard-working machine needs protection from overheating, but a system that generates the exhaust sound and thrust of a small turbine engine won’t find widespread acceptance as a desktop computer. A smaller fan should be able to handle the cooling load at a fraction of the noise.

While I'm offering free advice to the designers on the physical aspects of the computer, I'll put in my two cents regarding the power switch. As seen in photo 1, the switch protrudes prominently from the left side of the front panel, a little too prominently for my liking. Every time I saunter past the machine, I worry about accidentally bumping the switch and possibly flushing a 180-cell spreadsheet down the tubes. To avoid electronic disaster, I've unconsciously developed the habit of executing a quick side step when I pass the computer. My choreography would make Michael Jackson jealous. The designers wisely recessed the reset switch; why they left the power switch sticking out like a sore thumb is anyone's guess.

The inside of the cabinet is shown in photo 3. Most of the system logic fits neatly on one board. For instance, a Z80 DMA (direct memory access) chip, which manages disk-data transfers and memory-to-memory block moves, is on this board. Additional circuits and memory
can be placed in the two empty slots of the three-slot S-100-bus motherboard, which is shown toward the back in photo 3.

At the very bottom of photo 3, barely visible, is the top of a 10-megabyte hard-disk drive manufactured by Miniscribe Corporation. The drive interfaces to the computer through a Western Digital WD1000 controller. The floppy-disk drive is just above the hard-disk drive; a NEC D765AC chip controls the floppy-disk drive.

A battery keeps the CMOS (complementary metal-oxide semiconductor) MM58167 real-time clock ticking when the power is turned off. It was a nice feeling to have the QDP-300 greet me with the correct time and date when I unpacked it and typed in the CLOCK command. A voltage selector lets you choose between a 115-volt or 220-volt power source.

QDP provides a 12-month, on-site warranty, managed by General Electric Apparatus and Engineering Services, which has 50 service locations in the U.S.

Software
The QDP-300 first awakes under the control of an 8K-byte ROM (read-only memory) monitor. The monitor provides the lowest level of housekeeping, including booting, system routines, and debugging support. The boot logic loads CP/M-80 version 2.2 from either the hard or the floppy disk.

Although the CP/M implemented is version 2.2, QDP's programmers have incorporated several features of CP/M Plus (or CP/M 3.0). The most outstanding feature, a cache BIOS (basic input/output system), divides the 192K bytes of total memory into a 128K-byte cache region and a 64K-byte CP/M region. The cache region contains much of the BIOS, a fresh copy of the CCP (console command processor) and the BDOS (basic disk operating system) for quick warm booting, and a cache or LRU (least recently used) buffer for disk sectors. The cache buffer stores disk sectors in memory as they are read. When an applications program requests a sector, the BIOS checks the cache first. If the sector is in memory, that is, in the cache, it is transferred to the applications program without performing a disk read. Transferring a sector from memory versus reading it from disk is like delivering a transcontinental message over the telephone versus sending it by horse. Programs running in a cache environment can increase throughput significantly.

With much of the BIOS residing in the cache region, CP/M's transient program area (TPA) weighs in at a healthy 55K bytes without overlaying the CCP; a generous allotment that few CP/M 2.2 systems can match. Another CP/M Plus feature inherent in QDP's enhanced CP/M is the ability to search for command files on other than the current drive. If a command file is not found on the current drive, the operating system automatically searches drive A for the command. This obviates the need to place copies of commonly used utility programs on each drive.

QDP supplements CP/M's standard repertoire with several utility programs, the most notable of which are HELP, MENU, HCONFIG, FORMAT, SECURE, HARD-BACK, and RESTORE. HELP adds a little hand-holding to CP/M's terse command structure. It supplies on-line assistance for the utilities. HCONFIG provides the tool for fine-tuning the system. It configures logical drive assignments, protocol for the I/O (input/output) ports, and the cold-boot auto-load command.

At first glance, FORMAT appears to be a typical program that writes track and sector-header information to a floppy disk in single- or double-density mode. You can select 128-, 256-, 512-, or 1024-byte sectors. QDP apparently believes that the variety of options enables customization of disk formats for optimal performance. I think that providing anything more than the usual single and double density (128- and 256-byte sectors) is overkill, but the flexibility might suit some discerning users.

SECURE wins the Strange Program of the Month award. According to the documentation, SECURE directs the Winchester hard-disk read/write heads to a safe “landing zone” and “should always be run before powering down the computer.” As sure as the sun rises in the east, there will be times when either operator forgetfulness or an act of nature will cause the voltage to drop to zero before SECURE is executed. QDP claims that failing to run SECURE at power-down will probably result in loss of data on the hard disk. This is the first I’ve heard of such a limitation with a Winchester. Certainly there’s a risk of data destruction if power is lost during a read or write operation; however, while the disk is idle, the heads shouldn’t go diddling-bopping on the platter when the current is turned off. It sounds fishy; SECURE makes me feel insecure.

The HARDBACK and RESTORE utilities enable the hard disk to be conveniently backed up on eight double-sided, double-density disks.

QDP has added several systems features that make its CP/M more than just another plain implementation. All serial I/O ports are buffered up to 128 bytes. With a buffer that size, exceeding the type-ahead capacity of the keyboard is virtually impossible. System software automatically logs hard and soft disk errors. A utility program called SYSTAT can be used to display error counts. This feature is invaluable for earmarking marginal media or drives. Worn or deteriorating disks, for example, would post an inordinate number of errors.

Benchmarks

Now that I’ve whetted your appetite with an overview of the QDP’s innards, I’d like to discuss its most impressive feature—speed. Table 1 lists the results of the traditional Sieve benchmark (see “Eratosthenes Revisited: Once More through the Sieve,” by Jim Gilbreath and Gary Gilbreath, January 1983 BYTE, page 283). The QDP clocks in at 16 seconds in Pascal/MT+, about 16 percent faster than the fastest Z80 Pascal listed in the aforementioned article. In Microsoft BASIC, the QDP-300 runs the benchmark about 19 percent faster than a Z80 machine running at 4 MHz.

Table 1 also shows the increased throughput attributable to the system’s cache buffer. With the cache buffer enabled, the Pascal compilation and link run about 30 percent faster than without the cache.

To determine how the QDP-300 fares in word processing, I fed a 3600-word document into the Oasis Systems Word Plus spelling checker. Then, for a gross comparison, I ran the same document through Word Plus on a 2.5-MHz Z80 system with 64K bytes and dual, single-sided, single-density, 8-inch disk drives. The QDP knocked the socks off the disk-based system, processing the document in 30 seconds, one-tenth the time of the slower, albeit older and less expensive, computer.

Although benchmarks provide salient statistics, true appreciation of the QDP’s speed comes only when you sit down at the terminal with your favorite software. Programs execute swiftly. On my old computer, I typically fill up the keyboard type-ahead buffer, then daydream while the processor catches up. But on the QDP-300, there’s nary a moment between pressing the Return key and seeing the cursor flashing on the screen, awaiting your next command. Adjusting to the speed of the QDP-300 is a pleasurable experience. It’s like flying to a distant city instead of taking the bus. You get to read fewer magazines, but you arrive at your destination faster.

Documentation

The QDP-300’s greatest weakness surfaces in its documentation. The 200-page users manual describes the hardware and software poorly. It chalks up demerits for its lack of organization, clarity, and comprehensiveness. The critical procedure of running the SECURE program before powering down mysteriously pops up on page 38 in a subsection describing the MENU utility. The text of the manual betrays its Wordstar origins in sentences like this: “Taking good care of your disks is essential, and you will be rewarded with minimum problems...” A word such as “optionnumber8willnotappear” indicates that several pages were treated with something bigger than a fine-tooth comb.

The most annoying attribute of the users manual is its self-congratulatory, backslapping tone. For example, the section entitled “Computer Error Messages” starts out saying, “One of the most important features of the QDP-300 is its unique error handling, both human and computer types. QDP was the first microcomputer com...
THOTH TELLS YOU HOW TO ADDRESS PEOPLE

Designed for everyone from first time PC users to old pros, Thoth provides you with a confidential facility for personnel records organized and sorted in alphabetical order. Rapid interaction between three databases, on-screen help and a foolproof escape guide help you to create records quickly and easily.

ACTION LIST DATABASE MANAGER

SO MAKE AN APPOINTMENT WITH THOTH

You'll never miss a deadline or an important meeting again organize and sort by due date and priority. There's no better way to keep up-to-date than with Thoth.

Thoth has been designed with your busy schedule in mind, with a friendly suggested retail price of $99.95.

Thoth requires IBM PC with DOS 1.1 or 2.0, 128K memory, color graphics adapter and color monitor suggested.

THOTH THROWS AWAY THE CABINET AND KEEPS THE FILES

Thoth also helps you keep important information in an organized fashion for easy access. File all your vital facts under Thoth Organized and sorted by category and sub-category, they will always be at your fingertips.

VERSATILE DATA REDUCTION, DISPLAY AND PLOTTING SOFTWARE FOR YOUR APPLE* II

STRIPCHARTER — Turns your APPLE and Epson MX series printer into an economical 4-pen chart recorder. Prints and displays continuous 4-channel strip-charts of any length. Ideal for large data sets. Numerous user-selectable graphics options enhance output quality. Includes 5 demos on disk with 37-page manual. $100

VIDICHART — Proven tool for lab data management. Fast plots of 4 data sets with scrolling in 4 directions, zoom scaling on X and Y axes, 2 types of graphic cursors and on-screen STATUS REPORT, even plots A/D input while sampling, ADD, SUBTRACT, MULTIPLY, DIVIDE, INTEGRATE, DIFFERENTIATE, AVERAGE or NORMALIZE data sets with SIMPLEx COM-Manus. Ideal for spectra, chromatograms, rate-curves, etc. Includes SAMPLE DATA on disk with 28-page manual. ........... $75

SCIENTIFIC PLOTTER — Draws professional-looking graphs of your data. You choose data format, length and position of axes, 20 symbols, error bars, labels anywhere in 4 orientations. Includes 5 demos on disk plus 30-page manual. ........................................... $25

CURVE FITTER — Select the best curve to fit your data. Scale, transform, average, smooth, interpolate (3 types), LEAST SQUARES fit (3 types), Evacuate unknowns from fitted curve. Includes 5 demos on disk with 33-page manual. ............... $55

SPECIAL: VIDICHART, SCIENTIFIC PLOTTER, CURVE FITTER on 1 disk. ......................... $120

Add $1.50 shipping on all U.S. orders. VISA or MASTERCARD orders accepted.

pany to introduce this feature." The manual goes on to describe how the BIOS traps disk errors and enables the operator to retry, ignore, or reboot instead of just returning to BDOS. "In our nasty scenario above things were looking pretty bleak," the text continues, "but now comes QDP to the rescue!!" Yuk.

The description of the configuration program, HCONFIG, begins in a similar vein. "QDP has instituted a revolutionary utility program that changes the way our microcomputer operating system can be modified by end users." Come on, QDP. Any decent implementation of CP/M offers disk error trapping in the BIOS and a configuration program for modification of system parameters. Does the company really believe that its system, which was first sold in 1983, inaugurated these "revolutionary" features? Statements such as these remind me of Detroit's annual claims of revolutionary new automobiles.

To its credit, QDP supplements the documentation with a copy of Osborne CP/M User Guide by Thom Hogan. Jerry Pournelle recommends Hogan's guide as a "good introduction" to CP/M. It's definitely better than the standard documents distributed by Digital Research.

Conclusions

If asked to summarize the QDP-300 in one sentence, I would paraphrase a statement from Peter McWilliams's The Personal Computer Book: "All things considered, I'd rather have a good computer with poor documentation than good documentation with a poor computer." In my experience, this hardware breaks all speed records for CP/M-80 programs. And the extra utilities and better-than-average BIOS earn the software a gold star.

The documentation falls short by any measure, but QDP's customer representative patiently guided me through the gray areas. The information he supplied over the phone, coupled with addendums sent a week later, filled many gaps in the original users manual.

Some people may be concerned about investing their computing future in a five-year-old company that, quite frankly, holds less than the lion's share of the market. This risk applies to many technological ventures, but on the brighter side, QDP has not retired its development staff after one system. The company recently announced the QDP-400, a six-slot, 5-100 bus, Z80B system that includes the TurboDOS operating system from System 2000. A 16-bit coprocessor, which will open a path to the world of MS-DOS software, is in the works.

The complexity of the QDP-300 extends far beyond the needs of casual and first-time users. The computer's largest audience will be shops that employ professional programmers and systems houses that specialize in packaging hardware and software for small businesses. These sophisticated users should have no difficulty justifying the top-dollar price tag of this Z80 screamer.

CP/M user Edward Joyce (RI. 9, Box 149, Charlottesville, VA 22901) received his baptism in microcomputers at the Department of Computing and Information Sciences at Trinity University in San Antonio, Texas.
Maynard Electronics introduces three Winchester Hard Disc Drive Systems — the only drive systems to offer you 10 Mega-bytes of formatted capacity with complete internal installation! These systems offer the user countless benefits and features: capability of booting off the hard disc; additional functions while requiring only one card slot in your PC; and, use of available power, thereby preventing overheating problems which have affected other drives. Handling heavyweight data was never easier.

All three systems are quality engineered and work with DOS 2.0 without any special software drivers and also run with other operating systems designed to make use of the XT hard drive system. All you need is the IBM® DOS 2.0 Manual and you're ready to run!

Each system is equipped with a low-power hard disc drive, complete software, easy, a SandStar Card and Hard Disc Controller Module. SandStar is the first family of modular peripherals created for the IBM® PC. Simple instructions for easy installation are included and all components are backed by an Unconditional One Year Parts and Labor Guarantee.

Our Winchester Hard Disc Drive Systems offer 10 Mega-bytes of formatted capacity, are internally installed and use available power!

To expand your PC to perform like the PC XT, one of our Winchester Hard Disc Drive Systems is right for you. And if you have already made the wise decision to install any of Maynard's SandStar Cards, the SandStar Hard Disc Controller Module may be purchased separately.

TO ORDER, CONTACT YOUR LOCAL DEALER OR DISTRIBUTOR.

We make modern times better.
On IBM® PC compatibility, the portable computer, and you.

What is IBM PC compatibility and why is it important in a personal computer?

IBM PC compatibility refers to a computer's ability to perform like an IBM Personal Computer. Its importance can be explained in one word: software. You see, the overwhelming success of the IBM PC has created a booming IBM compatible software industry. As a result, some of the most advanced and innovative software packages available today have been written specifically for the IBM PC. So no matter what your business problem, it is most likely that the software to solve it already exists. But only a truly IBM PC compatible computer can take immediate advantage of these hundreds of state-of-the-art programs. As well as future IBM PC software breakthroughs.

Why are some computers more compatible than others?

IBM PC compatibility can be a very relative term.

For example, a computer featuring the same 8088 microprocessor as the IBM PC, but without the necessary compatible disk operating system is not IBM PC compatible. Nor are computers advertised as IBM compatible that use 3 1/2” floppy disks (the IBM PC’s are 5 1/4”) or magnetic bubble memories. While these computers claim IBM PC compatibility, they will not run software written for the IBM PC without modification.

To make certain of a system’s IBM PC compatibility, see if it can run popular software written for the IBM PC: Business programs like Lotus 1-2-3,” VisiCalc,” or WordStar.” Games like Flight Simulator.” Or educational software from Spinnaker.”

For true compatibility, you need a computer that can run all this IBM PC software right off the shelf. A computer like the Visual Commuter.”
The Visual Commuter: think of it as an IBM PC to go.

Commuter offers you a level of IBM PC compatibility unsurpassed in a portable or desktop computer. With the MS-DOS™ operating system, GW Basic™, a full 83 key IBM PC identical keyboard. And unlike many so-called IBM PC compatibles, Commuter can run virtually all of the software written specifically for the IBM PC. Commuter's 5 1/4" floppy disks are interchangeable with the IBM PC. It also features IBM compatible color graphics and monochrome support. There's even a port for the IBM expansion chassis built right in.

16 pounds of power at a very compatible price: $1995.

If you've ever lugged around a 35 pound computer with a handle, you'll appreciate the beauty of Commuter's design. At only 16 pounds (about half the weight of other portables in its class), Commuter has solved the weight problem that has plagued other full-function portables. Whether at work, home, or on a business trip, with Commuter you're travelling light. And at only 3 1/2" x 18" x 15" with built-in handle and carrying case, you can take it anywhere you can take a briefcase.

Commuter. With desk-top computer power including a 16 bit 8088 processor, 128K of memory (expandable to 512K), and a full 16 line by 80 column optional flat panel display. And built-in expansion capabilities for printers, hard disk, communications, and external monitors, including your television set.

Best of all, Commuter is priced at only $1995. Now what could be more compatible than that?

For more information, call 1-800-847-8252 (in MA call 1-800-462-5554), or write Visual Computer Incorporated, 135 Maple Street, Marlboro, MA 01752. Or visit your local Commuter dealer today.

Commuter. It can take your business places it's never been.
The Kaypro 10

A hard-disk CP/M portable with a large software bundle and a small price

Steve McMahon
Independent Software Developer

Kaypro's hard-disk portable computer, the Kaypro 10, like its siblings, the Kaypro II and 4, is not a technologically innovative machine. Kaypro has taken existing single-board computer and Winchester hard-disk technology, combined with a monitor, keyboard, and floppy-disk drive and wrapped it all up in a simple bent-metal case.

On another score, though, the Kaypro 10 is very innovative. The equipment and power delivered for the price are outstanding. At $2795 the Kaypro 10 costs less than many stand-alone hard-disk drives. And along with its 10-megabyte hard-disk drive comes a sturdy and serviceable CP/M microcomputer, a high-quality, built-in terminal, and an astonishingly large software bundle (see photo 1).

So, while the Kaypro 10 may have little to teach us about electrical engineering or systems programming, and nothing to teach about aesthetics or ergonomics, it offers many lessons about what kind of value is available for a limited budget.

Hard Disk or 16 Bits?

The appearance of this hard-disk computer with software for under $3000 will present many computer buyers with a dilemma: will they get better performance from an 8-bit machine with a hard-disk drive or a comparably priced 16-bit machine with floppy disks?

The answer, of course, will depend on the principal purposes for which the computer will be used. Large spreadsheet applications, graphics work, high-precision computation, and heavy statistical analysis will likely be served better by the expandable RAM (random-access read/write memory) resources of a 16-bit machine.

But if you're doing a lot of word processing or database management, you'll probably find that the 8-bit machine with the hard disk is faster and more convenient than the 16-bit machine with only floppy disks.

A reliable hard-disk computer system like the Kaypro 10 is a joy to work on if you're used to floppy-disk-only systems. The advantages are speed and capacity. The Kaypro 10 reads and writes material to and from the hard disk at a rate two to four times faster than the floppy disk. Programs run faster and records are found more quickly (see table 1).

The difference in capacity adds up principally to great advantages in convenience. Working with the 10, I found I could keep all my current projects on the hard disk along with all the tools I needed to do the work, such as word processors, spelling checkers, compilers, and database programs. I could switch easily and quickly among projects and tools. Floppy-disk handling, and the subsequent likelihood of damaging disks, was cut to a small fraction of what it was on a floppy-disk-only system. I got a lot more done in the same time because I spent less time with the logistics of getting the right files onto the right floppy disks at the right moment.

For people doing a lot of database-management work, the added capacity of the hard disk may be not only con-
The Kaypro 10 and its documentation. Even glancing through all the documentation for the extensive software bundle is a major chore.

Convenient but necessary. It enables rapid access by more than one index to records that previously had to be stored on separate disks.

The Winchester

A Winchester-type fixed hard disk is what makes all of this possible in an inexpensive portable. The two-platter, 10-megabyte drive manufactured by Tandon is sealed in its own container and double shock-mounted inside the 10. The sealing of the drive protects it from a possibly dusty or moist environment. Because there is only one drive, which cannot practically be removed, the drive must be backed up by copying its contents to floppy disks. The floppy disks can then be removed and protected.

Safety

Included with the Kaypro 10 is a safety program that is an important part of the portability of the machine. The safety program must be run before the 10 is turned off. The program causes the hard-disk read/write heads to be withdrawn to a data-free "landing zone" where the heads can do no damage if they accidentally strike the disk surface during movement of the computer.

The 10 also automatically deselects the hard disk whenever it is not in use for more than a few seconds. While this probably slows the 10 down some on hard-disk access, it cuts the chances of damage to the disk if power is interrupted.

Table 1: Disk read and write speed comparisons of the Kaypro 10 and the much more expensive IBM PC XT. The comparison mainly serves to highlight the slow speed of the Kaypro’s floppy- and hard-disk write routines. The Kaypro test was made with Microsoft’s BASIC-80, which is included with the 10. BYTE’s benchmarks are listed in the January 1982 BYTE, page 54.

Transporting the 10

Calling the 10 a portable is pushing the definition of portable. At 30 pounds, it’s a hefty burden to carry for more than a block or so. Anyone doing that will also discover that the carrying handle is quite uncomfortable.

Nonetheless, the 10 folds up into a neat package that can be carried easily to a car parked nearby, or it can be moved from room to room. The 10 fits under most major-airliner seats—a popular benchmark for portability—as long as you avoid the window seats. You won’t have any leg room left over, but it’s much preferable to
checking the computer as luggage (a Kaypro technical-support hotline employee told me this would constitute abuse of the computer).

If you carry the Kaypro around much you should definitely get a cover of some sort for it. Even folded up for transport, all the Kaypro 10's ventilation slots are completely open to dust and moisture.

The 10 I tested survived my carrying it around from day to day with no difficulty at all. While I didn't deliberately drop it, I did bump it around some, and nothing went wrong. The machine also survived being shipped across the country twice without accumulating any bad spots on the hard disk in the process.

By this measure, Kaypro's shock-mounting system for the Winchester seems to be a success. Despite this, I have one complaint: the Kaypro 10 User's Guide offers no guidelines at all on how to transport the machine safely or what kind of shocks it can be expected to survive. Presuming that the hard disk is vulnerable, I found this to be a distressing omission.

### The Display

The folks at Kaypro have certainly packed a beautiful monitor into this metal box. The 9-inch non-glare screen holds a full 25 rows (only 24 easily available to the user) and 80 columns of very clear green-phosphor characters. The characters are composed of 14 dots vertically by 7 horizontally, with 3 of the 14 vertical dots used as true descenders (see photo 2). The screen's resolution is much better than the Kaypro II's and the characters are a lot

A printer should complement your computer, not compromise it.

It's a simple fact that your small computer can compute a lot faster than your printer can print. A problem that becomes even more frustrating in business, when your computer is tied up with your printer while you're ready to move on to other work.

Of course, the only thing more frustrating than waiting on a slow printer is waiting on a printer that's down. And unfortunately, chances are the initial printer you purchased with your computer system just isn't designed to work on continuous cycle high volume printing.

More than likely, you've already experienced one, if not both of these frustrations. But now, you can turn printer frustration into printing satisfaction with the new Genicom 3014, 3024, 3304 or 3404. Professional printers for personal computers...price/performance matched.

Designed and built to increase productivity and maximize the value of your personal computer, the range of 3000 PC printers offers 160-400 cps draft, 80-200 cps memo, and 32-100 cps NLQ printing...performance for both high productivity and high quality printing.

The 3014/3024 models print 132 columns, while the 3304/3404 models give you a full 136 column width. The 3304 and 3404 models even offer color printing.

Each printer is easy to use, lightweight, functionally styled and attractive. And you can choose options from pedestals and paper racks to document inserters, sheet feeders and 8K character buffer expansion, plus more.

Genicom 3000 PC printers feature switch selectable hardware, dual connectors and dual parallel or serial interfaces, plus software emulations for Graftrax Plus and Okidata Microline 84 Step II. So your current system is most likely already capable of working with these Genicom printers without modification.

Most important, the Genicom 3000 PC printers are quality-built, highly durable printers designed for rapid, continuous duty cycle printing.

So why wait? And wait. And wait. Get a Genicom 3000 PC printer now.

Genicom Corporation, One General Electric Drive, Dept. C411, Waynesboro, VA 22980.

Circle 182 on inquiry card.
I don't think most people will have any problems reading this display, despite its relatively small size. It was quite readable under a variety of lighting conditions and at distances from very close to 5 feet away. In fact, I found this screen to be a lot more comfortable to work with for extended periods than many 12-inch monitors on nonportable computers.

The only advantage these larger, separate monitors have over the Kaypro's is that some may be easily adjusted for height and angle. Adjusting the Kaypro's monitor position or angle involves moving the whole machine laterally and propping things under it. It would have been nice if Kaypro had provided an adjustable stand to compensate for users' preferences and working conditions.

The 10's monitor is versatile as well as readable. It offers reverse video, half-intensity, underlining, blinking, and any combination of these video effects. Most of the 10's users won't see much of this versatility, though; only a small number of the programs included with the 10 make use of even the reverse video.

The reverse-video effect was very irritating to my eyes when it occupied more than a tiny portion of the screen. Unfortunately, Kaypro chose to make Wordstar's menus and status line appear in reverse video. The result is a glaring screen that makes it hard to concentrate on the text at hand. I was able to solve this problem by patching Wordstar to use half-intensity type rather than reverse video for its menus. Users who don't know how to patch Wordstar and don't have a sympathetic dealer won't be so lucky.

There shouldn't be any trouble getting applications software that will operate acceptably on the 10's screen because Kaypro imitated the popular Lear-Siegler ADM-3A methods for clearing the screen and addressing the cursor. Getting commercial software to use the previously mentioned video effects, though, will require some extra work on either the user's or the software vendor's part, because Kaypro went its own way in determining the codes to invoke these features.

Graphics

Ultrahigh resolution for text does not mean high resolution for graphics. The 10 offers bit-mapped pixel (picture element) graphics, but the resolution is only 160 by 100 pixels. These plump pixels can be used for bar charts if there aren't too many bars and there certainly will be a few games written to make use of them. But my guess is that there won't be a whole lot of use made of the 10's pixel graphics by applications programmers. If you're thinking of purchasing the 10 rather than another computer because of the 10's graphics, you should think again unless you're only after a taste of graphics programming.

The 10 also offers a good set of graphics characters that should prove marvelous for drawing up sharp menus or such. The graphics characters aren't documented in the manual, but Kaypro includes the source code for the more readable than the II's (see photo 3).
THE BUFFER DID IT.

Who Stole The 1500 Letters From The Computer?

Let's just say you've got to send a letter to 1500 different people. Would you like to spend 22.5 hours* or 60 seconds of computer time?

With a garden-variety buffer, the computer has to mix, merge and send 1500 addresses and 1500 letters to the buffer. Trouble is, most buffers only store about 32 letters. So after 32 letters, the computer's down until the printer's done. Altogether, you're talking 22.5 hours.

In the case of our new (not to mention amazing) ShuffleBuffer, computer time is 60 seconds flat.

Just give ShuffleBuffer one form letter and your address list, and it takes care of the mixing, the merging, and the printing. But that's not all ShuffleBuffer's stolen from the computer. Oh, no.

Who Changed and Rearranged The Facts?

Again, ShuffleBuffer's the culprit. You want to move paragraph #1 down where #3 is?

Want to add a chart or picture? No problem. No mystery, either. Any buffer can give you FIFO, basic first-in, first-out printing. And some buffers offer By-Pass; the ability to interrupt long jobs for short ones. But only ShuffleBuffer has what we call Random Access Printing — the brains to move stored information around on its way to the printer. Something only a computer could do before. Comes in especially handy if you do lots of printing. Or lengthy manuscripts. Or voluminous green and white spread sheets. And by the way, ShuffleBuffer does store up to 128K of information and gives you a By-Pass mode, too.

And Who Spilled The Beans 239 Times?

Most buffers can't tell the printer to duplicate. If they can, they only offer a start/stop switch, which means you're the one who has to count to 239. Turn your back on your buffer, and your printer might shoot out a room full of copies. ShuffleBuffer, however, does control quantity. Tell it the amount, and it counts the copies. By itself.

So, What's The Catch?

There isn't any.

Sleuth around.

You won't find another buffer that's as slick a character as this one.

You also won't find one that's friendly with any parallel or serial computer/printer combination. This is the world's only universal buffer.

With a brain.

If word processing has become increasingly important in considering the growth of your personal computer system, then your choice in selecting a printer should be a major decision, not a major investment. If PERFORMANCE, COMPATIBILITY and PRICE are significant factors in determining your decision, then the Juki Model 6100 Letter Quality, Daisywheel Printer will benefit you. Here’s why...

PERFORMANCE
Engineered for precision performance, the Juki Model 6100 has been field tested and proven for accuracy, reliability and versatility. It prints bi-directionally at 18 cps, has proportional spacing, 10/12/15 pitch and performs the latest word processing functions including superscript, subscript, bold/shadow printing, double strike, underlining and graphics. It houses over 40 built-in control commands, has a buffer memory expandable to 8k, and operates on a linear induction motor ensuring accurate positioning. Also, the Juki Printer is lightweight and conventional in design, has a low noise level and is available with a Tractor Feed. *Tractor Feed optional.

COMPATIBILITY
Interface it... the Juki Letter Quality, Daisywheel Printer is compatible with all major personal computers and is equipped with Centronics Parallel interface as standard equipment and is available with the RS-232C Serial connection as well. It conveniently uses IBM Selectric™ ribbons and 100 character Royal/Adler™ daisywheels with a variety of type styles to choose from.

COST BENEFIT
With all the advanced features of a higher priced unit combined with convenience and dependability, the low cost of the Juki Model 6100 adds up to one thing... hard copy at a soft price.

At $599.00 the Juki Model 6100 Letter Quality, Daisywheel Printer will complement your personal computer system with a minimum investment.

Contact your local Juki Distributor for further details.
A multi-flop py backup and recovery system will back up a hard-disk backup system with the 10. The MUFBAR anything, from an entire user area to individual files, chester drives may be more reliab le than floppy disks, The modified CCP displays the current user area along hard-disk Backup is replaced with AO>, Al>, ... , A15>, depending on disk, a directory error or a hard-disk failure can make from the hard disk onto floppy disks.

Photo 4: The Kaypro 10's main menu.

though they take up space on the same disk. Size of user areas is flexible; each could potentially contain nothing or utilize the entire disk.

Kaypro made a couple of modifications to the CP/M's CCP (console command processor) that make a world of difference in the usefulness of the user-area feature. The modified CCP displays the current user area along with the current drive letter whenever it prompts the user for a command line. So the usual CP/M A> prompt is replaced with AD>, A1>, ... , A15>, depending on which user area you're logged to. Also, whenever a command file is asked for that can't be found in the current user area, the CCP searches user area zero for the program. This means you can place most of your utilities in user area zero and they'll be available no matter what area you're logged to. (Unfortunately, programs like Wordstar can't find their overlays in different user areas, so there are still problems.) These little changes save a lot of time and trouble in day-to-day work.

Hard-disk Backup

Hard-disk backup should be easy and reliable. Winchester drives may be more reliable than floppy disks, but they still make errors. With the capacity of a hard disk, a directory error or a hard-disk failure can make a real mess.

Fortunately, Kaypro has included a quite workable hard-disk backup system with the 10. The MUFBAR (multi-floppy backup and recovery) system will back up anything, from an entire user area to individual files, from the hard disk onto floppy disks.

MUFBAR will automatically break up very large files onto multiple floppy disks if necessary. This capacity is an important one if you're thinking of keeping a large database on the 10. This backup program also gives you the ability to "stamp" backup disks with a note about the time and contents of the backup.

What the program won't do is tell you which files need backing up. As provided by Kaypro, CP/M offers no facility for marking files that have been changed so that just the changed files may be backed up. This means that either you'll have to keep a list of what files have been altered since the last backup or you'll have to back up all the files every time. Because the hard disk contains the equivalent of about 23 floppy disks, the latter would be a burdensome task.

In an environment where several people use the machine and each can't be disciplined to keep records of files changed, a floppy-disk backup system could mean courting disaster, no matter how convenient the backup program is. Such users would be well advised to look for a hard-disk computer with a better backup system, even though it is likely to be a far more expensive system than the 10.

Menus

The Kaypro 10 includes a set of menus extensive enough that many users may be able to completely avoid learning CP/M if they wish.

The master menu (see photo 4), which automatically runs when the 10 is turned on (this auto-load feature may be turned off easily by running a program called Nomenu.com), enables you to run any of the major programs provided with the Kaypro. All you have to do is move the cursor to the program desired and press the Return key. Brief explanations of what each program can do are provided in an information area on the right side of the menu. The explanations change depending on where you have positioned the cursor.

The main menu chains into a set of subsidiary menus in cases where there are more decisions to be made. These special-purpose menus follow exactly the format of the main menu. All are quick to use and intelligible.

I liked these menus a lot better than any of the other menu systems I've seen on inexpensive microcomputers. The reason the Kaypro menus worked, though, didn't have as much to do with the menu design as with the hard disk. Most microcomputer menu systems break down because all the applications you might want to run are not available on the same disk. Thus, the menus lead you through disk changes in a way that necessarily leaves room for errors the menu system can't deal with well. This problem goes away when the menu can immediately run the desired application.

The hard disk also eases up the space constraints that hinder the designers of a menu system. The 100 or so kilobytes an adequate menu system might require is a big sacrifice on smaller-capacity, floppy-disk-only computers.

The 10's menus, though generally very useful, do have some annoying flaws: chief among these is that there are some important omissions from the menus. For example, the hard-disk backup system is completely menu-driven, except for the fact that you can't format a floppy disk from the menu. So backing up disks requires you to leave the menu system. Anything that makes the backing-up process harder or more confusing is a real problem.

Also, there is no easy way for you to customize the
OUTSMARTS
HAYES

Take a look at both and you'll discover the Novation Smart-Cat modems give you everything you get with the Hayes Smartmodem—plus some extras.

Off-the-shelf software
It's a draw. There's a lot of software for both.

For the Smart-Cats, there's ASCII Express "The Pro,"™ Crosstalk XVI™, Transend™ and more that let you do virtually anything you'd like. No compromises.

Only on the Cats:

Instant status report
Place a call and your Smart-Cat knows what's going on every microsecond. Fail to get a dial tone? Your Smart-Cat tells you right now. With Hayes, you can wait through an entire call-answer cycle—then wonder what went wrong.

Dial tone detect on long distance
With special long distance telephone services, you must wait for dial tone part way through a long dialing sequence. The Hayes modem relies on a pause—which works if things go just right. Smart-Cat waits, detects the tone, then completes dialing. It always works.

True, automatic "redialing"
The Hayes modem gives you a simple Repeat of the last command. Enter another command since you last dialed and you've lost the number.

Smart-Cats give you both Redial and Retry Redial calls the last number dialed no matter what has happened in between.

Retry keeps retrying on a busy signal. A handy time-saver.

Easy on-line commands
With Hayes, you need escape and re-entry codes when on-line. With the Cats, just enter a single command—or even string a bunch together. Smart-Cats follow them, then go back on-line. No lost contacts. No lost data.

Test everything
The Hayes modem has only internal testing. But the Cats do more. They also test the rest of the communications loop. At 1200 baud, the Cats can automatically run data over the line, through the other modem and back. You know if your modem is right. You know if the rest of the loop is right, too.

Novation LSI vs. Hayes discrete components
Large Scale Integrated (LSI) circuits—more and more logic on a smaller and smaller chip—is today's technology. It's the breakthrough that has made personal computers possible. It eliminates all kinds of parts and adds all kinds of logic. Our LSI does something else extremely logical. It cuts costs.

$595* (Novation) vs. $695* (Hayes)
The Smart-Cat 1200 is $100 less than the Hayes Smartmodem 1200. Now that's a lot smarter.

Lower price, LSI technology, lots of software—and no waiting. You can see them now at your computer store and let your computer out tonight.

It was the personal computer circus. And it had gone on too long.
The crowd grew restless as each new act continued to perform varying
degrees of IBM compatibility.
Suddenly, the crowd gasped. It was the unexpected finale—the arrival
of Sperry, with a performance no one could have imagined possible.
Ladies and gentlemen, it was the Sperry PC. It ran IBM compatible
software.
But that wasn’t the show stopper. Because it soon became quite clear
the Sperry PC didn’t just run the IBM programs; it ran them better.
Better because it ran them faster—up to 50% faster.
It ran them with breathtaking

graphics, far more dramatic than the
IBM PC could provide.
And it ran them from a keyboard
that drew roars of approval, for it was
not only easier to operate, but far
more comfortable than IBM’s.
And as the crowd cried out for more,
that’s just what Sperry gave them: the
ability to plug right into a company’s
main computer, whether that system
was IBM or Sperry. Or both.
As the crowd sat stunned by this
final flourish, Sperry left all with a
most provocative question. Was it
possible that the Sperry PC could do
all of this and yet cost less?
Again, the crowd gasped.

Could it be?
Come see for yourself. Hands-on,
side-by-side. Call 800-547-8362,
toll-free. Or write us. Sperry
Corporation, Computer Systems,
Department 100, P.O. Box 500, Blue
Bell, PA 19424.

It is no longer enough to be
IBM compatible. Not even for IBM.

The Sperry PC.
What the personal computer
should have been in the first place.
menus. Kaypro provides the S-BASIC source code for the menus, but this isn't enough. Customization should be possible without having to program. It certainly shouldn't require having to program in an unusual hybrid language available only with the Kaypro 10.

Documentation

It's helpful that the menu programs that Kaypro provides to move you around the hard disk are so good, because the Kaypro 10 User's Guide provided with the machine is a positive hindrance.

This manual must be rated unacceptable for several reasons. Its description of the organization of the 10's software bundle is not only incomplete, but very often incorrect. Vital information on system software utilities is missing or also incomplete. Very important documentation, such as the description of the hard disk backup utility, is stuck in the back, without so much as a note at the beginning of the manual to indicate it's there. There is no index.

The information presented in the manual also fluctuates between user-friendly and cryptic. The first few pages of the manual constitute a very gentle ''shake hands with your Kaypro 10'' introduction, complete with simple illustrations. They are followed by explanations of a few important CP/M utilities rendered in such a way that only someone already familiar with CP/M stands much chance of understanding them. This sudden change in tone is characteristic of the manual as a whole. The Kaypro 10 User's Guide will satisfy neither new nor accomplished users.

The User's Guide is only one of a small shelf's worth of manuals that come with the 10. Most of the other manuals are for one or more of the many programs bundled with the machine. All of these manuals (even Digital Research's improved CP/M manuals) are much better than the Kaypro manual.

One very welcome piece of documentation included with the 10 I reviewed was the second issue of Profiles, a slick magazine published by Kaypro for Kaypro owners (Profiles, POB N, Del Mar, CA 92014). Many outfits offering software and hardware add-ons specifically designed for the Kaypro have ads in Profiles that are enlightening.

Software

One of the advantages occasionally touted for the practice of bundling software with a computer is that it eliminates the problem of choice for the buyer new to the computer world. The manufacturer makes the software choices for the average user by making appropriate software part of the bundle purchased. Because the computer manufacturer usually has great buying and bargaining power, bundling also often provides a software package that would add up to more than the price of the computer system if each software item were purchased separately.

Kaypro apparently has tremendous buying and bargaining power. But while the company may have used
New Qantex 7020. It speaks their language.

If you buy any printer without considering the Qantex 7020, you could make a serious mistake. This multimode workhorse is compatible with nearly all of today's PCs and software. So no matter which programs or PCs you use now or in the future, the 7020 can handle them. Lotus 1-2-3, VisiCalc, Wordstar, dBASE II, BPS, Business Graphics, Perfect Writer, Apple, IBM, Epson, DEC — you name it.

As a high density graphics printer, the 7020 is fully dot addressable with resolution to 144 x 144 dots per inch and handles your most complex applications. Quickly and quietly.

As a single pass NLQ word processor (75cps), the 7020 gives you a choice of fonts along with proportional spacing, justification, auto underline, bold and more. Data processing is a breeze with bidirectional printing at 180 or 150 cps. User defined formats and 6-part forms capability are both standard.

It even provides built-in variable bar code capability and an operator-initiated test mode. And with industrial quality construction and a 500-million-character printhead life, the 7020 will be around for years of hard use.

The 7020 costs just $1,495 and is backed by the most comprehensive support in the industry. Find out how compatible it can be with your business. Contact Qantex for details or a demo, 60 Plant Avenue, Hauppauge, NY 11788. Call toll-free 800-645-5292; in New York State 516-582-6060.

north atlantic Qantex
this power to provide great value, it hasn't exactly eased
the novice's burden of choice.

Indeed, the Kaypro 10 comes bundled with an astounding
quantity of software. Unfortunately, many a novice
user will prefer to substitute the adjective "stupifying"
for "astounding." There is far more software included
with the 10 than anyone is likely to find useful.

Experienced computer users will likely be happy
to make the appropriate choices between two word processors, two spelling checkers, two spreadsheets, two
communication programs, and three versions of BASIC.
But without guidance from a friend or dealer, people
new to word processing will likely flounder trying to
choose whether first to learn Wordstar or Perfect Writer.
It would be very difficult to learn both at the same
time. The same will hold for spreadsheet-users-to-be faced
with both Perfect Calc and Chang Lab's Microplan or
novice programmers confronted with M, C, and S
BASIC.

To the well-guided user, though, the only problem
with this over-bundling will be the embarrassment of riches. There are several first-rate, tremendously useful
programs in the Kaypro's bundle.

While I can't possibly describe all the software in this
review (most of it has been extensively reviewed on its
own previously), a few items deserve particular note.

**Word Processing**

Microrad's Wordstar version 3.3 is a fine enhancement
of an already excellent product. While users of version
3.0 will not notice any particular changes in Wordstar itself, the manual and installation program have been
markedly improved. Wordstar's manual is no longer
scandalously difficult to read and there is even a good
tutorial booklet included. I wish that Wordstar had
accomplished this without inserting so many self-congratulatory cartoons and text passages in the process, but
the new manual still makes me feel much better about
recommending Wordstar to new users.

The installation program can now be used to easily
change such variables as the justification method and
the degree of help displayed when the editor is first
entered. Previously, only persons able to use the difficult
patching facility were able to customize these features.
(Yes, the patching facility still exists and is also much
improved.)

If you've given up on Wordstar as slow and awkward,
you may be in for a pleasant surprise when you try it
on the 10. First, the inherent speed of the hard disk
allows it to run a lot more smoothly and quickly. There
are no more agonizing pauses while program overlays
or the next page of text loads from disk into memory.
Second, Kaypro has implemented a function-key system
that makes use of the redefinable numeric keypad keys
to trim down several multikeystroke Wordstar commands
to single keystrokes.

Perfect Writer provides an interesting and useful con-
trast to Wordstar. This Perfect Software product is not
nearly the text-formatting tool that Wordstar is, but it is
a far better writing tool. Anyone who does (or wishes
to do) a lot of actual writing at the keyboard should take
a careful look at Perfect Writer.

Perfect Writer’s principal advantage for writing is its
ability to split the screen into two text windows. This
feature allows me to work on one portion of text while
having another portion in view (that portion may even
be in a file). It often saves me from having to print
out a draft just to be able to look at a piece of text while
writing a reference to it. All this is great for writing and
nearly indispensable for programming. Imagine being
able to look at a function declaration while writing the
function call.

Add to the split screen a very fast block-move feature,
a deletion “undo” command, the capacity to have up to
seven files open for editing (and passing text back and
forth among them), and a good search-and-replace facili-
ty, and you have a very good editor.

What you don’t have, though, is a very workable text
formatter. Perfect Writer is not a “what you see is what
you get” editor. This is not necessarily bad. When work-
ing on a long manuscript, I’d rather not do my formatting
while I do my writing. Instead, I’d like to pass it
through a formatting program, one that would do the
hard work for me, when I finish. This is what Perfect
Writer attempts to provide, but the program fails to allow
even adequate formatting control. Only through a very
awkward process of multiple formattings is it possible
to avoid such formatting disasters as section headings
alone at the bottom of pages. Getting a good format of
a long (75 double-spaced pages) academic manuscript
took me a good part of a day.

**Spelling Checkers**

Kaypro has provided what is, in my opinion, the crème
de la crème of 8-bit spelling checkers: Oasis Software's
The Word Plus. The Word Plus not only checks spelling
against a 50,000 word dictionary, but shows suspected
errors in context and suggests alternative spellings. The
dictionary can be easily updated and, special-purpose
supplementary dictionaries can be assembled. Best of
all, though, The Word Plus consistently identifies fewer
incorrectly spelled words as potentially misspelled than
other checkers I've tried. This may, of course, just mean
that the folks at Oasis Software and I share about the
same vocabulary.

Perfect Speller runs a good bit faster than The Word
Plus, but I found that it frequently missed my typographical
errors. This spelling program is one of those that tries
to make a small dictionary file seem big by using prefix/suffix rules to expand on it. If you don't mind having
words like "whyed" and "whileor" in your correspon-
dence, this might not bother you as much as it did me.

**Spreadsheet Programs**

One strong point in favor of the Perfect Software is that
once you've learned one of the programs, the others are
a lot easier to learn. This is because each member pro-
gram of the Perfect series shares a similar command
Prentice-Hall speaks a language other publishers have forgotten.

IBM PC BASIC PROGRAMMING by Richard Haskell and Glenn A. Jackson: A see-as-you-do approach to beginning programming. Loaded with step-by-step screen illustrations and fascinating graphics examples. $13.95

THE IBM PC/XT GRAPHICS BOOK by John Fowler. Ph.D. An example-packed IBM BASIC graphics tutorial. Covers both simple and advanced concepts for business and pleasure. $16.95

LSF: THE LEAST SQUARES CURVE FITTER: A Problem Solving Aid for the IBM PC by The Summar Corporation: A software package that explains what Least Curve Fitting is and how engineers, social scientists, and data analysts can use it to solve problems on the IBM-PC. $39.95

TELECOMMUNICATIONS FOR THE IBM PC Jr by David W. Carroll: How to use the new IBM PC Jr. as a home communications terminal for gaining access to data-bases, sending and receiving electronic mail, and communicating with other computers all over the world. $15.95

GETTING THE MOST FROM WORDSTAR* AND MAILMERGE: Things Micropro Never Told You by M. David Stone: Exciting new ways to take full advantage of these two highly popular word-processing programs. $14.95

QUELO 68000 Assembler Package

68000

New 5.0 Release
First Commercial Release: January, 1983

The QUELO portable 68000 assembler conforms to the Motorola resident assembler, publication M68KMASM[D4].

QUELO 68000 Assembler Package Features:

Input file concatenation, include function, macros, global parameter substitution from command line, listing date-time stamp, up to 31 character symbols, conditional assembly, structured programming directives, instruction optimization, 68010 instructions, relocation and linking, complex expression linking (all operators), D8-DW-DI, directives for Z80 byte order data generation, object library utility, software configuration tracking, conditional linking, options for assembler and linker to write complete symbol table to a file, detailed symbol table listings, assembler symbol cross-reference, linker global symbol symbol cross-reference, object library symbol cross-reference, super linker load map, various HEX load formats produced by linker, error messages in English (not meaning numbers), extensive typeset manual with index, readily transported to any system with a C compiler and "UNIX like" system interface for command line and file access.

Ready to run in various disk formats for CP/M-80, CP/M-86, CP/M-68K, MS-DOS and PC-DOS.

$300 early bird price, good until June 30, 1984.
CP/M-68K, MS-DOS and PC-DOS $595 after June 30.

Portable version with detailed installation and testing instructions. $750 and license agreement.

If you manufacture a computer system or a compute based product.
You can purchase these "C" Language packages with SOlr software within Your Product Hardware.

Database

Anyone interested in keeping databases with the 10 should know that Perfect Filer may not meet your needs. While the program's preconfigured mailing-list databases worked very well and were easy to use, Perfect Filer proved aggravating when I tried to do much more.

The Perfect Filer manual provided with the 10 was noticeably the weakest of the Perfect series. After warmly greeting me with easy tutorials when I wanted to do easy things, it coldly abandoned me the moment I wanted to do something other than create a sample database of current members of Congress. The problem was that I tended to make mistakes. Apparently the authors of the tutorials were not so error-prone, because an explanation of how to make corrections was not included.

Perfect Filer was just as poor on error handling. Its response to that likely database error, filling the disk, was to let me go on merrily making entries. (I tried this on a floppy disk, as I didn't have the time nor the patience to fill the hard disk with a mailing list.) The manual didn't explain error messages and the program's on-screen messages were cryptic at best, particularly when it didn't like my attempts at form-letter generation.

Floppy-disk Translation

While reviewing the 10, I had the opportunity to try out a wonderful $49.95 disk-format translation program from Micro Solutions.

Uniform, which is available in different forms for the Kaypro II, 4, and 10, enables you to read, write, and for-
RUN VIRTUALLY ANY SOFTWARE ON ONE POWERFUL PERSONAL COMPUTER.

Here's the compatibility you have been waiting for. Dimension. A single personal computer able to handle Apple®, IBM®, TRS-80®, UNIX™ and CP/M® based software.

The Dimension 68000 Professional Personal Computer does it all. It's designed to emulate virtually any popular microcomputer and software combination today. Or tomorrow.

Dimension provides the incredible power of a 32 bit MC68000 microprocessor with up to 16 megabytes of random access memory.

And it lets you add future innovations as they develop.

Dimension. Compatibility and expandability with all the power of a mainframe. At a personal computer price, it's obviously the best value you can find. For more information ask your dealer or call us at (214) 630-2562 for the name of your nearest dealer.

Apple is a registered trademark of Apple Computer, Inc.; IBM is a registered trademark of International Business Machines Corporation; TRS-80 is a registered trademark of Radio Shack, a Tandy Corporation company; UNIX is a trademark of Bell Laboratories, Inc.; CP/M is a registered trademark of Digital Research Corporation.

THE MOST POWERFUL, MOST COMPATIBLE PERSONAL COMPUTER YOU CAN BUY.
mat 5¼-inch disks for a variety of different microcomputers. The version of Uniform for the Kaypro II can, of course, only translate single-sided disk formats; the versions for the 4 and 10 can handle most of the major double-sided formats as well. Televideo, NEC, Osborne, Xerox, Epson, Orona, Cromemco, Hewlett-Packard, Zenith, Morrow, and Radio Shack CP/M microcomputers are just a few of the many different machines listed on Uniform's easy to use menus.

Most impressive of all, Uniform on the 4 and 10 also provides a facility for translating CP/M and PC-DOS directory formats. This enables you to transfer data files between PC DOS 1.0 (160K bytes) and 1.1 (320K bytes) disk formats. I was able to use this feature to move a friend's Wordstar-format text files from NEC 8001 format disks to disks for use on an IBM PC in only a few quick steps.

Having Uniform on the 10 gives you a hard-disk computer that is data-compatible with the IBM for under half the price of the IBM PC XT. As PC format disks become the de facto standard for disk information exchange between microcomputers, this data compatibility will be very important. Some writers already are offered incentives by their publishers to furnish their prose on a PC-readable disk.

Revisions

The Kaypro 10 had been on the market about five months when I wrote this review. The machine I viewed (a late November 1983 model) was very different in both the software bundle and implementation of the operating system from what Kaypro was shipping in July of 1983. The software bundle had gone through several major changes, the BIOS (basic input/output system) was in revision "F" and the monitor EPROM (erasable programmable read-only memory) and the hard-disk interface board had each been changed. Several system utilities for use with the hard disk had been revised to work with the new EPROM and interface.

The BIOS, EPROM, interface board, and utility changes were necessitated, a Kaypro spokesperson said, to rectify a problem that only a few machines might have: incorrectly reporting hard-disk errors. In addition to preventing inaccurate reports of read faults, the changes also appeared designed to prevent a possible hard-disk reset error, an independent comparison of the old and new interface card suggested.

Kaypro is shipping kits to all its dealers that are necessary to fix any 10s already sold that might have the hard-disk difficulties, and no charge will be made for the repairs whether in or out of warranty, the Kaypro spokesperson said.

Conclusion

The drawbacks of the Kaypro 10 are definitely overshadowed by its many advantages; for instance, the 9-inch, high-resolution, non-glare screen has the problem of inflexibility, yet is much more readable than the 12-inch (and larger) screens of many desktop computers. In addition, the software varies in quality—but there is a lot of it bundled with the system. And while the User's Manual is poorly organized and incomplete, the menu system and enhancements to CP/M will aid both novice and experienced CP/M users in mastering the tremendous storage capacity of the hard-disk drive. Furthermore, the floppy-disk backup may not meet the needs of all users, but on the other hand, the system's hard-disk drive has advantages in speed and convenience over comparably-priced, floppy-disk-only computers. Overall, the machine reviewed was reliable and fairly easy to transport. Despite a few rough spots, the Kaypro 10's many advantages make it an exceptional value for the money. It should be considered by anyone interested in hard-disk capacity or performance at an excellent price.
Dow Jones means business.
The leading name in business information is now the leading name in business software.

The Wall Street Journal, Barron's, Dow Jones News/Retrieval. Dow Jones has set the standard for business information for over 100 years. Now Dow Jones introduces a full range of business and financial software for personal computers. Many of these programs manage information from Dow Jones News/Retrieval, the nation's leading online news and information service. All programs entitle you to a News/Retrieval password. All set standards for business and financial software.

*Telephone and modem required for News/Retrieval.

Accounting

New from Dow Jones, the accounting series is designed to meet all the accounting needs of small businesses. It offers power and flexibility, yet is easy to learn and use. When you purchase Dow Jones General Ledger, Accounts Receivable or Accounts Payable, you are eligible for a free training seminar designed by Arthur Young, one of the nation's foremost accounting firms. This seminar covers computerized accounting and bookkeeping principles.

Dow Jones General Ledger is the heart of the accounting series. Using Generally Accepted Accounting Principles, the General Ledger allows you to define the structure of your chart of accounts and establish account ranges for assets, liabilities, capital, income and expenses. It offers double-entry bookkeeping that's never out of balance, and allows you to post entries "in pencil" for easy error checking and correction. When you are satisfied, you can close your books and the General Ledger posts your entries "in ink" and freezes a full audit trail. When you print financial reports, the General Ledger formats them to reflect the structure of your chart of accounts.

Dow Jones Accounts Receivable and Dow Jones Accounts Payable complete the basic accounting system. Programs for Sales Order Entry, Purchase Order Entry, Management Analysis and Inventory will be available early in 1985.

By Trademark Software, Inc. and Dow Jones & Company, Inc.
Available for the IBM* XT.
Seminars and product may not be available in all areas.

Investment

Dow Jones investment software was introduced in 1982 and rapidly became the leader in the field. These best-selling programs, expressly designed for investors, money managers and business planners, allow you to analyze and manage your investments using financial information from Dow Jones News/Retrieval. You also have easy access to business news and headlines, economic updates and forecasts.

Dow Jones Market Analyzer is an integrated technical analysis and communications program that can increase the effectiveness of your investment decisions. The Market Analyzer collects and stores historical quotes from Dow Jones News/Retrieval, and automatically updates daily data on stocks, bonds, mutual funds and options. It then calculates and constructs price and volume charts, trend lines, moving averages, support/resistance lines and many other charts.

By RTR Software, Inc. and Dow Jones & Company, Inc.
Available for the IBM* PC, IBM XT, TI Professional and Apple II computers.

Dow Jones Market Manager provides you with a powerful investment information system for maintaining single or multiple portfolios.
Dow Jones Sales Director™ automatically consolidates information from the other two programs in the sales system, performs analysis and produces management reports that can then be distributed throughout the organization. Scheduling, word processing, graphics and spreadsheet capabilities are also included.

(Available summer/fall 1984) By PYE Software, Inc. and Dow Jones & Company, Inc. Available for the IBM PC and IBM XT.

Home Finance

Dow Jones software for the home helps you organize and control your personal finances. The products in this series keep track of how your money is earned, spent and invested. In addition, your Dow Jones News/Retrieval password brings you and your family news and information, encyclopedia articles, sports, weather reports and movie reviews.

Dow Jones Home Budget™ helps you plan and control your financial situation. It keeps track of your income, expenses, assets and liabilities to help you in financial planning, budgeting and tax preparation. You can program the Home Budget to flag tax-deductible expenses and automatically account for recurring transactions such as mortgage payments and telephone bills. The Dow Jones Home Budget allows you to produce reports about specific accounts and transactions, and provides you with a net worth statement that gives you a clear picture of your personal finances.

Dow Jones Investment Evaluator™ is a personalized system for managing your portfolio. It maintains one or more portfolios of up to 50 securities each, and automatically updates your stocks with the latest quotes from Dow Jones News/Retrieval. The Investment Evaluator displays or prints reports showing purchase value, current value and gains and losses, so you can evaluate your position at a glance.

By Dow Jones & Company, Inc. Available for the IBM PC and TI Professional.

All Dow Jones Software™ is fully supported by a sixty-day warranty, thorough documentation and a toll-free Customer Service hotline.

Visit your computer store for a free demonstration, or call for free brochures on Dow Jones Software and Dow Jones News/Retrieval:

1-800-345-8500 ext. 325

(Alaska, Hawaii and foreign call 1-215-789-7008 ext. 325)
The Market Manager automatically values your existing position in the stock market. Its tax lot accounting system records all your securities transactions and matches your sell transactions to existing positions in the market, to minimize tax liability. You can also generate reports for individual accounts and an overall securities holdings report.

*By TELEWARE, Inc. and Dow Jones & Company Inc.*
*Available for the IBM PC and Apple II and Apple III computers.*

**Dow Jones Market Microscope™** is a fundamental analysis program for money managers, business planners and investors. It allows you to produce reports that screen industries and companies using Media General and Corporate Earnings Estimator™ financial indicators. A Price Alert routine tells you which stocks have reached your critical levels for buying and selling.

*By National Softworks and Dow Jones & Company Inc.*
*Available for the IBM PC, TI Professional and Apple II computers.*

---

**Communications**

Dow Jones communications software is designed to meet the business analysis needs of executives and investors. These programs allow you to collect, store, and organize timely information from Dow Jones News/Retrieval. You have access to financial information on companies and industries, current and historical quotes, and exclusive news from The Wall Street Journal, Barron’s and the Dow Jones News Service.

**Dow Jones Spreadsheet Link™** is an efficient and accurate way to collect and transfer up-to-date financial information from Dow Jones News/Retrieval to Lotus™ 1-2-3™ VisiCalc® or Multiplan® spreadsheets. Spreadsheet Link saves you time by eliminating manual data entry, and requires a minimum of memory. Now you have immediate access to the information you need, and can enter it into your customized template with just a few keystrokes.

*By Solutions, Inc. and Dow Jones & Company Inc.*
*Available for the IBM PC, IBM XT, IBM® PCjr™, IBM® PC 3270, Apple II systems and Apple® Macintosh.*

**Dow Jones News Link™** allows you to follow and analyze the latest business news—easily and quickly. You can retrieve text and statistics from News/Retrieval and create your own personal database. Then, offline, it is easy to read, edit, index and store information. With News Link, the summaries and reports you produce can be transmitted to other locations using computers and modems. An expanded version of News Link includes additional communications features.

*(Available fall 1984) By Geo/Communications and Dow Jones & Company Inc.*
*Available for the IBM PC, IBM XT and IBM PCjr.*

---

**Sales Management**

Dow Jones sales management software enables sales professionals and their organizations to sell more effectively. These powerful new programs can be used as an integrated system. They produce reports that give you information about all phases of your sales cycle. All three programs feature in-depth tutorials and easy-to-follow menus.

**Dow Jones Sales Organizer™** is designed for sales representatives and managers. It tracks prospects throughout the customer relationship, and automates scheduling. The Sales Organizer produces budget, forecast, commission, lead capture rate, expense and call reports, along with quotation, order and product summaries. It has graphics and spreadsheet capabilities that allow you to analyze data the way you want, and includes word processing and order tracking.

**Dow Jones Prospect Organizer™** enables sales support staff to track prospects from initial lead through assignment to sales territories. The Prospect Organizer allows you to create a database of updated prospect information and to analyze media and promotion effectiveness. You can generate reports that show the geographic distribution and current status of your prospects. Word processing capabilities simplify correspondence, telemarketing, survey and direct mail functions.
Dow Jones News/Retrieval means information.

Included in any Dow Jones Software program, your Dow Jones News/Retrieval password brings you a world of electronic information on your personal computer (via telephone and modem). There is only one Dow Jones, and Dow Jones News/Retrieval provides you with exclusive news and information from The Wall Street Journal and Barron’s, stock quotes direct from the floor of the exchange, and a wide range of information and services for you, your business and your family. Dow Jones Investment and Communications software is specifically designed for easy access and management of information from News/Retrieval. Here are some of News/Retrieval’s data bases:

**Dow Jones Business and Economic News**
- News from The Wall Street Journal, Barron’s and the Dow Jones News Service
- Online headlines and summaries of major stories
- Text search of Dow Jones News
- Weekly economic update
- Full text of The Wall Street Journal

**Dow Jones Quotes™**
- Current quotes 15 minutes from the floor
- Historical quotes covering a full year
- Historical Dow Jones Averages™

**Financial and Investment Services**
- Earnings forecasts from Corporate Earnings Estimator™
- DISCLOSURE II — SEC filings and company profiles
- Detailed corporate financial information from Media General Financial Services
- Economic and foreign exchange survey
- Forbes rankings of U.S. corporations and industries
- Airline schedules and fares
- Merrill Lynch Research Service

**General News and Information**
- Academic American Encyclopedia
- Foreign and national news
- Sports
- Movie reviews
- Wall Street Week Online™ transcripts
- Comp-U-Store™ electronic shopping service

**MCI Mail Service and Free Customer Newsletter**

Converting the TRS-80 Model III for CP/M
Comparing Mapper III, Shuffleboard III, and Vid-80
Mark E. Renne
Free-lance Writer

When Radio Shack announced CP/M compatibility for the Model 4, it became another of the many manufacturers to make the CP/M operating system available for its computers. But should Model III owners rush down to their Radio Shack stores and shell out $799 for a Model 4 upgrade kit, or should they look into the many CP/M conversions available for the Model III? This article will briefly explain some of the basics of CP/M and then examine three different conversions that are available.

The so-called control program for microcomputers (CP/M) designed by Digital Research of Pacific Grove, California, has become the standard operating system for 8-bit microcomputers. It is used by more manufacturers than any other system. Some people would like to have you believe that CP/M is the answer to all your problems, but it has a few bugs of its own.

Myths about CP/M
Either on purpose or by ignorance, many salespeople insist that CP/M allows programs to be used on any other computer as long as it uses CP/M. Although there is some truth to this, CP/M is not as transportable as many people think. In fact, for a program to be transported from one brand of computer to another, several things have to be true depending on the program. For example, if it's a machine-language program, the computers must have the same central processing unit. CP/M Apple Visicalc will not work on a TRS-80 under CP/M. For other programs, the same language—including version—must be available on both computers. Also, the same version of CP/M usually will be required on both computers. TRS-80 users are familiar with this from Radio Shack's upgrade of TRSDOS from 1.1 to 1.3. In this article we will talk primarily about CP/M version 2.2. Note, however, that some new programs for CP/M version 3.0 may not run on CP/M 2.2.

Another problem is screen compatibility. Most people write CP/M programs with an 80-character by 24-line screen in mind; the Model III has a 64 by 16 screen. Some CP/M conversions for the Model III also change the format of the III's screen, but that increases cost. Because most microcomputers at one time had 64 by 16 screens, many programs work well in this mode. Other programs work on different brands and have an Install program that allows the user to adjust screen size.

Also, each computer formats the disks used in its system differently. The 8-inch, single-density format is standard, but 5¼-inch disk formats are chaotic. Don't be misled into believing you can simply take a disk from your neighbor's North Star and insert it in your TRS-80 because they both use CP/M. (Actually, you could insert it—it just wouldn't work!) Some CP/M systems, however, do allow this type of interchangeability, and I'll discuss that later.

For a program to be totally transportable, then, even under CP/M, it must be written for the same processor,
At a Glance

Name
Mapper III

Use
To convert the Radio Shack TRS-80 Model III to operate under the CP/M operating system as well as TRSDOS

Manufacturer
Omkikon
1127 Hearst St.,
Berkeley, CA 94702
(415) 845-8013

Hardware required
Radio Shack TRS-80 Model III, 48K bytes of RAM, disk

Software supplied
CP/M 2.2, MBASIC

Documentation
8½ by 11-inch, three-hole punched, 6-page installation manual,
15-page users manual, 150-page MBASIC manual, and 249-page CP/M manual

Price
$199

use the same language (including version), be set up for the same screen size, and be formatted in a way that can be read by the conversion.

The Advantages of CP/M

Why then, would you convert to CP/M? The principal advantage for users is the great number of programs available that run under CP/M. There are also a great number of users groups that support CP/M, providing public-domain software and also assistance for modifying CP/M for different machines.

The greatest advantage of CP/M for manufacturers is that it is hardware independent. In other words, only a small part of CP/M—specifically, the BIOS (basic input/output system)—has to be changed to work on different computers. This flexibility enables manufacturers to include an operating system for their computers with relatively little effort. It also makes it possible for programs written on one computer to be used on other computers because they have an operating system in common.

The Disadvantages of CP/M

Because of its flexibility, CP/M doesn't take advantage of any of the special features of a particular machine. For example, there's no way to access the graphics capabilities of the TRS-80. Also, CP/M works with only one drive at a time. If you want to execute a program, you must be "logged on" the correct drive; it does not search all drives for the program as TRSDOS does. There is no password protection on any files, but because any password eventually can be broken, maybe that isn't a drawback. Also, to copy a disk you must use three separate programs. The last problem with CP/M is the quality of error messages—there are only a few, and all are non-descriptive. It's hard to believe, but this operating system reports more cryptic messages than TRSDOS.

Converting the TRS-80 to CP/M

Let's look at some CP/M conversions available for the TRS-80 Model III. First, this machine requires a hardware conversion rather than just software because the Model III uses the first 14K bytes of memory for ROM (read-only memory) BASIC, while CP/M expects that memory to be empty and available for operating system use. This conflict can be resolved only by a hardware modification. Of course, all modifications still allow you to use TRSDOS for your existing software.

The conversion procedure is similar in all cases. Remove the cover of the TRS-80 as well as the heat shield covering the central processing board. Remove the Z80 chip and replace it with a circuit board that plugs into the Z80 socket. Then plug the Z80 chip into the circuit board. Some modifications also require a RAM (random-access read/write memory) chip to be removed and replaced by a plug connected to the CP/M board. The en-
As your terminal needs accelerate, move to Ann Arbor. We make the CRTs used by hard-driving professionals from M.I.T. to Stanford.

Take our Ann Arbor Ambassador, for instance. Nothing about it slows you down. The editing commands use line pointers to virtually eliminate the need for pad characters. The ANSI coding lets you put parameters in your commands to speed up execution.

And that's just for starters. The Ambassador does what no other alphanumeric terminal can: it gives you a 60-line display with zoom. You choose the format best suited to your software and your comfort—24 lines, 30 lines, 48 lines. Whatever. Then instantly zoom up to 60 to see what a printout will look like. Recapture something that scrolled by too fast. Or simply check for context.

Like all Ann Arbor products, the Ambassador uses a large, easy-to-read screen—either portrait or landscape. The case can be tilt/swivel or rack mounted. And the detached keyboard provides dozens of programmable keys to save you time.

Of course, starting at $1595, the Ambassador isn't for everyone. Just for the thousands of professionals who really want to move.

For more information, call 313/663-8000. Or write us at Ann Arbor Terminals Inc., 6175 Jackson Road, Ann Arbor, Michigan 48103. But don't wait too long—the Ambassadors are going fast!

Circle 37 on inquiry card.

Once you've worked with them, you won't work without them.

0 to 60
in less than a second.
tire procedure takes about a half-hour and is easy even for those who have had only a casual acquaintance with electronics.

Because the Model III lacks a number of ASCII (American National Standard Code for Information Interchange) characters on the keyboard (braces, brackets, control key, etc.), CP/M modifications must also reconfigure the keyboard to generate all the ASCII characters. Usually this involves a combination of keys, such as the Up-Arrow and another key. I'll discuss each modifica-
tion separately, but I've also summarized conversion features in table 1.

**Mapper III**

The least expensive board evaluated was the Mapper III from Omikron. Although the board lists for $199, it functions well and most of its limitations should be eliminated by the time you read this.

The board I evaluated was an early prototype board that Omikron was shipping to its customers. This board is single-density, uppercase only. The manufacturer indicated that double-density should be available very soon, which would be a must for any serious user of CP/M. Omikron indicated that this will be a free upgrade for its customers and will contain a number of enhancements I'll cover later.

The Mapper III uses the Down-Arrow key for the Control key and Shift-Break for escape. It emulates the SOROC IQ120 terminal for video addressing and screen display. Installation is easy and requires the removal of only one chip, the Z80. The board contains all the chips in sockets for easy repair and upgrade. It's also the smallest board that was tested.

The Mapper III that I tested could read only disks formatted for the Mapper III. Omikron indicated that the production board will read a number of formats with the previously mentioned software upgrade.

Omikron also expects to release a number of very useful utilities that will be standard with the production of the Mapper III, or free to owners of earlier Mapper IIIIs, in the near future. These include programs to check memory, check disk condition, emulate a dumb terminal, and transfer programs from TRSDOS to CP/M. The last program will be most useful for long BASIC programs that you don't want to retype. Programs written under TRSDOS probably won't run under CP/M without modification.

For another $199, Omikron offers an additional software package to go with the Mapper III. The package, which includes CBASIC-II, Wordstar, and Microproof, represents a substantial savings over retail prices of these packages and gives you a good start on CP/M software. Omikron also has a special user's purchase group, Cougar, that enables owners to buy additional software at greatly reduced prices.

The installation instructions are well written and I encountered no problems with the board. Also, Omikron offers a lifetime warranty on the Mapper III. Although the software for the version I tested was not as sophisticated as the other boards, even in its preliminary form, the Mapper III offers a good value for those interested in CP/M. You should check with Omikron, however, to verify current capabilities for a particular application.

**Shuffleboard III**

The Shuffleboard III from Memory Merchant is a moderately priced ($299) yet excellent conversion that contains an additional 16K bytes of memory, for a total of 64K under CP/M with a 48K-byte Model III. It includes both CP/M 2.2 and MBASIC, Microsoft's BASIC interpreter for CP/M, similar to the TRS-80 standard BASIC. A 77-page users manual and 398 pages of Digital Research documentation for MBASIC and CP/M 2.2 provide necessary documentation.

This conversion features an "auto-sense" boot that automatically determines what type of operating system is contained on the disk in drive zero. In other words, once installed, the conversion boots in the proper mode automatically; you can disable this feature if desired. The system normally boots from drive zero, but this also can be disabled, allowing you to boot from any drive for CP/M. (TRSDOS, of course, always boots from drive zero.)

The Up-Arrow key functions as a control key, and all other ASCII characters may be generated from the keyboard. The cursor may be set for either blinking or nonblinking, and linefeeds for the printer may be disabled or enabled easily to accommodate different printers.

A special function allows a remote terminal to be hooked up to the RS-232C port to allow for graphics, an 80 by 24 display, or any other special function. A SETCOM command, similar to that found in TRSDOS, is used to set the data rate, parity, character length, and stop bits. Direct cursor addressing is implemented, and console control characters are equivalent to a Lear-Siegler ADM-3A control set.

Perhaps one of the most unique features of the Shuffleboard III is its virtual drive function. Although difficult to explain in this limited space, virtual drive means that it may appear to the system that you have more drives.

FOR THE IBM PC

ANNOUNCING

EMACS
FOR THE
IBM PC

UniPress is pleased to announce the availability of MS-DOS EMACS to supplement our existing UNIX and VMS versions. MS-DOS EMACS is full-function Gosling EMACS, including compiled MLISP, macros, command undo and much more.

UniPress Gosling EMACS: The ultimate programmer's tool: C, Pascal and MLISP language assist. EMACS manages execution of Unix makefiles, and automatically points to lines containing errors in the source code. Keys can be bound as desired, macros can be named, customized MLISP routines can supplement the many included packages, and much more!

UniPress Gosling EMACS: Use EMACS as your session manager — divide your screen into a "shell window" to run commands, and one or more source file windows.

ALSO NEW! MINIMACS — Special efficiency-conscious EMACS. Faster and smaller; includes all standard editing features, keybinding, and multiple windows.

PRICES:

- UNIX: $395/Binary; $995/Source
- VMS: $2500/Binary, $7000/Source
- MS-DOS: $375/Binary, $995/Source

(Requires at least 384K)

UNIPRESS OFFERS A FULL LINE OF SOFTWARE FOR UNIX, VMS AND MS-DOS.

Lattice® C compilers to the 8086-family; both native and cross. Write programs on your mainframe for execution on the IBM-PC, etc. (Cross compilers for UNIX and VMS.)

Q-CALC — extraordinary UNIX spreadsheet.

LEX — Powerful interactive UNIX word processor.

PHACT — Multi-keyed ISAM database record manager for UNIX and MS-DOS.

OTHER UNIPRESS PRODUCTS:

Full UNIX System V operating system for the Apple LISA, IRDB The Menu System, UniCalc, and more.

Call or write for more information.

than you actually do. For example, the operating system may believe that you have two double-density and two single-density drives even though you have only two double-density configurations. This makes some difficult operations easy. A high-density format routine also increases disk capacity by about 11K bytes.

I strongly believe that any good conversion should include the ability to read many disk formats because very little CP/M software comes in the TRS-80 format. The Shuffleboard Ill will read and format Osborne, IBM, and Xerox disks. Superbrain, Kaypro, and Televideo should be ready soon. Of course, IBM programs won't run on the TRS-80 because IBM uses different central processors, but this conversion does make data transfer possible. Please note that I said Shuffleboard Ill would also format these disks. This enables you to prepare a disk directly on your computer for a friend who owns a different computer, a very nice feature that is well implemented on the Shuffleboard III.

The warranty is good for one year, and Memory Merchant offers a 15-day trial period. Installation instructions are well written and clear. I installed the board quickly and without board or documentation problems. The Shuffleboard III offers a conversion with the features most users require for a reasonable price.

Vid-80

The $399 Vid-80 by Holmes Engineering is the one board that not only converts the TRS-80 to CP/M but also converts the screen to 80 by 24. As mentioned earlier, most software is formatted for an 80 by 24 screen, and this conversion makes the Model Ill compatible with almost all CP/M software. For video and screen formatting, the Vid-80 emulates the Lear-Siegler ADM-3A terminal.

The conversion for 80 by 24 also works in TRS-DOS with some limitations. Software, especially machine language, will not work without conversion in the 80 by 24 mode. The board also redefines graphics from 127 by 47 to 159 by 71, slightly improving resolution. Locations for the PRINT@ command are also redefined from 0 through 1024 and 0 through 1919. It would take a separate review to evaluate the board for its use in TRS-DOS, but it does function under both operating systems.

The latest version of the board has the ability to read and write several 5¼-inch disk formats, including those of the IBM PC, Kaypro II, Xerox 820 (single- and double-density), Osborne-I, Zenith Z-100, Freedom Tech, and Morrow Micro Decision. Maximum storage using the Kaypro standard is 191K bytes. Considering that CP/M uses quite a bit of disk overhead, this is amazing. You end up with more storage capability than TRS-DOS.

After the board is installed, the Model Ill automatically recognizes which operating system is on the disk and boots up in the 80-character mode. If you want a 64-character mode, you hold down a "6" during booting. Installation requires the removal of two integrated circuits and their replacement on the Vid-80 board. Two solderless jumper cords and two power cords must be at-
The all new Freedom™ 110 VDT has just two things going for it.

The price, $595. The new Freedom 110 Video Display Terminal is without question the price leader of all low-end smart terminals. And it doesn't stop there. In fact, the price is only the beginning.

The performance. It starts with distinctive styling, including a tilt and swivel screen, and a sculptured, detached European DIN-standard keyboard. We paid a little extra for the green phosphor (amber optional) non-glare high resolution screen so you get the best in crisp, easy to read characters. We've packed the ergonomic Freedom 110 with a long list of user-relevant features, too.

☐ 24 x 80 display with user-accessible 25th status line.
☐ 10 programmable non-volatile function keys (20 with shift) and 20 pre-programmed codes.
☐ Flexible non-volatile set-up modes (full page or status line).
☐ 15 thin-line graphic characters.
☐ Non-embedded character attributes.
☐ 9 cursor control and 8 editing keys.
☐ Screen time-out.
☐ Block, conversation, monitor and local communication modes.
☐ Bidirectional buffered auxiliary port.
☐ 8 standard foreign character sets.
☐ Self-test mode.
☐ TeleVideo 910, ADDS Regent 25, Lear Siegler ADM 3A/5 and Hazeltine 1420 emulation.
☐ Chassis-mounted PC board for the same easy serviceability and add-on board capability as the advanced Freedom™ 200 VDT.

You get all this, plus our industry leading six-month warranty and comprehensive third-party service. To find out more about what price and performance leadership really means, contact your nearest Liberty dealer or distributor. Or call Liberty direct at (415) 543-7000.

See us at COMDEX in Atlanta. Booth 3432, West Hall.

Circle 231 on inquiry card.
tached. All this is done without any soldering or permanent change to your TRS-80.

In addition to the CP/M operating system and its utilities, two other programs are included. A Sap utility sorts and packs the directory to conserve space and alphabetize. An Unerase utility lets you restore files that may have been accidentally erased. Auto-repeat capabilities for each key are also standard with the Vid-80.

The Vid-80 RAM can be increased through expansion modules to nearly 1 megabyte. A CP/M 3.0 version should be available by now for Holmes's 64K-byte memory option (112K bytes total), which sells for $524.

For technical assistance and updates, Holmes maintains both a phone number and a computer bulletin board. This bulletin board, Connection-80, enables Holmes to pass on patches and other technical information and allows the user to leave questions about Vid-80 for Holmes. When I contacted Holmes with technical questions, both as a reviewer and customer, the company was courteous, quick, and correct each time.

Both Omikron and Memory Merchant indicated that they will be marketing an 80 by 24 conversion for their CP/M boards in the future. The Vid-80 already has this feature, which makes the Model III very competitive with the Model 4. The Vid-80 is a complete CP/M conversion and enables you to enter the world of CP/M without reservation.

What about the Model 4?

What advantages does the Model 4 have over the Model III? Well, they are a higher speed processor, an 80 by 24 screen, ASCII character generation, a new (TRSDOS 6.0) operating system, and CP/M compatibility. If you're only interested in CP/M, you should consider one of these boards for your Model III. Holmes also sells a speed-up kit for the Model III for about $100. Converting this way allows you to add one piece at a time, instead of all in one big costly chunk.

Conclusions

Each of the conversions is targeted at different users. You should decide which you need for your individual use. All the conversions worked without major problems and are easy to install following the instructions included with each.

The Omikron Mapper III is aimed at the low-budget user who intends to purchase his software from Omikron. Omikron's Cougar club allows owners to purchase major programs at very low cost. The company has a track record with the Model I Mapper and should have several enhancements included in the future.

The Memory Merchant Shuffleboard III is a full-featured CP/M conversion that meets the needs of most users. It reads three disk formats, and three more will be ready soon. The virtual-drive idea is exciting and very useful to two-drive owners. I was most impressed with this board and its implementation. I have used this board for several months without a single bug.

The Vid-80 from Holmes Engineering is the only conversion I tried that also converts the screen to 80 by 24. Sooner or later all computer users will want this size screen for some application, and Holmes solved that problem. I give Holmes four stars for this conversion.

I know that $400 is quite a bit to spend, but that's a very low price for CP/M, an 80 by 24 display, and accommodation of a wide variety of disk formats. Holmes has been in the TRS-80 business for many years and has a good record with the dealers with whom I spoke. If you can afford to do the conversion all at once, the Holmes board is a good choice.

All in all, the TRS-80 user has a number of conversions from which to choose. With Radio Shack turning to CP/M, it may not be many years before TRSDOS is gone forever. I think all serious users should start looking into CP/M and what it has to offer.

Author's Note:

I'd like to thank all the manufacturers for their cooperation and answers to my questions. I'd also like to thank Bob Byars at Mountain Data in Havre, Montana, for the use of his equipment and time.

DRAWING YOUR OWN CONCLUSIONS

...is easy with the versatile HIPAD™ DT-114 from Houston Instrument.

Enter a whole new universe of graphics, made possible by programs tailored to the HIPAD digitizer.

Exciting new applications in computer-aided drafting are now available, allowing you to create subdivision plats, machine drawings, schematics, architectural elevations and circuit-board artwork...with your microcomputer...at your desk...with no training as a draftsman.

Use of the HIPAD in medicine is increasing. With currently available software, physicians and dentists can prepare graphics of anatomical features for diagnosis and correction.

Artistic efforts are complemented by the HIPAD. With customized software, free-form renditions can be created quickly and precisely. Colors to fit the moment can be selected...and easily changed at a later time. The HIPAD provides access to the realm of high technology graphics.

The HIPAD features a full-size 11" x 11" digitizing area, and is both UL listed and FCC approved.

The Conclusions You Draw Are Clearly Correct. The HIPAD will open the door to a universe of form and color...and creativity.

For the name, address and phone number of your nearest representative, write Houston Instrument, P.O. Box 15720, Austin, TX 78761. Phone 512-335-0900, or 800-531-5205 if outside Texas for the name and location of your nearest representative. In Europe contact Bausch & Lomb Belgium NV, Rochesterlaan 6, 8240 Gistel, Belgium. DayFlo announces a major revision of the fundamental law of computing.
Garbage in, garbage out.

Since computers were invented, the conventional wisdom has held that input that doesn't conform to the computer's highly structured needs will result in unintelligible output.

Which meant that you had to learn to think like a computer in order to use one.

Trouble is, the world isn't organized to suit computers. Data is never collected in the way you want to retrieve it. That's why traditional, rigidly structured databases often wind up hindering your work more than they help.

DayFlo offers a new approach to database management needs. It's a Fluid Format™ Personal Information Manager. Which means it approaches the world the same way you do: taking in unorganized data and organizing it into meaningful information.

DayFlo is a powerful tool for your IBM® PC XT. It accepts both structured and unstructured data. When you want to extract information, just type in the key words you're looking for. Instantly, DayFlo organizes the data according to your criteria. And reorganizes it according to new criteria whenever you wish.

Information from other programs, spreadsheets, word processing or accounting files, virtually any data in the system can be assimilated by DayFlo. And once the information is at hand, DayFlo lets you manipulate it at will to produce letters, memos, reports and much more. You can work at your computer the same way you work at your desk, even switching quickly from task to task, without ever losing your place.

DayFlo's concept is as simple as it is revolutionary. You no longer have to think for the computer. Instead, it can help you think better for yourself. Which leads, inevitably, to a brand-new version of computing's fundamental law. DayFlo Software™

Garbage in. Information out.
The $14.95 Peripheral
That Puts Your Computer's Commands Where They Belong
And Your Manuals On The Shelf.

Now, you can command new computer productivity. Discover how much easier your personal computer is to use when the commands are at your fingertips. PC-DocuMate keyboard templates can save you time and frustration. You can recall needed commands, options and formats. Quickly.

Professionally designed and comprehensive. Each PC-DocuMate template has been designed by a software expert. Commands are logically and functionally organized so you can get the most from your software. And our templates are comprehensive reference aids which use both sides to document a product or a system. Completely.

Durable and guaranteed, PC-DocuMate templates are silk-screened onto durable, non-glare plastic to our exacting specifications. Each template is printed on both sides and color-coordinated to complement your PC. And your satisfaction is guaranteed. Fully. Or your money back.

Save time and enjoy greater productivity. Order your PC-DocuMate without delay.

Lower prices for better design. With PC-DocuMates, you get two-sided templates for less than a single-sided template from other manufacturers. And you get a better designed template. Order direct or ask your local dealer.

PC-DocuMates now available...

Robographics CAD-1
Convert an off-the-shelf Apple into a drafting system

Rik Jadrnicek
Micro Flow Company

There are more and more CAD (computer-aided design) packages coming out all the time. In fact, trying to keep up with them becomes a job in itself. Out of necessity, I find myself picking one or two outstanding characteristics from each to separate it from the rest. Robographics CAD-1 stands out for its use of libraries—the way it enables you to assemble large drawings with complete disregard for the amount of available RAM (random-access read/write memory)—and for its zooming abilities—the way it allows you to draw in much greater detail than the graphics monitor can show.

CAD-1 is a computer-aided design software package for the Apple II and Apple IIe computers. Using CAD-1, you can draw a wide variety of pictures with great accuracy and plot the image precisely on various output devices. For example, you may draw simple block diagrams, flowcharts, or a more complex schematic; you may design a personal computer circuit board or do some mechanical drawing on a valve; or you may do some space planning or architectural design.

How well a CAD system performs these tasks depends on software quality, the central processor, the graphics processor and monitor, and the hard-copy output device. Within the limitations of Apple’s 6502 processor and graphics resolution, CAD-1 performs very nicely. Written in assembly language with high-precision floating-point math, the program is lightning fast and seems to implement fully the processing power available.

**Hardware**

With this software, you can convert an off-the-shelf Apple computer into a drafting system. You need the CAD-1 software, the joystick supplied with the software, an Apple II or IIe with 64K bytes of RAM, a suitable video display, and two Apple II DOS 3.3 disk drives with controller cards.

CAD-1, with its special input device (a hardware box with three buttons, a rotating dial, and a joystick) retails for $1095. With it you can make the most of the entries necessary to run the program. You can draw accurately with the joystick and rotate and scale objects with the dial. More on this device later.

Photo 1: An Apple IIe displaying a typical CAD-1-created drawing.
Optionally, CAD-1 also supports the Robographics and Apple Graphics 11 by 11 digitizing tablets to make drawing easier. These devices simulate a drafting table and come in all sizes. You can trace existing drawings or simply draw from scratch on the digitizer surface. A stylus or cursor (sometimes called a puck) serves as an electronic pencil for entering data points at the press of a button.

To produce low-resolution, hard-copy plots of your drawings, you can use a dot-matrix printer. The software supports a variety of interface cards and you can configure the software yourself if a particular card is not directly supported. You can use a variety of quality plotters capable of producing A to D size plots (USA) or A1 to A4 size plots (Europe). These currently include Bausch & Lomb (Houston Instrument DMP 40 through 42), Calcomp (models 81, 84), Gould Bryans Colorwriter, Hewlett-Packard (7470A, 7580A/B, 7585A) and Watanabe Digiplot (all B or A3 sizes).

Monitor Drawing Resolution
A variety of graphics monitor options are available in addition to the standard Apple graphics capability. Herein lies the major limitation of most CAD systems including CAD-1. The software is capable of producing a large drawing (e.g., 24 by 36 inches) in detail, and a large format plotter is fully capable of plotting the same detail. However, the graphics display device can't accurately represent the image you see while you are creating and editing your drawing.

The resolution of the graphics processor and monitor determines the accuracy with which a display can represent an image. These devices have only a certain number of pixels (picture elements) with which to describe an image. The lower the number of pixels available, the lower the resolution and the more jagged the image.

For example, the resolution of the Apple is 280 horizontal pixels by 192 vertical pixels. The Robographics CAD-1 system uses the rightmost 24 columns of pixels for on-screen menus (see photo 1), leaving a workspace of 256 by 192 pixels. This area is used to represent your image no matter how large it is. It stands to reason that a 24- by 36-inch drawing appears very crude.

On the other hand, the actual drawing database is very accurate. The output device resolution provides the only limitation on the quality and resolution of the hard-copy output. For example, a dot-matrix graphics printer produces a low-resolution image while a high-resolution plotter reproduces the drawing accurately. These differences in actual, display, database, and output resolution are important to understand when configuring CAD systems.

Let's Draw
To begin drawing with CAD-1, you hook up the input device to your Apple, insert the program disk in the drive, and load the program. Then you insert a library disk in drive A and a buffer disk in drive B. There is a lot of disk swapping with CAD-1. When you use a plotter, an additional disk must be swapped. The system really needs a hard-disk version developed for serious applications.

Once the proper disks are in place and the system is loaded, the system presents you with a clear screen to draw on—clear except for a menu area down the right-hand side of the screen and a function area at the bottom. Using the joystick on the input device, you move a small cursor (an "X" on the screen) around the drawing area and place it on menu choices. Pressing a combination of the device's three buttons, you choose commands and functions from the menu and create drawings on the monitor screen. For example, if you move the cursor to the function area at the bottom of the screen, you can choose a primitive type (e.g., line, arc, circle, etc.), a color, and a line type (e.g., dotted). Then if you choose DRAW on the monitor menu, you can draw images on the screen with the joystick (or digitizer) and the buttons. You can freehand sketch, trace lines of
different widths, fill areas temporarily or permanently, insert text, erase objects, zoom, and pan (scroll from one area to another). See figures 1 and 2.

Since the program is written in assembly language, the cursor movements and placement of lines and shapes are instantaneous. You can freely manipulate lines, arcs, and circles while you watch them stretch and shrink on the screen before you. You can turn on a grid system and lock your drawing to the grid points (your drawing points snap to the nearest grid point—standard or user-defined) to produce precision drawing. You can have different x- and y-axis values and you can rotate the grid if you want to work on isometric images.

**Commands**

Several cursor lock modes are available for drawing precision. You can lock the cursor to move in only two fixed directions from its current position. The axes of these two directions can be set at different angles providing tremendous help in constructing isometric images. A NORMAL-TANGENT lock mode automatically senses the slope of the last line drawn then sets an orthogonal axis (at right angles) lock at the end of the line. I find this helps to create a smooth continuation of a previous line with an arc—a good way to construct a fillet (the concave transition surface between two otherwise intersecting surfaces).

You can determine the location of a specific point with the FIND command, snap the current grid to that point with SHIFT-GRID, and rotate the grid using NORMAL-TANGENT. You can even skew the grid for more variety. These are very powerful features for precision work. You can draw isometric projections in true scale or, if this is too confusing, call up two preset standard grids to restore your sanity.

The scale of the CAD-1 system is metric but the database units could just as well be feet or inches with decimal fractions. By the time you read this, CAD-1 expects to have automatic dimensioning with feet and inches (requiring a Saturn RAM expansion board to boost the Apple to 192K bytes of RAM), but currently dimensioning must be done manually.

With the NIB command you can determine the spacing between, and the direction of, the fill elements. This allows you to shade objects, giving dimension to your drawings.

There are some software limitations in CAD-1. I did not see a provision for entering data-point coordinates manually from the keyboard, either relative to the origin (0,0), relative to the current point, or using polar coordinates (angle and distance from a point). The ability to draw on layers, turning them on and off to display dif-

CAD-1 provides fast, powerful, and easy-to-use computer-aided design capability on an Apple II or Apple Ile

Different elements of your drawing, is also missing. In addition, only one text font is provided and it is only adequately attractive.

Zooming

CAD-1's ability to zoom into an area of the drawing helps to overcome the display monitor's limitations. For example, when you zoom into (or window) a particular room of a floor plan you are drawing, that room will fill the entire monitor screen. You can see more detail and you can draw with greater precision. The width of the screen could represent, for example, 1 inch, 1 foot, or 1 mile.

The concept of zooming is important to understand. CAD-1 provides a window into your drawing. Consider a 24- by 36-inch drawing. With CAD-1, you can see as much of that area as you want at a time. You can draw a border on the drawing and then zoom into a 9- by 12-inch area to do some detailed work. You can zoom in further to a 1-inch square and draw at 0.001-inch precision. In effect, you are scrolling a window (often called a viewport) over the surface of a larger drawing. Zooming back to the full-size drawing condenses all that detail into a relatively small area on the screen. This doesn't have any effect on the final plot, however; the full 24- by 36-inch image is plotted to scale depending on output device capability.
MOST ACCOUNTING SOFTWARE TURNS WORK STATIONS INTO BATTLE STATIONS.

When you have Champion Accounting Software, your personnel can leave the combat zone. Because Champion® gives you the performance you need, without a fight.

Champion is written in dBASE II™ on one convenient disk. And its features make conventional accounting software obsolete.

PERFORMANCE YOU CAN SEE.

Other software dealers will tell you what they think their product will do. Only Champion dealers will show you how the software performs:

- Help function provides users with clear, concise, on-line answers to questions about Champion.
- Unparalleled recovery program automatically puts the user's books back in balance in the event of a crash.
- Real-time updating. All files are simultaneously updated when data is entered.

PRaised by Experts.

"It performs extremely well...If you are looking for a good, competitively priced, fully integrated accounting package...take a close look at this one."

Amanda Hixson
INFOWORLD, 3/83

"...users will find this to be a very comprehensive software package with several attractive features that make it superior to its competition."

Carl Heinz, CPA
INTERNAL AUDIT, 8/83

**Drawing Size**

Each drawing holds up to 3000 bytes of information. For example, a line takes 10 bytes, an arc 15, a circle 8, a nib fill pattern 18, text 10 (plus 1 byte per letter). When the workspace fills up, the system notifies you with a beep. This is where CAD-1 gets creative. It is obvious that 3000 bytes is not much room for a detailed drawing. CAD-1 lets you store the work you have done in a library on disk. Within one library file you are allowed three pages of drawings. The number of drawings you can keep on each page varies from 4 to 64. Put simple images like letters on the 64-division page and more complex drawings on the 4-division page where you can save more detail.

Once you store your drawing in a library slot, you can return to the drawing editor, clear the screen, and draw another 3000-byte image. You can also store this drawing in a library and return to do another and so on until the memory is used up. Then you can copy back the stored library images to your current drawing. As the images come in, you can freely scale them by $x$ and $y$ and rotate them in increments of 5 degrees (by turning the rotating dial on the input device). Once copied, they are treated as one entity and occupy only 20 bytes in your current drawing. You can assemble about 150 of these drawings within the new drawing and then save that drawing as a library image. When copied into another drawing, this image also takes only 20 bytes of memory. This procedure can go on until the disk space is used up.

Developing large drawings with CAD-1 is a process of assembling smaller drawings that have been stored in the library. A certain amount of preorganization is, therefore, required to do complex drawings. You can even copy library items from different library disks into your current drawing. When the current screen is full, simply save the increasingly complex image to an available library slot and continue, incorporating it in another drawing. Animation effects can be developed by creatively interacting with the library images and the drawing-regeneration process.

There are some limitations associated with using library images that ought to be mentioned. When you copy a complex drawing in from the library, you can't edit it in detail. However, you can edit the original library image after which all references to it reflect the revisions. You can also print/plot your library pages for reference in assembling your drawings. Needless to say, this is a clever way of overcoming the RAM limitations of the Apple. The real drawing size limitation becomes the available disk space.

Since the regeneration of your drawing slows down in proportion to the drawing size, it makes more sense to assemble large drawings by overlaying a series of smaller drawings onto your plotter rather than by trying to fit everything into one drawing. Nevertheless, significant capability is available and one Apple disk will store several 24- by 36-inch plots with an average amount of detail.

**Packaging**

CAD-1 documentation consists of one 6- by 9-inch manual with typset pages printed on one side. The manual contains three sections, Getting Started, Basic Drawing, and Precision Drawing, and eight appendices covering subjects like library archives, constructing lines with a given angle and length, creating symmetrical drawings with the mirroring function, discussion of the plotting utility and the options available, and others. The manual is well illustrated with a good tutorial. It needs double-sided pages and a good section on CAD basics, though.

The package includes an intelligent plot utility on a separate disk with a variety of options. You can search the library pages for the image you want to plot and window the appropriate area. You can change line types or colors, choose predefined zoom and plot scales, and plot with dimensions in metric or English units (in decimals). The program automatically selects different pens on multipen plotters, and you can stop or pause the plot at any time—very handy if you need to change a pen.

The software is copy protected with one backup of the program disk supplied. There is a 90-day warranty against defects in material and workmanship after which disk replacement costs $10. Enhanced versions seem to be on the horizon, so check the company's update policy.

**Conclusions**

CAD-1 makes good use of the Apple computer. I am amazed at how much is possible with the processing power of the 8-bit 6502 chip. The accompanying hardware input device provides a very friendly interface; however, it is nice to see that a selection of digitizer devices and plotters is also supported.

CAD-1 is written in fast assembly language and uses floating-point math for very high precision capability. The drawing library is a very strong feature. The ability to copy library drawings into the current drawing with minimal RAM overhead makes large drawings possible within the limitations of addressable RAM. Automatic dimensioning in feet and inches will be a welcome addition.

Like all CAD systems, this package needs a graphics processor/monitor combination with higher resolution to take full advantage of its capabilities. Running the program requires too much disk-shuffling, especially for more complex drawings. A hard-disk version is needed along with more addressable RAM and an MS-DOS version. Currently the program runs on the IBM PC with a Quadlink card installed. A true MS-DOS version is planned for release in 1984.

This software appears as somewhat of a sleeper, like a Ferrari engine in a Volkswagen. It is worth checking out, especially if you plan some serious drawing with an Apple computer.

Software Review

Two More Versions of C for CP/M

A benchmark comparison of Q/C and Eco-C

David D. Clark
Pennsylvania State University

In recent years the C programming language has generated a great deal of interest. Small, concise, fast, powerful, and offering many operators, it provides both systems-implementation and applications-programming capabilities. C compilers for microcomputers have virtually exploded onto the marketplace in the past two years. I reviewed two of the newer releases: Q/C, written by Jim Colvin and distributed by The Code Works, and Eco-C from Ecosoft.

Q/C Version 3.0

Q/C is a fairly complete implementation of the C compiler unless you require floating-point capabilities. It comes in two basic forms: 8080, which requires either Digital Research's RMAC assembly language or Microsoft's MBO assembly language, and Z80, which works only with the MBO assembly language. It is a single-pass, recursive-descent compiler that takes its input from a file, passes it through a “window,” and produces an assembly-language file.

Originally derived from Ron Cain's small-c compiler (see reference 1) and tremendously increased in power through several major revisions, Q/C 3.0 is now a subset of the Unix Version 7 C compiler from Bell Laboratories. It lacks:

* variable types—long, float, and double
* bit fields
* casts
* sizeof
* typedef

The 8080 package includes an excellent paperback user's manual and a disk containing an executable version of the compiler, a program to change the defaults, a relocatable version of the function library, and "the source text for the compiler and the library." You must buy the M80 (or the RMAC) assembly language separately.

The manual first explains how to compile, assemble, and link a small program. Then it goes into more detail, explaining the command-line options (see table 1), redirection, assembly-language interfacing, the standard library, and the internal workings of the compiler itself. The manual is readable and complete.

Eco-C Version 1.52

Eco-C from Ecosoft has a three-pass compiler. First, the preprocessor accepts a C program as input and writes an intermediate token file to disk; then the C parser program writes an intermediate code file; finally, the code-generation pass reads the intermediate code file and generates an assembly-language output file. If the parser pass detects a bug, it calls an error-handling program to print a message telling where the error occurred and to abort the compilation.

The Eco-C compiler attempts to adhere strictly to standard C's syntactic and semantic rules. It is a very complete implementation lacking only:

Z80-based CP/M or MP/M 2.0 or later versions, with at least 56K bytes of memory and at least one disk with a capacity of 240K bytes (two are recommended)

Documentation
61-page loose-leaf manual; a 186-page loose-leaf manual also is included describing Microsoft's Utility Software Package, included with the compiler

Audience
Systems and application-software developers

Table 1: The Q/C compiler command-line options.

-a Generate an assembly-language file for Digital Research's RMAC assembly language. This option is not available with the ZBO version.
-c Generate a commented assembly-language file.
-d Send output to the console rather than a disk file. This is useful for debugging.
-l Toggle initialization of large arrays. When turned off, arrays larger than 128 bytes will not be initialized to zeros.
l Do a library generation. Each function encountered will be written to a separate file.
-m Generate an assembly-language file for Microsoft's M80 assembly language. This option is not available with the ZBO version.
-o Specify a name for the output file.
-r Toggle the inclusion of redirection capability into the compiled program. When turned on, a larger version of the run-time initialization routine is included that allows redirection of standard I/O from the command line.
-s Generate ROMable code with an optional specification of the stack starting address.
-t Generate trace messages in the compiled program. When turned on, code is generated to print a message of the form " > function-name" on entry to each function and " < function-name" on exit.
-v Toggle the compiler between verbose and terse mode. In verbose mode, the compiler displays progress messages as it proceeds.

The Ecosoft package consists of a loose-leaf user's manual and a disk containing the software. Microsoft's Utility Software Package, a standard software component, is included. It contains the M80 relocating macro assembly language, L80 linking loader, LIB80 library-management program and CREF80 cross-reference utility. Because the M80 assembly language comes with the compiler, you don't need any additional software to use the system.

The manual for Eco-C contains instructions on how to get started, command-line options (see table 2), some programming hints, a description of the standard library, and various details on how to work with the system. Some packages also come with a copy of the C Programming Guide, an easy-to-understand introduction to C by Jack Purdum, Ecosoft's president.

Benchmarks

To compare the relative performances of various implementations of the C programming language, I ran benchmarks on a "generic" CP/M-based system consisting of a Teletek Systemaster with a 4-MHz 8080A, a Heath H19A terminal, and two 8-inch, double-density, double-sided Mitsubishi disk drives. The CP/M 2.2 operating
In my previous article, I reported to the nearest half-second, was done on a hands-on line appeared on the screen and stopped with the IC marked against the BOS compiler. (The BOS compiler benchmark results is seconds depending on the program.)

The benchmark used a variety of different compiler options to check how small variations in the code would affect program performance. Figures 1 and 2 and table 3 present the results of the sieve program.

The BDS C compiler doesn't support register or static allocation; therefore, those results are missing from the table. In the statements examples, in addition to making the variables external, a call to the library routines to fill the array with the value TRUE replaces the following statement:

```
for (i = 0; i < SIZE; ++i)
  flags[i] = TRUE;
```

This saves a substantial amount of time. So does the improved algorithm program supplied with Eco-C-proof that an intelligent programmer can usually create a quicker program than an intelligent compiler can.

The BDS versions were compiled with the -o and -e options. The -o option optimizes the compiler the address where “external” variables should start. This allows direct reference to the variables (rather than through a table), saving time and space. The BDS versions used the L2 linker from Mark of the Unicorn (222 Third St., Cambridge, MA 02142), which offers some advantages over the standard linker, CLINK (such as linking very large files by swapping part of the linkages to disk and replacing indirect table references with direct references, eliminating the tables, reducing code size, and moderately increasing speed). The L2 linker is included with the BDS compiler.

The Sieve of Eratosthenes

One of the most difficult parts of benchmarking is selecting the programs to use in the tests. Jim and Gary Gilbreath proposed what has since become a standard for comparing microcomputer compilers and interpreters—the “sieve” program (see reference 3). Listing 1 shows the standard version of the sieve program.

The benchmark used a variety of different compiler options to check how small variations in the code would affect program performance. Figures 1 and 2 and table 3 present the results of the sieve program.

The BDS C compiler doesn't support register or static allocation; therefore, those results are missing from the table. In the statements examples, in addition to making the variables external, a call to the library routines to fill the array with the value TRUE replaces the following statement:

```
for (i = 0; i < SIZE; ++i)
  flags[i] = TRUE;
```

This saves a substantial amount of time. So does the improved algorithm program supplied with Eco-C-proof that an intelligent programmer can usually create a quicker program than an intelligent compiler can.

The BDS versions were compiled with the -o and -e options. The -o option optimizes the compiler the address where “external” variables should start. This allows direct reference to the variables (rather than through a table), saving time and space. The BDS versions used the L2 linker from Mark of the Unicorn (222 Third St., Cambridge, MA 02142), which offers some advantages over the standard linker, CLINK (such as linking very large files by swapping part of the linkages to disk and replacing indirect table references with direct references, eliminating the tables, reducing code size, and moderately increasing speed). The L2 linker is included with the BDS compiler.

Table 2: The Eco-C compiler command-line options.
If you own an IBM PC, the new StorageMaster 500 Series Fixed Drives from Control Data give you three great advantages.

- Larger capacity than IBM's fixed disk drive. The StorageMaster 518 offers up to 18 megabytes of storage; the StorageMaster 530 capacity of 30 megabytes is the equivalent of 15,000 double-spaced typewritten pages.
- You can boot* (start up) from StorageMaster 500 Drives—no need to boot up from a flexible disk as with other drives.
- More byte for the buck. Dollar for dollar, StorageMaster gives you more bytes of storage than IBM's fixed disk drive.

There's more. The 500 Series Drives have an average seek time of only 45 milliseconds—about twice as fast as most other drives. They store your information in a sealed, contamination-free environment. They require no cleaning or preventive maintenance. And they come ready to plug into your PC*.

Look for the 500 Series Drives at your local computer store. Or give us a toll-free call at 800/232-6789 (in Minnesota, call 612/921-4400, ext. 41) and we'll tell you where you can find our whole family of StorageMaster products.

*This capability requires the use of a StorageMaster 301 Controller.

Circle 110 on inquiry card.
Listing 1: The sieve prime-number generator benchmark program. This is the same program as originally presented in "Eratosthenes Revisited" (see reference 3). This version is slightly different from the version presented in Christopher Kern’s comparison of five versions of C for CP/M (see reference 2) in that there is no preprocessor directive to include the header file “stdio.h.”

```c
/* Eratosthenes Sieve Prime Number Program in C */
#define TRUE 1
#define FALSE 0
#define SIZE 8190

char flags[SIZE+1];

main()
{
    int i, prime, k, count, iter;
    printf("10 iterations.
");
    for (iter = 1; iter < 10; iter++) {
        count = 0;
        for (i = 0; i < SIZE; i++)
            flags[i] = TRUE;
        for (i = 0; i < SIZE; i++)
            if (flags[i]) {
                prime = i + 1 + 3;
                for (k = i + prime; k < SIZE; k += prime)
                    flags[k] = FALSE;
                count++;
            }
    }
    printf("%d %d\n", prime, count);
}
```

Figure 1: A comparison of the cumulative program CAL (compile, assemble, and link) times for the sieve benchmark. (All figures were drawn with a Hewlett-Packard A75A plotter.)

The long assembly and link times for Eco-C are the result of its method of initializing external arrays. The definition of C says that all external variables not initialized explicitly will be set to zero (see reference 4); therefore, the sieve program must initialize the external array flags to zeros before the program starts. In Eco-C the assembly language expands a macro containing the statement “DB 0” the required number of times, resulting in fairly small assembly-language files but very slow assembly.

Fibonacci Numbers

Another important measure of performance of any block-structured language is the speed at which it performs function calls. The calculation of Fibonacci numbers (1, 1, 2, 3, 5, 8, 13, ... ) is naturally recursive (obtainable by a finite number of computations), and thus provides an excellent way to examine the speed of function calls. Christopher Kern presented a benchmark program (see reference 2), shown in listing 2, that calculates Fibonacci numbers recursively. Because Q/C doesn’t allow type declarators on functions, I modified the program slightly to do that compilation.

Figures 2 and 4 present the results from the Fibonacci number benchmark program. There is a wide variation in execution speed for this program—a factor of three.

Table 3: The results of running the sieve benchmark program with various options and definitions of those options.

Eco-C has a tortuous function-calling protocol. My opinion on this is based on the assembly-language interface description and the file produced. The compiler puts all sorts of stuff in the code file and on the stack and then calls a library routine to perform the function call. When control returns from the function, Eco-C calls another library routine to put the returned values in the right places—not an efficient way to do things. Eco-C is the most costly of the three in execution time while Q/C is intermediate between BOS and Eco-C.

The similarity of the code-file sizes in this benchmark is interesting. The Fibonacci program doesn't contain a large array like the sieve program does; therefore, the program sizes for Q/C and Eco-C are comparable to BDS C's (see figure 3).

**Floating-Point Calculations**

One nice feature of Eco-C is that it includes floating-point variables. The matrix-multiplication program presented by Jerry Pournelle (see reference 5) was rewritten in C to test floating-point speed. Listing 4 shows the resulting program. Because all arrays in C start with an index of 0, some changes occur in the for loops, the final answer changes to 383740.00000, and the implicit data type conversions in Dr. Pournelle's program become explicit with the use of casts. Because C does all its floating-point calculations in double-precision, the matrices are
There are a lot of powerful reasons to write software for HP systems.

An enhanced UNIX™ operating system. And the cash bonuses you'll earn when you sell your UNIX-compatible applications with an HP system.

Those are compelling reasons to participate in HP's special program for software companies.

We have a whole range of products that can run UNIX, from our popular line of MC 68000-based machines to our powerful 32-bit systems. And we'll be expanding that range all the time.

While we're giving you a wider choice of products for your programs, we're also making it even easier for you to write them.

We've developed an especially powerful version of the industry standard UNIX, called HP-UX. Its enhancements provide for graphics, data base management and networking, to name just a few.

When you team up with HP, you have our full service organization behind you. Our factory and field support teams are dedicated to problem-solving. So, if you or your customers have any questions about HP-UX, just give us a call. We're ready to help.

And we're ready to make your efforts very rewarding. When your customer buys an HP system because of your application, we'll give you a cash bonus of 30% of your software's sales price—up to 6% of the net HP system's price. Our only restriction is that, to qualify for the bonus, your software must sell for at least $10,000.

There are lots of other good reasons to write HP-compatible software for UNIX or any of our other operating systems. To find out all about them, write to Hewlett-Packard, Attn: Gwen Miller, Dept. 57190, 19447 Pruneridge Avenue, Cupertino, CA 95014. In Europe, contact Henk van Lammeren, Hewlett-Packard Nederland BV, Dept.57190, P.O. Box 529, 1180 AM Amstelveen, The Netherlands.

UNIX is a trademark of Bell Laboratories.

Circle 39 on inquiry card.
Listing 3: The pointer-dereferencing program. This program declares a fairly simple structure with 20 levels of indirection then a variable that is a pointer to that structure through 20 additional levels of indirection. The program repeatedly references the character pointed to through the 40 levels of indirection.

```c
/*
 * test.c -- benchmark program to examine the efficiency
 * of pointer dereferencing
 */

#define LOOP5 50000 /* how many loops */
#define BELL 7 /* ASCII bell character */

struct cptr1 {
    char.....................................ptr1;
}

main()
{
    char yeldor;
    struct cptr1......................................pointer1;
    printf("%d loops\n", LOOP5);
    for (i = 0; i < LOOP5; i++)
        yeldor = ......................................pointer1.ptr1;
    printf("%sfinished\n", BELL);
    exit(0);
}
```

Figure 5: A comparison of the cumulative program CAL times for the pointer dereferencing benchmark.

declared double, rather than float, which incurs the time necessary for repeated conversions. When the 22K-byte compiled program ran, it required 48 seconds to execute using 8-byte floating-point numbers.

Pros ...

Both Q/C and Eco-C have some nice attributes.

Q/C is a large subset of Unix Version 7 C for non-numerical applications. It has an excellent manual and it includes the compiler's source code as well as the library's. Q/C is a modular compiler that doesn't seem difficult to modify if you want to produce code for a different processor. The Code Works provides good support—I have received two updates at low cost. Overall, it is a reasonably quick compiler that produces fairly good code.

Eco-C also provides fairly good support with free updates for one year. When the first copy of my compiler had a problem, I found that Ecosoft already knew about the error and had shipped the corrected version. Eco-C also features strict adherence to standard syntax and semantics, making it easier to write portable programs. It has good numerical capabilities including an excellent transcendental-function library, and the LL(1) parsing strategy finds errors at the earliest possible point of detection (some other types of parsers scan past the error before detecting it and their error messages are confusing).

... and Cons

Q/C and Eco-C have one problem in common. The Microsoft M80 assembly language (as well as Digital Research's RMAC) only allows six significant letters in identifiers. The L80 linker and format for relocatable files allows up to seven, but this too is inadequate. This limitation often requires more foresight and care in naming variables than it really should. It would be nice to have a relocating macro assembly language that allowed at least eight significant characters in identifiers. (The relocating macro assembly languages supplied with the UCSD p-System do. Unfortunately, they are not available for CP/M.)

Q/C has no real problems. It runs well, produces acceptable code, is cheap, and is an incredible learning tool. However, sizeof and type specifiers on function declarators would be helpful. It looks like typedefs would be easy to add.

The Eco-C compiler is a disappointment after reading Ecosoft's glowing advertisements and paying its high price. When I bought this compiler, the ads proclaimed Eco-C as a full C compiler with no mention of any restrictions. A typical compiler and link supposedly took only a minute or two. Since then, these claims have disappeared from the ads. Now the ads say that the package includes most of the library source code. My copy came with only one small runtime-initialization program in assembly language. Questions to the company about these problems received no response. (See the text box "Xtra, Xtra..." on page 256 for an update on these problems.)

One of the most annoying things about the Eco-C compiler is that it aborts compilation after detecting an error. It is impossible to continue scanning for additional syntax errors after finding one. If there are several trivial errors like missing semicolons, it takes a long time to compile a large program even though the LL(1) parsing scheme used by Eco-C is good at error recovery.

Eco-C generates lots of slow code for some applications. When BDS C or Q/C compiles a test program that involves filling the CRT (cathode-ray tube) screen with characters one at a time using cursor addressing, the
YOU COULD LOSE EVERYTHING IN A SPLIT SECOND

Blackouts, Brownouts, Power Drops, Surges, Noise — They Can Alter Data, Wipe Out Memory, or Damage Equipment.

PROTECT your personal computer with the finest price/performance back-up power source on the market.

What Was Once An Expensive Luxury Is Now An Affordable Necessity!

DataShield... The Quiet Necessity... is a rechargeable, battery-operated power source which takes over within 10 milliseconds whenever the power drops or goes out completely. It also boasts a built-in surge protector to guard against peaks, surges, and line noise.

Technologically, there is no comparable product on the market that is more advanced. That's a fact. It's been tested and proven. Economically, nothing comes close to the low price of the DataShield. Period.

If you have begun to realize the need for back-up power source insurance, but you were waiting until the quality and the price were right... well, stop waiting.

Contact your local computer dealer or contact the manufacturer for more details.

INDUSTRIES
320 River Street, Santa Cruz, CA 95060
(408) 429-6861 TELEX 175841

Circle 124 on inquiry card.
Listing 4: A C-language version of the matrix-multiplication benchmark originally proposed by Jerry Pournelle (see reference 5).

```
#define M 20
#define N 20
#define BELL 7
char qupj;
double sum, a[M][N], b[N][M], c[M][N];
main()
{
    sum = 0.0;
    print("Hit any character to start\n");
    qupj = getchar();
    fill();
    print("\nM filled\n");
    fill();
    print("\nN filled\n");
    fill();
    print("\nC filled\n");
    mult();
    print("The sum is: %20d\n", sum);
putchar(BELL);
}
fill()
{
    int i, j;
    for (i = 0; i < M; i++)
        for (j = 0; j < N; j++)
            a[i][j] = (double) i + j;
}
mult()
{
    int i, j;
    for (i = 0; i < M; i++)
        for (j = 0; j < N; j++)
            b[i][j] = (double) (int) (i + j/j);
}
sumit()
{
    int i, j;
    for (i = 0; i < M; i++)
        for (j = 0; j < N; j++)
            c[i][j] = (double) 0;
}
mult()
{
    int i, j, k;
    for (i = 0; i < M; i++)
        for (j = 0; j < N; j++)
            for (k = 0; k < M; k++)
                c[i][j] = c[i][j] + a[i][k]*b[k][j];
}
sumit()
{
    int i, j;
    for (i = 0; i < M; i++)
        for (j = 0; j < N; j++)
            sum = sum + c[i][j];
}
```

screen fills as fast as the terminal can accept characters. Eco-C takes twice as long and generates twice as much code as Q/C. This is apparently the result of the slow procedure-calling process.

Summary

As you may have guessed, I like Q/C and have mixed feelings about Eco-C.

Q/C, a large subset of the standard language and a good introduction to it, has a portable library and produces good code quickly. If you want to learn compiler construction techniques or modify the standard language, Q/C is the obvious choice.

Eco-C does everything claimed in its manual. It has the long, float, and double variable types required for many calculation-intensive programs—possibly the purpose behind its development. Eco-C also includes Microsoft's M80 assembly language—a nice extra for use with other packages.

Dr. David D. Clark (346 South Fraser St., #2, State College, PA 16801) is a post-doctoral research scholar in the department of chemistry at Pennsylvania State University. He has a B.A. in chemistry from Indiana Central University and a Ph.D. in biological chemistry from the University of Nebraska.
Fujitsu, Japan's largest computer company, sends you their best. The new Micro 16 personal business computer. A combination of thoughtful planning, innovative thinking and quality craftsmanship. Just what you'd expect from a Japanese company that's been making computers for three decades.

The Micro 16 is a complete computer system. The options of other computers are our standards. For example, its price includes the CP/M-86\textsuperscript{TM} operating system, SuperCalc\textsuperscript{TM} electronic spreadsheet, WordStar\textsuperscript{TM} word processing, a high resolution color graphics monitor, and two microprocessors, the Z80\textsuperscript{TM} 8-bit and 8086 16-bit.

The Micro 16 will run any of the more than 3,000 CP/M\textsuperscript{TM} software programs on the market today. Optional operating systems for the Micro 16s include MS-DOS and the multi-tasking Concurrent CP/M-86\textsuperscript{TM}.

The Micro 16s also comes with a detachable keyboard, dual built-in 5½" floppy disk drives, 128 kilobytes of internal memory expandable to over one megabyte, and expansion slots for future growth.

The unique and flexible design of the Micro 16s makes it easy to add advanced microprocessors of tomorrow, hard disks, mainframe communications or local area networking when the time is right.

Put a Japanese leader to work for you. Fujitsu's Micro 16s. For more information or the name of your nearest dealer call toll free 1-800-MICRO 16. Or write Fujitsu Microelectronics, Inc., Professional Microsystems Division, 3320 Scott Blvd., Santa Clara, CA 95051.

Fujitsu's Micro 16s.\textsuperscript{TM}
The LNW-80 Model II is a Z80-based, 8-bit microcomputer that evolved gradually from the old TRS-80 Model I. It is capable of running virtually all software and operating systems for the TRS-80 Models I, III, and 4 better than the TRS-80s do and of supporting a full-featured CP/M with 96K bytes of RAM (random-access read/write memory). Please note that this is not an objective review. I happen to believe that the LNW is the best 8-bit microcomputer you can buy. I'll try to tell you why.

While I'm an avid admirer of the TRS-80 Model I's basic design, the machine itself had a lot of faults. The Model III solved many of the severe problems but it didn't go far enough—no high resolution or color and only a 16 by 64 screen, for example. The Model 4 is better but it still doesn't provide color, Model I and III programs won't run in Model 4 mode, there's little flexibility in the types of disk drives supported, and CP/M and high-resolution graphics cost extra.

The LNW-80 Model II (see photo 1) lacks the limita-
tions of the TRS-80 Model 4. It has the excellent basic design of the TRS-80 Model I, none of its hardware problems, all the important features of the Model 4, and more. Like the Model 4, it has an 80 by 24 screen, high-speed operation (4 megahertz), and compatibility with CP/M.

But unlike the Model 4, it has high-resolution graphics, excellent color capabilities, and good compatibility with Model I, III, and 4 software, including all of the popular operating systems. It can also use almost any disk-drive configuration (including 8-inch and hard disks); its CP/M can read the most popular disk formats including IBM PC (Personal Computer), Osborne, Kaypro, Xerox, and industry standard 8-inch; and it's built better than any microcomputer I have seen.

In addition, the LNW comes with an incredible array of software, including several integrated small-business programs, a spreadsheet program, a word processor, a smart-terminal program, a TRS-80-compatible operating system, and a well-tailored version of CP/M. The software also includes an enhanced BASIC that supports the color and high-resolution features. The software alone, if purchased separately, would cost nearly the price of the whole package. While Osborne and Kaypro have been praised for their software, the LNW provides much more. LNW Research, the manufacturer, is planning an add-on board to provide software and hardware compatibility with the IBM PC. (They already produce add-on boards for the IBM.)

The Company

The LNW-80 started life as a series of kits: the first one was for an improved TRS-80 expansion interface; the second, for a group of improvements over the TRS-80; and the third, an assembled board allowing double-density operation of both 5- and 8-inch disk drives. (The kits have been severely criticized for being complex and hard to build. If you're thinking of building the kit, buy the documentation and look it over first.) Eventually, these kits were combined in an assembled package that was completely compatible with TRS-80 hardware and software. The LNW Model I was similar to the TRS-80 Model I without its hardware problems and with high-resolution graphics, an 80 by 24 screen, color displays, uppercase and lowercase, and flexible support for different disk drives.

The Model II introduced CP/M compatibility, 96K bytes of bank-selected RAM, an improved BASIC, and a number of other features. It also included an internal loudspeaker, the use of gray tones to represent colors on a black-and-white monitor, and joystick ports. With the IBM compatibility will come even more flexibility and performance. Even with all these changes and additions, the LNW is extremely well integrated and as reliable as any microcomputer I have used.

LNW Research provides inexpensive upgrades to the owners of earlier models. For example, I recently paid $299.50 to add CP/M to my LNW Model I. The upgrade included the hardware installed by the factory and the CP/M software with LNW additions. Future upgrades are promised at very small prices.

The company also provides excellent software support. When LNW began including a lot of free software with the Model II, the company made it available to previous owners for only $299—almost a thousand dollars worth of software.

Although it's not available as I write this, the upgrade from CP/M 2.2 to CP/M Plus (a costly upgrade on most machines) is expected to cost $25. LDOS, giving TRS-80 Model III compatibility, is planned soon, and a version of DOSPLUS, for compatibility with the TRS-80 Model 4, is in the works. The IBM and 16-bit add-ons, which will plug into the bus and provide slots for a number of IBM cards, are also expected at a very reasonable price.

Physical Description

The LNW-80 measures 16.5 inches wide by 3.5 inches high and 22 inches deep (see photo 1). It weighs 26 pounds, most of it in the attractive 16-gauge steel case, a symbol of LNW Research's commitment to physical quality. A friend of mine who designs electronic equip-
ment for the Navy looked over the machine's components and said it could survive on a battleship during combat. All edge connectors are gold-plated, all components are first quality, and most are soldered to the boards. (There are few loose connections with soldered joints.) There's a very quiet cooling fan and all connections (printer, disks, modem, etc.) are on the back of the case, which is open to provide easy access to the printed circuit boards.

As a result the LNW is extremely reliable. It has an excellent power supply that seems to be immune to power fluctuations. Turned on almost continuously for 3 months, the only failures were due to a complete loss of power, and it can operate with line voltages from 90 to 130 volts.

The keyboard is excellent. It is mechanically like that of a Model 1 and thus needs software debounce (a timing loop that solves the problem of extra characters on the screen), but all operating systems now provide that. It has a numerical keypad like the Models 1, III, and 4 with several additional keys for a total of 74. One is a control key for Electric Pencil or for Newscript that acts like a true control key when used with CP/M. Others are Caps Lock (which puts the computer into uppercase-only mode), Shift (which acts as if the Shift key were pressed), and High/Low (which chooses 1.2- or 4.0-megahertz operation). The four arrow keys are in a logically arranged cluster on the right-hand side of the keyboard, and there are three function keys that are LNBASIC programmable. You may redefine nearly all of the keys using the CP/M mode or LNBASIC. Finally, two widely separated reset keys reboot the machine when you press them simultaneously. Their placement keeps you from accidentally rebooting the system but may be a problem for some handicapped users.

The LNW has a Z80 processor and 96K bytes of RAM. In TRS-80 mode 48K is directly addressable by the user; the rest may be bank-selected. In CP/M mode the user has almost 61K of RAM available; various drivers use the rest. I believe 61K is more RAM than any other 8-bit CP/M-compatible machine provides. You may add another six 4164-byte memory chips to give you three more screens of graphics display.

There are four boards in the case: the keyboard substrate, the main processor board, an expansion board analogous to the TRS-80's expansion interface, and a disk controller board. There's also a small loudspeaker and a joystick port that is hardware-compatible with Apple joysticks. A small muffin fan cools the machine, but the case becomes perceptibly warm after about an hour's use.

**Graphics Features**

The LNW has excellent color and high-resolution graphics. There are four modes: 0 is like the TRS-80; 1 provides high-resolution black and white (480 by 192 points) and an 80 by 24 character screen (if you use the proper software drivers); 2 gives you 8-color graphics with 160 by 192 resolution (much more than is available...

(408) 727-5721

Crosstalk is a trademark of Microsoft; Hayes and Smartcom II are trademarks of Hayes Microcomputer Products.
in the normal black-and-white TRS-80); and 3 is a color-
graphics mode providing the same resolution as Mode
1 but in eight colors without alphanumeric (an RGB
monitor is needed). The graphics in Mode 1 are in 12K
bytes of RAM that is bank-selected into lower memory;
while graphics changes are made you can overlay them
on the screen with a normal alphanumeric display, you
can independently erase either the graphics or the
alphanumeric overlay, and you can call graphics pages
via LNWBASIC. This allows an unusual combination
of graphics and printed output. If you use the color modes
with a monochrome monitor, the colors appear as dif-
ferent intensities of gray. You may easily use all of the
graphics modes with LNWBASIC; it has a syntax similar
to the Radio Shack Color Computer's but it's much more
powerful.

Software
I believe the LNW-80 comes with more software than
any other microcomputer. The two operating systems
available are DOSPLUS (TRS-80 Model I compatible) and
CP/M 2.2. By the time you read this, a version of LDOS
To work with Model III disks, CP/M Plus, and a version
of DOSPLUS to make the LNW act like a TRS-80 Model
4 should be available. Electric Pencil (a good word-
processing program), Electric Spreadsheet (a Visicalc
clonc), Microterm (a small-terminal program including
80-character lines for the LNW), and Chartex (a plotting
program for bar graphs, etc.) all come free with the
machine. An integrated small-business accounting system
that includes general ledger, accounts receivable, ac-
counts payable, and payroll is also provided. All of that
software (except Chartex and the small-business pro-
grams) has been widely reviewed and is first quality.
(The business software is an extensive, complete system
that comes on six double-density disks with a manual
almost two inches thick.) The most important piece of
software, however, is LNWBASIC, which supports the
LNW's advanced features, particularly color, graphics,
and the additional memory.

Some Features of LNWBASIC
The LNWBASIC commands are summarized in table
1. The graphics commands are similar to those for the
TRS-80 Color Computer, but are more extensive. They
include: DRAW, which produces a shape defined by
a string and gives you a variety of options on how to pre-
sent it on the screen; CIRCLE, which draws circles and
eclipses or arcs; and LINE, which draws a line between
two points on the screen. PAINT fills a bounded figure
with a specified color, while PLOT specifies dot-dash pat-
terns for all of the graphics commands. Once you have
produced a plot, PSAVE saves it to disk and PLOAD
recalls it to the screen. PGET and ZGET save the graph-
icss within a specified rectangle to an array, and PPUT
and ZPUT retrieve them. You can erase graphics and
alphanumeric displays separately, allowing flexible plot
labeling. Other commands, like PCLS, FLS, COLOR, and
so on, support the machine's color abilities.

The graphics software is extremely flexible. It's at least
as good as many packages I have seen on mainframe
computers. Listing 1 gives you a very short program

| BLINK | switch blinking cursor on and off |
| CALL | address - execute a machine language program |
| CIRCLE | produce a circle, ellipse, or arc |
| COLOR | specify the color of the next graphics command |
| CONV | convert between various hexadecimal and decimal |
| DEFKEY | define a string assigned to a key |
| DESPOOL | send the contents of a file to a printer while |
| continuing computation |
| DISKEY | show the defined keys |
| DLOAD filespec | load a machine-language program |
| DO . . . UNTIL | do a loop until a condition is met |
| DRAW string | draw a figure specified by "string" |
| DRUN | exit LNWBASIC and run a command-level program |
| FLS | fill the screen with a character or color |
| GSUB name | go to a named or numbered subroutine |
| GTO | branch to a named or numbered routine |
| HIMEM | set the high memory limit |
| JOY | support use of joystick |
| LABEL | name a line for a branch by name |
| LCASE | switch lowercase on or off |
| LINE | draw a line between specified points |
| LOADKEY | load a file of defined keys |
| LOC | locate a string in the program text |
| MODE | set the graphics mode (see text) |
| MOVE | move a block of memory |
| NTROFF | turn off the new trace facility |
| NTRON | turn on the trace facility |
| PAGE | bank-select graphics displays from extended |
| PAINT | fill in a bounded graphics space with color |
| PCLS | clear the graphics memory or fill it with a specified |
| color or value |
| PGET | save a part of the video display to an array |
| PLOAD | load the graphics memory from a disk file |
| PLOT | specify dot and dash patterns in a plotted line |
| POFF | turn off the echo from video to printer |
| POINT | test a graphics point for color |
| PON | turn on the echo from video to printer |
| PPUT | put array specifications on the video screen |
| PRESET | erase a specified pixel or point |
| PSET | turn on a specified pixel or point |
| PSAVE filespec | save the hi-res memory to a disk file |
| QUICKEY | switch the abbreviated key entry on and off |
| REPEAT | switch the keyboard repeat and beep on and off |
| REST | restore a data pointer to the start of a line |
| RS232 | initialize the RS-232C interface |
| SIN | turn on (or off) input from the RS-232C interface |
| RSOUT | turn on (or off) output from the RS-232C interface |
| SAVEKEY filespec | save defined keys to a disk file |
| SOUND | produce a tone of specified pitch, character, and |
| duration |
| SPOOL OFF | turn off spooling of printer output |
| SPOOLON | turn on spooling of printer output |
| XSTR$(string) | execute a string as a BASIC statement (see |
| text) |
| GTO | branch to a named or numbered routine |
| REST | restore a data pointer to the start of |
| line |
| HIMEM | set the high memory limit |
| HLF | fill the screen with a character or color |
| QUICK | switch the abbreviated key entry on and off |
| REPEAT | switch the keyboard repeat and beep on and off |
| REST | restore a data pointer to the start of a line |
| RS232 | initialize the RS-232C interface |
| SIN | turn on (or off) input from the RS-232C interface |
| RSOUT | turn on (or off) output from the RS-232C interface |
| SAVEKEY filespec | save defined keys to a disk file |
| SOUND | produce a tone of specified pitch, character, and |
| duration |
| SPOOL OFF | turn off spooling of printer output |
| SPOOLON | turn on spooling of printer output |
| XSTR$(string) | execute a string as a BASIC statement (see |
| text) |
| ZGET | similar to PGET but faster |
| ZPUT | similar to PPMT but faster |

Table 1: A summary of LNWBASIC commands and statements.
FEATURES INCLUDE:
- 16 Bit CPU
- With 128K RAM Memory
- Expandable to 256K,
- Two 320KB Slimline
- Disk Drives,
- Floppy Disk Controller,
- Monochrome Monitor and
- Adapter, Parallel and
- Serial I/O’s.

A dot matrix printer that will improve your image.

Meet the Apple ImageWriter, the newest dot matrix printer for your Apple Personal Computer.

And with all that it has going for it, just maybe the best dot matrix printer on the market.

Take legibility, for instance.

The Imagewriter pulls 140 x 160 dots into each square inch. So you get text that's highly readable and high resolution graphics, besides.

And is it fast.

The Imagewriter cruises at an unbelievable 120 characters per second. And that's just in the text mode. It's even faster printing graphics, 180 characters per second, to be exact.

What's more, the graphics dump is up to 60% faster than other comparably priced dot matrix printers. And that makes the Imagewriter fast enough to handle the Lisa™.

Yet it's just as at home with an Apple III or Apple IIe. Thanks to Apple software experts who designed the control electronics to give the ImageWriter perfect compatibility. Not to mention some special capabilities like superscript and subscript, to name just two.

Now, with all this high-speed performance, you'd expect the Imagewriter to make the Devil's Own Noise. It doesn't. In fact, the Imagewriter is specially constructed — with overlaid seams and special sound-deadening materials — to achieve a remarkable 53 dB. How loud is a remarkable 53 dB? You'd make more noise if you read this aloud.

The Imagewriter even has quiet good looks, since we designed it to look like the rest of the Apple Family.

Yet even with all its improvements, the Imagewriter is a better deal than any other dot matrix printer with comparable performance. And you can print that.
Charge!

Go out there and get the Apple Personal Computer System you really want. Now. Without laying out your extra cash. Without tying up your other lines of credit. With the Apple Card. The only consumer credit card reserved exclusively for the purchase of Apple Computers, peripherals and software.

Like all our products, it works simply:

Fill out an application (short, to the point and annotated in English) at an authorized Apple dealer honoring the Card. Your salesperson will call in the application and in most cases get an approval for you right on the spot.

You can then take your Apple system home. You don’t even have to wait for the Card; we’ll mail it out to you. And by the time you get it, you’ll probably be well into doing whatever you bought your Apple system to do.

There is no annual fee for the Card, although a couple of restrictions do apply. The first purchase must include an Apple Personal Computer and you have to put 10% down. And subsequent purchases need to be at least $100 if made with the Card. Oh, yes — you’ll also have a credit limit.

When you use the Apple Card to make additional purchases, all you have to do is show the Card and sign the invoice. As long as it’s within your credit limit, of course. Our dealers get a little nervous when someone signs for half their inventory. You understand.

You’ll also receive monthly statements that include the latest purchases, credit available, and the minimum payment due. You’ll also be happy to know Apple Card credit terms are affordable and the payments can be spread out. It’s all spelled out for you at the time your Card is approved.

So stop by a participating authorized Apple dealer and get an Apple Card. Just think of it as credit where credit is due.

Give your floppy disks the boot.

We call it the “floppy disk shuffle.” It happens when you have two or more software programs on floppies and you need to work with both. What do you do? You put one disk in, boot it, do your work, take it out, put the other disk in, boot it, do your work — you get the idea.

Well, you can stop shuffling any time now.

Thanks to a unique new software program called Catalyst™ from Quark, Inc. Specially designed for your Apple III and Profile™ hard disk.

Catalyst allows you to take a wide variety of software programs and store them on your Profile. Once they’re on your Profile, you just select the program you want from the Catalyst menu that appears on your monitor — then Catalyst does the rest. You’ll never have to boot those programs again.

What kinds of programs will work with ProFile and Catalyst?

Almost anything written for the Apple III including copy-protected programs like VisiCalc®, Quick File™ and Apple Writer III. Or languages like Pascal, BASIC, or COBOL.

And once you’ve loaded these programs into your Profile, the only diskette you may ever need is the Catalyst.

So if you have an Apple III and a ProFile and more floppies than you care to flip through, get yourself a Catalyst. And boot those disks for good.

Apple Card is a trademark of VisaCorp. Inc. Catalyst is a trademark of Quark, Inc. Apple, the Apple logo, Quick File and Profile are trademarks of Apple Computer Inc.
The image produced by listing 1 as sent to a Centronics 739 printer.

Listing 1: The program that produces the image shown in figure 1.

```
10 CLS: PCLS: MODE 1
20 J=0
30 FOR I=5 TO 90 STEP 5
40 CIRCLE J+30+I,100,30,I
50 NEXT I
60 J=100+J
70 IF J>300 GOTO 70
80 GOTO 30
```

whose result is shown in figure 1. (The figure is actually the image as sent to a Centronics 739 printer and is nearly identical to the screen image.)

LNWBASIC has many abilities that are only indirectly related to the LNW. You can redefine various keys (including but not restricted to the programmable keys) to produce a string; for example, “Shift-@” could produce “CMD” or perhaps a string of graphics characters (in Mode 0). You can enter BASIC commands with a single keystroke using QUICKKEY. For example, “G” produces GOSUB—and there’s an excellent trace and debugging facility. You can send screen output simultaneously to a printer and disk file. (A spooler sends printer output to a disk file and prints from the disk file while the machine does other things.) You can exchange input and output with the RS-232C port (and the printer and disk), creating the possibility of writing specialized terminal programs in BASIC. Perhaps the most remarkable command is XSTR$(string) where “string” could be a function like A=SIN(B); you can enter this function from the keyboard or the disk and execute it as if it were a statement written from the program.

LNWBASIC resides in low memory. It doesn’t compete with any high memory routines you may want to use, and it’s compatible with many existing programs that live in upper RAM. It pushes your programs and data higher up and doesn’t leave much room. To get around the memory problem there’s a program called CREATOR that lets you assemble customized versions of BASIC with only the necessary functions. LNW BASIC is better than any of the enhanced BASIC packages I have seen for TRS-80 compatible machines.

The compiler, ACCEL3, can compile most LNW BASIC programs and is particularly compatible with LNW software; the few things that are not compatible are found only by trial and error. ACCEL3 can also compile HIRES graphics (see below) and is an important piece of LNW software.

There is other software available and more is being developed all the time by the manufacturer, users groups, and independent programmers. For example, LNW Research sells a program called CHARM that allows a user to define an independent character set. Another program called AUTOPL0T plots data on the screen in a versatile set of formats and can send the output to various printers. HIRES is a BASIC-compatible graphics driver that’s much faster than LNW BASIC but not as extensive. (It’s sold by E&H Software, 11814 Coursey Blvd., Suite 249, Baton Rouge, LA 70816.) A graphics printer driver (sold by Excellonix, 637 No. Bristol St., Santa Ana, CA 92703) will send a high-resolution plot from the screen to various dot-addressable printers, and a variety of drivers for different alphanumeric screen displays are available from LNW Research. A Tektronix emulator, a perspective plotting routine, and other packages are public-domain software and are available from two LNW-oriented bulletin boards (see text box at end).

**CP/M for the LNW**

Using the LNW with CP/M is like having a second computer. By the time you read this, CP/M Plus should also be available, but I’ve not seen it so my comments are on CP/M 2.2. Be aware that I strongly dislike CP/M: it’s slow, cumbersome, difficult to use, not suited to graphics, and has few features of the more advanced TRS-80-compatible operating systems. It seems ironic that many people consider CP/M to be the professional’s operating system while it is really the kluged outgrowth of a hobbyist’s product; most TRS-80 operating systems were written by professionals and are of much better quality. In my opinion the only reason to use CP/M on the LNW is to read disks written on another machine or to run a CP/M program; however, I have yet to find a program I needed that was unavailable in a TRS-80 version.

The LNW version of CP/M is excellent, having all of the features of the normal 2.2 version with some important enhancements. It provides a full 80 by 16 or 80 by 24 screen, the control key is a true control key, and it follows the protocols of the ADM 3A terminal (in setting up word-processing programs, for example).

Two programs are particularly important: LNW.COM and SET.COM. LNW.COM lets you set disk-drive configurations to almost any standard—5¼-inch or 8-inch, 40-track, 80-track, double-sided, and so on. You can set up drives to read and write the 5¼-inch disks compatible with several other machines, including the Kaypro, Osborne, IBM PC, and Xerox 820. The program SET.COM allows even more specialized disk configurations. You can set the various parameters, such as skew tables, sector length, and so on, to custom-configure drives so they work with the disk format from almost
STOP STRUGGLING WITH SPREADSHEETS!
THERE'S AN EASIER WAY TO DO YOUR BUSINESS PLANNING: PROFIN.

If you don't have days, or even hours, to do projections with a spreadsheet, consider this:

There is now a highly specialized software tool expressly for the business person who needs the answers more than the workout.

TIME-CONSUMING WORK ALREADY DONE FOR YOU
If you want to do forecasts and budgets, return on equity, discounted cashflows, net present values, capital expenditure analysis, interest calculations, depreciation comparisons or taxation scheduling without setting up the mathematical calculations or laying out a spreadsheet, you need Profin.

Profin is an easy-to-use (menu driven) program which leads you through your business analysis step by step. You simply answer the questions as they appear on the screen.

REPORTS AUTOMATICALLY LAID OUT
Once you've completed entry, you'll be able to see any or all of the following reports laid out for you:
- income statements
- tax schedules
- interest schedules
- returns on equity
- capital expenditures
- discounted cashflows
- and balance sheets.

You can then make any changes to any of the information already entered and look at revised reports.

And you can automatically load your Profin reports onto a Multiplan, VisiCalc, SuperCalc or Lotus 1-2-3 screen (or any other spreadsheet that reads D.I.F. files) to carry out further manipulations.

SPECIALIZED HELP FOR BUSY PEOPLE
Think of it this way: spreadsheets are great for the hobbyist who gains satisfaction from hours in front of the screen. But if you're a business person with little computer experience and even less spare time, you need the specialized tool: Profin.

Available under $300 for CP/M-80, MS-DOS, and IBM PC-DOS from your local retailer.

Also available: PLANFIN. For sales, marketing and other executives who just want simple forecasts and budgets, Planfin gives you operating income statements plus net income and discounted cashflow reports in less than 15 minutes. Under $200.

BUSINESS SOFTWARE

Please send me more information about how Profin and Planfin beat the spreadsheets for budgets and forecasts.

any machine. I have, for example, read Superbrain disks on the LNW.

One utility that I would like to see is missing: the ability to transfer ASCII (American National Standard Code for Information Interchange) files from CP/M disks to TRS-DOS-compatible disks.

When the LNW uses CP/M, it bank-selects out the normal TRS-80-compatible ROM (read-only memory). In addition it places several drivers in the bank-selected extra RAM giving the user nearly 61K bytes of directly addressable RAM space. I believe that's more than any other 8-bit machine provides. If you need CP/M, the LNW version is as good as you'll find anywhere.

**Documentation**

The manuals now provided with the LNW-80 are excellent; yet LNW's most criticized feature has been its documentation. The kits and the early machines were shipped with very inadequate instructions. It is surprising that the early kit customers managed to build working machines. Most of the LNW's published reviews and word-of-mouth information came from kit builders; luckily, those who bought the assembled machine had a much different experience.

LW Research is very aware of its documentation problem, and now there's an excellent user's manual (called an "operations manual") and an equally good technical manual. There are also manuals for DOSPLUS, Level II BASIC, and LNW/BASIC; all three are excellent. You must use the user's manual (116 pages) with the BASIC, LNW/BASIC, and operating system manuals, but it is usable by both the expert and the complete novice. It may be necessary to shift between several different books, but learning to use the LNW is made easy by the many examples and cross-references.

The technical manual (179 pages) is also excellent and contains complete circuit diagrams. It should enable anyone experienced with hardware to repair and modify the LNW. The CP/M documentation is a thin but clear summary of the CP/M procedures and the LNW enhancements. That manual is not enough for a programmer, however, and if you intend to use the product, you should buy one of the more detailed descriptions of CP/M available. Very complete documentation for the rest of the software (Electric Pencil, and so on) is also included.

My greatest criticism of the documentation is that the user's manual and technical manuals were written for the Model I and only a barely adequate addendum is provided for the Model II. This addendum would make a high school English teacher cringe and a high school typing teacher ill. What is worse, the obscure descriptions of some features are so difficult to understand, even an expert will have problems. It's a good thing you can effectively use the LNW without reading the addendum.

**Service**

There are relatively few LNW dealers at this time and local service is usually impossible. Therefore, there are
Digital Microsystems opened up the world of shared microcomputer resources with its HiNet™ Local Area Network in 1980. Now, 3000 HiNet LAN systems later comes the DMS-816: the cost-effective solution to the need for multiple IBM-compatible PCs.

Up to 63 DMS-816 work stations can be interconnected to share common data and expensive peripherals. Cost per user can be half that of stand-alone PCs. And if you already own IBM PCs, you can connect them to HiNet™ with low cost HiNet™ PC Adapter cards. Conserve your investment while expanding the utility of your system.

With the DMS-816 you have available the wealth of PC-DOS® software, as well as existing CP/M-80™ and CP/M-86™ programs. Standard 366K RAM memory means you can handle large, data-intensive applications immediately without the expense of purchasing added memory.

Your network is controlled by an extremely fast and reliable master station. And your communication pathways are unlimited — HiNet gateways let you talk to mainframes and public data networks.

As part of an international communications company — Excel group PLC — Digital Microsystems is the dependable supplier for everything you need on your HiNet LAN: large hard disk servers, network software, cabling and connectors, intelligent work stations, optional local storage. This translates into easy installation, training and support.

For a view of the world you never had before, call or write today.

Circle 433 on Inquiry card.
only two recourses for a user with hardware problems: find a competent local technician or send it back to LNW Research. The technical documentation is good enough that a competent technician should be able to work on the machine. If you must send it back, LNW Research has excellent support. It can usually repair a machine and have it back in the owner's hands within three weeks—a better response time than many local dealers.

LNW Research also has a very knowledgeable technical support staff that can and will gladly answer most questions. My problems have always been solved by phone. If you buy an LNW, you have the particular advantage of working with a small company—personal and friendly service.

Problems
I have few criticisms of the LNW-80. Mine didn't work when it first arrived, but that was due to UPS, not LNW Research, which helped me fix it quickly.

For several reasons I don't find it easy to use the 80 by 24 screen with the various drivers available. The drivers need upper memory that I want to use for other purposes; they slow up screen scrolling; and they're not compatible with my two most frequently used programs: a text editor (Newscript) and a smart-terminal package (ST80-III).

I would prefer a small separate keyboard—the LNW's design should allow this. The case soils easily, and the paint wore off the corners of mine after about 3 months.

However, the worst problem is that LNW Research's high standards for documentation fell again with the Model II. Its initial product documentation does not match the quality for subsequent releases. Let's hope that the company follows its own lead and publishes a high quality second release of Model II documentation.

Overall
The LNW's greatest advantage is its compatibility with other machines—much of the TRS-80 line and most CP/M-compatible products. Second is its graphics capability followed by its use of 96K bytes of memory. The manufacturer's upgrade policy is equally important. I expect IBM-compatible hardware and software to be coming soon. The LNW's price is comparable to or better than its competition's, and its quality of construction is outstanding. Then too, it comes with as much or more software than any other 8-bit computer I know of. . . . It's hard to choose which one of the LNW's advantages is most important.

Yet the LNW is not very popular. Why? For one thing, large firms like Apple, Radio Shack, and IBM can afford large advertising budgets, while LNW Research cannot. But LNW Research faces a special public relations problem: it is known as a kit manufacturer. LNW is just not commonly known. Whenever I tell someone I own one, I have to explain what it is and then defend it against the "Trash-80" reputation. I don't know what LNW should do to improve its image, but for the sake of anyone who wants to buy an outstanding computer, I hope that it succeeds. In my opinion the LNW is the best 8-bit microcomputer available.

The micro invasion has begun. And, chances are, you’ve now got a lot of different people in a lot of different departments using a lot of different micros.

Now there’s a way for you to control and maximize the benefits of all the different micros in your domain.

**Fight back with dBASE II.**

dBASE II is the relational database management system from Ashton-Tate that enables you to manage your micro-based corporate data resources with the high level of consistency and sophistication you’ve enjoyed with mainframe and minicomputer systems.

Armed with dBASE II and the dBASE II RunTime™ program development module, you can write programs which will enable micro users in each department to “do their own thing” while creating complete database consistency throughout the company.

dBASE II is a powerful, flexible way for you to effectively manage the micro proliferation.

**Help is here.**

If you’d like to know more about how dBASE II and RunTime can help you win the micro management battle, contact Ashton-Tate today. 10150 West Jefferson Boulevard, Culver City, CA 90230. (800) 437-4329, ext. 212. In Colorado (303) 799-4900. In the U.K. (0908) 568866.
Era one.
A new era in dependability. Era 2's electronics are so well put together we're able to offer a four-year warranty—twice the term of protection you get from yesterday's products.

On top of that our product support is outstanding. Our 800 number operates 9AM to 8PM (EST), Mondays through Fridays, 9AM to 5PM Saturdays with experts available to solve any problem or answer any question.

The state of the price of the state of the art. We're able to offer Era 2 for an amazing $429. By any standard the price/value ratio of Era 2 is outstanding.

Move your personal computer forward into a new era of communications. Visit your Era 2 dealer soon. Call 800-322-ERA2 (in MA, 617-762-9310) for the name of one nearest you. Or write us, Microcom, Inc., 1400A Providence Highway, Norwood, MA 02062. We'll send you a brochure with complete information on Era 2.

Era 2 with MNP is a 1200 baud Communications System (software and inboard modem) designed to operate with the IBM PC, PC XT, compatibles and PCjr; Apple IIE, Apple II Plus and Apple II. Its features include IBM 3101, Digital T100 and VT-52 terminal emulations. Era 2 executes multiple functions with a single keystroke.

stores a virtually unlimited number of telephone numbers—each one up to 31 digits. Era 2 is Bell 2A compatible, works with Pulse or Tone dialing. Its speaker alerts you to busy signals, wrong numbers, etc. Era 2 gives your personal computer error-free compatibility with other personal computers, data bases, airframes, almost any information source that can be reached by telephone line.
The TKISolver® program will take on your toughest problems—linear, quadratic, simultaneous equations, whatever. Then stand back. Because TKISolver turns your personal computer into a simple, yet powerful, desktop equation processor.

Whether your problem is a simple formula or a model consisting of many equations, TKISolver can help improve your productivity. Once the equations are written, enter the known values, press the I key, and TKISolver gives you the answer.

Engineers, scientists, architects, financial analysts and planners, educators, researchers, and other professionals who use equations and mathematical models can work more creatively with TKISolver.

**TKISOLVER GIVES YOU:**

**BACKSOLVING**

If the programs you use now require you to rewrite the same equation to solve for different unknowns, TKISolver can dramatically improve your productivity. Enter your problem once and then solve for the unknowns no matter where they are in your equation.

**ITERATIVE SOLVING**

If TKISolver can't solve an equation directly, take an educated guess at the answer. Type the I key and the TKISolver program starts with your guess and performs repeated approximations to converge on the answer.

**LIST SOLVING**

Given a list of input values, TKISolver automatically calculates the equation for every value in your list. For example, if you want to know how different interest rates will affect monthly loan payments, enter a list of interest rates and let TKISolver calculate the payment amount for each value.

**UNIT CONVERSIONS**

Any type of unit conversion—Fahrenheit to Celsius, meters to feet, dollars to deutschmarks, newtons to dynes—can be made without altering your equations. Just define the numerical relationship between two units of measurement and the TKISolver program automatically converts the variable value to the unit you specify.

**TABLES AND PLOTS**

Quickly generate tables and plots of your results on your screen or printer.

**AVAILABLE NOW**

You can run the TKISolver program on the IBM® PC and XT and compatible machines, the Digital™ Professional™ 350, the Digital™ Rainbow™ 100, the Wang Professional Computer, Apple® II/e, and on the following personal computers using MS™-DOS: TI Professional Computer, GRiD Compass Computer™, Canon AS-100, Eagle® 1600, Toshiba T300, and the Zenith Z-100™.

**SEE IT TODAY**

There's more. Lot's more. But you'll have to see it to believe it. And that's easy. Bring your own equations into your nearest computer retailer and ask to see the TKISolver program in action. The world's first equation processor for personal computers.
This Month's Features

A sneak preview of Apple's newest computer, the Apple IIc, is the highlight of this month's features. The new IIc is examined by West Coast Senior Technical Editor John Markoff and he reports that, with the icon character generator in ROM and a disk drive running under ProDOS, this lightweight, Apple IIe-compatible, transportable computer delivers a lot of bang at a price less spectacular than expected. Nevertheless, Cupertino's grown-up garage operation continues to be fruitful.

Like those classic science-fiction journeys into the human body, Brian Cameron tours the lap-portable TRS-80 Model 100's ROM. You can access ROM routines that'll make your Model 100 programs shorter and more efficient, using the information you'll gather from this excursion. Cameron, who has written a lot about his findings from mucking about inside Radio Shack computers, has once again proven that there are rewards for those willing to dig a little.

Speed and efficiency are key concerns of Drs. Roy Chaney and Brian Johnson. Here they explore a technique for realizing the true performance potential of Winchester disk drives. Memory caches and some sophisticated algorithms for prefetching data allow hard disks to move data at the megabit (and higher) speeds they were designed for.

Gregg Williams updates the Macintosh/Lisa story that appeared in February's BYTE with new information on models and prices. Authors Cacceci and Cacheris explore the subject of fitting curves to data.

Following on the heels of April's Real-World Interfacing theme, Stephen Gates takes us into the laboratory to put an IBM to work collecting data, while Richard Hallgren offers up the software portion of his two-part series on using an Apple II for data acquisition.

Next, Roy Crosbie offers an explanation of ISIM, a language designed for writing computer simulations. As Crosbie reveals, a continuous-system simulation language running on micros under CP/M can add a new dimension to computer modeling. For those of us trying to glimpse the forest through a tangle of branches, John Snyder offers assistance with an article on a method for indexing open-ended trees. Finally, Richard Thomas illuminates the gains to be made in program maintainability by using intraprogram remarks to document software.

—G. Michael Vose, Senior Technical Editor
The Apple IIc Personal Computer

A portable IIc compatible that runs ProDOS

John Markoff
BYTE Senior Technical Editor

In an industry that sees dozens and dozens of personal computers introduced each year, and despite the fact that the venerable Apple II is rooted in seven-year-old technology, it's remarkable that Apple Computer has succeeded in keeping its II product line alive and even thriving. Now, in the face of stiff competition from both foreign and U.S. manufacturers and in the wake of its own introduction of two significantly more powerful desktop computers (Lisa and Macintosh), Apple Computer has introduced the fourth version of the Apple II product line, the Apple IIc (see photo 1).

Evolving Apple II Technology

While the IIc will remain highly compatible with the Apple II product line from a software perspective, it is clearly not just "old wine in new bottles."

The IIc is what Apple Computer refers to as a "focused product." It is designed to fit into a market niche that places it in head-to-head competition with the IBM PC Jr at the high end of the home market for personal computers. However, a great deal of flexibility is evident in both the IIc software and hardware architecture and peripherals. As such, you can expect to see the IIc appearing in a variety of other markets, including business and educational applications.

The IIc represents an evolution of Apple II hardware and software technology in a number of areas. First, it is truly portable. The system unit weighs just 7 1/2 pounds and occupies a space of approximately 11 1/2 by 12 by 2 3/4 inches. Its carrying handle folds into the backplane. A built-in half-height 5 1/4-inch disk-drive unit is accessed from the right-hand side of the case. The IIc and its optional 9-inch monochrome monitor are shown in photo 2.

Later this year, Apple intends to enhance the portability of the IIc when it introduces a full-screen, high-resolution flat-panel display (see photo 3). I'll discuss the flat-panel display later. Although a battery pack will not be available upon introduction, the IIc runs on virtually any 12-volt (V) power supply. The AC-to-DC converter has been isolated from the system, and, because the IIc has no slots, the power-supply capacity has been reduced from 45 to 35 watts. A small briefcase-size carrying case is available to hold the computer, flat-panel display, and other peripherals.

The IIc is based on the 65C02, a new CMOS (complementary metal-oxide semiconductor) implementation of the 6502 microprocessor. The 65C02 is an extension of the 6502's instruction set (with 27 new instructions) and offers faster graphics and arithmetic operations. The 65C02 runs virtually all existing Apple II software; however, software written to take advantage of the new instruction set will not be compatible with the IIe and II Plus. The new microprocessor has a clock speed of 1.023 MHz and will perform up to 500,000 eight-bit operations per second, performance figures that match the 6502's.

The IIc extends the use of custom-designed ICs (integrated circuits) beyond what was used in the original IIe design. In addition to the input/output unit (IOU) and memory-management unit (MMU), the IIc contains a custom timing-generator (TMG) chip that generates several time and control signals, a general logic unit (GLU) that provides miscellaneous logic control required by the system, and the disk-controller unit, which is referred to as the IWM (Integrated Woz Machine). The IWM is also used as a disk controller on the Macintosh. It is a one-chip LSI (large-scale integration) of the disk controller originally designed by Steve Wozniak for the Apple II.

The increased use of custom LSI ICs has permitted Apple to further lower the chip count of the IIc (see photo 4). In addition to its sixteen 64K-bit RAM (random-access read/write memory) chips (the computer comes with a standard 128K bytes of RAM), the IIc has only 21 chips. This is particularly striking when you consider that this is three chips fewer than the number of non-RAM ICs in the IIe, despite the fact that many functions performed by additional cards (disk controller, two serial interfaces, 80-column video circuitry)
are now integrated into the IIc design.

Finally, the design of the IIc is based on a closed-hardware architecture giving the user no direct access to the system bus. However, in return for taking away the II's expandability, Apple included many of the features that have in the past required slots.

A quick look at the back of the IIc reveals connectors for two RS-232C serial ports, two video ports, an external disk-drive port, and a combination mouse/joy stick port (see photo 5). Thus, in the slotless version of the IIc, users will have access to the functions that traditionally have taken as many as five of the computer's seven slots. While the Macintosh's relatively closed hardware architecture has created some controversy, the decision to restrict hardware expansion appears to be more clear-cut in the case of the IIc.

Portability and ease of use have clearly been gained at the expense of expandability. Apple has decided to market the IIc to a novice computer user who, it is argued, will have no desire to get inside the hardware, but instead will be interested in a computer that can be set up and run as simply as a stereo system. Toward that end Apple has separated the documentation into a setup guide and reference manual.

The software evolution of the IIc is more subtle, yet it may prove to have far-reaching consequences. The IIc will come with Apple's recently released ProDOS operating system, which offers a significant increase in performance over DOS 3.3. ProDOS includes Unix-like hierarchical file structures that are compatible with the Apple III SOS operating system.

Although the Apple IIc ROM (read-only memory) will appear very similar to the IIe ROM to programmers, it actually was redone almost completely. The ROM went through a dramatic "code crunch" according to Peter Quinn, manager of the IIc design team. Additionally, several bugs in the IIe ROM were removed and other features added, including improved interrupt-handling capability, a built-in windowing function, and a series of 32 graphics characters.
found in the character-generator ROM. These characters, called Mousetext by Apple, are a series of icons designed to offer programmers access to a user interface that appears similar to that found on the Lisa and the Macintosh. They can be called directly and thus moved around on the screen faster than bit-mapped characters.

At the time of this writing, Apple was planning to price the IIc at "less than $1300." While this price is higher than some expected, Apple clearly has decided to go after the same market that IBM is trying to reach with the PCjr and has priced the IIc accordingly. Still, given equivalent features with the IIe, the IIc represents some price savings. But the trade-off for that price saving is the IIc's lack of an expansion slot. The amount of the price saving may determine the IIc's ultimate importance.

A Computer for the Home
Apple has styled the IIc to reach a group of potential buyers that heretofore have been afraid or uninterested in personal computers. The IIc is, according to senior product designer Rob Gemmell Jr., "the cuddliest computer we have ever designed."

This is reflected in the IIc's case, which has a significantly lower profile than that of the IIe. Apple also has chosen a lighter, white color called "Apple Fog" for the case. The new color scheme is part of a general redesign effort that will affect all new Apple products. Originally code-named Snow White, the project led to a worldwide search for a design consultant. Ultimately, Apple settled on German designer Hartmut Esslinger, the designer of the Sony Walkman portable stereo. Esslinger set down the aesthetic design guidelines for the IIc and has since been retained by Apple to consult on future products.

The back panel of the case also reflects Apple's attempt to simplify system installation. Connectors are labeled with icons that represent modem, printer, and other ports. Frequently used interface cables make use of easy-to-fasten connectors. For example, Apple has chosen to use standard DIN 5-pin connectors to fasten the serial cables to the IIc.

Other external design features include a new door design for the internal disk drive (see photo 6), a miniphone headphone jack and volume-control knob that are recessed on the left side of the computer, and two switches set just behind the keyboard that control 40/80-column display and selection of a Sholes or Dvorak keyboard layout. The Dvorak option was available on the IIe, but it had to be accessed with
jumpers and printed-circuit board trace cuts. The technical reference manual points out that you can change the key caps yourself, but it warns that if you break the switch stems you will void your warranty.

The IIc keyboard itself is functionally a duplicate of the Ile keyboard; it has 63 keys capable of generating the 128 ASCII (American National Standard Code for Information Interchange) characters. The actual mechanical design of the keyboard, however, is significantly different from keyboards on other Apple products. The IIc keyboard is laid out in a flatter fashion, in part because the IIc is designed to be used tilted up at a slight angle while resting on the handle, which folds down to serve as a stand. Although the keyboard is physically the same size as that of the Ile, the keys themselves are based on a new low-cost key switch that Apple has developed. The switch is not "full travel" (i.e., the keys don't depress deeply), but instead offers what Apple claims is improved tactile and auditory response.

It seems that no new version of the Apple II would be complete without altering the placement of the Reset key. This time it is placed just above and to the rear of the keyboard on top of the system case. As with the Ile, there are two levels of Reset. Holding down the Control key and the Reset key will cause a warm-start procedure with some programs. This leaves the resident program intact. Simultaneously holding down the open-apple key (to the left of the space bar) with the Control and Reset keys forces a cold start, which has the same effect as turning the power off and back on again.

Display Options

Although the video output of the IIc is similar to that of the Ile, Apple has attempted to generalize the output options of the IIc as much as possible. The back panel offers two connectors: a standard RCA pin-plug jack for a video monitor and a 15-pin D-type connector for video expansion. The latter interface is designed to support a number of display options, including RGB (red-green-
blue) displays, the forthcoming flat-panel display, and a variety of European display standards. All 15 pins are used and signals include a video-tex signal from the GLU, a 1-V sound signal to permit television speaker sound, a power source, a composite NTSC (National Television System Committee) video signal from the VID (video interface device) hybrid IC, a color-reference signal, and others. The intent is to let designers easily access all the hooks for both serial and composite data.

The basic system unit comes with a standard RF modulator designed to connect to the video expansion port, and an optional 9-inch monitor is available. An RGB adapter still is necessary, and Apple plans to have one available in the future.

Like the Ilc, the Ile can produce both 40- and 80-column text displays. However, if you use an ordinary color or black-and-white television set, 80-column text will be too blurry to read. For a clear 80-column display, you must use a high-resolution video monitor with a bandwidth of 14 MHz or greater.

In addition to text-display modes, the Ile also has three graphics modes: low-resolution (40 horizontal by 48 vertical), 16 color; high-resolution (280 horizontal by 192 vertical), 6 color; and double-high-resolution (560 horizontal by 192 vertical), 16 color.

The double-high-resolution mode is achieved by bit-mapping the lower-order 7 bits of the bytes in the two high-resolution graphics pages. These bytes in the two graphics pages are interleaved to provide 560 dots per line.

When the flat-panel LCD (liquid-crystal display) is available later this year, it will support all three graphics modes.

**Compatibility**

As it did during the transition from the II Plus to the Ile, Apple has made a significant effort to ensure software compatibility. Although it has switched to a half-height drive, Apple has continued to employ the 5¼-inch disk size for the II product line. The Ile also will continue to use 140K-byte single-sided drives.

In recent months, Apple has undertaken a major program of testing Apple II software on the Ile and informing software publishers if changes are needed to make their software compatible. Currently, Apple believes that the Ile is 90 to 95 percent compatible with the Apple II.

Compatibility problems, where they arise, may come from the ROM, the 65C02 microprocessor, unorthodox protection schemes, or illegal memory addresses. For example, programs that enter the monitor ROM at unpublished locations will not work. A more intriguing but apparently rare problem emerges from the fact that some programmers have discovered and used undocumented instructions for the 6502 microprocessor. These instructions no longer exist in the 65C02.

**Software**

Apple has made the decision to endorse selected third-party software that has been specially designed for the Ile. Of the 21 products that Apple is introducing with the Ile, 17 are published by independent software publishers. The programs fall into the broad categories of education, entertainment, and productivity and come from such publishers as Microsoft, Software Publishing, The Learning Company, and Brøderbund Software. Apple itself is offering AppleWorks, an integrated database-management, word-processing, and spreadsheet program; Apple Logo (see photo 7), redesigned to take advantage of the 128K bytes of RAM available in the Ile; Apple Education Classics; and the Apple Access II communication program.

Apple's endorsement is not an exclusive one. More than 100 other companies also are developing their
WITH THE PASSWORD™ MODEM AND
TELPAC™ BEN FRANKLIN COULD HAVE
PUBLISHED THE FRIDAY EVENING POST.

The Password™ modem and
Telpac™ software deliver text fast,
far, cheap, and letter-perfect. Fast?
Ten times faster than an expert typ-
ist (and four times faster than most
other modems). Far? Crosstown or
crosscountry. Letter perfect? Multi-
ple accuracy checks of your text are
just one editorial benefit. Cheap?
Thousands of words by phone
lines, for less than express mail.
And if the text is to be typeset,
the cost will be half or less—the
proofreading zero!

software for the IIc. A software developers toolkit and a technical reference manual will be available to software publishers.

**Peripherals**

Several peripherals designed to work with the IIc represent significant technological advances.

Apple has gone to the Japanese manufacturer Sharp for a full-screen flat-panel display that Apple hopes to have ready for introduction later this year. Several Japanese LCD manufacturers now are on the verge of introducing 80-character by 24-line flat-panel displays. Significantly, most of them will have an aspect ratio of 640 by 200 (width to height), corresponding to the IBM monochrome display. However, Apple has persuaded Sharp to manufacture a display for the IIc with an aspect ratio of 560 by 192. Apple currently has several working prototypes of the display. Recently, BYTE was shown a demonstration of one of these prototypes. The display differs from a CRT (cathode-ray tube) in appearance because of the square shape of individual pixels. (Individual pixels on an Apple monitor are twice as high as they are wide.) This makes characters on the display appear somewhat flattened; however, characters in 80-column display mode appeared quite crisp, and the display also produced remarkable high-resolution graphics.

The Scribe printer, which is being announced simultaneously with the IIc, is an impressive plain-paper thermal-transfer printer with color capabilities. Although the final price of the Scribe has not been set, it is likely to be in the $300 range. Apple is taking some pains to separate the Scribe thermal-printing technology from other thermal-printing techniques that require specially sensitized or coated papers. By contrast, the Scribe will print on virtually any paper surface, ranging from Xerox copier paper to continuous form-feed paper. The Scribe also will print on projection transparencies.

Although the Scribe is being announced with the IIc, it is designed as a printer to function with the entire Apple product line, including the Macintosh and the Lisa. BYTE was shown printing samples of graphics screen dumps from the Macintosh that appeared to exceed the Imagewriter in quality. The Scribe has two resolution modes and can operate at either 80 cps (characters per second) in draft mode or 50 cps in letter mode.

Scribe technology is based on a proprietary print head that consists of 24 resistance elements that are arrayed in a vertical column. While printing, the head is pressed against a ribbon that consists of a polyester backing and a carbon-filled paraffin ink. The resistance elements are pulsed briefly, heating them and melting the ink to deposit it on paper.

The design of the print head permits a resistance element to rise to a temperature above 300°F and then drop to below 95°F (below the melting point of the wax in the ribbon) within the space of several hundred microseconds. The dot resolution of the Scribe can range as high as 160 horizontal by 144 vertical dots per inch in letter mode.

Color printing can be achieved by inserting a color ribbon that has different colors laid out in serial bands; the Scribe skips intermediate colors when printing in a particular color.

While the Scribe is a low-cost printer to purchase, the cost of printing will be high. Ribbon cost for an 80,000-character black ribbon will be in the neighborhood of $5, and color ribbons may cost as much as $8. Apple claims that the Scribe will be most compatible with "low duty cycle" applications such as those associated with students, homes, or executive workstations.

**Questions and Comments**

Now that we've seen what the Apple IIc has going for it, what does it lack? First, there are the obvious shortcomings, such as its inability to run CP/M software. This is not an insubstantial omission, since Z80 cards are one of the most common additions to the Apple II beyond 80-column cards, serial cards, and disk controllers.

Second, Apple has chosen not to include a built-in modem. It seems reasonable to expect that a modem should be an integral part of any computer that is designed to be readily transportable. Apple's response is that it decided to leave the modem out for reasons of time, cost,
When it comes to software development, the difference between a Sage IV computer and other micros is like day and night. With the Sage Computer it'll take you fewer days and nights to finish your program.

Speed is the reason. Speed resulting from the fast MC68000 microprocessor, fast architecture, fast operating systems, and blinding transfer rates. The fact is, even we are surprised by the amount of software that's developed on Sage Computers.

So if you're a programmer, maybe you should spend some time learning how much time you could save using a Sage IV.

The Hottest Languages And Operating Systems.

Programs in nearly all of the important languages can be written on the Sage computer. Included in the price is the p-SYSTEM operating system which supports Pascal, BASIC, and FORTRAN.

Other operating systems are optional. For UNIX fans there's IDRIS, which runs up to twice as fast (even without a Sage computer). IDRIS conforms to/usr/Group Standards Committee standards and programs written under it are highly portable to other micros. CPIM advocates please note that Digital Research has developed CPIM-68K for Sage hardware, providing a truly complete software development environment. Versions of Pascal, BASIC, C-BASIC, C, and FORTRAN 77, as well as a very fast APL, may be used under this operating system. The Sage IV is also blindingly fast when running hyperFORTH with its extended programmer and user interfaces.

Besides IDRIS, other Multi-User operating systems that run on the Sage Computer are PDOS, MBOS, and MIRAGE.

A lot of excitement has been brewing in the Pascal World over Niklaus Wirth's new MODULA 2—and it's available for Sage computers. So is ADA, for the record.

If you found your language here, you just found your computer. The 16-bit, 2-million operation/second Sage IV micro with up to one MByte RAM and 18-MByte internal hard disk.

For more information and the name of your nearest SAGE dealer, call us today. And be sure to ask about our new software catalog describing over 200 application programs for Sage computers.

CHECK-MATE

COMPUTER SUPPLIES INC.
Never before has anyone put so much into something so small. The WY-50 gives you big terminal features without occupying your entire work-space. This took revolutionary design. Design a lot of people couldn't accomplish for the price. But we did.

In fact, the WY-50 introduces a new standard for low-cost terminals. You get a compact, full-featured design that meets the most advanced European ergonomic standards. 30% more viewing area than standard screens. And a price tag as small as they come.

The WY-50 sells for only $695.00.

FEATURES:
- 14" screen.
- 80/132 column format.
- Soft-set up mode.
- High resolution characters.
- Low-profile keyboard.
- Industry compatible.
- Only $695.00.

For more information on the revolutionary design, outstanding features and unique good looks of the new WY-50, contact WYSE and we'll send you a brochure filled with everything you need to know. The WY-50. The full-featured terminal with the small price.

The Texas Instruments makes the best software

Best-Seller List.

These best-sellers are among the most popular business software programs for microcomputers as reported in Inc. magazine, September, 1983.
Professional Computer perform even better.

See the difference TI can make with these best-sellers and hundreds more software packages.

Word processing, data base management, advanced integrated programs...the Texas Instruments Professional Computer can help you meet virtually every business and professional need. But before you consider software alone, consider the hardware too.

You can put three times the graphic information on screen—in both color and monochrome—so you'll be able to take even greater advantage of the best graphics programs. For best-selling word processing packages like WordStar, TI's comfortable, typewriter-style keyboard is a natural. Anyone familiar with a standard typewriter keyboard can start to work immediately, without re-learning key positions.

TI offers all the software you need.
So whatever your business needs, the TI Professional Computer runs the programs you need now, and the ones you'll want tomorrow. Thirty to forty programs each month are being developed by over 200 software manufacturers. You'll find them among hundreds of other software packages listed in the TI Software Journal.

So get more from your software with the best hardware, the Texas Instruments Professional Computer. For more information, call 1-800-527-3500. Or visit the dealer nearest you.

Texas Instruments
Creating useful products and services for you.

Our sharp, 8-color graphics give your displays even more visual impact.

The better the hardware, the more you get from your software.
The TI Professional Computer's outstanding monitor resolution and 8-color graphics make best-selling programs like Lotus 1-2-3 sharper, easier to work with.

Our easy to use keyboard makes word processing easier.
Inside the Model 100's ROM

Explore the built-in software in the TRS-80 Model 100

Brian Cameron
Free-lance Writer

The TRS-80 Model 100 is still a relatively new machine with not much software or information available for it yet. This probably will change, as it did for the original TRS-80 Model I and other early microcomputer systems. I hope to shorten the time it takes you to get information contained within the Model 100 by taking you on a walk through its ROM (read-only memory) chips, stopping at addresses you may find useful in your own BASIC or machine-language programs. I will show you the locations of the systems directory and your files and explain their formats. Finally, I will describe a program I wrote called DIR.CO. This program addresses a shortcoming of the Model 100 in that it shows the location and size of the files in the machine. DIR.CO will list each directory entry, even if the file has been erased, and give the starting address and length of each file. In some cases DIR.CO will provide even more information, such as the execution and entry addresses of a command file.

The Directory

The file directory starts at hexadecimal location F962. Each directory entry is 11 bytes long. The first byte is a flag byte that describes the status of the file. The bits defined in the status byte are:

6—identifies the file as a text (.DO) file
5—identifies the file as a command (.CO) file
4—shows that the program is in ROM if this bit is on
3—shows that the program is invisible if this bit is on
2—not used
1—not used
0—not used

The status byte is followed by a 2-byte starting address for the program and an 8-byte address containing the filename. The directory starts with the system entries. These are what the user is accustomed to seeing displayed in the main menu. The familiar system files are BASIC, TEXT, TECOM, ADDR, and SCHEDL. Each of these files contains a status-flag byte of hexadecimal 80. The status-byte list, above, shows that this means the files are command type and that they are resident in ROM. The next two directory entries refer to programs called SUZUKI and HAYASHI. Both these filenames are preceded by a zero. The status flags for SUZUKI and HAYASHI are hexadecimal 88 and C8, respectively. In each case the invisible bit is on for these files. The user directory entries start at hexadecimal address F9AF.

About Erased Files

An erased file has a status-flag byte of zero. All other files have the high-order bit of the status byte turned on. If you accidentally erase a file, you may be able to recover it. Start at the beginning of the user directory and move through it 11 bytes at a time until you come to the file you erased. Store a hexadecimal 80 in the first byte of the directory entry and the file will reappear. This, however, does not ensure that the file will be restored; to be recoverable it must have been the last file stored. The Model 100 ROM routine not only changes the flag to 00 when a file is erased, but it also closes any holes in the file structure. For example, if three files exist, F1.DO, F2.DO, and F3.DO, and you erase F2.DO, file F3.DO will close the gap that F2.DO left. This can be demonstrated with the DIR.CO program. Create several files and display their start and end addresses, then erase one of the files and invoke the DIR.CO program again. As long as the program erased was not the last directory entry, you will notice that the file previously listed after the erased file will now begin at a new address. Because of this file movement you cannot be assured that a file can be restored after a KILL command has been entered. It is unfortunate that the authors of the Model 100 ROM routines did not choose to simply mark a file as erased and then clean up any missing gaps at the next file save. Be careful if you attempt to recover a lost
That's right, in just minutes you can have a client's completed tax return in your hand.

Think about it...you increase client volume, you increase your profits...Plus, you save the cost of your computer service bureau—and you have complete client security.

FEDERAL AND STATE PACKAGES TO MEET EVERY NEED MICRO-TAX® offers four Federal tax packages and 25 State packages (fully integrated with the Level II Program), so you can select the programs that best meet your needs:

Level I—Federal Individual Package, for individuals preparing their own taxes.
Level II—Federal Professional Individual Package, for accountants, registered agents, tax attorneys, and other tax professionals.
Level III—Federal Partnership/Corporate Package, for those preparing Federal Partnership, Corporate, and Subchapter S returns.
Level IV—Overseas Tax Package, addresses the unique tax situations of United States Expatriates.

Levels II, III, and IV have a depreciation module and automatically compute underpayment penalties and minimum tax. Additional Levels II and III automatically compute self-employment taxes, and Level II computes income averaging.

FLEXIBLE DATA ENTRY. With MICRO-TAX® you can organize data entry in a sequence similar to that of manual tax preparation, or you can choose another sequence. The menu driven system makes data entry simple.

MULTIPLE PRINTING OPTIONS. You can input client tax information at the time of interview and produce forms immediately, or enter data during the day and batch print returns at night. MICRO-TAX® prints your returns on IRS approved substitute forms, or with transparent overlays.

TAXNET® TELETEXT SUPPORT NETWORK. MICRO-TAX® customers can now have access to an electronic mailbox and instantaneous memoboard through the TAXNET® teletext support network. With TAXNET®, you can send information, ask questions, get answers and updates—directly through your computer and modem.

TAX ORGANIZER. Now MICRO-TAX® offers a Tax Organizer. You get both the software and the forms, so each year, you can send your clients an organizer with the prior year's client data printed on it.

HARDWARE COMPATIBILITY. MICRO-TAX® is compatible with your IBM PC/XT®, DEC Rainbow™, Radio Shack™ or any other personal computer with CP/M-80®, PC DOS®, or MS-DOS®—from Apple™ to Zenith.

So, take the tedium out of tax preparation—save time and money—Call Micro-Tax® for complete details, or call your local dealer.

Table 1: The BASIC command entry points and internal codes. For an explanation of the abbreviations, see September 1983 BYTE, page 154.

file—if the files have been shifted after the erase command the results may be unpredictable.

**File Formats**

Three types of files can exist on the Model 100: BASIC files (.BA), command files (.CO), and document files (.DO). A BASIC file starts at the address specified in the directory and continues through memory until three zeros are encountered. A document file also starts at the address specified in the directory, but it continues until a Control-Z hexadecimal 1A is encountered. A command file is a little more complicated because it must provide such information as the start address and the length of the program. At the address specified in the directory, you will find where the command file is stored. This is not where it is executed. The program, when invoked from the main menu, will be moved to its execution address and control will then be passed to it. The first two bytes of the file contain the start address, or the address where the file will be moved to in memory. The next two bytes contain the length of the program. This is the program proper and does not include the start-address bytes.
INDUSTRIAL GRADE
IEEE-696/S-100 BOARDS

Dual Systems designs and manufactures a variety of IEEE-696/S-100 boards for 16-bit microprocessor systems running under UNIX and other operating systems. These boards bring high performance and three years of field-proven experience to your computing environment.

Each board is rigorously tested and burned-in for 186 grueling hours. If it can't bear the heat, it won't bear our name.

High Performance System Boards

Model WDC-SMD The WDC-SMD Hard Disk Controller* is specially designed for high throughput in large, heavily-loaded multi-user UNIX systems. All sectors on a track are transferred essentially within a single disk rotation regardless of where the head first settles or the order in which sectors are encountered. The controller offers 16-bit throttled DMA data transfers and disk transfers up to 10 Mb/sec. Also features dual-ported, full-track, look ahead cache, and on-board microprocessor. Interfaces with one or two SMD drives. $2195.

Model SI04-DMA The most advanced, intelligent, 4-port serial I/O board available for the IEEE-696/S-100 bus, this module features 256 bytes of FIFO buffer for input characters and provides DMA transfers for output. A built-in 6800A processor greatly reduces system overhead. $695.

Model DMEM Features 256K bytes of memory and either 8 or 16-bit data paths, 24-bit addressing, and parity checking on each byte. DMEM has no S-100 wait states. $1295.

Model EPROM Capable of either 8 or 16-bit data transfers, this 32/64K EPROM offers the versatility of running with 8K000, 1-8000, 8806, 16000, and other 16-bit processors. It accepts industry-standard 2732 and 2716 EPROMs. 64K RAMs may be mixed with 2716 EPROMs for use as a RAM/EPROM board. $345.

Model CPU-68000M High-performance CPU board with 16-bit data path, 10 MHz CPU operation, and M68000C5 MMU for multi-tasking applications. $1195.

Model CPU-68000 Similar to 68000M, but features 8K bytes of on-board ROM with Motorola's MacsBug monitor instead of the Memory Management Unit. $895.

Model M/BD-15 & 20 Back Planes These premium quality motherboards feature four-layer construction with two internal ground planes, and Schottky-diode termination. They provide high-speed operation with true transmission line characteristics and minimum noise. M80-15: $495, M80-20: $545.

Model CHMED This non-volatile CMOS memory board provides easy-to-use 8 or 16-bit data paths and 32K bytes of memory with dynamically movable write/protect window. On-board lithium battery holds data for 3-10 years with power off. $725.

Data Acquisition and Control Boards

Model CLK-34C Clock-calendar features a LSI CMOS chip and on-board, long-life lithium battery. $325.

Model AIM-12 A highly reliable A-to-D converter with 35msec. maximum conversion time, 12-bit resolution and accuracy, and 32 channels single-ended/16 channels differential. $725.

Model ADM-12 This D-to-A converter offers I/O-mapped port address, 12-bit ±1/2 L.S.B. accuracy (0-70°C), and voltage outputs of 0 to 10 volts, ±5 volts, and ±10 volts. $675.

Model VIC 4-20 Converts voltage outputs from ADM-12 into four separate 4-20MA current outputs. Module also provides overvoltage protection on all current output, plus transient protection per ISA standards. $600.

For more information, call (415) 549-3854.

CPU-68000M

Circle 143 on inquiry card.
ROM Routines

By understanding parts of the Model 100 ROM routines you will be able to shorten your programs and use the 32K bytes of ROM space that would normally be useless to your program. For example, there is no point in writing the code to clear the screen or home the cursor if these routines already exist in the machine. Because the Model 100 clears the screen when it leaves the menu, you should be able to use this function, as well as other routines (providing you can find them in ROM) and understand what each routine requires. To prove this capability, enter the BASIC command CALL 16945. This is the entry point for the BASIC CLS command. After you enter this command your screen will be blank.

Table 1 gives a list of BASIC command entry points, as well as their internal representation.

Many other useful ROM routines are available in the Model 100. Table 2 is a list and description of addresses discovered in the ROMs using a disassembler on an IBM 4341. You can easily incorporate these routines into your machine-language programs.

The DIR.CO Program

The DIR.CO program in listing 1 is an extended version of the BASIC FILES command, but it provides much more information than just the names of the current files. If a directory entry exists for an erased file, its name will also appear in the list of files, with the comment *ERASED* beside it. Each file appears by itself on the screen. Pertinent information also appears with the filename. You move through the system files by pressing the Enter key, at which point the screen is cleared and the next file length bytes, or the entry bytes in its calculated length. The two bytes following the length contain the entry address of the program. This is where the program will start executing from, once control is passed to it. The entry address is not necessarily the same as the start address, but they can be the same if the program is to start at the first byte specified in the start address.
HAVE IT YOUR WAY

18 Slot Chassis 125 Watt Power and IBM Compatible CPU

IMP SYSTEM — $1,300

The S-100 Concept for IBM Compatible Systems

You want a computer. You like the flexibility and options of the IBM PC. EXCEPT there are some things that you want your way. YOU:

• Don't like the funny keyboard.
• Want your own height drives so you can add a hard disk later.
• Want a powerful supply that is adequate for disk expansion.
• Want more than three additional slots.
• Want a faster or different CPU.
• Want higher resolution graphics.
• Want Dvorak or other keyboard layout.

113
12CB — Get a Character from Keyboard
This routine will wait for a character from the keyboard and return it in the A register. The carry flag will be set if it is a special character.

13DB — Check Keyboard
This routine checks to see if any characters are pending from the keyboard. The zero flag is set if no character is found. The zero flag is reset if there are keys waiting.

1470 — Print a Character
The character in the A register will be printed when this routine is called.

14A8 — Turn On Cassette
This routine will turn on the cassette motor.

14AA — Turn Off Cassette
This routine will turn off the cassette motor.

14B0 — Get a Character from the Cassette
A character is read from the cassette and returned in the A register. Upon entry to this routine, the C register must contain the current checksum. Upon exit, the C register will contain the updated checksum.

14C1 — Write a Character to the Cassette
This routine is similar to the cassette-read routine. The character to be written to the cassette must be in the A register, and the checksum must be in the C register. Upon return, the C register will contain the updated checksum.

190F — Get Time
Upon entry, the HL register pair must point to an 8-byte data area that will receive the system time. The format of the time returned is HH:MM:SS.

192F — Get Date
Upon entry, the HL register pair must contain the address of an 8-byte data area to receive the system date. The format of the date returned is MM/DD/YY.

1982 — Get Day
A call to this routine will return a 3-byte representation of the day of the week. Upon entry, the HL register pair must contain the address of the 3-byte area to receive the day.

1BE0 — Display Printable Characters
This routine displays the characters pointed to by the HL register pair, for the length contained in the B register. Only printable characters are displayed. If the value is greater than 7F or less than 20, then a blank is displayed in place of the character.

1E5E — Print LCD [liquid-crystal display] Screen
This routine will print the contents of the screen on the printer. This is the same entry point for the BASIC LCOPY command.

1FBE — Erase a .DO File
A call to this address will result in erasing a text file from the system. The HL register must contain the address of the file directory entry. The DE register pair must point to the start of the file. The start of file can be obtained from a call to 5AE3.

220F — Save a .DO File
This routine will create a directory entry for a text file. The filename must have previously been stored in RAM (random-access read/write memory) at location FC93.

2542 — Move from Address in HL to Address in DE
The data pointed to in the HL register is moved to the address specified in the DE register, for a length contained in the B register. This is a forward movement of data because HL and DE are both incremented.

27B1 — Display a String
This routine will display, on the LCD screen, the characters pointed to in the HL register. The display of characters is terminated when a zero is discovered in the string.

290C — Move from Address in BC to Address in DE
The data pointed to in the BC register is moved to the address specified in the DE register, for a length contained in the L register. This is a forward movement of data.

2EE0 — Move from Address in HL to Address in DE
The data pointed to in the HL register is moved to the address specified in the DE register, for a length contained in the C register. This is a backward movement of data because the HL and DE registers are decremented before each character moved.

3489 — Move from Address in DE to Address in HL
The data pointed to in the DE register is moved to the address specified in the HL register, for a length contained in the B register. This is a forward movement of data.

3472 — Move from Address in DE to Address in HL
Same as the call to address 3489 except that this is a backward movement of data.

39D4 — Convert and Display
The hexadecimal value in the HL register pair will be converted to a decimal number and will then be displayed at the current cursor position. (See the DIR.CO program listing for an example.)

Table 2: The ROM routines. (All numerical values are in hexadecimal notation.)
THE BEST THING NEXT TO AN IBM PC IS A SPINWRITER.

Put a Spinwriter® next to your IBM® PC, or XT, and get the best letter-quality printing available anywhere. Spinwriter is totally IBM plug-compatible and works with every piece of IBM PC software. It also works with all popular third party applications packages.

Depending on your needs, you can choose between our popular 350 wpm model 3550, or our new 200 wpm model 2050.

Both give you world famous Spinwriter printing quality and reliability. And both were made for the IBM. That's why 55% of the letter-quality printers used with IBM PC's are Spinwriters.*

Spinwriter gives you over 60 different type styles. Each with up to 128 characters.

And there's a forms handling option for every paper and forms handling need. Which means no matter what form your business takes, Spinwriter can handle it.

So, if you want to get the most out of your IBM, get a Spinwriter. For more information, just call 1-800-343-4419; in Massachusetts call (617) 264-8635.

Also available at: Entre, 1-800-HI ENTRE, Computerland stores (in California) 1-800-321-1101; (outside California) 1-800-423-3008, Sears 1-800-228-2200 and IBM Product Centers.

Find out why most IBM PC users are saying, "NEC and me."

Yes! I want only the best for my IBM PC. Please send me more information on:

☐ spinwriter 3550  ☐ spinwriter 2050

Spinwriter is a registered trademark of NEC Corp. IBM is a registered trademark of International Business Machines Corp.

Circle 291 on inquiry card.
40F1 — Check HL for Character
The byte at the address pointed to by the HL register is checked to see if it is a valid uppercase letter. If it is not valid then the carry flag is set.

40F2 — Check A for Character
This is similar to the call to address 40F1, except that the A register is checked for a valid uppercase letter A-Z.

4222 — Display CR LF
Calling this address results in a carriage return and a line feed being displayed on the screen. The A register is destroyed.

4229 — Beep
This routine gives a short beep on the speaker. The A register is destroyed.

422D — Home Cursor
This routine does the same as the call to address 5D6A, except that the HL register is not touched. This probably is a better choice.

4231 — Clear Screen
This routine is also the same as the BASIC command CLS. The A register is destroyed.

4235 — Protect the Bottom Line
After calling this routine you are unable to write into line eight. The system uses this to protect the function-key displays.

423A — Unprotect the Bottom Line
This routine undoes a call to address 4235.

423F — Scroll Lock
After a call to this routine the screen will be locked. A line feed cannot cause the top line to disappear or a fresh line to appear on the bottom.

4249 — Turn Cursor On
This routine causes the familiar block cursor to appear at the current cursor position.

424E — Turn Cursor Off
This routine will cause the block cursor to disappear.

4250 — Erase to End of Line
This routine will delete the entire contents of the current screen line.

4255 — Insert Line
This routine will insert a blank line on the screen below the current cursor position.

4256 — Insert Line
This routine will insert a blank line on the screen below the current cursor position.

426A — Erase Function Display
This routine will remove the function-key display from the bottom of the screen.

426B — Set (and display) Function Keys
This routine will set the function keys according to the table pointed to by the HL register and display them. This routine is the same as a call to address 5A7C to set the keys, followed by a call to address 426B to display the setting.

426C — Display Function Keys
As stated in the routine above, this routine will display the settings.

427C — Move Cursor to (row, col)
This routine can be used to position the cursor anywhere on the screen. Upon entry, the HL register points to the destination of the cursor.

H = ROW
L = COLUMN
The A register is destroyed.

428A — Erase Function Display
This routine will remove the function-key display from the bottom of the screen.

4294 — Get a Line from Keyboard
This routine will get a line of input from the keyboard and exit back to the calling routine when the Enter key is pressed. The data can be found in the keyboard input buffer, located at address F685.

4294 — Display a Character
The character in the A register is displayed on the LCD screen.
"My IBM PC XT" writes monthly billings and statements to Maxwell & Sons' 1,893 customers, and tells me who owes what."

When you work with a lot of information, you can't afford to re-enter every file when your hard disk fails. And no hard disk is fail-safe.

"My Sysgen Image" backs up the whole lot in less than five minutes. 10 megabytes on a single cassette...

The Sysgen Image backs up the hard disk in your IBM PC XT. So you can protect your files in minutes—instead of spending hours re-entering them.

"For just $995. That's cheap insurance. It lets me sleep at night."

The Sysgen Image for just $995. It's the most affordable insurance you can buy for your two most important assets: Your information. And your time.

Sysgen. Because a hard disk without tape just doesn't make sense.

Sysgen products for the IBM PC, PC XT, and other personal computers: Economical, 10- and 20-Megabyte hard disk systems with tape back-up. Or 10-Megabyte tape back-up for the IBM PC XT.

Go to your local computer dealer. Ask for a demonstration of Sysgen back-up systems. And find out how to make sense of your storage.

47853 Warm Springs Blvd., Fremont, CA 94539
(415) 490-6770 Telex 4990843

SYSGEN INCORPORATED

Circle 369 on Inquiry card.
Table 2 continued:

4855 - Print a Character (expand tabs)
This routine will print the character that is in the A register, unless it happens to be a tab character, in which case the tab is expanded out two spaces.

5288 - Drop Phone Line
This routine will terminate the phone connection.

52D0 — Connect Phone Line

532D — Dial a Number
This routine will dial the specified phone number pointed to by the HL register.

5791 — Display Message on New Line
This routine will display a message pointed to by the HL register. The message must be terminated with a zero. If the cursor is not at the beginning of the line then a carriage return is done before the message is displayed.

57FD — Main Menu
This is the address of the main-menu routine.

5970 — List Files
This routine is called from the main menu to display the files on the LCD screen.

59AD — Display Filename
This routine is called to build a filename. The DE registers must point to a string of characters containing the filename. The HL registers must contain the address of a work area large enough to contain the filename, file type, the period separator, and a trailing zero. After the call the HL register no longer points to the start of the string so it is advisable to PUSH the HL register before the call, and then POP the register before calling off to the routine to display the filename. For an example, see the routine called PUTFN in the DIR.CO program listing.

5A58 — Display String of Characters
Upon entry to this routine, the HL register must contain the address of a string of characters to be displayed on the screen. The string must be terminated with a 00. The A register is destroyed and HL points to the end of the string.

5A76 — Clear Function Keys
This routine clears the function-key table.

5A7C — Copy Function Keys
The HL register must contain the address of the function table that will be copied into the system function-key settings.

5A9E — Display the Function Table

5A99 — Find a Directory Entry
The DE register pair must point to the address of the file you wish to search for. A zero must terminate the name. Upon exit, the HL register contains the start address of the file. If the file is not found, the zero flag will be set.

5A93 — Get Start of File
Upon entry, the HL register must contain the address of the directory entry. Upon exit, the HL register will contain the start address of the file.

5D6A — Home Cursor
This routine will move the cursor to upper left corner of the screen. Registers A and HL are destroyed. (Also see address 422D.)

5FF2 — Wait for Space Bar
This routine waits until the space bar is pressed, then returns.

6CD6 — Cold Start Address

6CE0 — Warm Start Address

6D3F — Print a Character
The character in the A register will be sent to the printer. The carry flag will be set if the print operation is canceled by break.

6D6D — Return Number of Characters on RS-232C
This routine will return the number of characters pending on the RS-232C queue. The results are returned in the A register. If there are no characters pending, the zero flag will be set.

6D7E — Get Character from RS-232C
Upon return, the A register will contain a character from the RS-232C queue. The zero flag will be set if all is OK. The carry flag will be set if the Break key was pressed.

6E0B — Send XON
This routine will send an XON character (Control-Q) across the communication line. This character resets the XOFF code to stop the flow of data.

6E1E — Send XOFF
This routine will transmit an XOFF character (Control-S) across the communication line. This code is used to stop the flow of data to the Model 100. Data flow will resume only when you send an XON.

6E32 — Send Character to RS-232C
The character in the A register is sent to the RS-232C.
WAITING FOR SOFTWARE INTEGRATION?

Vendor X's word processing software looks great, but Vendor Y's spreadsheet program is number one, and Vendor Z has the communications package you really need. Wouldn't it be great if they were integrated?

With APX Core your personal computer gains the power to drive several different programs—from Vendors X, Y, and Z—at the same time. Coordinate them through overlapping windows that you define, and optimize keystrokes to save effort. APX Core even lets you "cut and paste" data among the different programs automatically.

Let APX Core integrate your choice of software. Our demo package can show you how.

Dealer inquiries invited.

APX Core Technical Specifications:

Minimum Hardware Required: IBM PC with DOS, 30K RAM plus memory required for resident application software, 1 Diskette Drive, and either monochrome or color display. (Call for availability on other hardware.)

Commands: Switch Task, Window, Transcribe, and Keysave.

Standard Features: Concurrent processing selectable per task, with automatic file and device allocation.

Qty. 1 Price: $195

Serious programmers use Optimizing C86 to control the IBM PC and MS-DOS computers. Features include 30% + more speed and:

- Full and Standard version of the C language—balance portability with control.
- Standard MS-DOS Linker support and option to produce MASM from C86.
- A rich set of libraries includes source for K&R functions, string handling, graphics, sorting, floating point (6007 and 6068/8308).
- "Large" model (1,000K RAM), "Small" memory model, MS-DOS 1.1, 1.25, 2.0, 2.1, 2.2, 3.1.
- Support for numerous add-on libraries including: HALO Graphics, C Tools, PHACT for ISAM.

Pull Charlie's strings with our fast, complete, reliable C Compiler —the leading compiler for serious programmers of MS-DOS and CPM-86 systems. Still $395.

"Looking for bus compatible data acquisition boards? You've come to the right guy."

Left to right, Fred Molinari, President

This isn't just a line.
Data Translation offers the most complete line of analog I/O boards available. Anywhere.

We have LSI-11** Bus, MULTIBUS** UNIBUS; IBM PC; Bus, STD Bus, and Apple** Bus. You'll never have to change buses to get the analog compatibility you need.

And you won't be left stranded for help...our user manuals and thorough diagnostics guide you through any technical road blocks. All for the same low fare.

So whether you're in scientific research or industrial control, call us.

We're the world's leading supplier of analog I/O boards, systems and software.

We'll have you up, and on line, in no time.

Call (617) 481-3700.

Data Translation is the leading supplier of microcomputer compatible analog I/O boards.
appears. A BASIC or document file shows its start address and length. A command file shows the address where it is stored in the file system, followed by its start address at execution time. The length and entry address are also provided for a command file.

To get the program into your machine, you can enter DIR.CO into the TEXT program and then run it through a resident assembly language. This can present problems, however, because there are not many assembly languages available for the Model 100 yet. Even Radio Shack has not addressed this problem.

I took another approach. I entered the program on a system that supports an 8080 or 8085 cross-assembly language and then loaded the machine code generated by the cross-assembly language into the Model 100. You could even use a Z80 cross-assembly language if you keep in mind that all instructions must be of the 8080 subset. The language that I used was on an IBM mainframe. Most large timesharing systems support a library of cross-development software, and this approach may be an alternative to a resident assembly language.

Another possibility is to enter the hexadecimal codes at the side of the DIR.CO program listing via the BASIC POKE command, although this is probably the most error-prone method.

To run the program, move the block cursor over the DIR.CO entry and press the Enter key, as you normally would to run a program. The system will make an obnoxious “beep” sound and return to the main menu because it thinks that the DIR.CO program is going to tread on unused memory. To run this program (or any other command-type program), you must move the high-memory pointer down to an address below the one in which the program is going to execute. You can enter BASIC and issue the command: CLEAR 512,57340, after which the DIR.CO program will execute properly, at least until another BASIC program resets the high-memory pointer. Another way to run this program from the main menu is to create a three-line BASIC program called DIR.BA, which will reset the high-memory pointer and run the DIR.CO program. This program looks like this:

```
10 CLEAR 512,57340
20 RUNM "RAM:DIR.CO"
30 MENU
```

Line 30 will return you to the main menu rather than leave you in BASIC. You could run this program instead of the DIR.CO program. The DIR.CO program incorporates several of the ROM routines that are found in table 2.

**Conclusion**

The Model 100 is full of interesting little secrets. It will only be a matter of time until more is revealed about this versatile machine.

HOW VISICORP SEES SEGMENTED ARCHITECTURE.
"Just beautiful."
That's what Bill Coleman of VisiCorp* calls our iAPX 86 architecture. He should know. He and his staff of over 50 people spent three years with it. Writing VisiOn,* the application software destined to become a multitasking industry standard.

The key to creating Visi-On was memory management. Allowing Coleman and his team to create an efficient concurrent processing environment, where different processes are active all at once.

As Bill puts it, "The real beauty of this architecture is that you don't have to keep an entire program in memory at any one time. Just the active segments of code actually being run."

In the 8086 architecture, those memory segments are variably-sized and mapped as needed. So loading is very fast. And the resulting performance is very high, because you can load the exact memory you need. Which then gives you the highest performance from any given memory size.

That means some significant runtime advantages. Like faster switching from task to task and window to window. While keeping your mice from running wild.

Another advantage of the 8086 is its extended family, the members of which are perfectly compatible. So your product, and your investment, are protected longer.

The 8087 coprocessor, for example. It adds floating point power, with calculations running up to 100 times faster than normal.

Or the new iAPX 286 microprocessor. In Coleman's words, "an optimal VisiOn machine."

The 286 handles some of VisiOn's multitasking chores in hardware, setting the software free for more powerful functions. Plus, it has on-chip memory management which protects one task from another and even helps prevent system crashes.

Best of all, you can experience all this for yourself. Because VisiOn is an open applications system. And VisiCorp is sharing information to encourage independent software development.

Which means you've got a wonderful opportunity to share in the forthcoming wealth.

Who knows? You might find yourself looking at your own work in a whole new way.

*VisiOn and VisiCorp are registered trademarks of VisiCorp. © 1984 Intel Corporation.
I've made a lot of new friends through my Datec PAL Plus Modem. Now I have friends who can deliver mail immediately. Confirm my reservations. Quote stock prices. Research my reports. Entertain me. Even keep me up-to-date on the latest scores.

With my PAL Plus Modem, I just call a friend whenever I need a favor. After all, what else are friends for?

To learn more about our friendly Personal Access Link modems, or for the name of your nearest Datec dealer, call 919-929-2135.

PAL Plus features: • 0-300 or 1200 bits per second • Touch/Tone or rotary pulse dialing • Autodial/Autoanswer • On-board monitor speaker with volume control • One-slot-only, no-hassle fit in the IBM PC or XT • Independent RS-232C port • CROSSTALK XVI communications software included free.

Circle 128 on inquiry card.
Many personal computer users are looking for ways to increase both the disk-storage capacity and the performance of their computers. One popular approach is through the use of a Winchester hard-disk drive. Although this is a valid approach for increasing disk-storage capacity, the performance may not necessarily meet all of your expectations. At first glance, the performance specifications of typical Winchester disk drives give the impression that there will be a large performance increase, relative to floppy-disk drives. In fact, this is often only partially true. In this article, we'll try to explain why this is so, what memory caching is, and why it can help provide the high performance that most personal computer users desire.

Three main parameters affect the speed performance of any disk drive. The first is the instantaneous data rate while actually reading or writing disk data. The second is the rotational latency, or the time required for the disk to rotate into the correct position to begin transferring the desired data. The third parameter is the seek time, the time required to move the disk head into the proper position on the disk.

The tracks on a disk are concentric circular paths around the recording surface of the disk, similar to the grooves on an audio record except that they are not in a spiral form. To provide access to the desired data, the heads on the drive must be moved to the track where the data is to be found. On most floppy-disk drives, this technique of moving the heads from track to track is implemented by the use of a stepping motor. Both the rotational latency and the seek time are determined by electromechanical factors in the physical design of the disk drive and tend to be very expensive to improve. Each track on a disk surface is broken up into smaller units of information, sometimes called sectors, but we'll refer to them as blocks. These blocks are the smallest units of information that can be read or written on a disk. This terminology is compatible with that of PC-DOS 2.0 as used with the IBM Personal Computer (PC). For the IBM PC, one disk block corresponds to 512 bytes of data.

A manufacturer's performance specifications for a typical Winchester disk drive might report a disk transfer rate of about 490K bytes per second. This can be compared with a transfer rate of about 23K bytes per second for a 5½-inch double-density floppy-disk drive like that used in the IBM PC. On the basis of this data, you might expect that the purchase of a Winchester disk drive would not only increase the disk capacity of the computer system but also would speed up the file transfers by as much as a factor of 21. These estimates, however, are not realized in practice. One reason for this is that the data is transferred from the drive faster than the computer can receive it. Few personal computers can accept a sustained data-transfer rate this high for very long. As a result, the data must be buffered in the disk controller, and the disk must be read only intermittently so that the average data-transfer rate between the disk and the computer is acceptable. The blocks in a disk track are frequently interleaved, or placed in a particular non-sequential order to match the average disk transfer rate to the speed of the computer. A typical interleave factor for a Winchester disk drive is 5. This means that when reading two logically sequential blocks, four blocks are skipped in between. Under these circumstances, the effective speed advantage for a typical Winchester disk system is frequently of the order of 3 or 4 over that of a 5½-inch floppy-disk drive, providing transfer rates in the range of 60K to 90K bytes per second. Floppy-disk drives are also fre-
These RAM-disk systems usually use computer RAM (random-access read/write memory), usually 64K to 320K bytes. These RAM-disk systems usually are pure software products that store disk data by simulating a disk drive, and they typically have a transfer rate of about 350K bytes per second. This rate is determined primarily by the processor speed and the bandwidth of the computer bus; having no electromechanical factors involved is an indication of the maximum possible data-transfer rate of the computer. This number is thus the approximate maximum transfer rate achievable on any disk subsystem attached to the IBM PC. The best you can hope for under any condition is a speed advantage of about 15 times over the floppy-disk drive. But this is still considerably higher than the advantage usually achieved with a real disk drive, so our first task is to understand why this is so.

So far, we have discussed what the data-transfer rate would be when the disk head was already at the correct position on the disk and the disk had already rotated into the correct position for the desired data. Our model gets more complex when the mechanical factors are included. For a real disk system (not a RAM disk), there always is a delay between the time when a data-transfer request is made and the time when the transfer actually starts. This delay is termed the access time and is the sum of two delays: rotational latency and seek time. Neither of these times is a fixed value; they are instead statistically derived times that are averaged over a range of common circumstances. Normally, 5¼-inch floppy-disk drives rotate at 300 rpm (revolutions per minute), or 5 revolutions per second. On the average, one-half of the revolution, or 100 ms (milliseconds), is required to get to the appropriate position to transfer the desired data. For a Winchester disk rotating at 3600 rpm, the corresponding time for one-half of a revolution is 8.3 ms. This time, normally referred to as the average rotational latency of a disk, indicates the average delay time that is encountered between the time of a request for a data transfer and the time the transfer actually begins, assuming that the head is already correctly positioned on the desired track.

The other mechanically determined delay is the seek time, the time required for the stepping motor to move the heads from the current track to the desired track; this is always a major portion of the access time. This time obviously depends on the distance between the respective tracks and the speed with which the heads can be moved. A disk manufacturer typically publishes an average seek time for a given drive, which is based on a track-to-track movement of an average distance. For statistical reasons, this average distance usually is taken to be one-third of the distance between the innermost and outermost tracks. For most floppy-disk drives, the head moves at a constant speed; therefore, the seek time is approximately proportional to the seek distance. For many Winchester drives, the head moves at a higher velocity for longer movements than for shorter movements. For a typical 5-inch Winchester disk drive, this average seek time is approximately 70 ms; for the IBM PC floppy-disk drive, it is approximately 125 ms.

As mentioned previously, the access time for a disk transaction is the sum of the rotational latency and the seek time. These figures are approximately 80 ms for a Winchester disk and approximately 225 ms for a floppy disk. These numbers are, of course, averages based on a completely random pattern of data requests, with all blocks on the disk considered equally likely to be accessed. This situation is not really typical of normal use, but the fact that the ratio of the access times is only about a factor of 3 in favor of the Winchester disk turns out to be remarkably indicative of the actual typical performance.

Now consider the impact of these numbers on the actual data-transfer rate to be expected. If we assume an average access time for each disk transfer, and if we assume that a typical disk transfer corresponds to 512 bytes of data, the transfer rate of the Winchester would be 6.4K bytes per second, and that of the floppy would be 2.3K bytes per second. Moving large contiguous blocks of data increases both of these numbers, but they illustrate why the actual average data-transfer rate is well below the peak rate for real disks. The reason behind this is that for both types of real disks, the access time dominates the data-transfer time. RAM disks, on the other hand, have no mechanical components and have essentially zero access time. The average data-transfer rate of 350K bytes per second is the same as the peak data-transfer rate, independent of the sequence or size of requested data transfers. This explains the enormous popularity of the RAM-disk concept today.

In actuality, the use of the average times previously calculated generally reflects pessimism about the time required for head movement between disk transfers. This is a result of the fact that the operating system (OS) usually does its best to try to keep the disk data blocks for a given file on the same or adjacent tracks. By doing this, head movement is minimized; when a single sequential file is being read or written, the real access time is much smaller than the average time specified by the disk-drive manufacturer. The OS, however, can do little to benefit certain types of programs that have several large files all opened simultaneously for random access. Thus you might see a transfer rate similar to the average one just described for a database-management system that transfers data to or from several large disk files, or for a compiler reading a large source file while generating both an object file and a listing file.

Multitasking also has a significant degrading effect on disk performance because there is no reason why files being accessed by different tasks would be near each other on the disk. In these cases, it is much more difficult for the OS to reduce the amount of head movement. It is common in multitasking systems to see
Oh, mentor of highest wisdom, help all mystified first-time buyers discover the ultimate truth about personal business computers.

Tell them that, unlike other computer companies, Kaypro does not advertise a low "starter system" price, then charge extra for so-called "options" like a monitor, software, disk drives or peripheral interfaces.

Tell them that Kaypro 2 has become the fourth largest-selling personal business computer because we sell it complete. For $1295.

Tell them that Kaypro 2 comes with a highly readable, 9" green-screen monitor, 64K RAM, Z-80 microprocessor. Two built-in disk drives with a 400K capacity. A more complete keyboard than Apple IIe. Interfaces for both a printer and a telecommunications modem. And a full complement of CP/M software to handle the overwhelming majority of Word Processing, Data Base Management and Financial Spreadsheets needs, with top quality programs such as Wordstar.

All for $1295.

Then, tell them to call 800-447-4700 for their nearest dealer, or call Kaypro at 619-481-4318.

Kaypro

The $1595 computer that now sells for $1295.

disk heads executing continual large seeks as the various tasks make data requests from files located at divers places on the disk. In this case, the average access time can be much longer than that indicated by the average times presented earlier. File servers for a LAN (local-area network) are an extreme case of the same problem.

Caching

The technique of caching is often the solution to this problem. The objective of caching is to economically provide both the high performance of a fast, small, expensive memory (such as a RAM disk) and the large capacity of a large, slow, cheap memory (such as a Winchester disk). The technique of caching has been used successfully in memory systems for many large mainframe computers and minicomputers for several years. Examples include the IBM 370, the Data General (DG) Eclipse, the Digital Equipment Corporation (DEC) PDP-11/70, and many others. Let us discuss the use of caching in computer memories first, then we will generalize it to disk applications. For the moment, we will consider only “read” accesses to the memory, that is, those accesses that require data to be moved from memory to processor.

The word cache in French means “to hide” or “hidden,” thus it is used in the context of computers to refer to a transparent memory. In the computers just mentioned, there are two types of memory. One is a small amount of high-speed, very expensive (cache) memory; the other is a large amount of slower, less expensive (main) memory. Copies of data located in certain parts of main memory are stored in cache memory. Whenever data accessed by the processor can be found in cache memory, it can be read at the fast speed; otherwise, it is read at the usual slower speed of the main memory. When the processor is successful in accessing data from the cache memory, it is referred to as a hit; otherwise, it is called a miss. If the fraction of the time that memory access results in a hit is high, the average time required to access data from memory is reduced, and the average performance is enhanced. All caching schemes depend on this one fundamental concept.

In the design of a cache-memory scheme, there are two technical problems that must be solved before you can effectively use this fast memory. The first is how to quickly determine whether the fast memory contains the information required by the processor. This problem is a serious one for memory caching primarily because the time for making this decision is very small (much less than 1 microsecond) in order to gain any advantage from the cache. This fast timing restriction does not affect disk caching. The more critical problem is determining the best algorithms to use to maximize the chances that the information required by the process will be available in fast memory. It is not, in general, possible to do this perfectly because it would be necessary to predict all future memory accesses. In effect, you would have to look into a crystal ball and predict what data the processor would need to access next so that the data could be moved from slow memory into fast memory before it was requested. If this could be done perfectly, all accesses would be fast-memory accesses.

Basically, two classes of algorithms attempt to provide an optimum choice of what data to keep in cache memory and when to move it there from slow memory. These algorithms attempt to partially predict future data accesses, given some information about current and past accesses, under the assumption that the future is likely to be an extrapolation of the past and the present.

One class of algorithm is called a prefetch algorithm. This type is based on the assumption that much data access is sequential in nature, and that access of some particular piece of data implies a strong likelihood that the next piece of data sequentially following the first will soon be wanted.

The second class of algorithm is called a replacement algorithm. This type is based on the premise that any data brought into the fast memory must displace data that is already there. The key here is to displace that data judged least likely to be needed again in the near future, based on some assumptions about the relationship between past usage and future usage of a particular piece of data. In effect, prefetch algorithms try to determine what data to bring into the cache before it is requested, and replacement algorithms try to determine what data to keep in the cache once it has been brought there. Of course, these two algorithms interact with each other because bringing in new data always requires the displacement of old data previously in the cache. A great deal of time and effort has been spent by computer manufacturers to determine effective prefetch and replacement algorithms. We will discuss details of these algorithms later.

Another important decision that must be made in the design of any cache-memory scheme is a choice of the amount of cache memory to be provided, relative to the size of the main memory that is to be cached. It also is frequently desirable to perform caching on blocks of data that are larger than the elementary units of information (bytes, for instance) because then the overhead of cache decision-making can be amortized over larger amounts of data, and the decisions do not need to be made as frequently. This unit of caching is frequently referred to as a page or a cluster.

Disk Caching

We now turn from caching in general to the specific case of disk-performance enhancement through the use of the caching technique. Let's begin with a brief discussion of disk-file access. This discussion somewhat favors PC-DOS 2.0—that was the target OS that motivated most of our work.

When an application program requests transfer of data to or from a disk file, a series of operations that is essentially invisible to the user must be performed by the OS. That is, the user program does not know how they happen. These operations, however, do have a significant effect
If you're looking for a premium modem without a premium price, here's a word of advice: Apple.

Introducing the Apple Modem 300. And, to keep up with the business world, our faster Apple Modem 1200.

Inside, they're packed with all the technical wizardry you would want in an intelligent modem. Auto-dial. Auto-answer. Built-in error diagnostics. And compatibility with all the latest advanced communications software.

But the real message is located outside, due north of the little green light.

That one familiar symbol tells you as much as a gigabyte of specs. It says Apple quality. Apple technology. And in the unlikely event you should need it, Apple service.

It also means total compatibility with whatever Apple you own. Particularly since we include the right accessory kit to get any system in our line on line. Immediately.

We even give you a subscription offer to THE SOURCE™ and a free demonstration of CompuServe®. Together, they let you access almost any subject known to mainframes.

And since the computer age happens to coincide with the plastic age, you can charge your Apple Modem with an Apple Credit Card.

Which, along with the low price, makes buying an Apple Modem as much fun as using one.

That's something no modem has been able to say before, either.

For an authorized Apple dealer nearest you call (800) 538-9696. In Canada, call (800) 268-7796 or (800) 268-7637. ©1984 Apple Computer, Inc. You're traveling through 140°
Only one disk guarantees safe passage through the torrid zone of drive heat.

Maxell.

A lifetime warranty. And manufacturing standards that make it almost unnecessary. Today and in the long run, you'll be glad you chose Maxell.

Consider this: Every time you take your disk for a little spin, you expose it to hazardous drive conditions. Temperature build-up can sidetrack data. Worse, take it to the point of no return. Maxell's unique jacket construction defies heat of 140°F. And keeps your information on track.

And Maxell runs clean. A unique process impregnates lubricants throughout the oxide layer. Extending media and head life. How good is Gold? Maxell's the disk that many drive manufacturers trust to put new equipment through its paces. It's that bug-free.

So you can drive a bargain. But in accelerated tests, Maxell floppy's lead the industry in error-free performance and durability. Proving that if you can't stand the heat you don't stand a chance.
on the implementation of caching algorithms and need to be discussed in that context.

First, let us describe what happens when an application program needs to read information from a file on the disk. The program requests that the OS open the file on the disk. The part of the OS that receives and dispatches all requests then forwards that request to a set of routines collectively called the file manager, which then goes to work to perform this operation. The file manager first looks into a special file (commonly called the directory) that contains the names of all of the files currently stored on the disk to see if the requested file is contained on the disk.

Assuming that the file is there, the file manager then looks into another section of the disk (commonly called the file-allocation table) to determine where the various parts of that particular file are physically stored on the disk. Some information is then returned to the application program that will be used when actually reading data from this file. In subsequent calls to the file manager, the program requests the actual transfer of data from the file now open, and it eventually makes a final call to the file manager to close the file.

The sequence of actions for a write operation is similar unless the file manager does not find the file already present; in this case, it updates the directory to contain the name of the new file and looks into the file-allocation table to find locations on the disk in which no data is currently stored, so that it can write the data onto empty portions of the disk. The important point in this discussion is that there is little, if any, direct relationship between the location of a logical block of data required by the program and the physical location of that data on the disk. The file-manager component of the OS is responsible for keeping track of the logical/physical relationship in a way that is invisible to the user.

The actual operations of reading and writing physical blocks of data to or from disk involves another component of the OS called the disk driver. The file manager tells the disk driver which physical blocks are required to be transferred, and the disk driver performs the actual data transfer. Done in this way, the disk driver does not need any knowledge of the nature or structure of files on the disk. This hierarchical relationship among the various components of the OS is very common; one file manager can work with multiple different disk drivers, and each disk driver need not duplicate the file-management function. As far as disk caching is concerned, the particular caching algorithms used will be very different depending on whether the caching is done at the level of the file manager (see figure 1a) or at the level of the disk driver (see figure 1b). The reason for this is that the file manager has a great deal more information about the organization of the files on the disk than does the disk driver. For example, it is easy for the file manager to know which blocks of data on the disk correspond to logically sequential data in a particular file, or part of the directory, or...

Figure 1: A block diagram of the structure of a typical operating system and its interaction between a user program and the disk. Figure 1a shows the operation when the cache is implemented as part of the file manager; 1b shows the operation when the cache is implemented as part of the disk driver.

Part of the allocation tables. As a result, the file manager can make better guesses as to what to keep and what to displace in the cache. Disk caching at the file-manager level can therefore lead to somewhat more efficient cache algorithms because they are based on more knowledge of the structure of the files on the disk. The problem we face with the implementation of caching at the file-manager level is that the file manager is an integral part of the OS, and any disk caching at this level must be done by extensive modification to the OS. On the other hand, disk drivers are more loosely connected to the OS and frequently can be modified or replaced without direct changes to the system itself. In some cases, as in PC-DOS 2.0, disk drivers can be loaded separately from the OS when the system is booted.

Now let us discuss how memory-caching techniques can provide faster apparent data-transfer rates for Winchester disk drives. If we substitute references to the disk drive for all references to the slow main memory and references to main memory for references to the fast memory in the previous discussion on caching, then we can consider the disk to be the large slow memory and (part of) the computer main memory to be the cache memory. For a specific example, let us assume that we have a small amount (perhaps 256K bytes) of main memory that we would like to use as a cache for a Winchester disk with a capacity of 10 megabytes. Now, it is impossible for all of the data on the disk to be simultaneously stored into the cache because the disk is 40 times as large as the cache. However, if the amount of data actually needed from the disk is a small fraction of its total capacity (over some reasonable period of time), then it could be made to appear to a user's program that all of the data needed was available from the Winchester disk. We would like for that information already to be contained in the cache so that we will have a hit on the cache memory. Whenever we have a hit, we expect to achieve a data-transfer rate close to that of a RAM disk (350K bytes per second), because a cache is very similar to a RAM disk in its internal construction. A convenient way to understand the effect of cache memory on the disk drive is to plot the effective transfer rate of the disk versus the ratio of hits to misses on the cache memory. This plot is given in figure 2 for various values of disk-access times, assuming 1024-byte transfers and a cache-memory transfer rate of 350K bytes per second. It is clear from the plot that it is impossible to achieve the max-

The design goal for a disk-cache ingestion operations requiring a great deal by rate (head always near the desired possible to achieve an improvement of 3 figure 3, which shows that it increases the hit/miss ratio for the cache memory. The upper curve is the case where the head is already positioned on the proper track, and the only delay is rotational latency. The lower curve is the average access time, including the average time needed for a seek.

imum transfer rate of 350K bytes per second. However, for hit/miss ratios of 10 and greater, it is possible to achieve a significant improvement in the transfer rate over that of the disk without caching.

The improved-performance factor is plotted versus the hit/miss ratio in figure 3, which shows that it is possible to achieve an improvement of 3 by using a disk cache, relative to a disk operating at its maximum transfer rate (head always near the desired track). The improvement might be around 8 over a disk that is performing operations requiring a great deal of head movement. And all this can be done with a hit/miss ratio of 10. The design goal for a disk-cache scheme is to use some of the extra addressable memory available in 16-bit processors (typically of the order of 64K to 320K bytes) as cache space for the Winchester disk. By utilizing prefetch and replacement algorithms for transferring data into and out of the cache memory to maximize the number of hits, you can hope to achieve a hit/miss ratio of at least 10. Of course, the size of the cache memory also is an important parameter, and enlarging the size of the cache always increases the hit/miss ratio but adds extra cost.

Let us examine specific techniques that might be used to implement the prefetch and replacement algorithms for disks. The choice between these two approaches is not simple, and it depends on how much the cache system knows about the file system. If the cache is implemented as part of the operating-system file manager, then the cache can make decisions based on knowledge of which files are open and of the relationships between physical disk locations and logical file structure. Frequently, caching at the file-manager level enables the cache to make special arrangements about caching the disk directory, the file-allocation table, and other frequently accessed global disk-data structures, and to attempt to decide what other data should be cached, based on educated guesses about the probable usage. If the cache is implemented as part of the disk driver, then the cache must make all decisions without any knowledge of file structure or logical data structures. The first approach can deliver higher performance at the cost of higher complexity; the second approach is always simpler but may require more care in the choice of the algorithm details because of its poorer knowledge base. Either approach is capable of delivering good performance, and some caching systems use both, providing directory caching in the file manager but doing most of the high-volume data caching at the driver level.

Now we will discuss prefetch algorithms in these two cases. As stated before, the prefetch methods are developed to anticipate the data needs of the processor and to attempt to place the data into the cache memory before it is actually requested by the processor. In the case of disk caching, it is much easier to anticipate the requirements of the processor than it is in the case of memory caching. The reason for this is that so many disk files are processed partially or wholly in a sequential manner. By assuming that the processor is soon going to need data in the region on the disk corresponding to data immediately following previously requested data, it is possible to predict with a high percentage of accuracy what data to prefetch in order to anticipate further requests from the processor.

There is one problem with this scheme: in most operating systems, sequential files are not placed on the disk in contiguous sequential locations. When a sequential file is written to the disk, the OS writes the information in clusters. Typically, these
We’ve Earned The Right To Be #1
By Being First So Often

When it comes to being FIRST with technology-leading products, Advanced Digital wears its #1 button with pride. We were FIRST to introduce an 8-Bit, single board S-100 computer... We were FIRST to introduce a 6MHz, 128KByte single board computer... We were FIRST to introduce a 8MHz, 128KByte Slave Processor board. And our record for being FIRST continues with...

- The introduction of SUPER EIGHT – an 8MHz master with Winchester and Floppy disk controller on one board.
- The introduction of SUPER SLAVE II – A dual slave processor that will support two users under TurboDOS.
- The introduction of our new SUPER 186 – the FIRST 16-Bit, single board S-100 computer that performs at twice the speed of older technologies. Loaded with features such as on-board floppy disk controller and up to 1MByte of RAM, the SUPER 186 is designed to function as a bus Slave or Master. Advanced Digital’s SUPER 186 permits you to take advantage of vast libraries of sophisticated applications software.

Advanced Digital boards are IEEE 696 compatible, run under a variety of operating systems such as CP/M 2.2*, CP/M 3.0, Concurrent CP/M, MF/M,* OASIS,* and TurboDOS.*

Top row L to R: Super Slave 128, HDC-1001, Super Slave 64, Bottom row L to R: Super Quad, Super 186, Super Six

and are available with CPU speeds of 4, 6, or 8MHz. On-board memory capacities range from 64KBytes to 1 MByte.

When it comes to selecting your S-100 boards, go with Advanced Digital – The Company that earned the right to be #1.

See your local computer dealer or contact Advanced Digital today... We’ll help you become #1.

clusters are composed of one or more contiguous disk blocks. The information is contiguous within a cluster. However, logically sequential clusters that correspond to sequential data in a file may not be physically contiguous, and physically contiguous clusters may not even correspond to the same file. For a freshly initialized disk (containing no files) onto which all of the files have just been copied, the file manager usually makes sure that the clusters for the files are physically contiguous and in sequential order. But after the disk has been used for a while and many files have been added, deleted, or modified, the disk becomes somewhat fragmented and adjacent clusters no longer necessarily correspond to adjacent data in a file. This fragmentation effect must be considered in the evaluation of the prefetch algorithm.

One of two similar prefetch algorithms is commonly used, depending on the implementation level of the cache. If the cache is part of the file manager, the prefetch algorithm is usually designed so that whenever some data is accessed from a particular file, the next cluster of the file is to be placed into the cache if it is not already there. This is done regardless of whether the access request is a hit or a miss. This algorithm is intended to ensure that after an initial miss on the first access to the file, the rest of the file accesses will have hit access to the cache.

The second algorithm is simpler and is usually used when the cache is part of the disk driver. Whenever a cache miss occurs, the required block, plus several other blocks occupying physically adjacent positions on the disk, are read from the disk under the assumption that physically contiguous data is likely to

be logically contiguous data, i.e., the fragmentation is fairly low. In the first case, it is necessary for the cache system to know the physical arrangement of particular files on the disk. In the second case, that knowledge is unnecessary, and caching can be performed more mechanically, usually as part of the disk-driver software. The cache system need not be part of the OS or know anything about the nature of file storage. In this simpler driver-based case, fragments will occasionally be fetched from other, not-needed files unnecessarily if the read prefetch cluster is different from the OS cluster used to store the files. This is especially true if the disk is highly fragmented.

One standard version of the second algorithm always reads an entire track from the disk whenever any part of that track is accessed. It is possible to improve on that by not reading the part of the track preceding the requested block. Another version might use a cluster size that corresponds to those used by the OS. All of these algorithms are ultimately based on the notion that once the time has been spent to move the head into position to read some requested data, it is beneficial to read as much data from that area as seems likely to be wanted later.

Replacement algorithms are concerned with the decision of what data to displace from the cache when a data request requires new data to be cached. Three techniques that have been examined for use in mainframe memory caching are random replacement, first-in/first-out (FIFO), and least recently used (LRU). The names of these techniques give a strong indication of their operation.

The random-replacement technique picks the data to be displaced in a random manner without regard to any knowledge about the likely usefulness of that data. The FIFO method keeps a counter to indicate the order in which data has been brought into the cache and always displaces the oldest data that is in the cache. The LRU algorithm is a variation of the FIFO, but it remembers the order in which the cached data has been used by the processor.
How to make your IBM run $2^{1/2}$ to 4 times faster.

Just plug in the Accelerator PC™ and watch your IBM * PC or XT take off.

Yes, Titan's done it again. The innovators who speeded up the Apple® now bring similar performance advantages to IBM users. Imagine running Lotus® 1-2-3™, VisiCalc®, or Multiplan™ without long delays. With the Titan Accelerator PC, your IBM PC or XT can run all your software faster. Data bases, word processors, spreadsheets, graphics, and much more will speed up by a factor of $2^{1/2}$ to 4 (average around 3).

The Accelerator PC has a 10 MHz 8086 processor and 128K of high-speed RAM, expandable to 640K with the memory upgrade piggyback option. It's compatible with your present hardware and software, and designed to be ready for future enhancements.

Get your work done in a third of the usual time.
See your computer dealer today or contact: Titan Technologies, Inc., P.O. Box 8050, Ann Arbor, MI 48107; Telephone (313) 662-8542.

Using the LRU method, data that has been unused the longest is displaced. The LRU method depends on the premise that data used frequently by the processor should remain in cache and should displace data used infrequently.

Some evidence from research conducted by mainframe manufacturers indicates that for the case of memory-to-memory caching, performance is not strongly dependent on which replacement algorithm is chosen. The manufacturers, therefore, sometimes choose random replacement as being the easiest to implement. We felt, however, that for memory caching of disks, the LRU algorithm would be the most effective. Certain areas of the disk, such as the directory and the file-allocation table, are used extensively and frequently by the processor. Thus, it is particularly important to ensure that these areas are in the cache memory at all times. The fact that they are used frequently causes the LRU algorithm to make sure they remain in cache memory, making the LRU the most efficient replacement algorithm. If the cache is implemented within the file manager of the OS, such frequently used disk-data areas often are given special treatment so they are always in memory and not at the mercy of the replacement algorithm.

So far, we have been talking only about the use of the cache to enhance the transfer rate of the read operations from the disk. We also must consider how the cache is affected by writes from processor to disk. We should consider if the cache should even be involved in write operations. The answer is that the cache must at least be involved to the extent that it faithfully represents the data on the disk. If new data were written to a location on the disk that had previously been read to the cache, and this was not known to the cache, then the next read access to that data would be from the cache and the processor would receive old (erroneous) data.

One of the absolute requirements of any cache scheme is that it must be an exact duplicate of that part of the disk it represents. If data on the disk is modified by writing to the disk, then it is necessary to check whether that part of the disk also is in the cache. If the written part also is cached, there are two options. One option is to declare the part of the disk just written no longer in the cache, which prevents the processor from getting a hit on the old erroneous data; the second option is to update the cache copy of the data to reflect the modifications produced by the write onto the disk. One of these two options must be chosen to ensure that the processor receives the updated version of the data during a subsequent read operation.

**An absolute requirement of any cache scheme is that it must be an exact duplicate of that part of the disk it represents.**

Another question that should be asked is whether there is any advantage in caching write operations in a manner similar to that of read operations, or whether data should be transferred first from processor to cache and then from cache to disk. In fact, the answer is yes.

Now let us see how caching can be used to greatly enhance the effective transfer rate on write operations. We have shown that the cache must be involved in the write operation to disk, at least to the extent that it makes sure all data in the cache agrees exactly with the data on the disk. Let us look at one way this could be performed.

Suppose that when the processor needs to write information onto the disk, it writes the information into the cache and then immediately requests the transfer of that part of the cache memory to the disk. This algorithm is known as write-through. Assuming we are using an interrupt-driven disk driver, once the transfer is started, the processor does not need to be held up waiting for the write operation to complete and can proceed doing other useful work. Because the write operation is interrupt-driven, it can proceed independently of user tasks to perform the write to disk. This implementation on a user task makes the effective write performance of the disk essentially the same as for a RAM disk (350K bytes per second) because the user task is held up only for the length of time needed to transfer the data into the cache memory, after which regular processing may be resumed.

One minor penalty is paid for this greatly enhanced write throughput: a short duration of time during which the user task thinks that the data has been written successfully to the disk, but in fact the transfer has not actually taken place. Prior to the completion of the write operation, the cache memory and the disk do not contain identical copies of the data. This is not a problem for future read requests because the cache responds to all processor read requests for this data with the updated result. The problem could occur if the computer were turned off very quickly after the completion of a program, resulting in the cache not having time to flush its contents to disk.

Another difficulty is the more of a nuisance than a serious problem is that the transfer from cache to disk occurs after the user task thinks it has successfully completed its write to disk. Any disk errors detected during the transfer from cache to disk must therefore be handled in the cache or in the OS because the user task thinks it already has completed a successful write to disk before the disk error occurs. This might be a serious problem for disks with high error rates. However, our experience has been that the reliability of a Winchester disk drive is much higher than that of a floppy-disk drive, and that the only error you might get with any frequency from a Winchester disk drive occurs when the drive is not turned on. The improvement obtained by the RAM-disk equivalent performance on disk-write operations greatly outweighs the minor inconveniences of handling disk-write errors.

A second feature that can be implemented in the cache software with essentially no loss in transfer rate is performing automatic verify on write. Again, because the write operation...
into cache is complete and the user task has resumed, verification of the integrity of the disk-data write can be done essentially independently, in parallel with the user task, and does not adversely affect the transfer rate of the write requests. The user task still loses the time required to transfer the data, but the disk-access time is not lost because the access overhead is concurrent with execution of the user task. There also is a cluster effect in writing; it is more efficient to write large contiguous groups of blocks than it is to write widely separated single blocks. However, writing is determined by the user task, so there is not a great deal you can do in this area to improve efficiency other than to choose an optimum sequence for writing the blocks to disk. The average access time for writes can be reduced by choosing a sequence that minimizes the average head motion required.

At this point, let us note that when this form of write caching has been adopted, there is a choice of the timing of the actual cache-to-disk transfers. In some cases, particularly in transaction processing for database-management systems, there may be a tendency for a particular piece of data to be written several times in a short time span. In this case, it is wasteful to repeatedly update the disk copy of the data. It would be more efficient to wait until all writes were finished, then update the disk copy. This is usually accomplished by adopting what is called a write-back algorithm.

When write-back is used, the cache is not copied to disk until the replacement algorithm determines that the data should be displaced, because that part of the cache is needed for other data. Usually a dirty flag is kept for each cluster of the cache, which indicates that the data has been modified but not copied to disk. If the replacement algorithm decides to displace the data, and if the dirty flag is set, the data is "written back" to the disk. Frequently, a timer also is used, so that after some interval of time, while the disk is not too busy, that data is written back anyway. If this were not done, it would be necessary to do something special to flush the cache before powering down the computer; otherwise, the system would lose the updated contents of the cache. A long interval between writing the cache and updating the disk also makes the system more vulnerable to data loss in case of a system crash, unless the system crashes gracefully enough to remember to finish the update first. This grace is rare in small computers.

**Experimental Results**

In order to determine experimentally the actual performance potential of a Winchester disk cache as a function of the various parameters discussed, we developed a cache driver for a Percom PHD-10 Winchester disk drive with 10-megabyte capacity, operating on an IBM PC with PC-DOS 2.0. Because PC-DOS 2.0 can use boot-time loading of disk drivers, it was particularly convenient to design the cache as part of the disk driver and not as part of the operating-system file manager. We used the write-through algorithm for all write operations to disk. The prefetch algorithm that we used is the cluster method but uses much larger clusters than the 2 to 4 blocks that are typical cluster sizes in PC-DOS 2.0. We used a cluster size equal to one track of the disk drive (16 blocks). Our choice was based on the hardware performance characteristics of the Winchester drive and its controller.

The data is organized on the disk, by interleaving, to optimize the transfer of an entire track of data. For this reason, we decided to transfer an entire track of data into the cache whenever a miss occurred. This may not be the optimal value for the cluster size because it is larger than the file-system cluster size, but we felt that this large cluster size would result in better overall performance for the cache-disk subsystem. This algorithm performs very well on relatively unfragmented disks.

The driver was constructed so that it would keep count of the number of read hits and misses on the cache memory. But first we must spend a little time quantifying what we mean by

---

How To Expand Your IBM

Exclusive six-function card expands workspace, increases speed, and boosts memory up to 576K.

The TITAN™ is the only expansion card that gives your IBM PC or XT both hard disk SASI interface and a parallel printer port. This advanced package also includes a pair of RS-232C serial ports, real-time clock/calendar with battery back-up, plus a choice of memory expansions. And everything slips into a single slot!

Pick a TITAN with parity-checked dynamic RAM from 64K to 576K. Each comes ready to run, complete with four super software selections. PSEUDO-DISK™ makes the RAM act like an exceptionally fast disk drive. PSEUDO-PRINT™ print spooler lets your computer calculate while the printer is running. WHATIME™ keeps track of date and time so you don't have to enter them at each system restart. HARDISK™ makes a 10MB Winchester addition plug-in easy.

Yes, it's a lot for one slot. And it's available now to add new utility to your IBM system.

Let us help you expand your IBM's productivity. For information on our multi-function boards and other Titan microcomputer products, see your computer dealer or contact: Titan Technologies, Inc., P.O. Box 8050, Ann Arbor, MI 48107; Telephone (313) 662-8542.

by a hit and a miss.

Suppose the processor makes a read request for four blocks of data from the cache driver. We assume here that all four of the blocks either are contained in cache memory or are not (they are not part in and part out). We also will assume that all four blocks are located on the same track of the disk. These are not the assumptions made in the actual implementation of the hit/miss computation algorithms, but they make the algorithms easier to describe.

If the four blocks are contained in the cache, the hit count is incremented by 4 to indicate that we had a hit of four blocks. If they are not contained in cache, the first impression is that you should increment the miss count by 4 to indicate that we had a miss of four blocks. The problem with doing this is that the access time for the first missed block is much slower than the access time for the next three blocks, once the first block has been read.

In order to transfer the first block of data, the heads must move to the correct position on the disk. This, according to the drive manufacturer, requires an average of 80 ms. However, once the head is at the correct position on the track, the transfer of a single block requires only about 5.2 ms. Therefore, blocks 2, 3, and 4 can be transferred with a much smaller time penalty than that of the first block (this is the same premise on which the prefetch algorithm is based).

In order to take this effect into account fairly, we constructed the driver so it kept two miss counters. The first counter is called the hard-miss counter and is incremented by 1 for this example. The second is called the soft-miss counter and is incremented by 3 for this example. In the computation of the hit/miss ratios, the soft-miss count was multiplied by 0.065 (5.2 / 80.0) and added to the hard-miss count to get the effective miss count. This data then was used to directly compute the hit/miss ratio as a figure of merit of the efficiency of various cache sizes and replacement algorithms. We considered only the hit/miss ratio for reads because a user task is held up waiting for the transfer to take place.

only in the case of a read. All writes are automatically hits by this definition.

The hit/miss ratio depends very strongly on the I/O (input/output) characteristics of the particular tasks using the disk. To see why this is the case, imagine that we are repetitive-ly performing operations that involve disk transfers totally contained in the cache memory. The hit/miss ratio continues to increase as we repeat operations on the same disk data.

You might ask, however, what conditions would correspond to repeated operations on the same files. Examples of this include running the same program several times (for instance, in a spreadsheet or a BASIC program), repeated editing or word processing of the same text file, or repeated editing and compiling using a language processor.

Our first choice for the mix of tasks was selected as a worst-case test of the advantages of caching. We picked a class of jobs that would use the disk extensively and would have the minimal repetitive usage of the same files. Our mix of tasks consisted of a C compilation of a medium-size program (350 lines) followed by a Pascal compilation of a long program (1000 lines). The compiled Pascal program was then linked to form an executable load module. The total number of blocks requested to be read by the processor was about 2000. We ran this same sequence of programs for each of the tests so that the effect of the mix of programs would not bias the conclusions for the relative efficiency of the various algorithms. In each case, the cache started empty.

Figure 4 shows the hit/miss ratio as a function of the cache size for the LRU replacement algorithm and a prefetch value of 16 blocks (whenever a miss occurs, one full track of data is prefetched). Notice that even for this worst-case mix of programs, the effective hit/miss ratio is almost 10 by the time you get to 256K bytes of caching memory and becomes greater than 10 for 320K bytes of caching memory. We may expect to achieve our goal of a hit/miss ratio of 10 using 256K bytes of dedicated caching memory for a better mix of programs.

We'll now look at the effect of various cache replacement algorithms on the hit/miss ratio. To do

![Figure 5: A bar chart of the effect of the hit/miss ratio of using different replacement algorithms to determine which part of the cache to discard.](image-url)

**Statistics + Data Plotting Software**

This book/disk package contains 18 programs in BASIC for processing and plotting data. They uniquely combine statistics with computer graphics to give you data plotting capabilities found only in programs costing many times more - and the're all fully documented in BASIC so you can modify and combine them for special applications.

Programs plot histograms with mean and standard deviation, sort and draw pie charts, linear plots, log plots, bar charts, running averages, stock market charts, 3D views of surfaces. Special features include curve fitting, regression, data management, automatic scaling and axis labeling, automatic replooting when data changes. Send check or Visa/Mastercard no. with expiration date. Call for faster delivery. All items in stock and ready to go. Book with Disk $52.00. Please specify IBM, Apple or Z-100.

BASF QUALIMETRIC™ FLEXYDISKS®
BUILT FOR ETERNITY - WARRANTED FOR A LIFETIME.

BASF Qualimetric FlexyDisks® offer you more... an extraordinary new lifetime warranty.* The BASF Qualimetric standard is a dramatic new international standard of quality in magnetic media... insurance that your most vital information will be secure for tomorrow when you enter it on BASF FlexyDisks today.

We can offer this warranty with complete confidence because the Qualimetric standard reflects a continuing BASF commitment to perfection... a process which begins with materials selection and inspection, and continues through coating, polishing, lubricating, testing, and 100% error-free certification. Built into our FlexyDisk jacket is a unique two-piece liner. This BASF feature traps damaging debris away from the media surface, and creates extra space in the head access area, insuring optimum media-to-head alignment. The result is a lifetime of outstanding performance.

When your information must be secure for the future, look for the distinctive BASF package with the Qualimetric seal. Call 800-343-4600 for the name of your nearest supplier.

Circle 54 on inquiry card.
It's called "OPEN ACCESS," and it's the result of 60 man-years of effort to create a truly do-it-all, super-program—one that can perform virtually every task you're ever likely to encounter.

The beauty of it is, all that capability resides on a single program. You don't have to re-enter data. Or spend time trying to get unmatched programs to work together.

OPEN ACCESS takes its name from the source of its power—a relational data-base manager that gives you access to more data in more ways than any comparable software.

OPEN ACCESS includes an electronic spreadsheet, 3-D graphics, word processor, appointment scheduler and telecommunications module—all revolving around the powerful information manager.

1

INFORMATION MANAGEMENT—THE MASTERMIND. This advanced data-base manager stores and retrieves multiple files quickly, easily and reliably. What's more, it shares all information with the other programs, so you never have to re-enter the same data twice.

2

ELECTRONIC SPREADSHEET—NUMBER CRUNCHING AND GOAL SEEKING. It helps you produce forecasts, cost estimates and "break-even" points—in seconds, instead of hours or days. Best of all, it allows "goal seeking." Ask, for example, "What sales must I have the rest of the year to net $1 million?" and OPEN ACCESS will figure it out.

3

3-D GRAPHICS—NOT JUST PRETTY PICTURES. These graphics distill raw data into trends that can be instantly visualized, helping you discern the important facts from a wealth of information.
does Arithmetic.
Your Appointments
the World.

Because they do not have a dedicated relational data-base manager that can quickly direct massive amounts of data, other programs simply can't do what OPEN ACCESS can. Some don't have a communications program, others no dedicated word processor. None have a time management program.

There's just one conclusion: At $595* OPEN ACCESS can do more for you than any other comparable business program on the market. Bar none. But the only way for you to be convinced is for you to see OPEN ACCESS work its magic on your work load. So call your local software dealer today, or call us at SPI, at 619-450-1526.

SOFTWARE PRODUCTS INTERNATIONAL
10240 Sorrento Valley Road
San Diego, CA 92121

ORD PROCESSING—EDITOR (TRAORDINAIRE! Superior word processors like it easy to correct types, change words, shuffle paragraphs and format documents. It is one of that breed. Use it to write client memos, letters, proposals and more.

TELECOMMUNICATIONS—YOUR LINK WITH THE WORLD. This program gives you access to virtually any other computer system in the world. Not only can you transmit and receive reports from your colleagues, you can also subscribe to special data banks that know everything from GM's stock price to the relative humidity in Genoa. Now that's power!

TIME MANAGEMENT—CONSERVING YOUR MOST PRECIOUS RESOURCE. This module helps you keep track of all your appointments, hour by hour, day in and day out. It alerts you to standing obligations, automatically coordinates meeting times with other busy professionals, and lists all your associates on a Rolodex™-like file.
This, the disk driver was modified to allow the use of any of the three algorithms in the cache module. Figure 5 shows the measured hit/miss ratios of the three different replacement algorithms. This data was collected using a cache memory allocation of 256K bytes. Notice that, as predicted, the LRU algorithm produces a slightly higher hit/miss ratio than either the FIFO or the random-replacement algorithms. Although the effect is not too large (10 to 20 percent), we thought it significant enough to justify the use of this algorithm even though it is somewhat more complex to implement.

To show how the caching driver might achieve an even greater hit/miss ratio for a more fortunate mix of programs, for our next example we took the text editing of this article, and we plotted the hit/miss ratio as a function of the number of times the word processor was executed for the purpose of writing part of this text. These results, also corresponding to a cache size of 256K bytes, are plotted in figure 6.

**Programs that are heavy on file access can show large improvement factors with the use of caching.**

The large increase in the hit/miss ratio from 7 to almost 50 when the word processor is used on the text file needs some explanation. When the word processor is first run, the files containing both it and the text file are loaded into the cache memory, then passed through to the processor. Unless they were previously in the cache, this results in a certain miss count that depends on the size of the word processor and the size of the text file. When the editing of the file is completed, the updated file is written out to the cache and then automatically transferred to the disk, but if the cache memory is sufficiently large, both the word processor and the updated text file also will remain in the cache. When the word processor is again used to edit the same text file, the cache will contain both. The second and all subsequent modifications to the file result in nothing but hits on the cache memory. In this case, which is referred to as being fully cached, you can therefore expect the hit/miss ratio to continue upward in a manner proportional to the number of times the word processor is used on the same file. Because word processing and computer programming frequently entail this sort of cyclic use of a small set of files, the benefits from disk caching for this type of computer usage are obvious from the plot. Of course, this speed-up effect does not mean that all processing is speeded up; it only applies to those that would otherwise be lost during inefficient disk transfers. If a program is computation intensive, with little file access, its execution speed is largely unaffected. Programs that are heavy on file access can show large improvement factors.

In general, “tuning” the cache memory allocation consists primarily of trying to get the cache size large enough to hold virtually all of the files in use over some reasonable period of time. This situation may be compared with a RAM disk where the size choice is made in much the same way.

In some systems, attempts have been made to use small caches of 64K bytes or less. Our experience is that attempting to use too small a cache frequently degrades performance rather than enhances it, so it is important to accurately assess the needs and provide adequate memory for this purpose. At the same time, using a larger cache size than is needed for the normal mix of tasks done is simply wasteful and expensive. A larger than average utilization of disk data would necessitate a larger disk cache; a frugal user of disk data might get by with less.

It is useful to compare the cache concept with that of the RAM disk. The big advantage of disk caching
SPSS Inc. a leading producer of statistical software for over 15 years, with more than a half million manuals sold in 80 countries, is making micro waves with SPSS/PC and SPSS/Pro. Two powerful new statistical and reporting programs which were designed for the IBM Personal Computer and the DEC Professional 350.

over a RAM disk is that the selection of which files are to be placed into the "fast disk" is completely automatic rather than manual, and the cache approach provides automatic, read-verified backup to the nonvolatile physical disk; consequently, it is unnecessary to remember to write the files back manually, and the risk of data loss due to power failure is minimized. The adverse effect of disk fragmentation can be overcome by occasionally performing a full backup and restore of all files on the disk. Doing this results in a completely compacted disk with all files completely contiguous. Thereafter, only those files that are modified will become fragmented, and the average fragmentation will be small. Besides the value of performing regular backup, this practice is beneficial even without caching.

Finally, to demonstrate that caching does produce a substantial improvement in overall system speed, we ran timing tests on two typical programs.

### The time spent in caching algorithms was insignificant compared with the time spent performing the actual data transfer.

The first task is a file copy. This program reads a file one block at a time, performs some processing on the data, and writes the resulting data back to the disk into a different file. The two files were moderately far apart on the disk. Figure 7 shows the time required to carry out this task in three cases. In the first case, no caching was used. In the second case, caching was used, but the program and files were not already in the cache. The third was the fully cached case, with the program and files already in the cache from the second test. By using the caching driver, this test exhibits improvement, by more than a factor of four, in the total execution time for this program.

Figure 8 shows the time required to compile and link the program used to collect the data presented in figure 7. The improvement is not as dramatic in this example because these tasks are more computation intensive, with less time spent in disk operations. Nevertheless, there is a decrease of 30 percent in total execution time.

You might well ask whether you should consider the degradation in the transfer rate produced by using the more complex algorithms in the cache system. That is, are we slowing down the transfer rate by spending too much time in determining if the data is in cache memory, or in sophisticated prefetch and replacement algorithms? We found, at least in the case of PC-DOS 2.0, that the time spent in the various caching algorithms was insignificant in comparison with the time spent performing the actual data transfer. It therefore turns out that the cache memory has a transfer rate almost equal to a RAM-disk system whenever it contains the requested data. We have, of course, implicitly assumed this fact in our previous plots of transfer rate versus hit/miss ratio. In this regard, disk caching has an advantage over memory caching. In disk caching, the various algorithms are executed once, at most, for every block that is transferred; in memory caching, some of the algorithms are executed once for each byte or word that is transferred.

### Conclusion

We have determined that you can utilize the added addressable memory afforded by 16-bit processors in a very useful way to improve the overall effective transfer rate of Winchester systems and to provide apparent, sometimes dramatic, performance increases. For the case of cach-
Development Tools That Work
Avocet cross-assemblers are fast, reliable and user-proven in over 3 years of actual use. Ask NASA, IBM, XEROX or the hundreds of other organizations that use them. Every time you see a new microprocessor-based product, there's a good chance it was developed with Avocet cross-assemblers.

Avocet cross-assemblers are easy to use. They run on any computer with CP/M* and process assembly language for the most popular microprocessor families.

5½" disk formats available at no extra cost include Osborne, Xerox, H-P, IBM PC, Kaypro, North Star, Zenith, Televideo, Otron, DEC.

Turn Your Computer Into A Complete Development System
Of course, there's more. Avocet has the tools you need from start to finish to enter, assemble and test your software and finally cast it in EPROM:

Text Editor VEDIT -- full-screen text editor by CompuView. Makes source code entry a snap. Full-screen text editing, plus TECO-like macro facility for repetitive tasks. Pre-configured for over 40 terminals and personal computers as well as in user-configurable form.

CP/M-80 version $150
CP/M-86 or MDOS version $195
(when ordered with any Avocet product)

EPROM Programmer -- Model 712B
EPROM Programmer by GTek programs most EPROMs without the need for personality modules. Self-contained power supply accepts ASCII commands and data from any computer through RS 232 serial interface. Cross-assembler hex object files can be downloaded directly. Commands include verify and read, as well as partial programming.

(PROM types supported: 2508, 2578, 2516, 2716, 2532, 2732, 2732A, 27C32, MCM8766, 2564, 2764, 27C64, 27128, 8748, 8741, 8749, 8742, 8751, 8755, plus Seeg and Xicor EEPROMs.

Before Johann Sebastian Bach developed a new method of tuning, you had to change instruments practically every time you wanted to change keys. Very difficult.

Before Avocet introduced its family of cross-assemblers, developing microprocessor software was much the same. You needed a separate development system for practically every type of processor. Very difficult and very expensive.

But with Avocet's cross-assemblers, a single computer can develop software for virtually any microprocessor! Does that put us in a league with Bach? You decide.

ing within the disk driver, the cluster prefetch method does a good job. We chose the cluster size based on characteristics of the disk hardware.

It appears that the LRU replacement algorithm delivers the best hit/miss ratio and should be used because the time spent in the actual transfer dominates the computation overhead. We also found that the complexity of the various algorithms had a negligible effect on the transfer rate.

On the basis of the example of the extremes between little repetitive usage and significant repetitive usage, we feel that the average single-user system can expect an overall hit/miss ratio greater than 10 for a cache size of 256K bytes. We generally attain hit/miss ratios of 20 to 50. These high ratios lead to an overall improvement in the disk transfer rate of 5 to 15, depending on the amount of head movement that occurs in the un-

Figure 8: A bar plot of the time required to compile and link a C program. As in figure 7, bar 1 was obtained with no caching, bar 2 was obtained with an empty cache, and bar 3 was obtained with fully cached operation.
Introducing the Most Powerful Business Software Ever!

VERSABUSINESS™ Series

Each VERSABUSINESS module can be purchased and used independently, or can be linked in any combination to form a complete, coordinated business system.

VERSARECEIVABLES™ $99.95
VERSARECEIVABLES™ is a complete menu-driven accounts receivable, invoicing, and monthly statement-generating system. It keeps track of all information related to who owes you or your company money, and can provide automatic billing for past due accounts. VERSARECEIVABLES™ prints all necessary statements, invoices, and summary reports and can be linked with VERSAPAYROLL™ and VERSAINVENTORY™.

VERSAPAYABLES™ $99.95
VERSAPAYABLES™ is designed to keep track of current and aged payables, keeping you in touch with all information regarding how much money your company owes, and to whom. VERSAPAYABLES™ maintains a complete record of each vendor, prints checks, check registers, vouchers, transaction reports, aged payables reports, vendor reports, and more. With VERSAPAYABLES™, you can even let your computer automatically select which vendors are to be paid.

VERSAPAYROLL™ $99.95
VERSAPAYROLL™ is a powerful and sophisticated, but easy to use payroll system that keeps track of all government-required payroll information. Complete employee records are maintained, and all necessary payroll calculations are performed automatically, with totals displayed on screen for operator approval. A payroll can be run totally automatically, or the operator can intervene to prevent a check from being printed, or to alter information on it. If desired, totals may be posted to the VERSALEDGER™ system.

VERSAINVENTORY™ $99.95
VERSAINVENTORY™ is a complete inventory control system that gives you instant access to data on any item. VERSAINVENTORY™ keeps track of all information related to what items are in stock, out of stock, on backorder, etc., stores sales and pricing data, alerts you when an item falls below a preset reorder point, and allows you to enter and print invoices directly or link to the VERSARECEIVABLES™ system. VERSAINVENTORY™ prints all needed inventory listings, reports of items below reorder point, inventory value reports, period and year-to-date sales reports, price lists, inventory checklists, etc.

VERSALEDGER™ $119.95
VERSALEDGER™ is a complete accounting system that grows as your business grows. VERSALEDGER™ can be used as a simple personal checkbook register, expanded to a small business bookkeeping system or developed into a large corporate general ledger system without any additional software.
- VERSALEDGER™ gives you almost unlimited storage capacity (300 to 10,000 entries per month, depending on the system).
- stores all check and general ledger information forever,
- prints tractor-feed checks,
- handles multiple checkbooks and general ledgers,
- prints 17 customized accounting reports including check registers, balance sheets, income statements, transaction reports, account listings, etc.

VERSALEDGER™ comes with a professionally-written 160 page manual designed for first-time users. The VERSALEDGER™ manual will help you become quickly familiar with VERSALEDGER™, using complete sample data files supplied on diskette and more than 50 pages of sample printouts.

SATISFACTION GUARANTEED!

Every VERSABUSINESS™ module is guaranteed to outperform all other competitive systems, and at a fraction of their cost. If you are not satisfied with any VERSABUSINESS™ module, you may return it within 30 days for a refund. Manuals for any VERSABUSINESS™ module may be purchased for $15 each, certified toward a later purchase of that module.

DEALER INQUIRIES WELCOME
All prices and specifications subject to change. Delivery subject to availability.
We've got speed, performance and 3,000 new applications to satisfy that appetite.

Introducing the Digital Research CP/M Gold Card.™ The pick of the hardware crop for your Apple® Computer.

Just plug it into any slot in your Apple II, II+ or Ile, and you get a new generation machine that runs CP/M Plus™ and all those programs it could never handle before.

Impressive, but not surprising. After all, who better than the creators of CP/M® to perfect it for your Apple?

And if you thought your Apple was a bit slow, chew on this. We combined CP/M Plus, the Z80B microprocessor and optional Disk Cache to push your Apple to perform up to three times faster than any of the competition.

With the speed to handle programs like dBase II™ in half the time. And we've included CBASIC® so you can write customized programs.
It even boosts your monitor's CP/M output to full 80 column video. And those are just the basics.

For serious programmers we also included a macro-assembler and symbolic debugger. Explaining it all in two complete manuals.

It all comes down to this. Soon there will be two kinds of Apple users. Those with the CP/M Gold Card. And those who are still hungry for one.
When Fox & Geller set out to conquer the world of Management Control software they met with key managers from Fortune 500 companies. They studied the demands made on managers, and the demands those managers made on their software. And they learned the reason many of them used the programs they were using was not because it was the right software for the job, but because there was nothing better to choose from. Well, now there is! Introducing OZ: MANAGEMENT CONTROL!

Designed by managers for managers! OZ is more than a spread-sheet. OZ is the first fully integrated Management Control System designed to bring highly sophisticated management technique to today's business manager.

OZ does everything a manager does, like: forecast revenues and expenses, compare actuals to forecast, pinpoint and understand variances. OZ can even perform 3-dimensional analysis of your data. And at the touch of a key, OZ will graph anything you call to the screen, in color!

OZ is complete financial reporting and information control with fully integrated graphics. OZ talks to you in plain English. And it's so fully automatic, so easy to use, that most functions are performed by touching only one key! OZ is the most advanced software ever developed for the personal computer.

Call us at (201) 794-8883 and discover the difference the right software can make in controlling your business.

You need control!

OZ: MANAGEMENT CONTROL.

by FOX & GELLER
Update on Apple Macintosh and Lisa 2

Gregg Williams
BYTE Senior Technical Editor

The Macintosh and Lisa 2 are out, although a few unpleasant surprises occurred between the deadline for my articles appearing in the February BYTE (pages 30 and 84, respectively) and Apple’s formal announcement on January 24. In a word, the Macintosh (or Mac) is more expensive than we thought it would be. At one time, Apple had decided on a $1995 price for the basic Macintosh, but the company changed this to $2495. Other changes include: Imagewriter (reported at $495), $495 if bought with a Mac, $595 otherwise; numeric keypad, $129 (up from $99); second disk drive, $495 (up from $395). Apple also announced a 300-bps (bits per second) modem for $225 and a 1200-bps modem for $495.

Apple has also formed the Apple University Consortium (AUC) to "further the use of computers in higher education" by making “commitments to supply large numbers of its new Macintosh personal computers to 24 leading universities, including Yale, Stanford, Dartmouth, Brown, and the University of Michigan. Apple requires member universities to create courseware and meet regularly together. Faculty and students will be able to buy Macintoshes at reduced rates; a source close to the University of Utah, an AUC member, said that the prices were $1200 for students and $900 for faculty.

Apple also announced three members of the Lisa 2 family: the Lisa 2, at $3495; the Lisa 2/5, at $4495; and the Lisa 2/10, at $5495. All units have 512K bytes of memory and one 3½-inch microfloppy-disk drive. The Lisa 2/5 adds an external 5-megabyte Profile hard disk, and the Lisa 2/10 adds an internal 10-megabyte hard disk. Lisa 1 owners can upgrade to a Lisa 2/5 for free until June 1, $595 afterward, or to a Lisa 2/10 for $2495. A 512K-byte memory upgrade is $1495. The Macintosh operating system (needed for a Lisa computer to run Macintosh software) comes free with the Lisa 2 computer and is available at extra cost for buyers of the Lisa 2/5 and 2/10. Apple also announced Apple Bus, a low-cost local network that will allow Macintoshes, Lisas, and (later) Apple II-family computers to share common peripherals.

Commentary

Initial reaction to the Macintosh has been strongly, but not overwhelmingly, favorable. A few traditional computer users see the mouse, the windows, and the desktop metaphor as silly, useless frills, and others are outraged at the lack of color graphics, but most users are impressed by the machine and its capabilities. Still, some people have expressed concern about the relatively small 128K-byte RAM (random-access read/write memory) size, the lack of any computer language sent as part of the basic unit, and the inconvenience of the single disk drive. Although Apple has said nothing officially, it is widely believed that Apple will offer a 512K-byte Macintosh upgrade by the end of 1984; since the Macintosh memory chips are soldered onto the printed-circuit board, this will not be a simple upgrade that most users will want to do at home. The Macintosh is largely a computer of unparalleled vision on Apple's part; however, that vision failed when the Mac was limited to 128K bytes of memory. It took no vision to see the need for a larger memory: much existing software (for the IBM PC, for example) already makes use of 256K- and 512K-byte memory spaces.

At the current prices, a usable system (Macintosh with one language, MacPaint/MacWrite, Imagewriter printer, and second disk drive) will now cost $3879 ($100 less if you buy the Imagewriter with the system). This is considerably more than the $2984 possible package price quoted in my February article. Marketing decisions have compromised Steve Jobs's vision of "something really inexpensive so that everyone can afford it." Also, the higher price will probably decrease the influence of the machine on the market; this may make the difference between the Macintosh being just another successful computer rather than being the computer that is popular enough to be a surviving alternative to the looming IBM monopoly.

Gregg Williams is a senior technical editor at BYTE. He can be reached at P.O.B. 372, Hanover, NH 03449.
Fitting Curves to Data

The Simplex algorithm is the answer

Marco S. Caceci and William P. Cacheris
Florida State University

Fitting functions to data is a frequent task in science and wherever you need to superimpose complex mathematical models on data. Most curve-fitting programs presently running on microcomputers are either locally written, brute-force stepping procedures, or Newton-Ralphson algorithms in BASIC and FORTRAN that have passed hands dozens of times. The Simplex algorithm we use is relatively recent (1965) and has been applied to curve-fitting problems only in the past few years, mostly in academic circles.

Consider a set of number pairs, \( x_1, y_1; x_2, y_2; \ldots; x_n, y_n \). It is easy to implement a linear fit, computing the parameters \( a \) and \( b \) of the "best" straight line, \( y = a + bx \), passing through the points. Some pocket calculators have the necessary routines in firmware. And there are programs available that can fit any set of points to a polynomial or some "well-behaved" function. It would be convenient, however, to be able to fit sets of data points to more complicated functions, or, for that matter, to find an algorithm capable of fitting a set of data points to any function, no matter how complex.

Within the speed and memory limitations of the computer on which it runs, the program Simp is capable of computing the parameter values that best fit a particular set of data points given an analytical function with any number of variables and parameters. The program utilizes the Simplex algorithm and is written in Pascal/Z version 4.0.

Problem Definition

It is easier to understand curve fitting if you start with an example. As a typical case of experimental data that provides useful information through a complex function, consider the Michaelis-Menten kinetic theory of enzyme action. The Michaelis-Menten equation has the form \( y = a \times x / (b + x) \). Experimentally, you measure the initial reaction rates: \( y \), for different substrate concentrations; \( x \), in order to determine the value of constants; \( a \) and \( b \). The \( a \) represents the maximum initial reaction rate and \( b \) the enzyme's affinity for the substrate. The problem lies in determining the best values of \( a \) and \( b \) for a given set of \( x \) and \( y \) data.

Figure 1 represents a set of six experimental data points, \( x_i, y_i \), and the curve described by the Michaelis-Menten function that best fits them. The points do not fall exactly on the curve because they are affected by experimental error, and they are redundant. Two would be enough to define the curve, but by providing a larger number, the errors tend to cancel and possibly can be estimated. A further assumption that simplifies the mathematics (and is usually true) is that the \( x \) values are virtually error free; the only significant errors are in the experimental determination of the \( y \) values.

In the equation \( y = a \times x / (b + x) \), constants \( a \) and \( b \) do not vary within a set. Variables \( x \) and \( y \) do. The experimenter varies \( x \), the independent variable, freely during the experi-
ment; \( y \), the dependent variable, is measured by the experiment, and its value (hopefully) depends on \( x \). The Michaelis-Menten equation forms a model when applied to an experiment, and the constants in the equation become the model's parameters. This model has, therefore, one independent variable and one dependent variable and it is described by an equation with two parameters. To fit the curve you must estimate the "best" values for these parameters.

You can use two strategies to obtain a fit: linear and nonlinear parametric fit. If the model contains only linear equations (integral powers of the variables), you can use a linear algorithm. The great advantage of linear methods is that the solution is often immediate, i.e., they don't require an indefinite number of iterations. The main disadvantage is that many functions are not, and cannot be reduced to, linear equations.

The Michaelis-Menten equation in the example is not a linear equation, although you can manipulate it into a linear form. It is easy to prove that if you plot \( 1/y \) versus \( 1/x \), the result is a straight line whose slope is \( b/a \), whose intercept is \( 1/a \), and whose equation is \( 1/y = 1/a + b/a \times 1/x \). You can find good values for \( a \) and \( b \) by drawing or computing the "best" straight line through the "manipulated" experimental points according to the least-squares criterion.

You can extend this approach by properly using matrix algebra to handle more than two parameters and/or polynomial expressions. It is generally not a good practice to transform nonlinear systems into linear ones even when it is possible. Not only is it somewhat cumbersome, since you must handle each different function in a different way, but the error distribution and the statistical weight of the data points change after such transformations. If you don't deal with this properly, it can result in substantial inaccuracies.

In general, to handle nonlinear functions you need nonlinear parametric fits. Unfortunately, all general-purpose, non-linear, curve-fitting algorithms developed to date have one annoying feature—namely, they are recursive. You must adjust the parameters in an iterative way with no idea of how many repetitions you will need to achieve convergence or even, for that matter, if you can. Nonlinear parametric fits also require initial estimates of the values sought.

The Response Surface

Getting back to the example, you need a method for finding the best values of \( a \) and \( b \) for a set of \( x \) and \( y \) data using a nonlinear approach. And you must be able to generalize this method for any kind of function.

First, you need a new representation of the data. If you choose arbitrary values for \( a \) and \( b \), you can determine the corresponding values of \( y \) for each experimental \( x \) from the equation. Good values for \( a \) and \( b \) can adequately predict \( y \) values that are close to those experimentally measured.

Quantitatively, if you have \( n \) data points, label each value of the independent variable as \( x_1, x_2, \ldots, x_n \) and each value of the dependent variable as \( y_1, y_2, \ldots, y_n \). Also, label your \( n \) predicted values (as calculated by the equation using certain values for \( a \) and \( b \)) for the dependent variable \( y_1', y_2', \ldots, y_n' \). Any pair of \( a \) and \( b \) values thus produces a set of \( y_1' \) predicted values corresponding to the experimental \( x_i \) set.

The sum \( (y_1 - y_1')^2 + (y_2 - y_2')^2 + \ldots + (y_n - y_n')^2 \) is called the sum of the squared residuals (SSR) and can be written \( \Sigma_i (y_i - y_i')^2 \). The lower this sum is, the better the curve fits. This is called the least-squares criterion. For random errors randomly distributed (usually a reasonable assumption), this is the best criterion of all.

If the error distribution is not random but known, you can usually assign a statistical weight \( w_i \) to each data point. The least-squares criterion will then minimize the sum: \( SSR = \Sigma_i w_i (y_i - y_i')^2 \).

Thus, the problem of finding the best values for a function's unknown
parameters becomes the problem of finding the minimum of a new function, \( SS_R \). In this example, we can picture \( a \) and \( b \) as the independent variables and \( SS_R \) as the dependent one (Figure 2). In general, if you have a function with \( n \) parameters to be optimized, \( SS_R \) describes an \( (n+1) \)-dimensional surface, called the response surface. If you have very bad parameter values, the surface point values are high. As you move toward better values, the response surface dips toward a minimum.

**Searching for the Minimum**

The best values of \( a \) and \( b \) lie at the minimum of the function \( SS_R = \Sigma_i \, w_i \, (y_i - y_i')^p \), and you need to find this minimum. Before discussing the Simplex algorithm, let's consider the most common alternatives.

The stepwise descent strategy consists of adjusting one parameter at a time, sequentially, until you find a minimum along that parameter, and then repeating the process until all values are stable. This algorithm is relatively easy to program and will converge virtually all the time, but it can be extremely slow to run, especially if there is a large number of parameters or any appreciable correlation between them.

Steepest descent methods adjust the parameter values along the direction of the response surface's fastest decrease. They involve fewer iterations, but they require knowledge or computation (by numerical differentiation) of \( SS_R \)'s first derivatives.

**A simplex is a geometric figure that has one more vertex than the space in which it is defined has dimensions.**

The Newton-Ralphson algorithm (and its many descendants) is the most popular nonlinear, least-squares fitting algorithm today. Although it is mathematically complex and always prone to divergence, it is fast (especially where the hardware supports matrix and floating-point operations), and speed is the most important consideration with computer time as expensive as it is.

Basicamly, the algorithm varies the parameters until the partial derivatives of \( SS_R \) are all sufficiently close to zero. At each iteration, it computes the amount by which the parameters are changed, creating a square matrix that contains all the second derivatives of \( SS_R \), then inverting this matrix and multiplying the result by the previous values of the first derivatives.

This approach often gives rapid convergence, but it also suffers substantial drawbacks. The program can diverge if it starts from inaccurate initial guesses. Considerable truncation errors can occur in the partial derivatives' calculations and in the matrix inversions, particularly when the installation does not support double-precision formats. Also, the numerical calculation of all the partial derivatives at each repetition requires massive amounts of computations.

The Marquardt algorithm and other more recent methods are mathematically equivalent to a mixture of the Newton-Ralphson and the steepest descent algorithms. It avoids the divergence problems of Newton-Ralphson without the unacceptable losses in speed. The amount and complexity of code generated in this way can, however, become substantial.

The Simplex method is relatively new; it was first proposed by J. A. Nelder and R. Mead in 1965. They used it to find mathematical function minimums. Since then, various applications to fitting problems have been developed.

A simplex is a geometric figure that has one more vertex than the space in which it is defined has dimensions. For example, a simplex on a plane (a two-dimensional space) is a triangle; a simplex in three-dimensional space is a tetrahedron, and so on.

The basic idea in the Simplex method is to build a simplex in the \( M+1 \)-dimensional space described by the parameters you want to fit. For example, in the Michaelis-Menten equation above, there are two parameters, \( a \) and \( b \). You can consider them as axes in a plane on which we create a simplex (a triangle). Each vertex is then character-
512Kbyte SemiDisk™ I $1095

Time was, you thought you couldn't afford a SemiDisk. Now, you can't afford to be without one.

Time was, you had to wait for your disk drives. The SemiDisk changed all that, giving you large, extremely fast disk emulators specifically designed for your computer. Much faster than floppies or hard disks, SemiDisk squeezes the last drop of performance out of your computer.

Time was, disk emulators were afraid of the dark. When your computer was turned off, or a power outage occurred, all your valuable data was lost. But the SemiDisk changed all that. Now, the optional Battery Backup Unit helps take the worry out of power interruptions. It keeps the SemiDisk powered for up to 5 hours during a power failure.

Time was, you had to wait until your printer finished printing to use your computer. That's changed, too. Now, the SemiSpool print buffer in our Version 5.0 software, running under CP/M 2.2, frees your computer for other tasks while your data is printing. With a capacity up to the size of the SemiDisk itself, you could implement an 8 Mbyte spooler!

But one thing hasn't changed. That's our continuing commitment to supply the fastest, highest density, easiest to use, most compatible, and most cost-effective disk emulators in the world.

SemiDisk.
It's the disk the others are trying to copy.

SemiDisk Systems, Inc.
P.O. Box GG  Beaverton, OR 97075  (503) 642-3100

Circle 344 on Inquiry card.
ized by three values: $a$, $b$, and the response $SS_R$.

To reach the lowest value of $SS_R$, the program moves the simplex "downhill", accelerating and slowing down as needed. It follows the rule: find which vertex has the highest (worst) response and which has the lowest (best), then reject the highest and substitute another one for it. The program computes the new vertex according to one of these mechanisms: reflection, expansion, contraction, and shrinkage.

If you want to create a reflected vertex, call $d$ the distance from the worst vertex to $M$, the midpoint of all the other vertices. For the triangle this is the distance from the vertex to the center of the line that connects the other two vertices. The reflected vertex is located at a distance $d$ from $M$ on the line continuation that joins the rejected vertex to $M$.

If the response of the reflected vertex is neither worse nor better than the best one in the simplex, then the program accepts it. If the reflected vertex has a lower (better) response than the previous best, the program tests an expansion by reflecting twice the distance $d$. The expanded vertex is accepted if it has a lower response than the rejected one; otherwise, the program accepts the reflected one.

If the reflected vertex has a higher (worse) response than the rejected vertex, the program tests a contraction by moving the rejected one a distance of one-half $d$ toward the midpoint. This contracted vertex is accepted if it produces a better (lower) response than the rejected one; otherwise, a shrinkage occurs and all vertices, except the best one, move directly toward it by half of their original distance from it.

Figure 3 illustrates these four mechanisms and figure 4 gives the rules of simplex movement in flowchart form. Figure 5 shows an example of a simplex moving on $SS_R$'s contour plot for a two-parameter fit.

It is possible to make various modifications to the present algorithm. One common variant substitutes the shrinkage with a contraction beyond point $M$. And you can change the coefficients for the reflection, expansion, and contraction within certain limits.

The rules given above show clearly the advantages of the Simplex strategy:

- Divergence is impossible.
- You need to compute the response value only once or at most a few times for each iteration.
- You don't need any knowledge of derivatives or numerical differentiation. This avoids rounding-off errors and allows the handling of non-continuous functions.
- No matrix operation is involved.

**Figure 3:** Two-dimensional simplex BWO illustrating the four mechanisms of movement: reflection, expansion, contraction, shrinkage. $B =$ vertex, $W =$ worst vertex, $R =$ reflected vertex, $E =$ expanded vertex, $C =$ contracted vertex, and $S =$ shrunk vertexes.
Two ways to show off your IBM PC.

There's no better way to show off your IBM PC - or any other micro - than with the new line of Toshiba printers. They offer state-of-the-art features, high reliability and low price.

**PI351**
The new Toshiba PI351 printer has a unique high-density 24-pin dot-matrix print head. It lets you print crisp, clean letter copy at 100 cps, draft copy at 192 cps. And with the software-selectable downloading fonts, you get to pick from a variety of type styles.

The PI351 has more stuff to show. Like 180 x 180 dots-per-inch high-resolution graphics, 132-column-width platen (great for spreadsheets and Lotus™ 1-2-3™ data processing and graphics), Qume SPRINT 5™ emulation, and a choice of either a forms tractor or automatic sheet feeder.

**PI340**
For considerably less, the new PI340 gives you just a little less. But it still has the same high-density 24-pin dot-matrix print head, the 180 x 180 dots-per-inch graphics resolution, and the Qume SPRINT 5 emulation. In addition to true proportional spacing and a built-in forms tractor. Whichever printer you choose, you also get nationwide service within 24 hours by Western Union technicians.

So the choice is yours. But when you choose Toshiba, you know you're putting on the best show possible.

For more information, call one of the distributors listed on the adjacent page.

Figure 4: Flowchart of the Simplex algorithm.

Every function that you can write as computer code, you can optimize with the Simplex algorithm. In particular, to implement contour conditions, such as "parameter r must be positive, parameter s must be between one and ten, etc.," you assign very high values to SSR points corresponding to out-of-boundary parameter values to prevent the simplex from ever entering these regions.

Program Description
Simp (listing 1) is written in Pascal/Z (Ithaca Intersystems) version 4.0 to run under the CP/M-80 operating system. This example contains about 200 statements and compiles into 19K bytes. Despite the care taken to try to avoid any nonstandard (Jensen and Wirth) expressions, some I/O (input/output) expressions are not standard, and you should be cautious about transporting Simp to other compilers. A version running on a Control Data Cyber-76 mainframe (Pascal 6000.3.4.0 compiler) is also presently available, and a BASIC translation for the Atari microcomputer is coming soon. To date, Simp has been used to fit functions with up to nine adjustable parameters, up to 200 data points, and two independent variables. The speed and memory limitations of the machine on which the program runs define the upper limit on these numbers.

To operate the program, you need only modify the function declaration and, in some cases, the constants' assignments and the I/O procedures. The only constants you must modify to accommodate different models are: m, the number of parameters to be fit; possibly mnp, the total number of variables per data point; and mnp, the maximum number of data points. In the present example, mnp is 2 (1 independent variable, x, and 1 dependent one, y) and mnp is 200.

The program input is in a disk file whose name is appended to the CP/M command. Procedure enter reads the input file. Simp directs enter to produce a screen output. If any error exists in the input file, you can easily detect it at this stage. If there are no errors, Simp redirects the output to the printer and invokes enter again. If you need additional data input or preprocessing of the data, you must modify procedure enter accordingly.

Next, Simp computes the starting simplex values, represented as a square matrix n x n, where n is the number of parameters you want to fit plus one. Each matrix row is a different vertex, for which the first n - 1 columns are the individual parameter values, and the nth column stores the response value to be minimized from the procedure sum_of_residuals.

Procedure sum_of_residuals receives a set of parameter values, and from these, combined with the experimental data, computes the response surface value at the corresponding point. That is, it computes the sum of the squares of the differences between individual experimental dependent variable values and those

## CALL FOR SOFTWARE & HARDWARE PRICES NOT LISTED HERE

**USED PCs & APPLES BOUGHT & SOLD**

"International Dealer Enquiries Welcome"

Circle 253 on inquiry card.

**TERMS:** All prices subject to change. Cashier's check/MO/Bank Transfer. Allow time for company or personal checks to clear. Prices reflect cash prepaid discount. VISA/MASTER CARD/CO/P.O.'S - 3%. California residents add sales tax. SHIPPING: $4 per item for UPS surface ($8 for Blue Label). Monitors $30. Printers $25. within continental USA.
An example of the simplex moving on the response surface's contour plot.

The main program loop moves the simplex according to the rules previously given. Procedure new_vertex substitutes the rejected vertex with a new one. Simp exits the loop when the error (the percent difference between the extreme values) for all parameters falls below the necessary limits or reaches the maximum number of iterations. At each repetition new_vertex displays the new accepted vertex's values on the screen.

Once the program exits the main loop, procedure report directs the results to the screen and the printer. It also creates two files on the default disk drive, FIT.DAT and ERR.DAT. FIT.DAT contains the fitted points, where Simp copies the input $x_i$ values and computes the corresponding $y_i$ values using $a$ and $b$'s estimated values. ERR.DAT contains the $(x_i, dy_i)$ data points, where the $x_i$s are from the input and the $dy_i$s are from the computed residuals (the quantities $y_i - y_i'$). Both files begin with a series of six separated ones followed by the number of data points and then the data points themselves. If you need to post-process the data or if you change npp, procedure report will require modifications.

**Program Operation**

You must create an executable file, SIMPCOM, from the source file, SIMPPAS. In Pascal/Z, this is done by executing:

```
A>pascal56 simp
This creates SIMP.SRC.
A>pasopt simp
Optional optimizer. It saves a few bytes.
A>asmbl main, simp/rel
Creates SIMP.REL relocatable file.
A>link simp/n:simple
Creates SIMPCOM object code file.
```

The command A>simp <infile> invokes the program where <infile> is a valid CP/M filename. The disk input file, <infile>, is organized as follows:

- the maximum number of iterations (integer). Zero gives an infinite loop. Very generally speaking, the program usually converges in less than $20 \times m^2$ repetitions.
- your initial parameter guesses (m floating points).
- your initial parameter increments (m floating points). 0.0 blocks the corresponding parameter. The recommended values are one-tenth to one-half of your initial guesses.
- the maximum errors allowed ($m + 1$ floating points—one for each parameter and one for the sum of the squares of the residuals). The recommended values are $1E - 4$ to $1E - 6$.
- the data $(x_1, y_1) ; x_2, y_2 ; \ldots ; x_n, y_n$.

The program tolerates different input formats and any separator (space, tab, carriage return, line feed) should work. It is essential, though, to terminate the input file without any
THE PERSONAL COMPUTER NETWORK
Buy Hardware/Software at Wholesale, And Save On Software Rentals, As A NETWORK Member Only!

Save hundreds of dollars when you buy DIRECT from America's Number 1 Computer Buying Service at just 8% above DEALER WHOLESALE PRICES, plus shipping.

Members receive The Personal Computer NETWORK's Giant Catalog featuring over 10,000 products and the lowest prices on the widest selection of computer software and hardware in the nation!

RENT BEFORE YOU BUY — Members are eligible to rent The NETWORK’s Business and Game Software Rentals for a much smaller fee than other software rental services. And The NETWORK's rental charges are far less — just 20%-25% of the Member WHOLESALE PRICE.

Listed below are just a few of the over 10,000 products available at our EVERYDAY LOW PRICES!

The VISUAL 1050 is an advanced personal computer system designed especially for managers and professionals. It comes complete with top-rated software and high-performance hardware... all fully configured for easy set-up and simple operation. The VISUAL 1050 costs much less than other full-feature personal computers and comes with everything you need to tackle important professional jobs, right out of the box.

Words, Numbers and Graphics

The VISUAL 1050 solves more professional problems than any other computer in its class. Whether you work with words, numbers, or graphics, the VISUAL 1050 speaks your language. You get WordStar, MailMerge, Multiplan and Digital Research's DR Graph... leading software packages for word processing, spreadsheet and graphics. And all have been specially adapted to share data and perform as an integrated software family.

Communications, BASIC and More

You get Terminal Emulation software which turns your VISUAL 1050 into a powerful ASCII terminal for dial-up access to remote computer resources. And you get CBASIC* for custom programming applications. CP/M Plus,* a new and improved release of CP/M, allows your VISUAL 1050 to support hundreds of popular third-party packages.

Unbeatable Value

$2,695 is the total retail price for the VISUAL 1050. You get the best and most popular software packages, ready to run on hardware which offers the features and quality you should demand. Two high capacity disc drives. 128K memory standard. Fast, bit-mapped graphics. Full size green screen. Standard printer and communication ports. Rugged 93-key keyboard with special WordStar engravings. You can't buy a more complete hardware and software solution at anywhere near the price.
Get big performance from your small computer for just $2.95!

...with the latest information on Interactive computing, Incompatibility, New BASIC applications, Computer simulations, Data file development and maintenance, CP/M and its uses, Writing more advanced programs, Algorithms, and more.

Take this 5-volume Programming Library (a $76.65 retail value) for $2.95 as your introduction to the Small Computer Book Club.

You simply agree to buy 3 more books—at handsome discounts—within the next 12 months.

In the ever changing computer field, new techniques and applications seem to happen overnight... developments in software, design modifications in hardware, innovative programming techniques, and more!

Keeping current on the latest trends is essential... but it can be almost a full-time job. That's why we created the Small Computer Book Club. With books by some of the most respected authors in the field, we'll keep you up-to-date with the rapidly changing world of computers. You'll get steady training that will both refine and broaden your small computer talents... talents that will help you get more out of the time you spend "on-line."

A division of The Library of Computer and Information Sciences—the oldest, largest, and most respected computer book club in the world—the Small Computer Book Club gives you access to virtually every important computer topic.

What can the Programming Library do for you?

The 5-volume Programming Library will challenge your knowledge and expand your capabilities... teaching you to get more from your small computer than you ever thought possible.

Master virtually every BASIC application.

1. THE BASIC HANDBOOK: Encyclopedia of the Basic Computer Language, by David A. Lien, is an invaluable tool, whether you operate a "bottom-of-the-line" pocket micro or a megabyte system.

You'll learn all there is to know about the uses of BASIC, as well as what to do about the problem of incompatibility.

Plus, THE BASIC HANDBOOK explains virtually every significant BASIC language feature of practically every BASIC-speaking computer in the world. It is the most complete collection of BASIC words ever, with strategies programmers can use to convert the many different "dialects" to their computers. Publisher's Price: $19.95.

Make your ideas become reality.

2. BASIC AND THE PERSONAL COMPUTER, by Thomas A. Dwyer and Margot Critchfield, gives you the resources you need to really take advantage of your computer's full capacity.

The best introduction to programming in BASIC and extended BASIC, this book will enable you to learn BASIC within eight hours, and to do almost anything else you want—write programs, sort data, and much more... all with step-by-step examples.

There are also sections on computer graphics, program development, data bases, word processing, computer simulations, and more. Publisher's Price: $15.55.

Understand CP/M and its uses.

3. CP/M AND THE PERSONAL COMPUTER, by Thomas A. Dwyer and Margot Critchfield, is an informative overview of how CP/M works and how to apply CP/M to profes-
sion and personal computing.
You'll get down-to-earth explanations that break CP/M into basic components for easy mastery of filing, debugging, editing, information flow, and more. The volume functions as a complete guide to this microcomputer disk operating system. There's even coverage of how to use popular commercial CP/M application programs in four major areas: word processing, spread sheets, database management, and accounting systems.
Publisher's Price: $19.95.

Write programs you can read.
4. THE LITTLE BOOK OF BASIC STYLE: How to Write a Program You Can Read, by John Nevison, challenges the reader to go beyond computer literacy to fluency, teaches you how to write programs of less than one page, encourages thoughtful program organization, and more.

Covering everything from algorithms and games to problem solving and programming, THE LITTLE BOOK OF BASIC STYLE is a comprehensive guide that not only will teach you the rules to follow, but explain why they are necessary.
Publisher's Price: $8.25.

Use data files on microcomputers.
5. DATA FILE PROGRAMMING IN BASIC: A Self-Teaching Guide, by LeRay Finkel and Jerald R. Brown, is the first self-instructional manual in clear, non-technical language, for both hobbyists and professionals who want to add data file programming to their computing capabilities.

Data files are the key to using microcomputers effectively—whether for business or personal applications. Yet, being able to set up and maintain data files is beyond most people's capabilities. But with DATA FILE PROGRAMMING IN BASIC, you'll grasp the necessary techniques quickly and easily. Includes step-by-step instructions for programming, data file maintenance, and modification of commercial programs.
Publisher's Price: $12.95.

4 Good Reasons to Join
1. The Finest Books. Of the hundreds of books submitted to us each year, only the very finest are selected and offered. Moreover, our books are always of equal quality to publishers' editions, never economy editions.
2. Big Savings. In addition to getting the Programming Library for $2.95 when you join, you keep saving substantially—up to 30% and occasionally even more. (For example, your total savings as a trial member—including this introductory offer—can easily be over 50%. That's like getting every other book free!)
3. Bonus Books. Also, you will immediately become eligible to participate in our Bonus Book Plan, with savings up to 70% off the publishers' prices.
4. Convenient Service. At 3-4 week intervals (10 times per year) you will receive the Book Club News, describing the Main Selection and Alternate Selections, together with a dated reply card. If you want the Main Selection, do nothing and it will be sent to you automatically. If you prefer another selection, or no book at all, simply indicate your choice on the card, and return it by the date specified. You will have at least 10 days to decide. If, because of late mail delivery of the News, you should receive a book you do not want, we guarantee return postage.

If the reply card has been removed, please write to: the Small Computer Book Club, Dept. Y-AF6, Riverside, N.J. 08075 to obtain membership information and an application.

See Software.

Dick is a programmer. Dick is bored. Harried. Dick struggles with trace chores. Debugging routines. Nonexistent documentation. Hidden bugs. So Dick is four months behind schedule. And customers are upset when bugs slip through. They yell and make Dick upset. They make Dick's boss upset. Nobody is very happy.

See Software Run.

Jane is a happy programmer. She uses ANIMATOR™. It's a VISUAL PROGRAMMING™ aid for MICRO FOCUS™ LEVEL II COBOL. It runs on a micro. It makes child's play of test and debugging tasks.

With ANIMATOR Jane sees a picture of the program explaining itself. In real time. In COBOL source code. ANIMATOR tracks the program's exact execution path. Including subroutine branches. Jane can have the program run fast. Or slow. Or stop. With one key. This makes it easy to spot problems. Insert fixes. Set breakpoints. Instantly.

Jane's programs are best sellers. They're delivered on time. With no hidden bugs. Jane's boss likes this about Jane. Because he doesn't like customers to yell at him.

Run, Software, Run.

This software vendor just went public. Because he doubled productivity. Eliminated bugs. Cut costs. Produced terrific applications. Beat the competition to market. And customers don't yell at him anymore. All thanks to ANIMATOR.

See ANIMATOR now.

Let ANIMATOR help you do better work. And speed your applications to market. Write for more information. Or call (415) 856-4161. Right now.

character between the last digit and the EOF (end of file) mark to avoid a "read beyond EOF" error.

Listing 2 gives the input for this example. If you use a dedicated program to write <infile>, you can avoid many problems with inexperienced operators.

The printer output (listing 3) consists of the input data followed by:

- the number of iterations
- the values of the parameters and SS_R at the vertexes of the last simplex
- the final mean values of the parameters and SS_R
- the estimated errors on those mean values
- for each data point: the experimental and the computed dependent variables, experimental and calculated values
- the standard deviation of the experimental points from the fitted function
- the estimated standard deviation of the "true" function points from the fitted ones

Problems

Simp never diverges but this does not guarantee that no problems will develop. Programming or input errors are easily corrected while others are not.

Failure to converge and premature conclusion are usually the result of using the wrong input parameters along with truncation/round-off errors in the machine's arithmetics. Very large initial guesses and/or very small initial increments create a starting simplex with virtually identical responses at the vertexes. In cases like this, the program often ends prematurely.

If the acceptable errors are exceedingly large, the program may emerge while the simplex is still far from the minimum response, possibly along a saddle. If the acceptable errors are too small, on the other hand, the simplex can keep bouncing around the minimum until the maximum number of iterations is completed. This is due to the simplex's inability to contract further because of "quantum" round-off errors in the machine's arithmetics.

In many instances the results are largely insensitive to one or more of the fitted parameters. In these cases, the simplex travels great distances along these coordinates before coming to rest. When you know that a parameter is of only marginal significance in the fit (i.e., its value scarcely affects the results), it is a good idea to give it a large acceptable error. If you don't, Simp keeps changing that parameter, without noticing any effects on the response surface.

Last, sometimes the program gives results far from the expected, but the fitted curve matches the experimental data excellently. This happens when a particular function can be equally satisfied with more than one set of parameters (the response surface has more minima). When you suspect more than one solution exists, good starting guesses and small increments usually help. It is always a good practice to verify the uniqueness and precision of your results by running the program with different starting guesses.

Simp does not provide an estimate of the computed parameter errors. A good way to evaluate them is with the following Monte Carlo or sensitivity analysis:

- from the parameters a, b, etc., produced by Simp, compute the set, x1, y1; x2, y2; etc., consisting of the independent variable's experimental values and the dependent variable's "expected" values. (Simp writes these points in FIT.DAT.)
- to this set, add random numbers with a Gaussian distribution mean = 0 and a standard deviation equal to the experimental data's computed by Simp to create a sufficiently large number, m, of simulated experimental point sets:

  \[
  x_1, y_1^1; x_2, y_2^1; \ldots; x_m, y_m^1 \\
  x_1, y_1^2; x_2, y_2^2; \ldots; x_m, y_m^2 \\
  \vdots \\
  x_1, y_1^m; x_2, y_2^m; \ldots; x_m, y_m^m 
  \]

- run Simp on each of these simulated experimental sets.
- the new computed parameter values should approach the experimental data's. Their standard deviation is a reasonable estimate of the error in the computed parameters. A statistically significant difference between the mean value of the simu-
Sheet Feeders By Rutishauser.
Swiss-Made Quality. Competitive Prices.

Rutishauser. Remember the name.
Our precision sheet feeders save you time. And money. Rutishauser products are made to exacting standards of Swiss craftsmanship. Built to perform. Built to last. Time after time after time. Rutishauser. The very best in document and forms handling equipment...electronic or mechanical...for word and data processing systems.

MECHANICAL SHEET FEEDER (2:00)
Automatic feeding. Simple and easy to install and load. No special software, switches, controls, or adjustments needed.

PROGRAMMABLE DOUBLE BIN FEEDER (11:00)
Flexible control and consistently reliable performance — with or without electronic commands. Operator programmable, with remote/local modes. Also reacts to mechanical or electrical bin selection.

BI-DIRECTIONAL FORMS TRACTOR (9:00)
Trouble-free handling for accurate continuous forms feeding. Fits any standard word/data processing printer.

SINGLE BIN SHEET FEEDER (3:00)
One of the most widely used single bin feeders in the world. Automatic. Compact. Lightweight. A powerful microprocessor controls paper position and insertion.

DOUBLE BIN SHEET FEEDER (12:00)
Interchangeable and software compatible with our demand sheet feeder model. Each sheet fed upon command. Ample capacity with room for 450 sheets.

DEMAND SHEET FEEDER (10:00)
Feeds sheets upon command by printer system. Accommodates virtually any size paper or type of form.

FRONT FEED DEVICE (1:00)
Programmed insertion of forms for complex applications. Handles preprinted forms, ledger cards and other single or multipart documents.

Rutishauser sheet feeders are available for leading letter-quality printers. Rutishauser. Swiss standards of lasting value. Call us at (214) 343-9154 (USA) or (00-41-1) 926 46 00 (International). Isn’t it...about time?

Rutishauser of America, Inc.
10345 Brockwood Rd.
Dallas, Texas 75238

TOTAL CONTROL:
FORTH: FOR Z-80®, 8086, 68000, and IBM® PC
Complies with the New 83-Standard

GRAPHICS. GAMES. COMMUNICATIONS. ROBOTICS.
DATA ACQUISITION. PROCESS CONTROL.

- FORTH programs are instantly portable across the four most popular microprocessors.
- FORTH is interactive and conversational, but 20 times faster than BASIC.
- FORTH programs are highly structured, modular, easy to maintain.
- FORTH affords direct control over all interrupts, memory locations, and i/o ports.
- FORTH allows full access to DOS files and functions.
- FORTH application programs can be compiled into turnkey COM files and distributed with no license fee.
- FORTH Cross Compilers are available for ROMed or disk based applications on most microprocessors.

FORTH Application Development Systems include interpreter/compiler, virtual memory management and multi-tasking, assembler, full screen editor, compiler, utilities and 200 page manual. Standard random access files used for screen storage, extensions provided for access to operating system functions.

Z-80 FORTH for CP/M® 2.2 or MP/M II, $100.00.
8080 FORTH for CP/M 2.2 or MP/M II, $100.00.
8086 FORTH for CP/M-86 or MS-DOS, $100.00.
PC/FORTH for PC-DOS, CP/M-86, or CP/M, $100.00.
68000 FORTH for CP/M-68K, $250.00.

FORTH + Systems are 32 bit implementations that allow creation of programs as large as 1 megabyte. The entire memory address space of the 68000 or 8086/88 is supported directly.

PC FORTH + $250.00
8086 FORTH + for CP/M-86 or MS-DOS, $250.00.
68000 FORTH + for CP/M-68K, $400.00.

Extension Packages available include: software floating point, cross compilers, INTEL 8087 support, AMD 9511 support, advanced color graphics, custom character sets, symbolic debuggers, telecommunications, cross reference utility, B-tree file manager. Write for brochure.

Your IBM PC is smarter than you think.

It's really a terrific computer once you get the hang of it. But getting through the IBM manuals can really hang you up. Unless you do it the smart way. Using Ashton-Tate's Reference Encyclopedia for the IBM Personal Computer.

The IBM PC Reference Encyclopedia.

Authors Gary Phillips and Karen Phillips took everything you might even think you'd want to know about your IBM PC and compatible products, and assembled it all in one place.

This Second Edition of our Encyclopedia is two volumes jam-packed with information that gives you the meanings behind the manuals and keeps you current on compatible software and hardware products.

Inside, you'll find several thousand quick-reference entries and over a hundred in-depth "how-to" items.

We'll tell you everything you need to know about DOS (including 2.0). We thoroughly cover the PC and the XT. Detail topics like disk organization, printer control and more. Describe IBM and non-IBM programs and add-ons realistically, so you don't get trapped in the software/hardware jungle. And show you dozens of other ways to get the most out of your PC.

We've compiled tables and reviews you won't find anywhere else. Gathered hundreds of practical tips and techniques from magazines, newsletters and dozens of experienced users, so you won't have to learn them the hard way.

It's easy to take.

We've made all this information easily accessible, because the Encyclopedia is efficiently indexed and thoroughly cross-referenced. It's all explained in plain English with enough depth for both novice and intermediate users. We update it twice a year, to keep you up to speed on all the new developments.

And it's all yours for a suggested retail price of just $69.95. Including two free updates.

So pick up a copy of the Ashton-Tate IBM PC Reference Encyclopedia (Second Edition) at your nearest computer or software store. And stamp out manual labor today.

Ashton-Tate, 10150 West Jefferson Boulevard, Culver City, CA 90230. (213) 204-5570. In the U.K., call (0908) 568866.

Circle 425 on inquiry card.
New Microsoft® Word. It makes your IBM Personal Computer think it's better than a $10,000 word processor.

With Microsoft Word, what you see on the screen is what you get on the paper. So it's easy to spot mistakes. **Boldface**, **underline**, and **italics** look like this, not this: ^Bboldface^B, ^Sunderline^S, ^Iitalics^I.

And, when you make changes, paragraphs are automatically reformatted. Flush right, flush left, centered or justified. It even gives you several columns on a page, like a newspaper.

**Word forgives and doesn't forget.**

There's an "uh-oh" command called Undo. Make a mistake? Or just want to experiment? Hit Undo.
Word undoes your last change and remembers things the way they were.

Word does windows. Up to eight, to be exact. So you can transfer or edit between eight different documents. Or between eight different pieces of the same document.

**Word travels fast.**

Word has a Mouse, a handy little critter that lets you move copy, select commands and edit faster than you can say "cheese."

Word also lets you create your own style sheets, so you can standardize your documents, memos, files and letters.

It's not surprising that Microsoft has a way with Word. We designed the MS-DOS operating system that tells the IBM® PC how to think. And we pioneered the first microcomputer BASIC, the language spoken by nine out of ten micros worldwide.

For a few final words, call 1-800-426-9400 (in Washington State call 206-828-8088) for a free Word brochure and the name of your nearest Microsoft dealer.

Stephen C. Gates
Illinois State University

You have a new IBM Personal Computer (PC) and you want to use it in the laboratory to collect data from a scientific instrument. How do you do that with a small investment of time on your part and still get a product that is a powerful, useful tool in the laboratory?

I faced that same problem almost two years ago when our chemistry department received its first IBM PC, and I wanted to interface it to a variety of chemical laboratory instruments. We had only one of each type of instrument, so I was faced with the possibility of designing a custom interface for each of 10 or more instruments.

Fortunately, I had interfaced single instruments to a DEC LSI 11/23 and to an Apple, so I knew from my own previous mistakes that a little advanced planning would make this a much simpler project. Specifically, I realized that interfacing can be made much easier by using two simple concepts: first, buy commercially available hardware where possible, and, second, develop general-purpose software that can be used for almost any instrument.

By utilizing these two concepts, I found that even undergraduate chemistry students with little previous computer experience can produce research-quality interfaces, with complete software, in less than one week. If you follow the suggestions provided here, you should be able to design and implement an interface to the instrument of your choice in less time. All you need to do is be able to program in BASIC, FORTRAN, or some other language that allows the use of assembly-language subroutines.

The essential elements of this system are a commercially available data-collection board that fits in one of the slots of the IBM PC, a preamplifier and filter for conditioning the signal from the instrument, and a set of BASIC and assembly-language routines to perform tasks common to all of the instruments to be interfaced.

The utility of this approach arose fairly naturally from some initial design decisions. My major criteria for selection of equipment and software were ease of development and ease of use. Therefore, I judged it to be not cost-effective to spend time developing special-purpose A/D (analog-to-digital) converters, timers, or other equipment. Similarly, I chose to use BASIC for all purposes except the data-collection process itself because of the ease of programming, even for novices; when the programs are completely tested, they are converted to compiled BASIC to greatly increase their execution speed.

In order to encourage a variety of users, I put the (now several) IBM PCs on carts so that the computers can be wheeled from experiment to experiment. Each cart contains a 64K-or 128K-byte IBM PC with a colorgraphics monitor adapter and green monitor; dual 320K-byte disk drives; a combination board containing an A/D converter, D/A (digital-to-analog) converter and programmable clock; and a preamplifier and filter combination. A typical system in use is shown in photo 1.

Each of the components on the cart is designed to accommodate interfaces to a variety of instruments. If you are attempting to develop a similar system, it may help to have a description of why I selected each component.

Data-Acquisition Board

Several different manufacturers now market general-purpose data-
acquisition boards (see reference 4). These usually include a multi-channel A/D converter, one or more D/A converters, and a programmable clock as standard features, with options such as programmable gain, higher acquisition rates, and DMA (direct memory access). For most scientific applications, a 12-bit A/D conversion is necessary; 8-bit A/D converters simply do not provide adequate resolution.

In addition, most laboratories now use nonintegrating A/D converters rather than integrating types because of the slow speed of the latter. The primary advantage of the integrating A/D converter is the reduction of noise; however, this can be accomplished instead through appropriate software used with the nonintegrating type. The A/D converters on almost all of the general-purpose data-collection boards now available are of the nonintegrating type.

While not essential, a programmable clock is highly recommended. Although timing can be controlled by carefully timed program loops, usually in assembly language, it is much more easily and accurately achieved in hardware.

For these reasons, I chose to use a Tecmar (6225 Cochran Rd., Cleveland, OH 44139, (216) 349-0600) PC-Mate Lab Master board with a 16-channel, 12-bit nonintegrating A/D converter with no programmable gain and a general-purpose clock/timer. The board also contains two D/A converters and a digital I/O (input/output) section that I do not routinely use, but which you may need if you plan to control the operation of your instrument as well as collect data from it.

Connecting the Interface
In order to use the hardware interface in your lab, you must first connect the interface to the instrument. If the instrument has a recorder output, this is very easy to do; simply connect the A/D converter input to the recorder output wires. For signals below 1 volt maximum, the preamplifier should be interposed between the A/D converter and the instrument.

Often, particularly on more recently designed instruments, both a recorder output and a BCD (binary-coded decimal) or other computer-compatible output exist. If there is a computer output, no A/D converter is needed; instead, a digital I/O board, serial interface, or other hardware is required. Unfortunately, I found that the documentation provided by Tecmar on the digital I/O section of the interface board is almost no help to those who are not already familiar with this type of hardware.

Alternatively, if no suitable output
is provided, it may be necessary for someone with knowledge of the electronics of the instrument to locate for you the portion of the circuitry needed to provide a suitable voltage output to the A/D converter. Where possible, this voltage should be in the volt range, rather than in millivolts (mV) or microvolts (µV). Fortunately, most instruments have recorder outputs and consequently are very easy to interface.

**Preamplifier**

Depending upon the instrument being interfaced and the A/D board being used, varying amounts of preamplification are needed. I designed our system to accommodate a wide variety of possible inputs; hence, a simple amplifier circuit was included to permit five different gains between 1 and 1000. The amplifier schematic is shown in figure 1.

Alternatively, a programmable-gain A/D board may be desirable, although that option is usually much more expensive than a separate amplifier. There is another reason for separate preamplifiers, however. Instruments with full-scale outputs of under 10 mV are common in scientific laboratories because of the widespread availability of 10-mV strip-chart recorders. For these instruments, your best alternative is to build the preamplifier into the instrument itself, or at least to connect it so that it is as near as possible to the instrument. This reduces the amount of noise picked up by the low-level signal lines that, in effect, act as antennas to the various sources of electronic noise in the environment. In general, the shorter the distance between the instrument and the A/D board, the better the signal-to-noise ratio will be in the final data.

**Filter**

The most general solution to noisy signals is software filtering, because the filter can be varied to best match the noise level. However, particularly for low-level signals and low data-collection rates, e.g., 1-mV signals at 60 Hz (hertz), I have found it useful to have a hardware filter because of the large amount of computation time required for extensive software-based filtering. For such instruments, I use the simple, passive, low-pass filter included in figure 1. This filter has a cutoff frequency of approximately 0.5 Hz, which is adequate for filtering out the most common noise signals that are 60 Hz or higher in frequency. More expensive filters, including active and notch filters, may be desirable for specific applications. Almost any "electronics for scientists" text can be consulted for more details.

**Data Collection**

One aspect of interfacing that texts often neglect is the need for general-purpose programs to collect, plot, and process the instrumented data.
Now you can have the power of Quark's Word Juggler word processor. And the convenience of the Lexicheck spelling checker, with its 50,000 word dictionary and special Word Guess Plus™ feature. All in one package. For virtually half the price.

The new suggested retail for Word Juggler IIe is only $189. Word Juggler for the Apple III and III Plus is only $229*.

Ask for a demonstration today. For the name of the Quark dealer nearest you, call 1 (800) 543-7711. And be sure you look into Quark's other popular office automation tools for the Apple IIe, Apple III and Apple III Plus. Especially the Catalyst™ program selector.

*Previous list prices: Word Juggler IIe, $239; Lexicheck IIe, $129; Word Juggler for the Apple III, $295; Lexicheck for the Apple III, $149. All prices suggested U.S. retail.

However, by having a suitable library of general-purpose routines, you can shorten the development time for your specific interface considerably. By using the general-purpose data-collection, smoothing, and display routines described here, you can concentrate all of your efforts on developing the software and end up with a higher quality product in a much shorter time than if you “reinvent the chip” for each new interfacing project.

In order to provide high data-collection rates and a real-time plot, I wrote a data-acquisition routine in assembly language. The routine illustrated in listing 1 provides rates up to 2400 Hz with a real-time plot, and up to 20 kHz without plotting. Even faster rates are possible with special hardware settings of the standard Tecmar board, and rates up to 125 kHz are available as an optional feature. However, very few instruments will require higher rates than 20 kHz.

The routine in listing 1 assumes the use of the Tecmar Lab Master data-acquisition board, so that some of the code is device-specific and would need to be modified for use on other systems.

Although the listing is fully documented, several comments are required. First, using the excellent procedure suggested by Rollins (see reference 2), the routine begins with a header section to enable it to be converted by EXE2BIN to a binary file that can be loaded into memory with a BASIC LOAD command. Second, high-resolution plotting is done using the BIOS VIDEO_IO routine, which is invoked with interrupt 16 (10 hexadecimal).

Three different clock rates are used, depending upon the desired data-collection rate. This is done to achieve maximum precision. For high data rates, the 1 MHz clock in the Tecmar board is used directly. For rates below 31 Hz, a 10-kHz subfrequency of the clock is used; to use the 1-MHz clock directly would require chaining several of the counters together. Rates of less than 1 Hz are counted with a 100-Hz subfrequency.

At very high data rates, it is possible that a conversion may take place...

Listing 2 continued on page 372
before the previous data point has been read from the A/D converter. This is referred to as an overrun. Thus the program must check for the occurrence of an overrun. Upon finding one, the assembly routine sets a flag that can be read by the BASIC program and the data collection is finished.

At very high data-collection rates, interrupt-driven processes occurring in the computer, such as interrupts by the system clock, may interfere with data collection. Indeed, initially this program was limited to 6 kHz until I realized that the interrupts from the system clock were taking too much time. For this reason, at rates above 5 kHz, the subroutine turns off interrupts with a CLI (clear interrupt flag) instruction; when data collection is completed, the interrupts are again enabled by using an STI (set interrupt flag) instruction.

At low-to-moderate data-collection rates, it is useful to have a real-time plot. This is done for each data point collected by loading the low and high bytes of the data point into a register and converting it so that the screen displays a -10-volt A/D reading at the bottom and a +10-volt reading at the top—i.e., so that the full screen is used for the display.

When this assembly-language routine is linked to a higher level program, such as a compiled BASIC or FORTRAN program, only minor changes are required. The Header section must be removed, so that the code starts at Temp. The Timer procedure must be made Public, and the last line of the routine must include an End statement instead of an End-Header statement. After assembly, the subroutine is linked to the calling program using Link in the normal fashion; EXE2BIN does not need to be run in that case.

Sample BASIC Program

A short interpreter BASIC program for the IBM PC that uses the assembly-language routine is shown in listing 2. The program sets aside a region of memory for the routine; the location chosen in line 30 may vary depending upon the amount of memory available in the system. The
value 31500 is correct for a 64K-byte system using Advanced BASIC. After the data has been collected, the overrun flag is checked, and the data is displayed in the high-resolution graphics mode. The data is scaled to fill the entire screen.

Once the data has been collected and displayed, you usually will need to remove high-frequency noise. A simple method for doing this in software is shown in Listing 2. It uses a

If you thought you'd never find fun games for your hardworking home computer, happy days are here. Because now ATARISOFT™ has all the great hits...Pac-Man®, Donkey Kong® by Nintendo,® Centipede®, Defender®, Joust®, Jungle Hunt®, Moon Patrol®, Pole Position®, Galáxian®, Ms. Pac-Man®, and Battlezone®.

And we've got them for all the hit computers...Apple, IBM, Commodore 64, Vic-20, ColecoVision®, and TI 99/4A. We've got Pac-Man, Centipede and Defender for Intellivision™ too.

So dust off your joystick and ask your dealer for all the ATARISOFT hits. It's the software your hardware's been waiting for.

ATARISOFT.™
All the hits your computer is missing.
Figure 2: The effect of filtering on noise levels can be very significant. Figure 2a shows 200 data points taken from an instrument over a period of 20 seconds. Ideally, the signal should be a straight line, but instead shows both long-term and short-term noise. In figure 2b, data from the same instrument is passed through a digital (software) filter once; in figure 2c, it is passed through the filter twice. In figure 2d, data from the same detector is passed through a hardware low-pass filter.

"Savitzky-Golay" type smoothing algorithm (see reference 3), which is a rapid, easily implemented smoothing technique that is equivalent to fitting a least-squares line through the data. The order of the fit and the number of points included in the fit can be modified to provide varying amounts of smoothing. A second-order, 9-point smooth is the one most often used in my lab. In picking which software filter to use, you may find an article by Cram et al. quite useful (see reference 1). For severe noise problems, other techniques such as ensemble averaging or filtering using fast Fourier transforms may prove useful.

The usefulness of the filtering process is illustrated in figure 2. Figure 2a shows data collected from the detector of a high-performance liquid chromatograph, without filtering. In figure 2d, data was collected from the same detector, but with the low-pass hardware filter being used. In figure 2b, the data is exactly the same as the unfiltered data (figure 2a), except that it has been passed through the Savitzky-Golay second-order, 9-point filter contained in listing 2. In figure 2c, the data from figure 2a has been passed through the Savitzky-Golay filter twice; the reduction in the noise is striking. I often use a combination of hardware and software filtering for optimum results.

Examples of Use

I offer a four-week course to science students that teaches them to interface to a variety of scientific instruments using the techniques described in this article. Students spend one week learning BASIC, two weeks learning the concepts of interfacing and writing simple programs, and one week interfacing the computer to a specific chemical laboratory instrument.

Although the students learn to write data-collection and display routines in BASIC, for their final project they use the Timer routine in listing 1. Using the standardized interfacing system, in one week's time they have written complete data-collection and analysis programs for a number of different instruments, including a pH meter, a UV (ultraviolet)-visible spectrophotometer, a differential scanning calorimeter, a high-performance liquid chromatograph (HPLC), and a polarograph. Even though these programs were written in one week's time, each of these programs is now in routine use in our teaching or research laboratories.

I'll use two examples to show how quickly and easily instruments can be interfaced using this approach.

One student interfaced an IBM PC to a polarograph, using the circuitry shown in figure 1. The polarograph already has a sophisticated preampli-
WORK SMARTER—NOT HARDER
WITH THE SMART-CARD™ MANAGEMENT SYSTEM™
FROM EXEC-U-PLAN™

GET MORE DONE IN LESS TIME
Control 20-50—even hundreds of projects at a time—with the smartest, easiest, most flexible method ever developed for planning and monitoring activities, schedules, appointments, performance, details and deadlines. The SMART-CARD Management System helps busy executives accomplish more in less time—by freeing the mind’s memory banks and thought processes to focus where it counts! No matter how well organized you are, The SMART-CARD Management System will give you a better return on your time investment. We guarantee it!

CONTROL HUNDREDS OF PROJECTS WITH COMPUTER-LIKE EFFICIENCY
The SMART-CARD Management System is designed to function in many ways like a personal data processing center, but, with much greater flexibility and ease. Simply record all important information directly onto color-coded SMART-CARDS. Then insert them into the system’s exclusive through-panel -for visual control of hundreds of entries at a glance. Merge cards into the system after meetings. Move cards as projects are completed or priorities change. Retrieve information instantly. The SMART-CARD Management System’s unique features and six special purpose cards help you plan and manage more effectively than ever before.

QUALITY CRAFTSMANSHIP
Individually crafted of the finest genuine leathers or rich leather grained vinyls, each SMART-CARD System comes personalized with your name or initials on the cover. Take the handsomely styled, highly portable EXEC-U-PLAN System with you to meetings, on business trips, or for a more productive daily commute.

WORKS FOR EVERYONE
Available in three styles to satisfy a wide range of needs and preferences, The EXEC-U-PLAN SMART-CARD Management System is ideal for all SMART-CARD Management Systems are executed with the system’s exclusive see-through panels. Plus the SMART-CARD Management System Manual

SUPER DELUXE
Our premier model
- Manages 576 projects
- 4 panels—72 SMART-CARDS per side. Expands to 1440 with purchase of extra panels
- 4 tabbed dual pocket dividers
- 1,000 asst'd SMART-CARDS
- Multi-function calculator
- Digital time piece and alarm
- Calendar-phone-address book
- Color-coded signals
- Name or initials on cover
- Pen, tablet and business card storage
- Deluxe lock Plus the SMART-CARD Management System Manual

Leather grained vinyl $105.00
Genuine leather $155.00
Plus $4 shipping and handling

THE TRAVELER
Our streamlined model
- Manages 144 projects
- 500 asst'd SMART-CARDS
- Color-coded signals
- Name or initials on cover
- Pen holder
- Plus the SMART-CARD Management System Manual

Leather grained vinyl $52.50
Genuine leather $52.00
Plus $4 shipping and handling

All Models Available in:
LEATHER GRAINED VINYL
Chestnut Brown (dark), Willow Brown (medium), Cinnamon Brown, Black, Burgundy and Natural Tan Suede.
GENUINE LEATHER
Black, British Tan and Burgundy.

SATISFACTION GUARANTEED
If for any reason you are not completely satisfied with your EXEC-U-PLAN SMART-CARD System, simply return it within 30 days of purchase for a full and prompt refund.

SPECIAL BONUS
Now—for a limited time only—receive a handsome, matching Pocket Organizer FREE with any model shown at left. This compact tuck-away version of the SMART-CARD Management System puts key data in your pocket—and lets you easily make new entries on-the-go. Retail value $15.00.

Using the Tecmar A/D Board

The Tecmar board can be given instructions, and have information read from it, in one of two ways: either the I/O (input/output) mode or the memory-mapped mode can be used. In the I/O mode, various functions of the board are accessed through ports, which are addressed with INP and OUT instructions in BASIC, or IN and OUT instructions in assembly language. In the memory-mapped mode, the functions are accessed at a series of consecutive memory locations; this requires PEEK and POKE instructions in BASIC, or any memory-addressing instruction in assembly language, such as MOV or TEST.

The choice between these two modes is largely a matter of personal preference. The memory-mapped mode is slightly faster but the board is configured at the factory for the I/O mode, which is probably the simpler mode to program. In either mode, you must select the base address, which is the first of 16 consecutive addresses used to communicate with the various functions on the board. The base I/O address set at the factory is 1808. However, other base addresses, as well as the memory-mapped mode, may be selected using the appropriate jumpers or switches.

Other options available on the board include auto-incrementing of the A/D (analog-to-digital) converter (automatically switching the channel from which data is being taken), and the range of the signals coming from or going to the instrument. In addition, three types of inputs to the A/D converter are selectable by appropriate jumper settings: single-ended, pseudo-differential, and true differential. The single-ended setting is normally used, but the differential modes are particularly useful with low-level signals in environments with large amounts of electromagnetic noise. It is also possible to use interrupts to signal the computer when the A/D board has data ready for storage.

The system described in the text uses a 10-V to +10-V bipolar range for the A/D board, clock triggering of the A/D board, and a single-ended input. Only one instrument is normally connected, so the auto-incrementing feature is disabled, as are interrupts. Timer 5 is used to trigger the A/D board.

The clock portion of the Tecmar board provides a general-purpose mechanism for timing various events or for providing timing pulses for triggering various events. At least 18 different modes of operation are possible, each with several options. To the average user, this number of possibilities can prove highly confusing at best.

For triggering the A/D board at specific intervals, however, the process is fairly straightforward. The clock circuitry contains a 1-MHz clock, which is further subdivided either by powers of 10 (BCD scaling) or by powers of 16 (binary scaling), depending upon the option selected. Any one of five counters can be loaded with a count, which is then either incremented or decremented every time the clock "ticks."

For example, with a BCD scaling of divide-by-100, the clock provides a 10-kHz output. Assuming the count is in a downward direction, then the 16-bit counter can be loaded with a value of 99 to provide an output pulse to the A/D board every 0.01 second (i.e., 10 kHz + 100 = 100 Hz). Note that the counter provides an output to the A/D board when it attempts to go below zero (called the "terminal count"); hence, the counter is set to 99 rather than to 100.

To connect the counter pulses to the A/D converter, the output from the specific counter must be directed to the trigger input of the A/D converter. Because of the pin placement on the Tecmar board, the easiest method for doing this is to connect the output of another 5 to the A/D converter by jumpering pins 3 and 4 of connector J2.

All of the functions of the clock are controlled using two I/O ports accessible to any program. Although these ports are termed control port and data port, both ports are needed to set up the correct timing sequence. In a typical use of the timer, the control port is first directed to point to an internal register called the master mode register. Then, you can select the various control options by loading a 16-bit word into the master-mode register via the data port; this selects an option such as whether an 8- or 16-bit I/O bus is being used, what is to be used as a source of the clock frequency, and so forth.

Most of the information, however, is loaded into another internal register, the "counter-mode register." There is one such register for each of the five counters. Hence, the program uses the control port to select which counter-mode register is to be used; in this case, the one for register 5 is selected. This counter-mode register is then loaded, through the data port, with the various options selected for that register. Options include whether to count up or down, whether to count in binary or BCD, and which subfrequency of the clock is to be used. Special options are available if the counters are to be used as a time-of-day clock.

When the program is ready to begin collecting data, the appropriate counter must be loaded with the correct count and "armed," i.e., started counting. Assuming that the A/D converter has been set to recognize the signal from the clock as a trigger by enabling the external start bit, the A/D converter will automatically initiate a conversion (data collection) every time the counter register goes to zero. Hence, the program only needs to wait until the A/D converter signals that it has completed a conversion and then store the data; no timing loops need to be written. The A/D converter will continue to be triggered by the clock until the clock output is turned off by the program.
"Thanks for the prompt reply. Sure was a lot faster than waiting for the mail!"

A complete plug-in communications system for Apple® computers. From Hayes, the established telecomputing leader: the simple but sophisticated Micromodem II™ plug-in board modem and its companion software, Smartcom. Everything you need to expand the world of your Apple II, II Plus and Apple III. In one, convenient communications package.

With Micromodem II and Smartcom I, you can access data bases, bulletin boards, and the varied resources of information services. Plan your travel itinerary via computer, including flight numbers, hotel and rental car reservations. Retrieve and analyze daily stock and options prices. Work at home and send reports to your office. You can even do your shopping by computer!

Micromodem II. Think of it as your Apple's telephone. It allows your computer to communicate with any Bell-103 type modem over ordinary telephone lines, at 110 or 300 bits per second. Micromodem II installs easily in an expansion slot, and requires no outside power source. It connects directly to either a single or multiline modular phone jack, to perform both Touch-Tone® and pulse dialing.

Micromodem II dials, answers and disconnects calls automatically. And, unlike some modems, it operates in full or half duplex, for compatibility with most time-sharing systems.

A built-in speaker lets you monitor your calls when dialing. That way, you'll know if a line is busy. With Smartcom I, Micromodem II automatically redials your last number.

Discover how Micromodem II can help you perform any communications function. Whether you're a newcomer to personal computing or a seasoned professional, you'll appreciate the ease and speed with which you can perform any communications function. And your Mac proves it!

Let Smartcom I guide you through a few easy-to-answer questions to tailor the program to your particular needs. Then you're ready to go!

Make a selection from the Smartcom I menu to manage your communications, files or printer. Program prompts guide you along the way. And menu selections let you easily make a call, end a call, or answer a call. When you're on the receiving end, your Micromodem II answers automatically, even if you're not there!

Convenient! And so is the Smartcom I memory for phone numbers. Smartcom I stores three of your most frequently called telephone numbers and one prefix. Plus, it also remembers the last number dialed.

Smartcom I also provides a directory of the files stored on your disk. And lets you create, list, name, send, receive, print or erase files right from its menu.

Smartcom I is as versatile as you need it to be. It accepts DOS 3.3, Pascal, CP/M™ 3.0 or CP/M Plus™ operating systems. And accommodates up to six disk drives and several printer interface cards.

Like all our products, Smartcom I and Micromodem II are backed by excellent documentation and full support. Including a two-year limited warranty on the board and 90-day warranty on Smartcom I!

See your dealer today. Then plug into the exciting world of telecomputing.

A second example of an instrument that students have interfaced is a high-performance liquid chromatograph. The normal output of the HPLC is a 10-mV signal displayed on a strip-chart recorder; hence, the preamplifier was set to a gain of 1000 to provide a 10-volt signal to the A/D converter.

The student writing the program divided it into two sections: a data-collection portion and a data-analysis portion. In the data-collection portion, all of the parameters of the instrument and the sample to be analyzed are recorded, thus providing a permanent record of the conditions of the analysis. The program also asks for the names of the substances being analyzed, if known, and whether an internal standard is being used.

The data collection is done using the assembly-language routine, with a real-time plot of the data. If more than a predefined number of points are collected, the data is "bunched," or averaged, together. The Savitzky-Golay smooth is then performed, and the smoothed data and identifying information are stored in a disk file.

In the second section of the program, the peaks in the data are integrated, and the area of each peak is compared to that of an internal standard. Proper integration involves deciding where each peak starts and stops and then selecting the appropriate baseline to be subtracted from each peak. The results of this process are shown in figure 3. Again, the program is used routinely in our analytical laboratory course; figure 3 shows an analysis of caffeine in coffee performed by a group of students in that course.

Conclusions

One of the many advantages of the revolution in "home" computers is that powerful but inexpensive computers can be used in scientific or industrial laboratories, even by those with relatively limited computer skills. Utilizing off-the-shelf components and simple programming languages, extremely sophisticated data-collection and data-processing systems can be developed very rapidly.

The system described here represents a hardware and software solution to the problem of data collection and analysis in a wide variety of commonly encountered laboratory situations. By making only minor modifications, you should be able to adapt it to other types of hardware and to other types of instrumentation with an extremely wide range of applications, not only in chemistry, but in other scientific and industrial areas as well.

Would da Vinci have settled for a Crayon?

A great artist must command his tools and his medium to fully express his creativity...to solve his design problems. To solve information problems, you need to command an information management system that allows you the flexibility to design solutions tailored to your needs.

Data Spectrum™, is a comprehensive and powerful information management system for business and personal use that goes beyond "user friendly" to downright "people affectionate."

Data Spectrum is the master work of information management. It allows you to customize the organization of information to your specific needs. To search, sort, analyze, edit, evaluate and merge files as you want. And even to generate forms, reports, labels and standard letters.

All menu driven. All built in. With special features like "RAPID TRANSIT": A new file management approach that processes smaller files at blinding speed and automatically switches to "LARGER FILE ORIENTATION" to handle larger files.

Destined to set a new standard in the industry, Data Spectrum's on-screen tutorial blends text, graphics, humor, sound and animation to lead the user through the concepts, uses and operating techniques of this innovative software package.

On-screen tutorial and powerful program functions make Data Spectrum the universal information management system and problem solver. And a work of art. Our program update service and information "Hot-Line" will keep it that way.

So if you are looking for solutions rather than just software, Data Spectrum will bring them to light.

Write or call us for your nearest computer dealer carrying Apple or IBM versions of Data Spectrum. If there is no dealer in your area, you can order Data Spectrum directly from us...with a full money back guarantee. 1-800-323-6902 Illinois Residents 312-298-0997. Putting the Apple II Work

Part 2: The Software

A high-speed system for the acquisition and analysis of data

Richard C. Hallgren
Michigan State University

Last month, I described the overall system approach and provided you with construction details and preliminary testing. In this concluding part, I'll discuss the software I've developed that makes the system operational.

System Software

The software that enables the computer to collect and display the data can best be visualized by breaking down the total program set into a number of subroutines:

1. A main routine written in Applesoft BASIC is responsible for calling all machine-language subroutines, displaying the data on the high-resolution graphics screen, and storing the data on disk.
2. A machine-language routine that controls the digital section of the A/D converter and provides high-speed transfer of the binary data into the Apple II.
3. A machine-language routine that scrolls the displayed data horizontally across the video display.
4. A machine-language routine that enables you to mix text with the data displayed on the high-resolution graphics screen.

The Applesoft program expects the machine-language routines to be stored on disk drive 1 and to have the following names:

- A/D — routine that controls the digital section of the A/D converter
- Shift — routine that scrolls the data
- Hires — routine that writes text onto the high-resolution graphics screen
- Table — graphics character look-up table

After you have loaded these programs and stored them on a disk initialized with the Hello routine, execute the Applesoft routine. If the program jumps to the A/D routine but never returns, you probably have one of two problems:

1. The program did not enter the A/D routine correctly. Usually, you will get strange characters appearing on the screen, and/or the keyboard will not respond without turning the power off and then back on.
2. Absolutely nothing happens. Make sure that the IRQ signal is getting to pin 30 on the interface connector.

Once you get the program to go to the A/D routine and to return, the end is in sight. If the data does not plot correctly, check the section in the Applesoft routine that supports this. For example, if you try to scroll the data and the computer does strange things, take a close look for mistakes in the scroll subroutines.

Applesoft Routine

Listing 1 gives the program with comments. This BASIC routine first loads all the machine-language routines and then loops until the operator is ready to digitize data. Once the operator indicates that data is to be taken, the program jumps to the machine-language A/D routine that proceeds to digitize and store a predetermined quantity of data. Program control then returns to the Applesoft routine. The data is then plotted on the high-resolution graphics screen, and text is added to the plots. If the data is "good," you can store the data on disk. If the data is not good, you can initiate the acquisition of a new block of data.

A/D Machine-Language Routine

The machine-language A/D converter subroutine is called from the BASIC program by executing CALL -28656. This forces the computer to execute the subroutine stored at memory location 9010 hexadecimal.
logic and wait a few machine cycles

6502.

gram, which was executed when the contents of the X register.

It is time to take another subroutine.

return from subroutine.

The system interrupt logic is disabled while the 8 MSBs of the current data-storage address (the contents of memory location 08) are compared with the 8 MSBs of the maximum allowable address (the contents of the X register). If the maximum limit has not been reached, the program jumps to memory location 9038. If the maximum limit has been reached, the subroutine restores the contents of the accumulator, the contents of the X and Y registers, and the processor status. After that, the return from subroutine (RTS) command forces the computer to return to the BASIC calling routine.

At memory location 9038, the subroutine enables the system interrupt logic and waits a few machine cycles to see if it is time to take another sample. The sampling rate is determined by connecting the output of the crystal-controlled oscillator and frequency-divider logic to the interrupt request line (IRQ) going to the 6502 chip. If it is not time to take another sample, the subroutine returns to memory location 9026, where the interrupt logic is disabled. If it is time to take another sample, the interrupt logic forces the computer to jump to memory location 9040. This address was determined by the Hello program, which was executed when the DOS (disk operating system) was initially booted.

At memory location 9040, the three

Listing 1: A/D converter main routine written in Applesoft BASIC.

(Unless otherwise indicated, all addresses are hexadecimal.) Listing 2 gives the program with comments. Upon entering this subroutine, the contents of the accumulator, the contents of the X and Y registers, and the processor status are saved. The subroutine then clears the Y register and loads the X register with the 8 most significant bits (MSBs) of the memory address defining the upper limit of the block of memory reserved for data storage. The memory address for the lower limit of the block reserved for data storage is loaded into memory locations 0A (least significant bits or LSBs) and 0B (MSBs). These two memory locations serve as a pointer to the current location in memory in which a byte of data is to be stored.

The system interrupt logic is disabled while the 8 MSBs of the current data-storage address (the contents of memory location 0B) are compared with the 8 MSBs of the maximum allowable address (the contents of the X register). If the maximum limit has not been reached, the program jumps to memory location 9038. If the maximum limit has been reached, the subroutine restores the contents of the accumulator, the contents of the X and Y registers, and the processor status. After that, the return from subroutine (RTS) command forces the computer to return to the BASIC calling routine.

At memory location 9038, the subroutine enables the system interrupt logic and waits a few machine cycles to see if it is time to take another sample. The sampling rate is determined by connecting the output of the crystal-controlled oscillator and frequency-divider logic to the interrupt request line (IRQ) going to the 6502 chip. If it is not time to take another sample, the subroutine returns to memory location 9026, where the interrupt logic is disabled. If it is time to take another sample, the interrupt logic forces the computer to jump to memory location 9040. This address was determined by the Hello program, which was executed when the DOS (disk operating system) was initially booted.

At memory location 9040, the three
AD7570 A/D converters are simultaneously instructed to begin the conversion of their respective input signals. The subroutine then loops until all three units have finished their conversion cycles. The subroutine then proceeds to load the digitized signal from the first AD7570 into the accumulator. The contents of the accumulator are then transferred into the memory location determined by the contents of memory locations 0A (containing the 8 LSBs) and 0B (containing the 8 MSBs) and the contents of register Y (which are added to the contents of memory location 0A).

After the data has been stored, the Y register is incremented. The subroutine tests the Y register to see if the increment caused the register to be equal to zero (a transition from #FF to #00). Such a transition indicates that memory location 0B then needs to be incremented. The subroutine then proceeds to load and store data into successive memory locations until all three converters have been serviced. A return from interrupt (RTI) command then forces the computer to return to the point in the program where the interrupt request was detected. The subroutine ultimately ends up back at memory location 9026, where the interrupt logic is again disabled and a test is made to see if the maximum allocated data storage address has been exceeded.

Once the data has been digitized and stored, program control returns to the BASIC routine. The first 209 data samples from each input channel are displayed on the high-resolution graphics screen. Differentiation of the data is achieved by using a unique color for each input channel. The full width of the graphics display is not utilized for data so that reference text can be added on the right-hand side of the screen.

High-Resolution Text Generator

The text-generator software is used to write textual information on the high-resolution graphics screen. This capability lets you identify data points and display the magnitude of selected data points along with the data. The character set for the graphics generator was purposely limited

Circle 372 on inquiry card.
to numbers and uppercase letters to conserve memory. Listing 3 gives the high-resolution graphics, text-generator program, and table 1 is the graphics character look-up table. The program takes the textual character that is to be displayed on the graphics screen and matches it to a corresponding graphics character contained in the look-up table. This graphics character is then displayed on the screen by loading it into the correct memory location in page 2 of the high-resolution-graphics memory block. By using this subroutine, you avoid having to "draw" text on the graphics screen using the PLOT commands. The routine is initialized by using POKEs to insert the subroutine entry address into memory locations (decimal) 54 and 55. Any PRINT statements that follow will force the text that was to be printed to be displayed on the graphics screen.

Data-Scroll Routine

The information that is routed to the video display when the Apple is in the high-resolution-graphics mode comes from an 8192-byte block of memory. The rationale that determines the relationship between a dot's position on the screen and the dot's position in the picture-page buffer is not all that obvious to me. The best that I have been able to do is to map out the relationship between a dot's position on the screen and a memory-address location in the picture-page buffer.

Seven of the 8 bits in each byte contained in the picture-page buffer are displayed as dots; the eighth bit determines the color of the other 7 dots. A total of 40 bytes is displayed on each horizontal line of the video display. The LSB of the first byte in a line is displayed on the left-hand edge of the screen, followed by the second bit, the third bit, etc. A total of 280 dots (40 bytes × 7 dots) is displayed on each of the 192 lines (24 lines × 8 dots) that can be displayed on the screen.

In order to help myself understand the picture-page memory map, I con-

The DiskBank® Media Mate.

Introducing Media Mate... another affordable solution in diskette filing technology from DiskBank.

Media Mate combines an attractive desktop appearance with superior protection, organization and storing capability for 50 diskettes. All at a cost your budget will appreciate.

Available in sizes to accommodate both 5¼” and 3½” diskettes, Media Mate includes a fortress of features:

- Sturdy, high impact styrene construction
- Attractive smoke see-thru cover
- Convenient adjustable tab dividers
- Self-locking cover with easy-carry handle
- Case on case stackability

For protecting, organizing and storing your valuable diskettes, make the little investment that pays off big. Buy a Bank. Buy DiskBank.

Table 1: Graphics character look-up table.
Micro Design International, Inc. announces 10-Megabytes of formatted capacity with complete internal installation, all for $895.00. Now you can expand your IBM® PC to a XT. By equipping it with the MDI Hard Disk save up to $2,000 over the cost of a XT. This system also works with most PC look alikes, and is DØS 2.0 and 2.1 compatible.

Unlike other internal drives which require an external power supply, The Insider uses available power. In fact, it uses only 0.9A of current thereby eliminating overheating, a problem which has plagued other drives. Our drive and electronics are so good that we carry a full one year warranty.

The MDI System includes complete software, cables, simple installation instructions and is available in the following configurations:

Paul Heckel feels that to be "friendly," software should be visual, interactive, and above all, communicative. He first summons up the techniques of the great masters of communication in film, and of painters like Pablo Picasso and writers like Mark Twain. He then adds techniques of his own developed through years of successful software design, including programs for the Craig Language Translator and the all-new Viewdex™ system for the Epson HX-20. The result is a free-wheeling guide that is as delightful and surprising to read as it is easy and practical to use.

The Elements of Friendly Software Design explains:

- The thirty principles of friendly software design
- How filmmakers' communication techniques can be used to make software design "friendly"
- Visual thinking as a key to design
- Planing for prototyping and revision
- Factors that determine user acceptance
- Examples of excellence—why VisCalc is so successful
- Seven traps that snare even the most experienced designers

"Unique and indispensable; by far the most important and practical book on the subject"

—Larry Tesler, Manager, User Interface Design, Apple's Lisa

We can’t think of anyone who isn’t better off with a DX-15 DAISY WHEEL PRINTER.

Dynax’s DX-15. And if you want the kind of printer that lives in the fast lane, the DX-15 is your printer. It does it all, certainly all that far more expensive models can do. The DX-15 offers you some important options like Keyboard, Tractor Feed and Auto Cut Sheet Feed. Not only that, the DX-15 is a very durable unit, be it for business, home or word processing applications. And who says a great printer has to be expensive? Not us! What we say is you’ll be dumbfounded when your dealer tells you just how inexpensive the DX-15 happens to be. Give him a call or drop by. Dynax’s DX-15 says it ALL.
How good a manager are you? Thoughtware Module 1.1 "Assessing Personal Management Skills" will tell you. This program is a three-part, comprehensive self-assessment of your personal attitudes, behavior and understanding as they relate to your effectiveness as a manager.

**Unit 1** assesses your leadership style by examining the degree to which you are task- or people-oriented and how you use communication, teamwork, participation, initiative and support to get results. It also assesses your understanding of what motivates employees, promotes teamwork, and the extent to which you provide feedback.

**Unit 2** assesses your attitudes about setting goals and objectives, clarifying roles and responsibilities, and delegating. It also assesses the methods you use to improve employee performance and the ways you conduct performance evaluations.

**Unit 3** assesses your personal effectiveness by looking at how you manage time and stress, how you conduct meetings and solve problems. The programs conclude with specific recommendations designed to address the weaknesses identified.

To introduce you to Thoughtware, we’ll send you "Assessing Personal Management Skills" (which normally sells for $350), for only $150. (See adjacent column for details.)

Thoughtware programs run on the following: IBM® PC, PC XT, PCjr and compatible PC’s. Apple® II Plus and IIe.

Expanding The Universe Of Learning.

**Thoughtware Is The Future.**

It's a new way to learn, a logical and innovative approach to management training. It will revolutionize management training now and in the future. Thoughtware utilizes the latest research in management development from leaders in the field, and has been tested nationally.

For individuals, and their organizations, the educational, economic and operational benefits of Thoughtware's computer-based learning programs are enormous. But Thoughtware isn't just the future.

**Thoughtware Is The Present.**

Some of the largest and most prestigious corporations and organizations in the world have purchased Thoughtware's assessing Personal Management Skills Program.

And hundreds more. What they've learned, you can now discover.

You can reap the benefits of Thoughtware by visiting your local computer dealer, or call us at our toll-free number 1-800-THT-WARE, or write:

**Thoughtware Inc.**

Suite S, 2699 So. Bayshore Dr.

Coconut Grove, Florida 33133.

**Thoughtware Programs include:***

1.2 Understanding Personal Interaction Styles ($350)
2.1 Leading Effectively ($450)
2.3 Defining Goals and Objectives ($450)

Consider the total display to be made up of three blocks; each block is made up of eight boxes; each box is made up of eight rows. Table 2 shows a breakdown of the picture buffer organized so that each row has a memory address associated with it that defines the leftmost 7 dots (plus the associ-
Multi-function RS-232 Transfer Switches

MFJ-1240 $79 95

Multi-function RS-232 transfer switches let you switch your computer among printers, modems, terminals, any RS-232 peripherals; monitor data line failure, protect data lines from surges, and use as null modem for less cost than a switch alone. Switches 10 lines (2, 3, 4, 5, 6, 8, 11, 15, 17, 20). LED data line indicators monitor lines 1, 2, 3. Metal oxide varistors protect data lines 2, 3 from voltage spikes and surges. Push button reverses transmit-receive lines (2, 3). PC board eliminates wiring, crosstalk, line interference. Connects chip modem. Crystal controlled. Aluminum cabinet. 9x15x4 In. Other models available. Order from MFJ and try it. If not delighted, return within 30 days for refund (less shipping). One year unconditional guarantee. Order yours today. Call toll free 800-647-1800. Charge Visa, MC. Or mail check, money order. Add $4 00 each for shipping and handling.

AC Power Centers

MFJ-1105 $99 95

Add convenience, prevent data loss, head bounce, equipment damage. Relay latches power off during power transients. Multi-filers isolate equipment, eliminate interaction, noise, hash. MOVs suppress spikes, surges. 3 isolated, switched socket pairs. One unswitched for clock, etc. Lighted power, reset switch. Pop-out fuse. 3 wire, 6 ft. cord. 15A, 125V, 1875watts. Aluminum case. Black. 18x24x2 In. MFJ-1107, $79 95. Like 1105 less relay, 2 sockets, 2 unswitched. MFJ-1108, $129 95. Like 1107 but intelligent. Switch on device plugged into control socket and everything else turns on. Others available.

Acoustic/Direct Coupled Modem

Use with any phone anywhere $129 95

Author's Note:
The data-scroll routines let you control a window that permits examination of blocks of 209 adjacent samples of data. The position of this window is controlled by the left and right arrow keys (see figure 2). The data-scroll routines are broken up into two machine-language programs. Listing 4 gives the machine-language program that shifts data from right to left across the screen; listing 5 gives the routine that shifts data from left to right.

Without going into exhaustive detail, these routines move the contents of the picture-buffer memory so that the displayed data shifts either 14 data points to the left or the right. The rightmost (or leftmost) 14 data points are cleared so that new data can then be shifted in. The subroutines have to take into consideration the picture-buffer structure shown in table 2 (it would have been a lot easier if the picture buffer had been organized in a simple sequential manner). The shifting effect results in a window that can move back and forth across the memory block containing the digitized data.

Conclusion

I encourage those of you with modest data-acquisition and data-analysis requirements to consider the use of a system similar to the one described here. In our laboratory, we have found it to be a relatively inexpensive way to pursue research interests and have no doubt that it will continue to be a valued part of our laboratory in the years to come. The only items required are an Apple II and the circuitry and listings presented here.

Richard C. Hallgren is an associate professor in the Department of Biomechanics, Michigan State University, East Lansing, MI 48824. He works on applications of microprocessor-based systems to scientific research.

Author's Note: If you do not have either the time or capability to construct such a project, please write to me and I will direct you to a source for the hardware and the system software.
Encounter REVELATION

For $950, Revelation Software by Cosmos will give your PC capabilities that no microcomputer has ever had before. Through a versatile, high performance Relational Data Base Management System developed by Cosmos, Revelation will give your microcomputer all the power and sophistication of a minicomputer.

Revelation features a database with variable-length fields and records, (up to 64K), and unlimited files and accounts. File size is limited only by disk size.

Also featured: A powerful, hybrid programming language.
A fourth generation applications and program generator
Our programs write programs!
Communications functions that give your PC the power to utilize applications, programs, and data from thousands of existing mainframe and minicomputers.
8087 math chip support
Revelation co-exists with MS/DOS™ or PC/DOS™ 1.0, 1.1, 2.0 versions, and is compatible with the IBM PC™ XT™ COMPAQ™, Corona™ Columbia Multi-Personal® and the Eagle 1600™. It's also compatible with minicomputers utilizing the PICK Operating System™ Minimum configuration requires 320K memory and 8087 math chip.

SPINWRITER INTRODUCES PAPERWORK

- Bidirectional tractor for continuous, fan fold paper or labels with sub/super scripting.
- Cut sheet guide for single sheets.
- Demand document tractor for tear-off continuous forms.
- Unidirectional tractor for continuous fold paper or labels.
- Dual bin adapter for first and second sheets.
- Envelope feeder for interfeeding with cut sheets.
ES 9 WAYS TO GET YOUR MOVING FASTER.

These nine NEC forms handlers can automate most of the printing operations in your office.

With most other printers, you'd be lucky to find even one of these productivity tools.

Most competitive forms handlers are made by third parties. Which means they're compromises.

NEC forms handlers have all been conceived by the Spinwriter team. So they are perfectly integrated with the Spinwriter® 3500 and 2000 Series letter quality printers.

You'll find Spinwriters along with forms handlers at:
Participating Computerland stores
(California) 1-800-321-1101, (Outside California) 1-800-423-3008
Entré Computer Centers
1-800-HI ENTRE
Sears 1-800-228-2200
Also available at IBM Product Centers.

Or call 1-800-343-4418 for your nearest authorized NEC distributor nationwide. In Massachusetts call (617) 264-8635. For product literature, use the coupon below. And find out why more and more PC users are saying, "NEC and me."

Send me literature on spinwriter forms handlers.

NEC AND ME

NEC Information System, Inc. 1414 Mass. Ave., Boxborough, MA 01719
The key to effective simulation is the availability of a mathematical model of the relationships between the system variables including accurate data. When this model is accurately programmed and validated, useful simulations can be performed. This programming usually involves the use of advanced techniques such as the solution of differential equations, random-number generation, graphics, and statistical analysis. Many simulation models involve thousands of relationships between variables.

It is hardly surprising that simulation, which is widely used by many who are not expert programmers, should have stimulated the development of special software aids including special simulation languages.

Discrete and Continuous Languages

There are two groups of simulation languages that have a sufficiently wide area of application to warrant the title “general purpose.” These are the discrete and the continuous simulation languages. Discrete simulation languages are applied mainly to problems arising in management sciences and operational research studies, particularly queuing systems. These systems remain in a particular state until an event occurs that causes a change in the state of the system.

This article, however, is mainly concerned with the second group, continuous-system simulation languages (CSSLs). A continuous system, as its name suggests, is one whose state changes continuously. The mathematical description of a continuous system is based on differential equations. A differential equation can be regarded as a relationship between a quantity and its rate of change.

For example, consider a piece of metal at a temperature of \( x \) degrees F (Fahrenheit) cooling in an ambient temperature of 70 °F. The rate of cooling is approximately proportional to the temperature difference

\[
\text{Rate of cooling} = k(x - 70)
\]

Mathematical notation uses the \( dx/dt \) to represent the rate of change of the quantity \( x \) with time \( t \). The notation \( x' \) is also used—in the example, \( x' \) is the rate of cooling of the metal object in °F/second.

The differential equation \( x' = k(x - 70) \) describes a continuous system in which the temperature \( x \) is changing continuously as time passes. Simple models of this kind can be solved easily, but computer simulation comes into its own when more complex systems are involved with more complex differential equations.

In many practical applications it may be necessary to solve dozens or even hundreds of equations simultaneously. One of the main advantages of using a CSSL is that the numerical techniques necessary for solving these equations are built into the language. It is only necessary to specify the differential equation in a natural notation and the language does all the work.

Of the several CSSLs presently available for microcomputers, we should mention micro-DYNAMO from Addison-Wesley and TUTSIM from Twente University (Netherlands). Within this article, I shall focus on ISIM, a language developed for the CP/M environment. We will explore the syntax and capabilities of ISIM by creating a simulation of a rocket launch.

ISIM—A CSSL for Microcomputers

ISIM is a development of the ISIS language (see text box), modified to run under the CP/M operating system. Even so, ISIM retains most of the notable features of its parent, several of which are unique to CSSLs on any kind of computer.

We start our description of the language with the way of defining differential equations. We have already
seen one example; another is listed below:

VEL' = G * (THRUST - DRAG) / (W - G)

Readers familiar with FORTRAN or BASIC should be reasonably comfortable with this example. The only unusual feature is the use of a prime (') to represent differentiation. We would use a second derivative (e.g., VOUT") to define a second-order differential equation.

A complete model of a system will often contain a mixture of differential and algebraic equations. For example:

DYNAMIC

W = 3000 - 40 * T
DRAG = K * Y' * * 2
Y'' = G * (THRUST - DRAG) / (W - G)

These equations are a very simplified model of the launch phase of a rocket. The first statement uses the key word DYNAMIC to introduce the equations. W is the weight of the rocket plus fuel that is initially 3000 pounds, but is falling at the rate of 40 pounds per second. DRAG is the drag force that is proportional to velocity squared. The final statement relates the acceleration of the rocket Y'' to the THRUST of the rocket motors, the DRAG, the weight W, and the gravitational acceleration G. THRUST is treated as a constant in this case and is set elsewhere in the program.

The part of the program depicted above is called the DYNAMIC region. It specifies the differential and related equations to be solved between an initial time (usually zero) and a user-specified final time. The solution proceeds in a step-by-step manner using a time increment that is also set by the user.

Before the DYNAMIC region can be processed, a certain amount of initialization of the model is needed. Time T must be set to zero and the initial values of Y, Y', and THRUST (all zero) must also be set. These operations need only be performed once and this occurs in the INITIAL region that precedes the DYNAMIC region as follows:

INITIAL

Y = 0; Y' = 0; T = 0
THRUST = 7000

ISIM, along with most other CSSLs, also has a TERMINAL region for any calculations or output to be made after the completion of a run.

To be of any utility, a simulation needs output statements. Because CSSLs are concerned with time histories, the most useful types of output are tabulated numerical output or graph plots. These can be easily provided by ISIM statements of the form:

OUTPUT T, Y, Y' for a table of values of T, Y, and Y' and PLOT T, Y, 0, TFIN, 0, 50,000 for a graph of Y against T.

The OUTPUT statement automatically prints headings, selects number formats, and prints one line of output at regular intervals controlled by the user by setting the value of system variable CINT (communication interval). A sample of the output produced is shown below:

<table>
<thead>
<tr>
<th>T</th>
<th>Y</th>
<th>Y'</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.0000</td>
<td>0.0000</td>
<td>0.0000</td>
</tr>
<tr>
<td>2.0000</td>
<td>21.659</td>
<td>43.319</td>
</tr>
<tr>
<td>3.0000</td>
<td>86.934</td>
<td>87.330</td>
</tr>
</tbody>
</table>
The PLOT statement produces a graph plot of \( Y \) against \( T \) on a graphics terminal. The additional parameters specify that \( T \) will be plotted between zero and its maximum value \( TFIN \) (time final), another system variable set by the user. \( Y \) will be plotted from zero to 50,000 (the estimated maximum altitude of the rocket for this run).

**Encore Presentations**

So far, our program is concerned with describing the system that is to be simulated and the form of output. All CSSLs also provide facilities for controlling a sequence of simulation runs, since it is rarely sufficient to simply make one run of the simulation with fixed parameters. Multiple runs may be made for several reasons: to observe the behavior of the system with different values of key parameters or initial conditions; or to run the same case with a different step-length for the numerical integration routine, to check on accuracy; or to run it with different OUTPUT or PLOT statements, and so on. (In simulation terminology, we are performing an experiment on the model.)

ISIM provides a slightly unusual but very flexible approach to defining the experiment compared to most other CSSLs. The conventional approach is to use RUN-control commands that change values and output requirements, and call for a single run. Setting up a sequence of runs using this approach can involve long lists of commands specifying each change with a RUN command for each run. The ISIM method is to incorporate the definition of the experiment into the program in a control section of code that appears before the model definition. This section of code can be written using looping statements, including functions and subroutines; and special simulation functions; including functions and subroutines and so on. In simulation terminology, we are performing an experiment on the model.

ISIM has a number of other features, including functions and subroutines and special simulation functions; including functions and subroutines and special simulation functions. A feature common to most CSSLs is the PREPARE statement. The keyword PREPARE is followed by a list of variables. Rather than being tabulated or plotted, the value of the variables are stored in a disk file at each time step. They are then available at the end of a series of runs to be plotted in a variety of ways, the user having the choice of which variables and which runs are to be plotted. These graphs can be produced on a graphics terminal or as character plots on a video display terminal or printing terminal.

**Interactive Features**

The full power of ISIM cannot be appreciated without some reference to its command structure, for it is through ISIM's commands that the interactive power of the language is made available. The ISIM system is always in one of two modes, command mode or program mode. In command mode the system prompt is "$" and in program mode it is "?".

When in program mode, ISIM statements are entered from the keyboard. The ISIM processor checks each line for syntax errors as it is input and generates an immediate er-
ror message when a fault is detected. Correct lines are translated to an inter-
mediate code that is interpreted at run time (similar to the Pascal p-system).

To switch to command mode, type "$" followed by an ISIM command.
Commands are available to list all or part of the current program ($LIST),
to change, delete, or insert lines in the program ($CHANGE, $DELETE, or $INSERT), and to execute the
program ($START). Alternatively, the
program can be saved to a CP/M file
($SAVE), the program buffer can be
cleared ($CLEAR), or a new program

After a program has been executed,
user minicomputers, though capable
of handling larger programs, are
often unable to support this degree
of interaction. In many ways the
microcomputer provides an ideal
basis for interactive simulation,
especially the more powerful 16-bit
systems that can address more
memory than the 8-bit systems.

Where Do We Go from Here?
Shortage of memory restricts the
power of the simulation system in
two ways. One is that provision of a
full range of facilities such as are
present in ISIM takes a lot of code, more
than can be handled at one time in
64K bytes of memory. Disk overlays
are necessary, although no disk
swapping occurs during actual execu-
tion of a simulation run. ISIM uses
nine overlays. Second, the amount of
memory that can be allocated for the
user program is also restricted.
The much larger available memory space
of the 16-bit systems will largely
eliminate these problems and an IBM
PC (Personal Computer) version of ISIM is due to be released early in
1984.

Ray E. Crosbie is a professor of computer science
at California State University (Chico, CA 95926).
He has a B. Eng. and a Ph. D. in electrical engineer-
ing from Liverpool University in England.

Software Information
To obtain software mentioned in article
contact Crosbie, Hay, and Associates, POB
943, Chico, CA 95927.
A programmer's most important software tool is the language compiler or interpreter he uses. He has to depend on it to work and work well.

At SuperSoft, we believe it. That's why we offer three fine compilers: SuperSoft FORTRAN, SuperSoft BASIC, and SuperSoft C, that answer the programmer's need for rock solid, dependable performance on 16 bit systems.

Compatible with Microsoft BASIC

The SuperSoft BASIC compiler, available under CP/M-86 and MS DOS, is compatible with Microsoft* BASIC and follows the ANSI standard.

Greater accuracy with BCD math routines

If you have used other languages without BCD math, you know how disconcerting decimal round off errors can be. For example:

<table>
<thead>
<tr>
<th>With IBM PC*</th>
<th>With SuperSoft BASIC with BCD math</th>
</tr>
</thead>
<tbody>
<tr>
<td>10 A=.99</td>
<td>10 A=.99</td>
</tr>
<tr>
<td>20 PRINT A</td>
<td>20 PRINT A</td>
</tr>
<tr>
<td>30 END</td>
<td>30 END</td>
</tr>
<tr>
<td>Output: .9899999</td>
<td>Output: .99</td>
</tr>
</tbody>
</table>

As you can see, SuperSoft BASIC with BCD provides greater assurance in applications where accuracy is critical.

SuperSoft's BASIC is a true native code compiler, not an intermediate code interpreter. It is a superset of standard BASIC, supporting numerous extensions to the language. Important features include:

- Four variable types: Integer, String, and Single and Double Precision Floating Point (13 digit)
- Full PRINT USING for formatted output
- Long variable names
- Error trapping
- Matrices with up to 32 dimensions
- Boolean operators OR, AND, NOT, XOR, EQV, IMP
- Supports random and sequential disk files with a complete set of file manipulation statements
- IEEE floating point available soon as an option
- No run time license fee

Requires: 128K memory
BASIC compiler: $300.00

For CP/M-86*, MS DOS, and PC DOS

*SuperSoft BASIC is compatible with Microsoft BASIC interpreter and IBM PC BASIC. Due to version differences and inherent differences in compilers and interpreters some minor variations may be found. Machine dependent commands may not be supported. The vast majority of programs will run with no changes.
SuperSoft FORTRAN is the answer to the growing need for a high quality FORTRAN compiler running under CP/M-86 and IBM PC DOS. It has major advantages over other FORTRAN compilers for the 8086. For example, consider the benchmark program used to test the IBM FORTRAN in InfoWorld, p. 44, Oct. 25, 1982. (While the differential listed will not be the same for all benchmark programs, we feel it is a good indication of the quality of our compiler.) Results are as follows:

- **IBM FORTRAN**: 38.0 Seconds
- **SuperSoft FORTRAN**: 2.8 Seconds

In its first release SuperSoft FORTRAN offers the following outstanding features:

1. Full ANSI 66 standard FORTRAN with important extensions
2. Standard data types, double precision, varying string length, complex numbers
3. Free format input and free format string output
4. Compact object code and runtime support
5. Special functions include string functions, dynamic allocation, time/date, and video access
6. Debug support: subscript checking, good runtime messages
7. Full IEEE floating point
8. Full 8087 support available as option ($50.00)
9. Raffor preprocessor available as option ($100.00)

SuperSoft FORTRAN: available NOW and working great!

**Requirements**:

- 128K with CP/M-86 or MS DOS
- 32K with CP/M-80
- FORTRAN: $425.00 (in each environment)
- 8087 Support: $50.00
- Raffor: $100.00

For CP/M-86, MS DOS, IBM PC DOS, and CP/M-80

In 1982 SuperSoft helped C programmers around the world move their applications from 8 to 16 bit operating systems with the first C compiler under CP/M-86, PC DOS, and MS DOS. Today there are several C compilers on the market, and you can look at them all. But if you want a C that’s fully portable, syntactically compatible with UNIX version 7 C, rigorously tested, fast in both compilation and execution, packed with more library functions than any other, and produces a very highly optimized assembly code... then you’ll find only one. The SuperSoft C compiler.

**Professional Quality**

SuperSoft started working on C over three years ago, and the work has never stopped. While others were struggling to put in features, SuperSoft was refining and polishing... adding the quality professionals depend on.

**Thoroughly Tested**

SuperSoft C has been tested with hundred of commercial application programs. And all this testing has paid off... with a compiler that’s highly reliable in every phase of operation.

**Portable**

SuperSoft C is now available in most operating systems environments. Since we don’t sell operating systems, we can support them all. And as new operating systems become popular, SuperSoft C will be there.

**Packed with Library Functions**

SuperSoft now has the most complete set of library functions available. All provided with source code.

**Thorough User Manual**

The new user manual is extensive—jammed with thorough explanations to help you every step of the way. And our technical hotline can help answer any additional questions. SuperSoft C: $350.00

Indexing Open-Ended Tree Structures

How to "walk" through a "grove" of A-trees in search of hierarchical nodes

John Snyder
Disc Inc.

One challenge to software designers is the problem of how to keep track of the elements within a hierarchy. For example, in a multilevel, menu-driven system, users always start with a main menu that lists the major functions. They select a major function, which may result in another menu of subfunctions. If it does, they then select a subfunction, which may result in still another menu of sub-subfunctions. When a function is completed, there should be a flexible, automatic selection of another function (e.g., return to the main menu or go directly to another subfunction menu).

Another example of a hierarchical structure is an assembly process, where, instead of a main menu, there is an assembled part and, instead of subfunctions, subparts. Both examples represent open-ended tree structures. That is, each node may be a terminus, or it may be the origin of any number of subnodes.

Problems with Open-Ended Trees

For the purpose of menu (or similar selection-driven) processing, subscripts are the easiest index to use. For example, if we start each subscript with zero, then the main menu is 0, 0, 0, . . . , and the $i$th selection from the main menu is $i, 0, 0, . . .$, and so on.

Assuming that the depth of the tree is the longest chain of nodes, the tree can be structured as an array with its dimension equal to the depth, and it can be indexed by conventional subscripts ($I, J, K, . . .$). Actual entries in this multidimensional array may be record numbers, function codes, or whatever the application dictates. However, such an array will be lightly filled and subject to the restriction that entry $I, J, K$ can exist only if entry $I, J$ exists.

What is needed is a structure for looking up entry values that are indexed by subscripts without the prohibitive overhead of this potentially huge array.

The A-Tree Solution

Instead of using a single multidimensional array, two one-dimensional arrays are used to effect a solution. The first array describes the tree structure and is called an A-tree ("A" for awkward). This array has one element for each node of the tree. By "walking" through the tree from top to bottom and from left to right, you
can discover the relationship between the nodes of the tree and the array elements.

Figure 1 illustrates a sample A-tree. Each node is marked with its subscript reference number and with its A-tree element number in parentheses. The absence of unused lower-level subscripts emphasizes the open-ended depth of the tree. The values of the A-tree array describe the tree structure. Each element contains the number of subnodes originating from the node to which the element corresponds. The first three columns of table 1 list the A-tree array that corresponds to the sample tree in figure 1.

Clearly, the array uniquely defines the tree structure. Now, once you locate an entry in the A-tree array, the corresponding entry in the second array will contain the data needed for processing. Thus, the second array is a parallel reference array for the A-tree array.

The A-Tree Searching Method

The definition is simple enough, and the structure is certainly space efficient, but now that you have it, what do you do with it? Obviously, the A-tree cannot be interrogated by any conventional search method. You certainly do not want to do a "tree walk" to look up an entry every time.

It turns out there is a fairly effective—if not simple—method of scanning the A-tree array through the use of a difference table. This difference table is developed as follows: if \( N \) is an A-tree element number, and \( A(N) \) is its corresponding A-tree element value, first define the sum \( S(N) \) for this element as \( S(0) = 0 \) and \( S(N) = S(N - 1) + A(N - 1) \) for \( N \) greater than 0. Then define the difference \( D(N) \) for this element as \( D(N) = S(N) - N \).

The last two columns of table 1 list the sums and differences for our sample tree in figure 1. You can now use the A-tree array and its associated difference values to find any subscripted reference. (The sums are only intermediate calculation figures; they are not actually used in the search.)

The basic algorithm is as follows: if \( N \) is an A-tree element number that corresponds to a given node, and you wish to find the element number corresponding to the \( I \)th subnode originating from the given node, then, first, check \( A(N) \) to make sure it exists, i.e., \( A(N) \) cannot be less than 1; then calculate \( V = D(N) + A(N) - I \); finally, scan for the first occurrence of \( V = D(M) \) with \( M \) greater than \( N \). Such an occurrence is guaranteed, and \( M \) will correspond to the desired node.

Since the root is always element zero (0), and since the algorithm can be repeated for as many subscript levels as are necessary, you can find the element number of any combination of subscripts through successive scans.

For example, suppose you wish to find the A-tree element corresponding to subscripts 3, 2, 1 in the sample tree. Using table 1, start at the root and look for 3. Since \( A(0) = 3 \), you know 3 exists. Then, calculate

\[
V = D(0) + A(0) - 3 = 0 + 3 - 3 = 0
\]

So, starting with element number 1, scan the differences for the first 0, located at element number 18. Looking now for 3, 2 (3, 2 exists because \( A(18) = 2 \)), calculate

\[
V = D(18) + A(18) - 2 = 0 + 2 - 2 = 0
\]

Scanning from element number 19, you will find the first difference of 0 at element 20. Finally (3, 2, 1 exists because \( A(20) = 1 \)), calculate

\[
V = D(20) + A(20) - 1 = 0 + 1 - 1 = 0
\]

Scanning from element number 21, you will find the first difference of 0.
at element 21 and that completes your search. (This method can be mathematically proven by induction through the subscript levels.)

Programming this is much easier than it sounds at first, and it can be quite fast when you use string scan instructions. You can speed it up even more by saving the subscripts of the last node found and the pointers to each of its upward chain nodes. This enables you to start the next search with the lowest common node to the last node.

Updating the A-Tree

Adding entries to or deleting entries from an existing A-tree is slightly tedious and involves shifting portions of the array. To add a new node, first check that a back chain, or entry for the next highest subscript value, exists. Then add 1 to the element value of the next highest subscript. Finally, insert 0 in the appropriate location (a difference table can be used to find this location), and shift all remaining entries up by one position.

To delete a node, reverse this procedure. First, check that no forward chain exists, that is, that the A-tree entry for the element to be deleted has a value of 0. Then, subtract 1 from the element value of the next highest subscript. Finally, delete the entry by shifting all remaining entries down by one position.

These procedures assume that you can insert or delete a middle node for a given subscript level. For example, you can add an entry between 2, 3 and 2, 4 as a new 2, 4, making the existing 2, 4 now 2, 5, and so on down the line. If doing this causes problems, you can modify these procedures to only allow adding or deleting the last entry at a subscript level.

Comments on Applications

In actual use of an A-tree, you must determine the maximum number of nodes allowed in the tree and the maximum number of subtrees to be allowed for reference. If the A-tree reference array is being used for a limited resource, such as record numbers, it may be useful to keep deleted reference entries at the end of the reference array for reuse when new entries are added.

Note that each entry of the A-tree is the start of another complete A-tree. That is, every A-tree consists of a “nest” of A-trees. In the part assembly example, it may be useful to have a separate index on the A-tree array by part number. Such an index provides direct reference to each nested A-tree subpart. To demonstrate the handiness of the A-tree, imagine that you wish to find all of the unassembled subparts that constitute a given part. To do so, you need only search for all of the A-tree entry values of 0 between the given subpart and the next subpart at the same subscript level.

The reference array entries need not be unique. In fact, the same item may appear any number of times in a given tree. If such duplication is extensive and includes not only individual nodes but all subordinate subnodes, you can use reference “pointer” nodes. That is, after the first occurrence of a subtree, any other occurrences of the same subtree are represented by terminus nodes that point to the subtree's starting node.

You can even make “reentrant” references, pointing from one node to a node linked above it. Pointer nodes allow cross-branching and make the connectedness (and hierarchy) of the tree unlimited.

Sample Programs

To illustrate the structure of A-trees, I have included listings 1, 2, and 3, functions written in C that perform the A-tree search algorithm. Routines Searcher and Findindex are opened (they do not know the overall length of the A-tree or the number of subscript levels it contains). As long as the lowest subscript value passed is 0, they will terminate properly. To accomplish this, it is necessary to define several work arrays (used exclusively by these functions) as arguments.

John Snyder is a vice-president responsible for technical support for Disc Inc. (3837 Naylor Lane, Baltimore, MD 21208). He has been a software consultant for 17 years.

Listing 1: Routine Calcdiff, written in C, determines the A-tree's difference values.

```c
/*----------------------------------------*/
/* name calcdiff — Calculate the difference table for an */
/* A-Tree */
/*----------------------------------------*/
int Calcdiff(int *atree, int *adiff, int size) {
    int count = 0;
    do {
        int sum = 0;
```

Listing 1 continued on page 410
Reach for the programming horizon of the 80’s with Lattice C, the fastest C compiler.

Select course of your next software project towards greater power and portability by selecting Lattice C, recognized as the finest and fastest 16-bit C compiler. Lattice C, the full implementation of K&R, continues to lead the way by announcing full memory management up to 1 Megabyte. Major software houses including Microsoft, MotaPro and Sorcim are using Lattice C to develop their programs.

LIFEBOAT offers Lattice C with a tested set of software tools to provide a complete development system including:

- HALO
- PANEL
- PMATE
- PLINK - 88
- C-FOOD SMORGASBORD
- LATTICE WINDOW
- FLOAT47

Color graphic primitives
Screen design aid
Customizable program editor
Overlay linkage editor
Screen and I/O utilities
Multi-window functions
8087 floating point math

LIFEBOAT is available for a wide variety of 16-bit personal computers including IBM, HCP, Macintosh, Visic, Walter and on other microcomputers running PC-DOS, MS-DOS and CP/M-86.

Call LIFEBOAT at 212-860-0300 for free information on the Lattice C family of software development tools.

Please send me the complete LIFEBOAT software catalog. $3.00 enclosed for postage and handling.

Irvine, CA 92714
714/261-6226 (6227)

Listing 1 continued:

Listing 2: This routine, Searcher, finds the lowest common node between the previous and current sets of subscripts. This information is used to search in routine Findindex.

Listing 2:

```c
#include <stdio.h>

int Searcher(int *atree, int *adiff, int *subs, int *last, int *inds)
{
    int index = 0;
    while ((subs && last && subs == last) ||
        (atree ++ == index) &
        (adiff ++ == index + 1))
    {
        index = Findindex(atree, adiff, subs, last, inds, index);
        return(index);
    }
```

**Description**: Searcher locates the lowest common node between the current set of subscripts and the previous set of subscripts, adjusts pointers accordingly, and calls Findindex to complete the search. Note subs and last must be long enough to always allow an extra (zero) subscript at the end. (Also, adiff, last, and inds could be local to calcdiff, searcher, and Findindex. However, this would not allow them to be of arbitrary length.)

**Synopsis**:

```c
int Searcher (int *atree, int *adiff, int *subs, int *last, int *inds);
```

**Function**: Optimizer "front end" for Findindex.
Listing 3: The Findindx routine performs the actual search within the A-tree algorithm.

```c
/**
 * name    findindx — Search A-Tree for entry corresponding to a given set of subscripts and return the index.
 * synopsis index = findindx(atree, adiff, subs, last, inds, index);
 *        int index;    Output index to atree() corresponding to input subscript values. Set to -1 if entry does not exist.
 * description If N is an A-Tree element number corresponding to a given node, and we wish to find the element number corresponding to the Ith sub-node originating from the given node:
 *        (1) First, check A(N) to make sure it exists, i.e., A(N) cannot be less than I
 *        (2) Calculate V = D(N) + A(N) - 1
 *        (3) Scan for the first occurrence of V = D(M) with M > N
 *        Such an occurrence is guaranteed, and M will correspond to the desired node. findindx performs this algorithm recursively until a zero value subscript is encountered.
 */

int findindx(atree, adiff, subs, last, inds, index)
{
    int value;
    if (*subs == 0) {
        *last = 0;
        return(index);
    }
    if (*atree < *subs) {
        *last = 0;
        index = -1;
        return(index);
    }
    value = *adiff + *atree - *subs;
    do {
        index++;
        atree++;
    } while (value != +++adiff);
    *inds++ = index;
    *last++ = *subs++;
    index = findindx(atree, adiff, subs, last, inds, index);
    return(index);
}
```

IBM PC Software: the value of choosing.

Shoes.
If they don't fit, they're not worth wearing.
Software programs.
If they don't fit, they're not worth using.
That's why it's altogether fitting that IBM Personal Computer Software offers you a choice.

Size up the selection.

You'll find many types of programs in the IBM software library. They'll help keep you on your toes in the office, at home or in school.

There are, in fact, seven different categories of IBM programs called "families." A family of software for business, productivity, education, entertainment, lifestyle, communications or programming.

Of course, every program in every family is tested and approved by IBM. And IBM Personal Computer Software is made to be compatible with IBM Personal Computer hardware.
Putting your best foot forward.

Although every person isn't on equal footing when it comes to using personal computer software, there's something for almost everyone in the IBM software library.

For example, you may be on a shoestring budget and want a big selection of programs with small price tags.

You may be introducing students to computing and want programs that are simple to use and simple to learn.

You may run a business requiring sophisticated inventory and payroll programs. Or you may run a business requiring a single accounting program.

You may write interoffice memos and want a streamlined word processing program. Or you may be a novelist looking for a program with features worth writing home about.

Now you can find IBM Personal Computer Software that fits—to help you accomplish specific tasks and reach individual goals.

Stroll into a store today.

What's the next step?
Visit an authorized IBM Personal Computer dealer or IBM Product Center near you. To find out exactly where, call 800-447-4700. In Alaska or Hawaii, 800-447-0890.

Ask your dealer to demonstrate your choice of programs. Then get comfortable. Sit down at the keyboard and try IBM software on for size.

IBM Personal Computer Software

Circle 205 on inquiry card.
Designed for Operator Enjoyment.

The leader in quality and reliability now offers the Viewpoint family with all the most user-requested features:

- Earth-tone colors and small size to complement any office environment.
- Tilt and swivel display for operator comfort.
- Low profile keyboard with adjustable height for easier data entry.

VIEWPOINT™/Color.
The first truly low-cost color terminal

VIEWPOINT™/90.
OEM's delight... double-high / double-wide, split screen, programmable function keys, down-line loadable, and more.

VIEWPOINT™/78 and VIEWPOINT™/78 Color.
IBM functionality in mono-chrome and color

VIEWPOINT™/60.
A fully featured editing terminal.

VIEWPOINT™:
Best price/performance in a conversational terminal.

Using Comments to Aid Program Maintenance

Complex software can be maintained more easily by the judicious use of remarks embedded within program code

Richard A. Thomas
Engineering and Mining Journal

Real-life documentation comes disturbingly close to Kelly-Bootle's comic assessment, a fact bemoaned by programmers who have to set up, modify, or maintain software. Documentation is a critical part of program maintenance, and maintaining programs has been estimated to consume up to 50 percent or more of the average electronic-data-processing budget in a company.

Programming "comments" are a more important aspect of documentation than is generally recognized. Often these comments, written into the program code, are the only form of documentation a maintenance programmer uses when trying to navigate an unfamiliar program. In theory they are the programmer's guide to how a program works.

Comments are part of the "internal" documentation written for the programmer, as differentiated from the end-user's manual. But the industry is, as yet, without a standard for such comments or a widely accepted format for their placement. As many companies have found, rarely does this internal documentation—which includes flowcharts, pseudocode, and the listing itself, as well as the comments—contain all the information necessary for maintaining a program.

What internal documentation is present, according to Robert Glass and Ronald Noiseux in their Software Maintenance Guidebook, "is frequently out of date and thus, unreliable." Of the different types of often unreliable internal documentation, comments are perhaps the worst offenders. These remarks turn out to be inadequate, misleading, or dead wrong as much as half the time. And for better or worse, they tend to be the most long-lived documentation because they are embedded in the code itself.

Problems with Comments

Comments are intended for people, not compilers. As such, they are most often set off by delimiters, the first of which signals the compiler to ignore the material that follows until it sees some terminating delimiter. Assembly language and all higher-level languages have some notation for setting off program comments. In assembly language, an asterisk or semicolon in column 1 identifies the line as a comment; in COBOL, an asterisk appears in column 7; in FORTRAN, a "C" is used in column 1; in RPG, an asterisk appears in column 7; and in APL, a special "jet" symbol is used.

According to one computer-industry study done in England, 10 generations of maintenance programmers maintain an average program before it is discarded and rewritten. If the intra-program documentation in this average program is up to date and explicit, many man-hours of code deciphering will be saved over the life of the program. If the comments are redundant, out of date, or otherwise misleading, maintaining the program will consume many
budget dollars, frequently more than if the code had been completely un-commented.

Hence, comments sometimes are not only useless but also result in substantial hidden costs that pad the data-processing maintenance department's time sheets.

Why do comments so often fail to lower maintenance costs, and in some cases actually increase them? Problems with comments in listings appear to fall into one of five general categories:

1. Comments are present but not useful in understanding the code, usually because they are redundant, self-indulgent, or vague.
2. Comments are incorrect translations of the associated code.
3. Too many comments exist, causing distraction.

**Often these comments are the only form of documentation a programmer uses to navigate an unfamiliar program.**

4. Comments are absent altogether, leaving the maintenance programmer to guess at code meanings.
5. Comments are outdated, not having been maintained along with the code.

The first problem is the most common. Comments frequently echo the code, with no added value accruing to the reader. Redundancy is often the result of adhering to an arbitrary standard that specifies x number of comments for y number of coded lines. The programmer may find nothing much to say about the last three lines of code that the code does not say itself. The result is a trivial comment like “Multiply M by N and add result to total.”

Redundancy also occurs because a programmer does not understand the meaning behind the program's application. For example, the programmer may insert comments like “Multiple price by quantity” or “Subtract Velocity1 from Velocity2 and divide result by Time” that echo the code, unaware that, in fact, “Revenue” and “Acceleration,” respectively, are being calculated.

A programmer's egoism may also contribute to the lack of usefulness of the comments. Ed Yourdon, in his book *Techniques of Program Structure and Design*, writes, “Many programmers seem to write comments as personal messages to themselves, that is, to remind themselves of the purpose of the particular instruction or program statement they used. The personal note, though, may be completely indecipherable to anyone else.”

Often a programmer's comments are vague and imprecise, seemingly written with the unconscious assumption that the maintenance programmer is a part-time telepath who can divine meanings from the ether. Some authors feel this supports the widespread belief that programmers hate to document and are notoriously bad writers. Yourdon further suggests that some software creators strike the superior attitude: “Any decent programmer ought to be able to understand this.”

The second category, comments that don't even remotely agree with the associated code, is particularly costly. The maintenance programmer looking at such comments is, in a sense, starting from below zero on the understanding scale, not even knowing that the comment has actually said nothing related to the code. The maintenance programmer then falls victim to what Gerald Weinberg calls the “psychological set.”

Loosely defined, the psychological set is a blind spot caused by what you believe to be true. If, as a programmer, you read an erroneous comment and then delve into the code, you will be hindered by what you “know.” Yourdon and Weinberg both cite experiments indicating that maintenance programmers might at times be better off stripping all comments from the code before trying to debug or modify a listing. With some experienced programmers, this is already standard operating procedure.
Three good reasons to try Encore diskettes.

1. It saves you money.

Encore diskettes meet the same high standards as the more expensive brands. In fact, Encore actually exceeds system requirements. Yet you can buy Encore diskettes for only $1.59 for single-sided, single-density 5¼" diskettes, when you purchase 4 or more boxes, ten diskettes to a box.

A diskette intended for a wide range of uses.

Whether you use a lot of diskettes or only a few, you need something more than guaranteed accuracy and reliability. You need economy.

Encore was designed to meet the demand for a reliable, low-cost diskette. At Encore’s low price, it’s ideal for memos, rough drafts, spreadsheets, reports, even scratchpad-type uses.

Designed for all major personal computers.

IBM® • Apple® • Radio Shack

Art Encore was specifically designed to provide optimum performance and reliability on the four leading computer systems. Inmac’s Quality Assurance Department constantly monitors all Encore diskettes to ensure they meet or exceed the media specifications for these systems.

Our on-going testing program guarantees that the Encore diskette you buy tomorrow will be as good as the one you buy today.

2. It’s absolutely reliable.

Encore is guaranteed for one full year, or Inmac will replace it, free.

Inmac’s Quality Assurance Department requires that Encore meet the media specifications for the most popular systems—Apple, Commodore, IBM, and Radio Shack—exactly. So you can rely on Encore diskettes in your system. They won’t lose information or cause read/write errors.

45-day money-back trial.

We’re backing our Encore diskettes with a 45-day money-back trial because we’re positive you’ll be delighted with Encore’s quality and performance.

And we’re sure that once you try Encore, you’ll agree that it’s the most reliable economy floppy available.

If you don’t agree for any reason, just return the three diskettes for a full refund.

3. And you can get one, free.

For a limited time only, we’re offering a special trial pack of three 5¼" Encore diskettes. You pay the regular price for two of the diskettes, but the third one is free.

We’ll send you 3 single-sided, single-density 5¼" diskettes for only $5.19. (Single-sided, double-density for $5.99. Double-sided, double-density for $8.79.) Use all three Encore diskettes for 45 days.

Then, if you’re not completely satisfied, return the three diskettes for a full refund.

Here’s how it works.

Simply mail the attached postage-paid card, or phone our toll-free number:

1-800-538-8157 extension 987. In California, 1-800-672-3470, extension 987.

For this special offer, please include payment with your order. You may send a check, money order, or bill it to your Mastercard or Visa account. Company PO's accepted with verification.

Offer is limited to one trial pack per customer. Good only in U.S. Customer must be 18 years or older to order.

Remember to ask for your free Inmac catalog. It contains over 2,500 computer supplies and accessories, many not available anywhere except through the Inmac catalog or special offers like this one.

Inmac

2465 Augustine Dr., Santa Clara, CA 95051
The third category, too many comments, may come as a surprise to new programmers operating under the general academic edict that “more is better.” The problem most often springs from arbitrary decrees concerning code/comment ratios (discussed earlier), from programmers not having enough to do, or from abortive attempts to document a particularly tricky or obscure piece of logic.

Since a maintenance programmer working in a high-level language is required to remember a wide range of variables, many of which are irrelevant to the present assignment, the addition of a barrage of unnecessary comments compounds the problem by distracting or misleading the programmer and thus reducing the readability of the code.

The fourth category, uncommented programs, resides at the opposite end of the spectrum. Yourdon does not mince words about the importance of comments in listings:

In my opinion, there is nothing in the programming field more despicable than an uncommented program. A programmer can be forgiven many sins and flights of fancy . . . however, no programmer, no matter how wise, no matter how experienced, no matter how hard-pressed for time, no matter how well-intentioned, should be forgiven an uncommented program.

Reasons for not commenting a program vary considerably, but the result is usually the same—maintenance programmers wandering around for hours, chewing up pencils and scratching their heads, trying to puzzle out what 10 lines of code do in a 20-page listing.

Here are some reasons why code goes uncommented: (1) documentation gets skipped on “rush” projects; (2) the programmer believes the program is only going to be used once; (3) the programmer mistakenly thinks comments will take up too much space (a consideration only in very small microsystems); (4) the programmer believes the program will
run substantially faster without comments; (5) the program is simple, and
the programmer feels no one could misunderstand it; (6) the programmer is lazy.

The final category of problems, outdated comments, is only a subset of a larger problem, namely, outdated documentation. As I mentioned earlier, programs are around a long time before being put to pasture. The accompanying documentation, both internal and external, frequently becomes marginal or useless after a few changes are made in the software.

Many programmers simply do not bother to change comments to reflect their modifications. Usually, no review is made to discover whether comments have also been updated during maintenance. Getting the program back up and running is a company’s only concern. Often when updates or refinements are made in the code, the maintenance programmer will document these changes at the top of the module or program, leaving a host of now-irrelevant comments in the body of the listing, to be tripped over by the next generation.

Historical Treatment in Literature

After examining a sizable portion of the available information on program comments in both books and magazines, I can offer a few short generalizations.

First, most books on electronic data processing treat the subject superficially or not at all. This is especially true of journals, which, paradoxically, run a fair share of articles on documentation but seem unaware that this includes comments. On the other hand, those books that do treat the subject in some depth are very new (late 1970s through the early 1980s); hence, the ideas embodied in them are not yet widely disseminated. And, finally, much of the available literature is divergent, strongly opinionated, and somewhat dogmatic.

Regarding this last point, the most evident debate centers on how many comments are appropriate. Several authors advise liberal use of com-
ments; some even presume to offer a numerical guideline (surprisingly, Yourdon recommends an average of one comment for every two to three lines of code). Other sources caution that the programmer be stingy with comments, using them only where absolutely necessary. Still others suggest that the question of how many comments misses the point—it is quality that counts.

Another debate concerns standards. Should they be applied to program comments, or will suggested guidelines suffice? Standards are accused of stifling creativity in some literature, while elsewhere they are lauded as the only means for controlling output.

A third controversy revolves around where important internal documentation should be physically located. While most internal documentation currently resides in manuals and other media separate from the actual code, several theorists believe the main documentation should be embedded within the code itself. Glass and Noioux’s text on Combating the Problem

Given the existence of high program-maintenance costs in the electronic-data-processing industry and the importance of comments to the maintenance programmer, what seems to be needed is a more structured approach to the use of comments. This means more extensive treatment in universities and colleges, specifically in programming and design classes, and the development within industry of more effective standards and other means for controlling how comments are used.

The suggestion that educators play a larger role in developing standards may raise the ire of instructors who feel they have treated the area sufficiently. What I suggest is a more formal approach to the use of programming comments with emphasis on (1) debunking the “many-comments” myth; (2) determining when to add comments in a program’s development cycle; (3) deciding what to comment; (4) establishing where the comments are best placed, assuming options exist; and (5) working toward the “egoless programming” model, all detailed below.

Perhaps the dogma about the positive value of many comments should be de-emphasized and replaced by a better understanding of how and why comments should be used. Comments are a form of “defensive code” that should protect a maintenance programmer, much like “idiot-proofing” a program protects the data-entry clerk or the user.

The brief survey that accompanies this article (see the text box on page 421) is my own invention. Not meant to be a scientific sampling, the responses are from 100 people who work in the data-processing field, teach, or edit computer journals. The survey points out that many data-processing professionals append comments after they are finished coding, a practice that goes relatively undisputed (and largely undaddressed) in the classroom. However, several writers suggest that this temporal separation is far from optimal.

According to Eric Weiss in Computer Usage—Fundamentals, “Too often, programmers wait until they have finished their programs before turning to documentation. THIS IS A SERIOUS MISTAKE. The programmer can save effort and time, and make his documentation much better, simply by documenting his program as he prepares it.” Yourdon reinforces this: “Documentation can be just as useful during the design and implementation of a program as it is afterward. The very act of writing documentation usually forces the programmer to reexamine the basic workings of his programs.”

Authors’ opinions vary on which specific elements of a program require comments. However, a few generalizations are available to guide the new programmer. Among the most important of these is Weinberg’s
Comments on Comments

The survey results below represent a sampling of 100 data-processing executives, teachers, and computer-magazine editors, all of whom have had experience with program analysis. Participants were not selected by means of any statistical pattern, and their responses are meant only as a straw poll on the subject of programming comments.

1. Does your organization use any project-documentation standard? (sample size (N) = 100 respondents; average number of years experience = 8)
   - Yes: 67
   - No: 33

2. If your answer to question 1 is Yes, does the standard contain any rules or guidelines concerning the use of comments in program listings? (sample subset = 67)
   - Yes: 23
   - No: 15
   - I don’t know: 29

3. When do you insert or attach comments to programs that you are creating? (N = 100)
   - Before: 8
   - During: 73
   - After: 29

   (11 people checked more than one answer: 5 checked all three, 6 checked During and After coding)

4. How useful are other people’s comments in helping you to understand, modify, and/or maintain programs? (where 1 = very useful, 5 = no value, and 10 = harmful)

<table>

5. When maintaining/modifyting someone else’s code, do you change old comments to reflect your updates?

   - Rarely: 24
   - Usually: 28
   - Frequently: 17
   - Always: 37

6. How successful were the creators of COBOL in their attempt to make a language “self-documenting”?

   - Unsuccessful: 21
   - Somewhat successful: 65
   - Very successful: 14

Reminder that the whole idea of a comment is to prepare the mind of the reader for a proper interpretation of the instruction to which it is appended. A brief sampling of authors’ suggestions on what should be commented includes the following recommendations:

- Comment all data, since understanding data is often the key to understanding the program.
- Distinguish between true constants and initialized variables via comments.
- Introduce all modules with comments—a practice that often helps the programmer recognize that a module is not functionally cohesive. (Some authors even suggest putting the pseudocode at the top of each module.)
- Comment all “tricky” or obscure logic; however, it is better to make such logic “untricky.” As a rule it is better to rewrite such code.

Most authors agree that comments should be physically offset from the associated code. Weiss suggests that comments can be handled more easily as insertions between instructions than as attachments to the instructions themselves; the comments can then be changed readily without having to retyp or repunch any instructions, which may allow new errors to creep in.

In other scenarios, comments can be consistently indented or even highlighted with underlines or boldface. Glenford Myers suggests in his book Software Reliability: Principles and Practices that comments be offset to the extreme right of a listing, permitting a programmer to examine the code without interruption. In his words, comments “should be analogous to footnotes in a book.”

A programmer should view the code as a part of the entire project rather than his or her personal fragile baby. With regard to comments, this means recognizing that a given piece of code does not rise and set by its creator’s word. Other people will rework it, probably many times over. Ego pursuit can even blind the programmer to the fact that a module may have unintended interactions with other modules, a problem for which the art of comment writing has few remedies.

Classroom discussions on the five concepts above cannot single-handedly combat the future drain on financial resources caused by poor commenting. The electronic-data-processing industry must also establish and support more explicit standards or guidelines for using comments.

“Programs written to standards, whatever else may be said about them, are usually more predictable and therefore often easier to get aboard more quickly. That, in turn, contributes to preventing maintenance,” say Glass and Noisieux, who express a preference for general guidelines over less flexible standards. They further call for an audit to see that comments are inserted properly.

Unfortunately, the industry appears remiss in driving these points home. An unexpectedly high percentage of the data-processing professionals surveyed have no project-documentation standard in their companies (see survey question 1).

Two other points about standards for comments are worth mentioning.
First, their quality must be high—clear, concise, well-written—or they will simply be ignored. Second, as William McGee emphasizes in Effective Program Development—The Choices, supervisors’ reinforcement must be positive and regular, with support from all levels of management. Standards alone will not produce high-quality documentation.

The Future
Comments are necessary because programs are cryptic. In this writer’s opinion, it is a safe bet that compilers of the future will support more self-documenting, more English-like programming languages, thereby reducing the need for comments.

However, current efforts at making languages self-documenting have met with only limited success. The industry’s greatest attempt to create a self-documenting language—COBOL—was only partly successful (see the final survey question).

Until self-documenting languages achieve better results, industry will operate on a “show-me” basis. Companies are slow to incorporate new approaches without concrete cost/benefit data. And no panaceas will permanently roll back maintenance costs into insignificance. Glass and Noisieux conclude: “No matter how well the preventive maintenance task is performed, we must face the onerous fact that the majority of the effort will be simply hard work. Only by thorough, painstaking attention to the detail of the program can some problems be resolved.”

Compatibility. A lot of manufacturers talk about it. Mostly, compatibility is defined as something that almost works like the original. Our hard disk subsystem for the IBM PC runs on 2.0 without modifications, patches or use of device drivers. Just boot 2.0 and run.

And we haven't cut back on reliability either. The Apparat hard disk uses the Xebec controller and connects via a host interface module to one of the slots in your PC. The HIM also contains an RS-232 serial async port for use with a mouse, modem, etc. Even with compatibility and reliability built in, we've managed to provide some very competitive pricing. The 10, 15 and 26 megabyte drives are priced at $2,295, $2,695 and $3,395 respectively.

When you use a multifunction RAM Card, such as the Apparat Combo II (with up to 512K of RAM, RS232, parallel printer, clock calendar, and game adapter) along with the HIM, floppy disk controller and CRT monitor adapter cards in your PC, you still have one slot available for future expansion.

If you're considering a fixed disk for your IBM PC, look at all the systems available. Look for compatibility. Look for reliability. Look for value. We think you'll pick ours.

For more information or to order yours call 800/525-7674 or write Apparat, Inc., 4401 S. Tamarac Parkway, Denver, CO 80237, 303/741-1778. Dealer inquiries invited.

Welcome to the new computer shows designed specifically for BYTE subscribers. The BYTE Computer Shows. The first will be in Chicago’s McCormick Place on May 10-12, but you don’t have to travel cross-country to get there—others will be held this year in San Francisco, Boston and Los Angeles. The BYTE Shows will be “selling” shows—where you can buy, not just look. BYTE subscribers will enjoy special reduced admission prices to all BYTE shows, and conference seminars. Those seminars will be targeted to the interests of BYTE subscribers, and led by such BYTE favorites as Jerry Pournelle. The BYTE Shows will be professionally produced by The Interface Group—the same pros who bring you the Comdex Shows. Their show know-how, combined with BYTE’s editorial expertise, will make the BYTE Shows ideal information centers and shopping marts for BYTE subscribers. More details on BYTE subscriber benefits will be coming to you by mail. But plan now to be in Chicago May 10-12, or at the BYTE Show nearest you!
Heathkit Happiness

Dear Jerry,

I was very disappointed with the "Heathkit Horror" letter written to you by Mr. Richard J. Townsend (January, page 452). I feel very strongly that Mr. Townsend didn't convey the whole story of his experience with his H-100 kit.

Building a Heathkit is not an electronic experience; it is an experience in following a long, detailed checklist. My wife knows very little about electronics but has successfully completed several Heathkits. She uses her skills as a seamstress (which includes following instructions) to complete the kits.

My rampant curiosity over Mr. Townsend's letter led me to call a Heath store with the same, but hypothetical, problem. We worked with the assumption that the board was ruined when it was half completed. I was offered several options. I could buy a blank board for $25 and start over again. I could then finish the new board with the unused components. I might have to buy replacement parts for the ones I couldn't salvage from the ruined board. If the parts were not on hand, they could be ordered to arrive in 5 to 10 days. This option would cost between $40 and $75, a cheap lesson in carelessness.

If I were really in a hurry, and free with my money, I could buy the entire disk-controller kit (H-207) for about $395 and start fresh. Again, if not on hand, the delay would be no more than 5 to 10 days.

This consultation was conducted over the telephone, free of charge and mine for the asking. Mr. Townsend probably could have had this information had he asked for it.

Digging a little deeper, I figured that the "local Heath store" for Orinda, California, was probably the El Cerrito store. I gave the "We Won't Let You Fail" folks there a call to find out how Mr. Townsend's problem could fall through the cracks. When I called, the problem had been long solved. The end of the story for Mr. Townsend was a brand-new, fully assembled, functionally checked, disk-controller board.

According to the Heath folks, this is the current policy for customers that fry that particular board during construction.

Thanks for tracking down the end of the story. I know the Zenith folks were pretty upset when they saw Townsend's letter, but it arrived there during a blizzard in Illinois, and I missed the rest.

I agree that assembly of Heathkits is in large part an exercise in carefully following instructions. I know five or six people who've built their own Z-100s, and they're all happy with them. They also understand their computers better. If you have the time, it's not a bad way to get into the computer revolution. . . .

In Defense of CB-80

Dear Jerry,

I've noticed Modula-2 growing on you over the last several months. I don't want to start a contest between it and CB-80 but merely address an issue you raised in your January User's Column on page 80.

To me, it was good news, not bad news, to discover that CB-80 does no range checking on array indices. It seems to me that wherever an index could get out of range, the program has to check it anyway so as not to crash, even if there is an error message. Much array work is controlled by loops. In those situations, the speed gained by skipping the range check may be valuable. In other words, automatic, low-level range checking would be, in any actual case, either unnecessary or inadequate at run time. True, its absence can put a burden on the programmer—one more possible mystery to debug—but I think it's worth the burden. Of course, the new structure certainly ought to have been documented.

CB-80's not checking ranges and not insisting on a DIM statement (being satisfied with a declaration) are the very things that provide a way to write functions that operate on arrays. The installment of my series in the February Lifetimes offers the idea in the course of a discussion of array structure. In particular, you can write function KILARY%, which recovers the space of an array as you suggest. It is a bit cumbersome, I admit, and you need one for each dimensionality. And it sure would be nice if we could pass arrays to functions more easily. Still, it does the job; to me, the overall speed and simplicity are worth the effort in the relatively few cases where they're needed.

One other point. As I understand it, the unassigned value of a string is not exactly a default, but no value at all. The compiler allocates a word of space to each string mentioned in the source; the value of that word is zero until the string is assigned, at which time the value becomes a pointer (SADD) to the string. The assignment NULLS" compiles a constant consisting of a length word of zero and, at run time, copies that constant to a new place whose address is placed in the allocation for NULL$. The address of the allocation, of course, is VARPTR(NULL$).

John S. Coggeshall
Philadelphia, PA

Of course, one person's bug is another's feature; my problem with CB-80 is that it's all too easy (for me, anyway) to write code that can sometimes let a subscript exceed its intended range; the resulting crash gives no indication whatever that this is the problem.

The original CB-80 really was Compiled CBASIC; that meant you could compile your program under CBASIC, which, being only pseudocompiled and then interpreted, was very slow but had range and dimension checking. This made it simple to test programs, and when they ran properly under CBASIC, you could compile them for speed.

Alas, the last versions of CB-80 have nifty features that were not added to CBASIC.

Programming "philosophy" varies with the programmer. Those who spend a lot of time writing programs will generally prefer speed of execution to programmer convenience. In my case, though, programming is something I do along with many other things, and I need all the help the computer can give me. One of the values of Pascal is that once you get a program past the compiler, the program generally does what you wanted it to do.

CBASIC used to work that way; CB-80 doesn't. I hate to think like a computer: I want the compiler to catch my mistakes.

Jerry Quixote

Dear Jerry,

Yesterday I opened my latest purchase of software for my IBM PC. It's a 6805 cross-assembler by Avocet Systems of Dover, Delaware. I am aware of your software disclaimer crusade and I thought that you should see what I found in my licensing agreement.

Sit down.
The manufacturer actually guarantees the software will work or it will fix it; if the company can't fix it, it will give my money back.

I have included a copy of that section of the disclaimer where Avocet doesn't disclaim anything.

Don't get cocky, but I think you may have knocked over a small windmill.

Thomas Quinn
Blue Bell, PA

I saw the Avocet people at CP/M East, just after my tirade about the company's previous disclaimer appeared in print. They were very polite and said they intended to make real changes in the licensing agreement. However, I never received the update. Thanks. It's quite reasonable. That's an agreeable surprise. Now for the larger windmills. . . .Jerr

Almost Persuaded

Dear Jerry,

A couple of comments concerning FORTH: first, Leo Brodie, who wrote Starting FORTH, has completed a sequel, Thinking FORTH, to be published this spring by Prentice-Hall. I have read the manuscript and it is excellent. The first part of the book, in which he discusses general precepts of programming, will be of interest even to non-FORTH programmers. I hope that you will have an opportunity to read the book.

FORTH, unlike most computer languages, was developed and refined "in the field" by practicing programmers who faced real-world tasks and demands. Its structure and methods stem directly from the need to get the job done with minimum use of critical resources: computer memory, computer power, and programmer time. FORTH was thus designed so that programs written in it would be easy to write, modify, and maintain.

FORTH, like Modula-2 and Pascal, is compiled, but in FORTH compilation is immediate upon the definition of a word, and the new word is called merely upon invoking its name. This frees the programmer from various intermediary complexities (separate compilation, linking, etc.). More important, it allows for immediate, on-the-spot testing and use of each small unit, which permits the programmer a natural and iterative process of development.

The immediacy of the compilation, and the brevity of definition that allows, enables the programmer to interact with the program as it is written. In situations in which the feedback from one's actions is immediate, one can achieve a state of mind in which one's efforts and effects each shape the other and consciousness merges with the process so that one
Alloy's PC BACKUP gives IBM, Eagle, Columbia, Compaq, Kaypro, Corona, Texas Instruments, and Zenith users total data protection.

PC BACKUP from Alloy, the leader in data backup technology, eliminates the headache of costly, time-consuming data loss for users of the IBM PC and all 100% compatibles. It backs up your files with the finest file-oriented cartridge tape backup and retrieval system for Winchester hard disks available today. So your data is safe when not in use, and at your fingertips when you need it. And only Alloy can deliver high performance storage/retrieval and data protection with such reliability.

Designed to meet PC owners' increasing storage needs and to put an end to data loss, PC BACKUP is the standard among major PC users today.

Here are some of its remarkable features:

- 1 Megabyte/minute. Automatic sub-directory backup with date and time stamp and archive bit support.
- Insure against data loss, find out more about PC BACKUP. It's available right now. Call Alloy today at (617) 875-6100, or ask your local dealer about PC BACKUP.
CHOOSING A SERIAL INTERFACE FOR YOUR APPLE* COMPUTER.

The "Second Serial Hardware Decision"...

Once you've selected the right serial printer or modem for your Apple* system, your hardware decisions are over for a while. Right? Wrong, of course! You still have to decide on an interface card. This "second serial hardware decision" is an important one—one made much simpler by SERIALL™, the new serial interface for Apple computers.

At a significantly lower cost than Apple's own serial card—$159.00 vs $195.00—SERIALL gives you a bunch more features. Practical, everyday features, not useless extras.

For one, SERIALL is the only interface that provides graphics capabilities for serial printers including Apple's new dot matrix Imagewriter™.

SERIALL also offers 27 easy commands for text formatting and screen dumps, making it the most intelligent serial interface you can use with an Apple.

Equally important, SERIALL gives you complete communications interfacing capability. You can use it for modems or in the special terminal mode for timesharing and talking to other computers.

In fact, SERIALL completely emulates the Apple serial card as a communications interface.

No additional software or hardware modification is required.

Finally, consider the quality. SERIALL's five-year warranty is proof that this interface is built to work long and hard. No other serial card is backed by a guarantee like this.

After comparing SERIALL feature-for-feature with other serial interface products, we think you'll agree—SERIALL truly is the Do-It-All serial card for Apple computers.

Available from Practical Peripherals—makers of MICROBUFFER™, PROCLOCK™, PRINTERFACE™, and GRAPHICARD™.

*Apple and Imagewriter are registered trademarks of Apple Computers, Inc.
You make such a good case for FORTH that I'm tempted to try it. Alas, I don't seem to have any good current implementation for any of the machines I have, and I suspect that by the time I get one, I'll have lost the impulse; but perhaps not.

I know something of the creative mood you speak of; indeed, I'm reminded of some of my best programming efforts, which were done in BASIC, when I first started playing with these machines. Those programs have long since been converted to more efficient languages, but their concepts remain pretty good.

Michael Ham
Iowa City, IA

Certainly FORTH produces devoted and enthusiastic followers! . . . Jerry

Dear Jerry,

I am following with great interest your comments on the fascinating language Modula-2. I have two questions: Are there any publications, in addition to Dr. Wirth's book? What is the address of the...
Why are there so many ads in BYTE?

BYTE carries more pages of advertising than any other computer magazine in the world, because:

1. BYTE is the only high-tech magazine serving the entire microcomputer field. Our editorial covers all hardware, all software, all peripherals. Therefore, every computer-related product belongs in BYTE.

2. Do you know any sophisticated computer user who doesn't know BYTE? Over 400,000 pay to read BYTE every month because it is the authority, the international standard by which all other computer magazines are measured. Including pass-along, BYTE's high-tech readership totals nearly 850,000. It's an audience every advertiser wants.

3. Do BYTE readers like all those ads? They'll send over 6 million "more-information" inquiries to our advertisers this year. No other magazine comes close. Whether in the front, middle or back of the magazine, ad pages in BYTE average over 1,000 inquiries. Some back-of-book advertisers have pulled over 2,000 with a single ad!

That's why there are so many ads in BYTE.

If you're an advertiser, or are thinking about becoming one, talk to us—we're the people who wrote the book on microcomputer marketing. Just call Pete Huestis, Advertising Sales Manager, at (603) 924-9281.
Barry has a number of CP/M general-purpose utilities, such as disk catalogs, directory handlers, erased-file recovery programs, etc., which he sells at reasonable prices. Recently he put a number of them over onto the Epson QX-10.

I have an experimental copy of Wordstar for the Epson; it seems to work fine. For the utilities, you need to talk to Barry Workman at (818) 276-4401. For Epson Wordstar, you'll need to write Micropro; it should have it commercially available by now. ... Jerry

Another Valdocs User

Dear Jerry,

I couldn't disagree more strongly with your distaste for the Epson QX-30. I've had mine for a year, and am a beta site for Valdocs, and have been through nearly every version of that marvelous piece of software.

Is the QX-10 slow? Absolutely not. I touch-type at a fairly high speed and have no problems whatsoever. Disk operations can be somewhat less speedy than I'd like—block moves, for instance, are definitely tedious—but on balance, I see little difference between my QX-30 with Valdocs and an IBM PC running Wordstar. (Timing differences, that is. For ease of use, keyboard excellence, and on-screen display, the QX-10 cannot be beaten.) I did add the Comrex hard disk, which significantly improves speed and flexibility.

I use the QX-30 daily, have written many hundreds of thousands of words on it, and am totally satisfied. As West Coast Editor for Popular Science, I use the QX-30 to transmit my copy to New York and to receive proof copies back. I get electronic-mail news releases from JPL and a Los Angeles PR agency, both of which have installed QX-30s and are happy. I expect to receive considerably more electronic mail as the Valdocs program improves.

I am frequently asked for computer recommendations, as you are. The only machines I recommend to writers are the QX-30, for those who can afford it, and the Kaypro, for those who can't. In any office setting, where word processing is important, the QX-30 is a superb machine and Valdocs is the only way to go. I'll stand by that until I see something better.

By the way, the new Titan board, which converts the QX-10 into an IBM PC look-alike and which serves as a 256K-byte RAM disk for Valdocs, should make the

Modula Research Institute? I thank you in advance for the information.

A. Vargas
New York, NY

The documents that come with Velition Systems Modula-2 are about the best introduction to the language I know of. I know of no other Modula-2 introduction in print except for Wirth’s book, which some claim to be a sure cure for insomnia. Dr. Michael Hyson and I are writing a tutorial and introduction that ought to be in print next fall.

A lot of Modula-2 software is in the public domain and can be obtained from Modula Research Institute, 950 North University Ave., Provo, UT 84604. ... Jerry

Timing the NS16032

Dear Jerry,

Seeing your reminder in the December 1983 User’s Column (Kazangol, page 92) galvanized me into—well, reduced sloth. Table 1 shows the n x n time results for an NS16032 CPU with NS16081 FPU running at 10 MHz and no wait states. The program is the Pascal version. Table 2 illustrates the results from my Olivetti M20.

Richard Mateosian
Berkeley, CA

That 16032 is fast! The chip looks awfully good; a lot of minicomputers can’t do what the 16032 can do. Now all we have to do is get systems using it . . .

Bill Godbout tells me he’ll have an S-100 version running fairly well late this spring, but it will be for development work only; users will have to wait a year or so. ... Jerry

Barry Workman at (818) 796-4401.

That’s the QX-10 hot line! He put a number of CP/M utilities into Epson QX-30 format, available for a reasonable charge. What are they, and how can they be gotten hold of? I love the machine, but as you know, obtaining formatted software is a royal pain in the neck. Naively I contacted my dealer, expecting her to access some programs. She referred me to an “Epson Hot Line,” which turned out to be a wholesale distributor of Epson programs in California. The only way that software could be obtained, however, would be by having my dealer contract to buy programs from them. Help!

Irene Matiolas
Jackson Heights, NY

QX-10 CP/M Utilities

Dear Jerry,

You’ve mentioned that Barry Workman is putting a number of CP/M utilities into Epson QX-10 format, available for a reasonable charge. What are they, and how can they be gotten hold of? I love the machine, but as you know, obtaining formatted software is a royal pain in the neck. Naively I contacted my dealer, expecting her to access some programs. She referred me to an “Epson Hot Line,” which turned out to be a wholesale distributor of Epson programs in California. The only way that software could be obtained, however, would be by having my dealer contract to buy programs from them. Help!

Anyone can sell you a box full of hardware. But is it too much computer? Too little? Will it run the appropriate software? What about service? If you need the right answers both before and after the sale, call your nearest Full Service CompuPro System Center. For product information, see pgs. 120-1.
BYTE's User to User

 Detecting Errors

Dear Jerry,

In the January User's Column on page 68 you said, "Eagle tells me it did a lot of work on parity checking and found that it decreases the overall reliability by 15 percent." Did you really think about this before you committed it to print?

Some companies realize that memory chips have higher error rates than most other computer circuits and have designed appropriate error-detection schemes, such as parity, into their computers. For Eagle to produce a computer that will let these errors go undetected and tell us this is better upsets me.

Perhaps the problem is the definition of reliability. Apparently some people feel that a computer is reliable if it will always do something without regard for the validity of the result. I view reliability as being able to trust what the computer tells me. Detecting errors with parity and similar techniques increases reliability.

If you need your computer "right now," you might be upset when your machine stops running because of a small error. Alternately, undetected errors can result in misleading responses when you ask "What if...?" What if you make an important business decision based on erroneous answers? Wouldn't you rather
Advancing the technology of data security

Introducing Data Sentry.®
Computer security so advanced, even Mata Hari couldn't hack it.

Your most confidential files may be easy prey for the advances of an artful hacker. That's why Lockheed used its years of experience with high-technology systems to create Data Sentry.

Protection for sensitive data
Its own internal computer gives you the telecommunications features of an intelligent modem. But unlike other modems, Data Sentry is smart enough to keep your secrets from the most persistent computer intruders.

Data Sentry puts an electronic wall around both large and small computers. And because its protection is external to your CPU, it can eliminate the expense of internal security software. It blocks the inquiries of would-be Mata Haris with a sophisticated security sequence.

Security for every situation
First, Data Sentry requests the phone number of a caller desiring access to your computer. Then it hangs up the phone and searches its list of authorized phone numbers. If the caller's number is authorized, Data Sentry dials the caller back and requests entry of a password. If the correct password isn't supplied within three tries, Data Sentry disconnects and will not return further calls from that phone number.

Data Sentry also lets users select other lower levels of security if desired, including callback to any number with entry of password. And an option, Remote-ON®, lets you turn your computer's power on and off from a remote terminal after security has been cleared.

Versatile and confidential
Data Sentry logs all attempted contacts for audit trails and analysis of users. Its security set-up is locally controlled by a master password that is accessible only to authorized personnel. And its design includes high-reliability components, the latest LSI circuitry, plus Autodial 300/1200 baud full-duplex communications, with auto ranging for incoming data.

Data Sentry will deal with your toughest security problems.
And it'll never fall for just a pretty face.
For a list of your nearest Data Sentry distributors, call toll-free 1-800-443-0100, Ext. 471. Or write: Lockheed GETEX, Suite 945, 1100 Circle 75 Parkway, Atlanta, Georgia 30339.
know that your computer is having problems so you can ask another machine for a second opinion?

Paul Crumley
Monroeville, PA

I didn't say I agreed with Eagle's position; I reported what its vice-president for development told me. Dr. Godbout tends to your view: he doesn't trust dynamic-memory chips operated at high speeds and wants parity checking.

On the other hand, present parity-checking software doesn't restore your data; it merely dumps your job if it finds an error—which could be caused by a genuine memory error or (about a 15 percent chance) by an error in the chip that stores the parity bits.

Eagle lets you test memory on-start-up; if it detects a faulty memory chip, it gives you the choice of running the system or not. The IBM simply won't work if it finds a memory error, even if the error is in high memory you'll not use for most of your programs. I can certainly think of times when I want the machine, and don't care if there's a minor memory error. Other times, though, I'd completely agree with you.

I guess there ain't no justice. . . . Jerry

---

**Televideo 950 and Palantrir**

Dear Jerry,

On your Televideo 950 (if you haven't gotten rid of it): it's easier to cut traces and disable keys than it is to insert the PROM, and you can always solder back over them if you have to. I've disabled 925 and 950 break keys more than once (they reset the OSM Zeus, among other machines, and are in a position that's even more dangerous than the Back Tab).

There is a program that enables you to use the arrow keys, the home keys, the Back Tab (it's used for decimal tab, I believe), and most of the function keys and special keys to do word processing in what appears to be a dedicated word-processing environment. It's Palantir Word Processing, and it's just the ticket for a lot of people. It's easy to use and conceptually easier to understand for a lot of people who are not computer literate. Unfortunately, Palantir supplies little labels (which come off and get lost) instead of key-caps, but its program is good, and its mail-merge-like utility is built in and included in the price (and more like a language than simply a "mail-merge"). It's a good product.

Jeff Lasman
Simi Valley, CA

I've reviewed Palantir; it was written by the original author of Magic Wand (a.k.a. Peach-text), and it incorporates a fair number of features I like.

For the record: Jeff Lasman is the editor of the newsletter of the Valley Computer Club, 1409 Kuehner Dr. Suite S-80, Simi Valley, CA 93063: dues are $10 a year, and well worth it for anyone in that area interested in computers. One of its previous speakers was Tony Pietisch, and it has good meetings.

While I'm on that subject, I can also recommend the Connecticut Micro Decision Users Group, 773 Dixwell Ave., Box #5, New Haven, CT 06511. The current issue of its newsletter has a long piece on public-domain software. . . . Jerry

---

**More on Superfile**

Dear Jerry,

I would like to respond to the letter you
Send 2000 Letters Per Hour via Your Personal Computer

Delivered in 48 hours or sooner at 26 cents a piece using MAIL-COM™.

Presenting E-Com
Two years ago the U.S. Postal Service quietly announced the E-Com® Service, enabling specially equipped personal computer users to bypass costly manual mail preparation, by electronically submitting their messages and mailing lists directly to the Postal Service via modem. This high speed computer originated mail arrives at its destination within 48 hours—often less—in an attention-grabbing blue E-Com envelope.

Announcing MAIL-COM, Only from Digisoft Computers.
MAIL-COM is powerful software you can use with your personal computer to access E-Com. With your personal computer, a modem and MAIL-COM you can send from 200 to 2000 letters per hour for just 26¢ each. Typed, addressed, folded, inserted, sealed and delivered, Complete. MAIL-COM is the complete integrated software available for E-Com operation. It’s easy to use. No special training is necessary. And since Digisoft Computers developed MAIL-COM in accordance with U.S. Postal Service specifications, users are guaranteed certification for use upon purchase of MAIL-COM software. MAIL-COM is the easiest and most economical way to do your mailings.

MAIL-COM includes a complete letter editor and address maintenance program, as well as communications software.

Directly interfaces with dBASE II, Wordstar, MailMerge and other databases.

Each letter in your mailing can be identical or all can contain variable insertions. MAIL-COM operates all the features offered by E-Com.

Thousands of Uses.
If you have need for fast, economical mass mailing capabilities, MAIL-COM puts you and E-Com together.

Use it for new product announcements, invitations to press events, invoicing, fund raising, collection, bulletins to your sales force, new business prospecting, reactivation of customers and much, much more. Every department in your company will have use for MAIL-COM.

Don’t Delay
With MAIL-COM you could be saving time and money on fast, efficient E-Com letters. MAIL-COM software is available for the IBM PC, PCJr., Kaypro, CP/M, Apple II and other formats. Order today. Call 212-734-3875.

BYTE’s User to User

printed in your December 1983 column from Alan Beagley in Australia ("For Your Information," page 508). Obviously, Mr. Beagley’s friend is a novice user of the Superfile utility program since neither he nor Mr. Beagley realized that the power of the rename facility lies in its being able to rename any filename to any other filename, even ones that are illegal in CP/M. Therefore, the file he accidentally renamed to MAIL LIS could have easily been renamed again using the Superfile utility program. You don’t need DU, Spat, or some other program to do this.

FYI Inc. (the maker of Superfile) gives the utility program away with Superfile. When I asked the company why it went to the trouble to write the utilities, FYI said that it wrote it for its own use and decided to include it with Superfile for customers who needed its capabilities.

It is also obvious from your comments last June and your comments after Mr. Beagley’s letter that you have not taken the time to learn what Superfile really does. But I’ll bet even you will be astounded by FYI’s newest product called FYI 3000 (available on the IBM PC). I recently used one and could hardly believe my eyes. This program takes standard text files from my word processor and cross-indexes all the paragraphs in the files, using every word as a keyword. FYI says that it will handle 65,000 keywords and 65,000 paragraphs (with 500 words each) in a single filing system.

One more amazing feature of FYI 3000: it gives me a count of each word in my text so I can analyze my word usage.

If you call FYI, I’ll bet it will send you a review copy of FYI 3000 if you promise to give it a closer look than you did Superfile. Please try to reorient your thinking from the fixed-field approach to the more natural free-format approach used by Superfile and FYI 3000.

I read your column and appreciate your frank approach. However, I do wish you would be a little more careful in your research so that you don’t give your readers erroneous advice.

John Shine

You may recall that FYI’s silly licensing agreement was so terrible that I couldn’t legally run its software, since I have to use more than one machine. I understand it has changed that and made other changes as well. Apparently I had an early copy of the program; in any event, I haven’t seen the updated version you describe.

Although I do sometimes solicit review software, for a while there was such a long queue of good stuff that I hesitated to add to it. Now that we’ve added to the permanent stuff, things are a little better here at Chaos Manor. A little better, . . . Jerry

Comprehensive Graphics at Practical Prices

Imaginator 2 adds smart graphics to your H/Z-29 terminal. You gain high speed, high resolution graphics with Tektronix* 4010/4014 compatibility standard.

Check these outstanding features:
1. Fast — 500,000 pixel per second vector drawing rate
2. High Resolution — 672 x 500 pixel graphics
3. Standard 1024 x 1024 memory plane
4. Hardware “Pan” and “Zoom”
5. Up to 24 pages of graphics memory, 6 standard
6. Instantaneous paging facilitates animation

Also ask us about our Imaginator 1 upgrade for H/Z-19 terminals and H/Z-89 computers.

Jerry Pournelle welcomes readers’ comments and opinions. Send a self-addressed, stamped envelope to Jerry Pournelle, c/o BYTE Publications, POB 372, Hancock, NH 03449. Please put your address on the letter as well as on the envelope. Due to the high volume of letters, Jerry cannot guarantee a personal reply.

Jerry Pournelle is a former aerospace engineer and current science-fiction writer who loves to play with computers.

*Say you're a BYTE reader to get this special price — normally $380!*

High reliability 8" Shugart SA 1002 5.33 Mbyte drives for $350 ea., unused in their original factory packed cartons. 1000's of pleased customers. Also available: new Western Digital controller card ($350); interfaces for IBM, Apple, S-100, STD, Heath/Zenith, SS-50, SS-30. Shipping for drive, $12. Call before they're gone — LIQUIDATORS, 800-871-6282, or send check or money order to 105 S. Main St., Greer, S.C. 29651.
Minor miracle.
You've never seen anything quite like the new Epson LQ-1500 Business Printer. It switches effortlessly back and forth between draft and letter-quality printing, on fanfold or single sheet paper. And it does it at a price every office can afford.

**Two for one.**
With the LQ-1500 in draft mode, you can race through a report at 200 characters per second. Then switch over to letter quality and polish off a pile of correspondence four times faster than the average daisy wheel.

Need graphics? The LQ-1500 gives you business charts with a crispness and definition you wouldn't think possible in a dot matrix. And with the LQ-1500's 15.5-inch carriage, your spreadsheets and ledgers can take on a distinction they've never had before.

**The secret.**
The Epson LQ-1500 is the logical extension of Epson's outstanding dot matrix printers. Instead of nine "wires" forming each letter, however, the LQ-1500 has 24. So you get letter-quality characters to rival fine office typewriters, in proportional, italic, condensed, expanded, subscript, superscript and over 200 other different typefaces. All without changing a print wheel. With the LQ-1500, you can even create 128 characters or symbols of your own and add them to the printer's internal memory.

**String of miracles.**
For Epson, the LQ-1500 is just one more in a long line of miracles, many of which are also on display at your neighborhood computer dealer.

And like all products in the Epson line, the LQ-1500 is now backed by a one-year warranty on parts and labor, ready to go to work with just about any personal computer made, and available in more places than any other brand.

But that's not really miraculous. That's just Epson.

---

**Actual LQ-1500 print sample.**

---

**Number one. And built like it.**

May 1984

May-June
Computer Showcase Expos, various sites throughout the U.S. National and local vendors exhibit a broad range of small systems, peripherals, software, services, and supplies. For a show schedule, contact the Interface Group Inc., 300 First Ave., Needham, MA 02194, (800) 325-3330; in Massachusetts, (617) 449-6600.

May-June
Courses from QED Information Sciences, various sites throughout the U.S. and Canada. A few of the courses to be held are “Project Management,” “Systems Design,” and “Structured Programming.” For a complete list of titles, contact Priscilla Goudreau, QED Information Sciences Inc., QED Plaza, 170 Linden St., POB 181, Wellesley, MA 02181, (800) 343-4848; in Massachusetts, (617) 237-5566.

May-June
National Educational Computer Library Conferences, various sites throughout the U.S. The National Educational Computer & Technology Conference and the Eastern and Southern Educational Computer Conferences are on the agenda this spring. For details, contact National Educational Computer Library, POB 792, Torrington, CT 06790, (203) 489-2728.

May-June
Productivity '84, various sites throughout the U.S. This series of two-day programs serves as a showcase of Hewlett-Packard products. Seminars are available, and more than 25 products are to be demonstrated, including the HP 150 personal computer and laser printers. Admission is free. For more information, contact Hewlett-Packard, Public Relations Department, 3000 Hanover St., Palo Alto, CA 94304, (800) 554-4466.

May-June
Seminars from the Continuing Education Institute, various sites throughout the U.S. Among the seminars offered are “Database Machines: An Overview,” “Modern Techniques in Digital Signal Processing and Spectral Estimation,” and “Peripheral Array Processors.” For complete information, contact Continuing Education Institute, Oliver’s Carriage House, 5410 Leaf Treater Way, Columbia, MD 21044, (301) 596-0111; in California, (213) 824-9545.

May-June
Seminars from Datapro Research Corporation, various sites throughout the U.S. Subject areas include data communications, microcomputers, and information systems. In-house presentations of technical programs can be arranged. For a 40-page catalog of seminars, contact Datapro Research Corp., 1805 Underwood Blvd., Delran, NJ 08075, (800) 257-9406; in New Jersey, (609) 764-0100.

May-June
Seminars from Technology Transfer Institute, various sites throughout the U.S. The Technology Transfer Institute sponsors the James Martin Seminar and a one-day executive-only seminar called “The End-User Revolution.” The programs explore such topics as evolving to electronic banking, relational database, and executive strategies for the information age. Full details on the seminars, registration, and meeting locations are available from the Technology Transfer Institute, 441 10th St., Santa Monica, CA 90402, (213) 394-8305.

May-June
Understanding Microprocessor-based Equipment and Troubleshooting, Chicago, IL, Detroit, MI, and Minneapolis, MN. This comprehensive four-day seminar provides a background in microprocessor fundamentals and troubleshooting techniques for technicians and engineers. Equipment familiarization and hands-on experimentation are emphasized. On-site presentations can be arranged. For information, contact the Registrar, Micro Systems Institute, Gar­nett, KS 66032, (913) 898-6152.

May-July
Courses from Integrated Computer Systems, various sites throughout the U.S. Among the courses to be presented are “Designing with 16-bit Micros,” “Programming in C: A Hands-on Workshop,” and “Hands-on Unix Workshop.” The fee for each course is $895. Enrollment details are available from Ruth Doxick, Integrated Computer Systems, 6305 Arizona Place, POB 45405, Los Angeles, CA 90045, (213) 417-8888.

May-July
Reliability and Maintainability Engineering Institutes and Short Courses, various sites throughout the U.S. A couple of the programs to be offered are “Reliability Engineering, Testing, and Maintainability Engineering” and “Mechanical Reliability and Probabilistic Design for Reliability—The Stress/Strength Interference Approach to Designing a Desired Reliability into Components and Equipment.” For a complete schedule, contact Dr. Dimitri Kececioglu, College of Engineering, Aerospace and Mechanical Engineering Department, University of Arizona, Tucson, AZ 85721, (602) 621-2495.

May-August
Computerworkshops Computer Seminars for Educators, various locations throughout California. Among the seminars offered are “Authoring Tools and Word Processing for Educators,” “BASIC Programming for Educators,” “Designing Educational Courseware,” “Computer Literacy for Educators,” and “How to Set up a Computer-based Education Program in Your School or District.” The fee is $50 per course. For details, contact Compukids of Seal Beach, Rossmoor Shopping Center, 12385 Seal Beach Blvd., Seal Beach, CA 90740, (213) 430-7226; West Los Angeles, (213) 473-8030; Tarzana, (213) 343-4008; Rancho Bernardo/San Diego, (619) 451-1742.

May-August
Conferences and Expositions from the Society of Manufacturing Engineers, various sites throughout the U.S. and around the world. More than 25 conferences and expositions are scheduled. For a calendar, contact the Public Relations Department, Society of Manufacturing Engineers, One SME Dr., POB 930, Dearborn, MI 48121, (313) 271-0777.

May-August
Courses in C Language and Unix, Concord, MA, Somers Point, NJ, and College Park, MD. Three day-five day courses are offered: “C Programming Workshop,” “Advanced C Topics Seminar,” and “Unix Workshop.” For complete details, contact Joan Hall, Plum Hall Inc., 1 Spruce Ave., Cardiff, NJ 08232, (609) 927-3770.
IBM PC/XT COMPATIBLE

10MB and 20MB WINCHESTER

Enhance your system with a CHRISLIN HARD DISK SUBSYSTEM and MEMORY

Chrislin's 10MB & 20MB Hard Disks come with host interface adapter, controller, winchester drive, power supply and cable

Each Chrislin memory comes with an RS232C (serial) port, RAM disk emulator and 256KB-512KB of parity memory.

"DEALER INQUIRIES INVITED"

DEC LSI-11 COMPATIBLE

10MB to 140MB Q-BUS WINCHESTER

256KB to 4MB Q-BUS MEMORIES

UP TO 4MB QUAD
- Control status register
- On board parity
- Block mode DMA
SINGLE QTY. PRICE: 1MB $1975

UP TO 2MB QUAD EDC
- Error detecting & correcting
- Block mode DMA
- Battery back-up mode
SINGLE QTY. PRICE: 512K $1495

UP TO 1MB DUAL
- Control Status Register (CSR)
- On board parity generator checker
- Battery back-up mode
SINGLE QTY. PRICE: 256KB $525

EMULATION RL02
10MB Winchester/Floppy (8") $4495
20MB Winchester/Floppy (8") $4995
40MB Winchester/Floppy (8") $5995

EMULATION RK06/RK07
42MB Winchester/Floppy (8") $6995
70MB Winchester/Floppy (8") $7195
140MB Winchester/Floppy (8") $8195

Call for pricing on RM02 emulation and / or tape backup.

MICRO COMPUTER

CI-MICRO-11 SYSTEM FEATURES

- 11/23 PLUS CPU board which includes two serial lines
  diagnostics and boot or 11/73 CPU
- 22 bit addressing backplane and power supply
- 256KB - 4MB of parity memory (Block Move. CSR)

STANDARD CONFIGURATION

LSI 11/23 CPU, 256KB memory, 20MB winchester, 800KB dual floppy, 2 serial I/O, bootstrap, power supply, 4 x 8 backplane all in a rack mountable chassis. $6850

Digital Consulting Associates' Classes and Seminars, various sites throughout the U.S. For descriptions of seminars and classes on dBASE II, Lotus 1-2-3, database administration, and other microcomputer-related topics, contact Digital Consulting Associates Inc., 339 Salem St., Wakefield, MA 01880, (617) 246-4850.

Software BanC Seminars, various sites in the U.S. and Canada. Such seminars as "Problem Solving with 1-2-3," "dBASE II," and "Exploring Unix" are planned. For information and registration, contact Software Bank Inc., 661 Massachusetts Ave., Arlington, MA 02174, (800) 451-2502; in Massachusetts, (617) 641-1241.

Computer Competence Seminars, Boston University Metropolitan College, Boston, MA. This series of hands-on presentations is tailored for managers who know little or nothing about computers and for those who wish to sharpen their computing skills. Some of the seminars on the docket are "PCs for Improving Financial Analysis and Decision Support" and "Personal Computers for Sales and Marketing Professionals." Fees range from $225 to $595. In-house programs can be organized. For details, contact Joan Merrick, University Seminar Center, Suite 415, 850 Boylston St., Chestnut Hill, MA 02167, (617) 738-5020.

May-September
Technical and Management Seminars for Professionals, various sites throughout the U.S. Subject areas encompass system-performance management, networking, personal computing, applications design and programming, real-time applications design, management development, and other issues relating to computers. On-site seminars can be arranged. For a brochure, contact Digital Equipment Corp., Educational Services, Seminar Programs BUOTOR/ES, 12 Crosby Dr., Bedford, MA 01730, (617) 276-4949.

May-October

May-December
Seminars from the Institute for Professional Education, various sites throughout the U.S. Programs in statistics, management, simulation and modeling, personal computers, and computer science are offered. For an explanatory pamphlet, contact the Institute for Professional Education, POB 756, Arlington, MA 22216, (703) 527-8700.

May 10-12
BYTE Computer Show, McCormick Place, Chicago, IL. Seminars, product displays, and conference sessions are some of the highlights of this show sponsored by BYTE and Popular Computing magazines. For complete details, contact the Interface Group, 300 First Ave., Needham, MA 02194, (800) 325-3330; in Massachusetts, (617) 449-6600.

May 11
Writing Efficient Programs, Mathematics and Science Building, Room W-117, Montclair State College, Upper Montclair, NJ. Dr. Jon Bentley from Bell Laboratories will speak on writing machine-independent code. He will present a general set of rules for using this tool and show how these rules can speed up a program. A subtheme will address the problem of converting programming tricks into engineering techniques. For information, contact Gideon Nettler, Department of Mathematics and Computer Science, Montclair State College, Upper Montclair, NJ 07043, (201) 893-4294.

May 13-17
Computer Graphics '84, Convention Center, Anaheim, CA. Panel discussions on specific standards, technical sessions exploring the application of standards in a working environment, and tutorials explaining standards will be complemented by an exposition. For details, contact the National Computer Graphics Association, Department ZF, Suite 601, 8401 Arlington Blvd., Fairfax, VA 22031, (703) 698-9600.

May 14-17
The Twenty-fifth International Conference of the Association for the Development of Computer-based Instructional Systems, Hyatt Regency Hotel, Columbus, OH. Guest speakers will focus on the problem of exchanging courseware between computer systems. The use of computers, education for the disabled, and computer-based instruction in home economics and music are other topics of interest. Hardware, software, and courseware will be demonstrated. Program particulars can be obtained from the Association for the Development of Computer-based Instructional Systems, 409

Why YOU should join the Byte Book Club now!

- Best and newest books from ALL publishers! Books are selected from a wide range of publishers by expert editors and consultants to give you continuing access to the best and latest books in your field.

- Big savings! Build your library and save money too! Savings range up to 50% or more off publishers’ list prices—usually 20% to 25%.

- Bonus books! You will immediately begin to participate in our Bonus Book Plan that allows you savings up to 70% off the publishers’ prices of many professional and general interest books.

- Convenience! 14-16 times a year (about once every 3-4 weeks) you receive the Club Bulletin FREE. It fully describes the Main Selection and alternate selections. A dated Reply Card is included. If you want the Main Selection, you simply do nothing—it will be shipped automatically. If you want an alternate selection—or no book at all—you simply indicate it on the Reply Card and return it by the date specified. You will have at least 10 days to decide. If, because of late delivery of the Bulletin you receive a Main Selection you do not want, you may return it for credit at the Club’s expense.

As a Club member you agree only to the purchase of three additional books during your first year of membership. Membership may be discontinued by either you or the Club at any time after you have purchased the three additional books.

Fill out the card and mail today! If the card is missing, write to:

BYTE BOOK CLUB™ P.O. Box 582, Hightstown, New Jersey 08520

May 16-18
Teaching Math with Microcomputers, Marriott Hotel, Miami, FL. This program, sponsored by the National Council of Teachers of Mathematics (NCTM), is designed to inform elementary, intermediate, and secondary school mathematics teachers how to effectively use the microcomputer as a classroom tool. For further information, contact NCTM, 1906 Association Dr., Reston, VA 22091, (703) 620-9840.

May 19
The Seventh Annual Show & Tell Microcomputer Conference, University of Oklahoma Mathematics and Physical Science Complex, Norman. Computer hobbyists are invited to speak briefly, demonstrate an example of their presentation, and answer questions. For details, send a self-addressed, stamped envelope to Show & Tell, Dr. Richard Andree, University of Oklahoma, Mathematics Department, 601 Elm St., Norman, OK 73019.

May 20-23
The Fourth Annual Conference of the Association of Human Resource Systems Professionals, Hyatt Regency, Fort Worth, TX. Roundtable discussions will address topics related to the theme "People, Data, and Systems...Putting It All Together" Embracing cross-disciplinary concerns and emphasizing the practical requirements of successful human-resource information-system development, discussions will explore networking, vendor evaluation, and time management. For complete details, contact HRSP Inc., 3051 Adeline St., Berkeley, CA 94703, (415) 548-1364.

May 20-23

May 20-23
The Thirteenth Mid-Year Meeting of the American Society for Information Science, Indiana University, Bloomington. The theme for this meeting is "The Micro Revolution: Implications for the Information Age." Joseph Weizenbaum, author of Computer Power and Human Reason and a professor of computer science at Massachusetts Institute of Technology, will speak. For more information, contact Stephen Harter, School of Library and Information Science, Indiana University, Bloomington, IN 47405, (812) 336-513.

May 20-25
The Fourth Jerusalem Conference on Information Technology—JCIT, Jerusalem, Israel. Papers, panel discussions, workshops, and exhibits will emphasize software engineering and manufacturing related to the theme of this international event, the "Next Decade in Information Technology." The fee is $225. Imtech '84, the national exhibition of high technology, runs concurrently with JCIT. For information on Imtech '84, contact the Government of Israel Trade Center, 350 Fifth Ave., New York, NY 10118, (212) 560-0660. For details on JCIT, contact the Fourth Jerusalem Conference on Information Technology, POB 29313, 61292 Tel Aviv, Israel; tel: (03) 258-535.

May 21-22
Evaluating Decision Support Software: Personal Computer, Mainframe, and Distributed Applications—A Managerial Perspective, New York Hilton, Rockefeller Center, New York City. This conference will explore the influence of new developments in end-user computing, software design, distributed decision support, local area networks, microcomputer technology, fourth-generation languages, and artificial intelligence. Further information is available from the DSS Conference, 215 First St., Cambridge, MA 02142, (617) 547-5061.

May 21-23
AAMSI Congress 1984—The Third Spring Joint National Congress, Hilton Hotel, San Francisco, CA. Invited and contributed papers, special sessions, tutorials, reviews, panel discussions, and demonstrations will focus on the applications of computers and information technology and systems to all fields of medicine. Program sponsors include a dozen professional organizations that have united the American Association for Medical Systems and Informatics (AAMSI) in producing this three-day program. For particulars, contact AAMSI, Suite 402, 4405 East West Highway, Bethesda, MD 20814, (301) 657-4142.

May 22-23
Data Processing for the Non-Data Processing Executive, Part 2, Miyako Hotel, San Francisco, CA. This is the second part of a program that addresses microprocessor and database technology, packaged software, and data communications. It's designed for people with a basic understanding of electronic data processing. In-house presentations are available. Register with the American Management Associations, POB 379, Saranac Lake, NY 12983, (518) 891-0065.

May 22-24
Softwest '84, Denver Merchandise Mart, Denver, CO. This conference and exhibition features educational seminars, lectures, and panel discussions on software, equipment, and peripherals for Apple and IBM computers. For information, contact the Colorado Conference Group, Suite C, 3312 Cripple Creek, Boulder, CO 80303, (303) 499-1034.

May 22-25
COMDEX Spring, Georgia World Congress Center, Atlanta. For details, contact the Interface Group, 300 First Ave., Needham, MA 02194, (800) 325-3330; in Massachusetts, (617) 449-6600.

May 22-26
Micro Expo '84, Palais des Congres, Paris, France. Manufacturers and vendors of hardware, software, peripherals, and accessories for the microcomputer market will attend this conference and exposition. For details, contact Sybex France, Centre Paris Daumesnil, 4 Place Felix Eute, 75583 Paris Cedex 12, France. In the U.S., contact the International Show Coordinator, Sybex Inc., 2344 Sixth St., Berkeley, CA 94710, (415) 848-8233.

May 22-26
Oficomp Korea '84—The International Korean Office and Information Management Exhibition and Conference, Korea Exhibition Center, Seoul, South Korea. Exhibits will include demonstrations of computers, communications equipment, and business machines. Contact Clapp & Poliak International.

**MICRO CONTROLLED DIGITAL DATA RECORDER**

**FEATURES:**
- Microprocessor controlled data buffering
- Buffers data in RAM
- Data comes in at any standard baud rate, plays back at any baud rate (switchable)
- Tape runs only during block record/playback
- RS232 input/output: 110/220 v ac or 12 v dc • 1.2 MB per tape side
- Uses chrome oxide audio cassettes
- Has hold-off during playback via CTS line

**APPLICATIONS:**
- PROCESS CONTROL
- POINT OF SALE
- TELEPHONE SWITCH LOGGING (SMDR)
- INSTRUMENTATION
- DIAGNOSTIC SUPPORT
- PROGRAM LOADING
- DATA LOGGING

**BUFFERED VERSION MODEL PD1-BF**
- $595.00

- Personal Computer and STD Computer Interfacing for Scientific Instrument Automation, Blacksburg, VA. This workshop provides hands-on experience in wiring and testing interfaces. The fee is $395.

**June 1-3**
- The First Annual Computer Country Fair & Exposition, New Hampshire Voc-Tech College, Stratham. Demonstrations and displays of computer hardware and software for home, personal, and business uses will be featured. Adult admission is $2.50. For more information, contact Julianne Cooper.
Professional Software for the Software Professional

DMA products operate on the full range of Z80, 8086, 8088 processors, including the IBM-PC

Here's what you can do!

Application Creation
FORMULA II™
The Application Creator
The first and only Application Creator—a do-it-yourself concept for office automation. FORMULA II lets you define your files, forms, menus, and reports—FORMULA II then creates your program. FORMULA II includes a Database manager with an English Query language and a Form/Report Creator with word processing features.

Communications
ASCOM™
ASCOM™ is the most versatile asynchronous communication package on the market. It features interactive, menu-driven, and batch operations; supports auto-answer and auto-dial modems; includes most popular protocols; provides network simulation; and many other options. Xerox Corporation, NCR, Monroe Systems for Business, and the big 8 accounting firms use ASCOM™.

SYNC/COM™—A bisynchronous communication package that will be configurable for a variety of systems and includes a flexible interface to the operating system. 2780/3780/3270 protocols available on microcomputers with appropriate hardware.

TERMCOM™—A configurable terminal emulator allowing any personal computer to emulate most conversational and selected block mode terminals with asynchronous communications. Available December 1983.

Utilities
EM80/86™
This software emulator lets you use eight bit software on sixteen bit microcomputers without hardware modifications.

The 8086 O.S. Converter™
CP to MS—Permits execution of Digital Research's CP/M-86 programs under Microsoft's MSDOS (or PC-DOS). MS to CP—Permits execution of MSDOS programs under CP/M-86.

UT-86™
This package of user-friendly utilities for the IBM Personal Computer and similar systems includes copying, directory sorting, patching, and a general purpose file print utility.

Coming Soon
DMA: "C"™—A "C" language compiler which will generate either Z80 or 8086 assembly language code. Due to a unique optimization routine which is based upon a functional "P-code" model, the efficiency of DMA: "C" will far exceed that of existing compilers.
Cooper/GK, 41 Front St., Exeter, NH 03833, (603) 778-0344.

June 2-3
The Ninth NJ-NYCT Microcomputer Show & Flea Market, Meadowlands Hilton Hotel, Secaucus, NJ. More than 250 vendors will display computer equipment, parts, supplies, software, and accessories. Admission is $6. Contact Ken Gordon Productions, POB 13, Franklin Park, NJ 08823, (201) 297-2526.

June 4-5
Electronic Motion Control Association Seminar, Chicago, IL. This educational program combines tutorial sessions with technical paper presentations. Devices and systems will be displayed. For details, contact the Electronic Motion Control Association, Suite 1200, 230 North Michigan Ave., Chicago, IL 60601, (312) 372-9800.

June 4-6
Advanced Project Management, Berkeley, CA. The fee for this short course is $645. Advanced registration is required. Contact Continuing Education in Engineering, University of California Extension, 2223 Fulton St., Berkeley, CA 94720, (415) 642-4151.

June 4-7
Electronics in Oil and Gas/ U.S., Convention Center, Dallas, TX. This exhibition will focus on electronics technology as it applies to processing, production, supervision, data control, communications, navigation, maintenance, testing, instrumentation, exploration, and safety. The conference program, held concurrently with the World Oil and Gas Show and Conference, will cover telemetry, sensing, computers, simulation, and automation. Complete particulars are available from Martin C. Dwyer International, 1350 East Touhy Ave., Des Plaines, IL 60018, (312) 299-9311.

June 4-7
Robots & Cobo Hall, Detroit, MI. More than 80 industry experts will expound upon the latest aspects of robot implementation, applications, and research. Nearly 250 builders and suppliers of industrial robots, related services, and components will exhibit their wares. For more information, contact RJ/SME, POB 930, Dearborn, MI 48121, (313) 271-0023. June 4-8
The Thirteenth Annual Meeting of the MUMPS Users Group, Adam's Mark Hotel, Philadelphia, PA. Introductory and advanced tutorials on MUMPS programming and applications, workshops, round-table discussions, site visits, and formal presentations will be offered. In addition, hardware, software, and systems will be demonstrated. Contact the MUMPS Users Group, Suite 308, 4321 Hartford Rd., College Park, MD 20740, (301) 779-6555.

June 6-8
Introduction to the Design of Fault-Tolerant Microcomputer Systems, San Francisco, CA. This course serves as an introduction to such major topics as fault-tolerant computing as microprocessor testing, redundancy techniques, error correction and detection, and fault classification, detection, diagnosis, and recovery. The fee is $650. For information, contact William C. Dries, Engineering and Applied Science, University of Wisconsin Extension, 432 North Lake St., Madison, WI 53706, (608) 262-3520; in Wisconsin, (608) 262-2061.

June 6-8
ACM SIGCOMM '84 Symposium on Communications Architectures and Protocols, Montreal, Quebec, Canada. Address inquiries to Rebecca Hutchings, Honeywell FSD, 7900 Westpark Dr., McLean, VA 22102, (703) 827-3982.

June 6-9
The 1984 Rochester FORTH Applications Conference, University of Rochester, NY. An international conference now in its fourth year, this convocation is appropriate for both experienced users and newcomers to the FORTH language. Invited speakers will discuss real-time systems and FORTH applications and technical details. Contact Diane Ranocchia, Institute for Applied FORTH Research Inc., 7 Elmwood Ave., Rochester, NY 14611, (716) 235-0168.

June 11-13
Data Processing for the Non-Data Processing Executive, Part 2, New York City. For details, see May 21-23.

June 11-13
Auditing in the Contemporary Computer Environment, New York City. For details, see May 14-18.

June 11-15
Fiber and Integrated Optics, Teaneck, NJ. This short course explores such fiber-optic components as single-mode and multimode fiber cabling, photo detectors, receiver and repeater technology, and optical-fiber sensors. The fee is $875. For details, contact Continuing Engineering Education, George Washington University, Washington, DC 20052, (800) 424-9773; in the District of Columbia, (202) 676-6106.

June 13-15
Managing the Audit Computer-based Bank Systems, Chicago, IL. A course providing a comprehensive audit approach for evaluating and testing controls in computer-based bank systems. Information is available from Darlene Flooding, Bank Administration Institute, 60 Gould Center, Rolling Meadows, IL 60008, (312) 228-6200.

June 11-30
Faculty Development Institute: Retraining in Computer Science, Wheaton College, Norton, MA. The Faculty Development Institute, made up of introductory and intermediate courses, is designed to increase educators' capacity to teach computer science at the college level. The tuition is approximately $1000, with additional expenses for room and board. For further information, contact Nerox Inc., 439 Washington St., Braintree, MA 02184, (617) 848-6944.

June 12-14
Advanced Manufacturing Systems Exposition & Conference—AMS 84, McCormick Place, Chicago, IL. The theme for this event is "The Computer: Mind of the Future." Demonstrations of information and automated production systems directed at the needs of manufacturing companies, more than 50 conference sessions, workshops, and short courses will be featured. Some topics of interest include planning for closed-loop systems, software selection and systems integration, artificial intelligence, and robotics. AMS runs concurrently with Info/Software (see below). For details on AMS 84, contact Clapp & Poliak, 708 Third Ave., New York, NY 10017, (212) 370-1100 or 661-8410.

June 12-14
Info/Software, McCormick Place, Chicago, IL. An exposition and conference de-
WE MADE IT POWERFUL.
BUT WE KEPT IT SIMPLE.

When you're cooking up a unique software product, it's not enough to think of all the right ingredients. You also have to mix them very carefully. Especially when you're serving the wide variety of people who use the IBM personal computer today.

Until now, if you wanted to use your IBM PC to turn data into meaningful information, you had to make an unappetizing choice between two kinds of data base management systems: Multifile systems so powerful they're difficult to use. Or single file systems so simple they can't be used to do much.

Until Power-base™

Power-base is the only multifile data base manager powerful enough to get the job done, yet simple enough to be mastered in one sitting. Even if you've never used a computer.

There are no languages to learn, no commands to memorize. To tell Power-base what you want, simply keep choosing from the menu which never goes away, yet never gets in the way. Even making a selection is simple. You use the same three keys every time. To make a change, you simply make another choice.

And the unique DataZOOM™ gives you the power to move rapidly from file to file, right to the piece of information you need.

It's hard to make a simpler choice than Power-base.

Especially with a price so easy to digest: $395.

Get a taste of Power-base for yourself. For a demonstration copy, send us $10. It's refundable when you purchase Power-base at your local participating Computerland or other authorized dealer.

voted exclusively to demonstrations of applications and systems software. Mainframe, minicomputer, and microcomputer software will be featured. Info/Software runs concurrently with AMS 84 (see above). Further information is available from Clapp & Poliak, 708 Third Ave., New York, NY 10017, (212) 370-1100 and (212) 661-8410.

June 12-14
Update '84, Hyatt O'Hare Hotel, Chicago, IL. This forum is targeted at the information-management and micrographics industry. Trends in office automation technologies and their relevance to imaging and image transmission capabilities will be considered along with the opportunities and competitive pressures that these technologies represent. For details, write to IMC Update '84, POB 34404, Bethesda, MD 20817.

June 13-15
Clinical Laboratory Computer Symposium 1984, Towsley Center, University of Michigan Medical School, Ann Arbor, MI 48109, (313) 763-1550. Topics to be addressed include how to write computer-related text and graphics. Contact Dr. Sally Boland, 5 Reed House, Plymouth State College, Plymouth, NH 03264, (603) 535-1550.

June 17
The Seventeenth Annual Association for Small Computers Users in Education Conference, Western Kentucky University, Bowling Green. This conference will focus on academic computing, robotics, computer applications in libraries, and the effective use and control of institutional word processing, demonstrations and a
The Rixon PC212A...
The Perfect Modem
For Your IBM® PC
...Only $499

The Rixon® PC212A offers you the only 300/1200 BPS full duplex card modem with auto dial and auto answer that plugs directly into any of the IBM PC® card slots. Because the Rixon PC212A was designed specifically for the IBM PC, it is loaded with user benefits.

The PC212A eliminates the need for an asynchronous communications adapter card and external modem cable, this alone saves you approximately $190. The PC212A provides an extra 25 pin EIA RS232 interface connector, a telephone jack for alternate voice operation, and a telephone line jack for connection to the dial network. Without question, the PC212A is the most user friendly, most reliable, and best performing modem for your IBM PC. An internal microprocessor allows total control, operation, and optioning of the PC212A from the keyboard. A user friendly HELP list of all interactive commands is stored in modem memory for instant screen display. Just a few of the internal features are auto/manual dialing from the keyboard, auto dial the next number if the first number is busy and instant redial once or until answered.

In the event of power disruption a battery back-up protects all memory in the PC212A. In addition, the PC212A is compatible with all of the communication programs written for the Hayes Smartmodem™ such as CROSSTALK™. Also available for use with the PC212A is the Rixon PC COM I™ a communications software program (Diskette) and instruction manual to enhance the capabilities of the PC212A and the IBM PC. PC COM I operates with or replaces the need for the IBM Asynchronous Communications Support Program. The program is very user friendly and provides single key stroke control of auto log on to multiple database services (such as The Source™), as well as log to printer, log to file transfer and flow control (automatic inband or manual control). PC COM I is only $49.00 if purchased at the same time as the PC212A. The PC212A comes with a 2 year warranty. For more information contact your nearest computer store or Rixon direct at 800-368-2773 and ask for Jon Wilson at Ext. 472.

PC212A $499
PC212A WITH ASYNCH PORT $539.

June 17-21
International Banking Conference on Computer Networks, Hilton, Tel Aviv, Israel. This educational program for bankers, corporate executives, government representatives, and electronics manufacturers will center around the theme, "Bank Transfers Via Computer Networks." Security and fraud concerns will also be discussed.

June 18-22
The Fourth Annual Notre Dame Short Course Series: Computers in Biology, University of Nevada-Reno. Three concurrent short courses on Computers in Biology will be offered: "Computers in Bioeducation," "Microcomputers in Classroom and Laboratory," and "Computerized Data Analysis in Biological Research." A computer background is not required. Most days will include lectures and hands-on sessions. Tuition is $450. Contact Professor Theodore J. Crovello, Biocomputing Short Course Coordinator, Department of Biology, University of Notre Dame, Notre Dame, IN 46556, (219) 239-7496.

June 18-22
Office Information System Software, Massachusetts Institute of Technology, Cambridge, MA. This course provides a systematic treatment of the concepts behind the design of multifunction office workstations, including technology, human factors, software, and applications generators. Further information is available from the Director of the Summer Session, Room E19-356, MIT, Cambridge, MA 02139.

June 18-22
Experimental Music Studio, Massachusetts Institute of Technology, Cambridge. Two complementary sessions, "Techniques of Digital Audio Processing" and "Workshop in Computer Music Composition," make up this program. The former, which runs from June 18-29, provides a technical background as well as practical experience in digital sound-synthesis methods. The latter, which begins July 2, gives composers the opportunity to experiment with the computer as a musical instrument. Both workshops involve lectures, tutoring, and hands-on experience. No special technical knowledge is required. Application information is available from the Director of the Summer Session, Room E19-356, Massachusetts Institute of Technology, Cambridge, MA 02139.

June 19-22
Percom '84—The Second International Exhibition and Conference on Business and Personal Computers, Jade Ballroom, Hotel Furama Intertional, Hong Kong. Exhibits at this show cover a wide spectrum of mini- and microcomputers, hardware, software, peripherals, accessories, components, and publications. The emphasis is on products for the commercial, manufacturing, and education industries. Contact Adsale Exhibition Services, 20/F, Tung Sun Commercial Centre, 194-200 Lockhart Rd., Wan Chai, Hong Kong; Telex: 63109 ADSAP HX.

June 19-22
How to Document a Computer System, Sheraton Commander Hotel, Cambridge, MA. This seminar presents a series of procedures that covers the system-development process, including project initiation, study, design, programming, implementation, and maintenance. The fee is $155. Contact Technical Communications Associates, Suite 210, 1250 Oakmead Parkway, Sunnyvale, CA 94086, (800) 227-3800, ext. 977; in California, (408) 737-2665.

The $2395 DEVELOPMENT SYSTEM

Turns any personal computer into a complete microcomputer DEVELOPMENT SYSTEM. Our integrated control/display program runs under POM/DOOS, CP/M, or TRS-DOS, and controls the UDL via an RS-232 port.
John Fairchild likes our style

DHL, the #1 Worldwide Courier Express, now makes
time-critical deliveries overnight throughout the U.S.

To cover the volatile, ever-changing world of fashion, "it's not
enough to be fast," says John Fairchild, Chairman, Fairchild Publications. "You must be accurate and reliable."

That is what has made his Women's Wear Daily and W the leading barometers of the American fashion industry.

That same speed and reliability have made John Fairchild a steady client of DHL.

"For overnight delivery," says Fairchild, "DHL is the next best thing to taking it there yourself."

From samples to sketches, from photos to contracts, DHL delivers all kinds of time-critical documents and packages overnight across the country.

30,000 locations.

More on-time deliveries to

more places around the world than any other express courier.

DHL's state-of-the-art delivery system encompasses 727s, Learjets, helicopters and fleets of trucks to speed things on their way.

As John Fairchild says, "I like their style."

For information, call your local office of DHL Worldwide Courier Express.

June 25
How to Document a Computer System, University Inn, Pittsburgh, PA. For details, see June 20.

June 26-28
PCExpo, Coliseum, New York City. This show is dedicated to the IBM Personal Computer market. Exhibits by manufacturers, software producers, and vendors will be complemented by a daily seminar program. Contact

June 26-29
Logo '84 Conference, Massachusetts Institute of Technology, Cambridge. Four main themes, Logo Learning, Learning Environments, Technical Forecasts, and Images of Future Work, constitute the main program. Product exhibits will correspond with the discussions. Contact the Special Events Office, Room 7-111, Massachusetts Institute of Technology, Cambridge, MA 02139.

June 26-29
Using FORTH Effectively, Humboldt State University, Arcata, CA. This is a hands-on advanced course on the generation and internal operations of a FORTH system. A mastery of an introductory FORTH course or minimum of six months using FORTH, knowledge of assembly language, and operating-system principles are prerequisites. The fee is $150 or $200 with three quarter hours academic credit. Registration information is available from Claire Duffey, Office of Continuing Education, Humboldt State University, Arcata, CA 95521, (707) 826-3731.

June 27-29
Introduction to the Design of Fault-Tolerant Microcomputer Systems, Boston, MA. For details, see June 6-8.

July 1984

July 2-6
Contemporary Computer Auditing: Integrity Controls, New York City. This program is designed to provide an
THE AT&T INTERNATIONAL BUSINESS NETWORK:

IT COSTS LESS TO SEND YOUR FACTS BY FAX.

signed contracts almost anywhere in the world.
This unique ability makes fax one of the most exciting electronic mail technologies available today.
All you need is a telephone and a facsimile machine.
And in as little as 25 seconds, an exact duplicate arrives at its destination.
With fax, faster is cheaper.
And different machines have different capabilities, different speeds.
With the AT&T Network, you can transmit up to 400 words on a 1-minute call.
Most telex machines transmit at a standard 66 words per minute.
Any fax machine can match that rate. And most beat it easily.
In fact, you can save as much as $8.00 per page with AT&T’s lowest rates compared, with sending the same page via telex. With some fax machines, you don’t even have to be there.
They can be programmed to transmit during Discount and Economy periods. Telex has no daily reduced rate periods.
Since fax is a copy of the original, you don’t need a typist. No special operators.
And since there’s no retyping, no redoing of any kind, fax is free of transcription errors.
So if your international customer or business associate needs a document, a blueprint, or a signed contract in a hurry, you can fax it on the spot.
Transmitting facts with fax.
Another cost-effective service for your business from the AT&T International Business Network.
International service to and from continental US.

An exact copy of the original. That’s fax. And fax is the only system that can transmit blueprints, legal documents, and...
overview of the complete computer-auditing environment, its controls, and the interrelationships. Full details are available from Beth Ann Musto, EDP Auditors Foundation, 373 Schmele Rd., Carol Stream, IL 60187, (312) 682-1200.

July 8
The Third Annual National Conference of the Association for Women in Computing, Holiday Inn Center Strip, Las Vegas, NV. The conference theme, "Choice or Chance in Computing Careers," will be the starting point for sessions about women entrepreneurs, technologies in the forefront of the eighties, and career development. Registration and additional information can be obtained from Patricia Timpanaro, AWCC '84 Registration, 40 Main St. #206, Stoneham, MA 02180.

July 9-12
The 1984 National Computer Conference—NCC, Convention Center, Las Vegas, NV. One of the most prestigious conferences, the NCC will provide professional-development seminars, more than 500 exhibits, and nearly 100 technical sessions in 10 program tracks. Contact the American Federation of Information Processing Societies Inc., 1999 Preston White Dr., Reston, VA 22091, (703) 620-5926.

July 9-13
Fiber and Integrated Optics, San Diego, CA. For details, see June 11-15.

July 10-12
Computer-Security Technology, University of California, Berkeley. This short course looks into protective technologies in three general categories: procedural, hardware, and software. A module evaluating a computer-security program will be included.

Registration costs $595, which includes all materials. For details, call or write Continuing Education in Engineering, University of California Extension, 2223 Fulton St., Berkeley, CA 94720, (415) 642-4151.

July 23-25
Summer Computer Simulation Conference—SCSC '84, Copley Plaza Hotel, Boston, MA. Technical sessions made up of plenaries, papers, panel discussions, and a variety of tutorials will be featured. Highlights include displays of simulation computers, simulators, auxiliary devices, and software. Special sessions will also be held on artificial intelligence. Contact Charles Pratt, Simulation Councils Inc., POB 2228, La Jolla, CA 92038, (619) 459-3885.

July 23-27
ACM SIGGRAPH '84, Minneapolis, MN. This is the eleventh annual ACM conference on computer graphics and interactive techniques. Refereed technical paper presentations, panel discussions, a design show, film and video presentations, and nearly 30 courses are some of the features of this event. Course offerings will be divided into four categories: CAD/CAM/CAE, animation/image synthesis, graphics, and general topics. What is said to be the first total computer-generated Omnigraph will be shown. For details, contact SIGGRAPH '84 Conference Office, 111 East Wacker Dr., Chicago, IL 60601, (312) 644-6610.

July 23-27
Advanced Technology: Its Impact on International Business, Economics, Finance, and Trade, Miramar Sheraton Hotel, Santa Monica, CA. Speakers at this symposium will explore the need for cooperation and competition with Pacific Rim countries in the building of supercomputers. Program details and registration information are available from Charles Partington, West Coast University, 440 Shatto Place, Los Angeles, CA 90020, (213) 487-4433.

July 23-29
International Heath/Zeniths' Group Conference, Pheasant Run Resort, St. Charles, IL. For details, call or write the Heath Users' Group, Hilltop Rd., St. Joseph, MI 49085, (616) 982-3463.

In order to gain optimal coverage of your organization's computer conferences, seminars, workshops, courses, etc., notice should reach our office at least three months in advance of the date of the event. Entries should be sent to: Event Queue, BYTE Publications, POB 372, Hancock, NH 03449. Each month we publish the current contents of the queue for the month of the cover date and the two following calendar months. Thus a given event may appear as many as three times in this section if it is sent to us far enough in advance.

### BYTE's Bits

**Database Aids Cancer Treatment**

The National Cancer Institute's PDQ database provides physicians with up-to-date information on the prognosis and accepted treatment options for specific cancers. PDQ, designed for use with office or personal computers, offers several files of information, such as treatment statements for each type and stage of cancer and data on active cancer-treatment research protocols that are open to patient accrual. A list of physicians who are members of organizations that have a special interest in cancer-patient care is another feature of PDQ.

Currently, physicians have access to PDQ through more than 2000 National Library of Medicine MEDLARS centers. During the course of this year, the Institute plans to make an expanded version of PDQ more widely available through the cooperation of commercial vendors. Those vendors willing to participate will receive monthly updates from the Institute in machine-readable form. The Institute will promote PDQ among physicians and encourage vendors to conduct their own promotional efforts. If you're willing to help bring this vital service to community-based physicians, write to NCI PDQ, Room 11A49, Building 31, National Institutes of Health, Bethesda, MD 20205, for more information.
The V6 diesel
4 million miles of testing made it right.
Oldsmobile Cutlass Ciera makes it great!

In the lab and on the road—the most thoroughly tested engine ever offered by Oldsmobile. V6 engines were run non-stop...24 hours a day...six days a week...for nearly two months. In all, over 1,000 hours of dynamometer testing of the V6 diesel. Additionally, six fleets of over 150 diesel V6 vehicles were tested over a 3-year period...on the road...coast to coast. In all, over 4.1 million miles of testing.

Impressive performance and diesel efficiency through precision engineering. The inherent advantages of a diesel were teamed with the balance and smoothness of the V-type engine configuration. The results: remarkable—0 to 30 in 5.2 seconds and 0 to 50 in 11.7 seconds—in a V6 diesel Cutlass Ciera, according to test track data.

The fuel economy? Equally impressive at—43 estimated highway and 28 EPA estimated mpg.*

Conclusion: with a high technology diesel Oldsmobile, you get both spirited performance and money-saving economy.

Additional savings with Olds Diesel Traveling Package. Now you can save $300 compared to the Manufacturer's Suggested Retail Price of the same options purchased separately. On V6 Diesel Traveling Package equipped Olds Cutlass Ciera models with: AM/FM Stereo Radio, Wire Wheel Discs, Power Door Locks and Cruise Control or Rear Window Defogger. See your dealer for details.

3-year/50,000-Mile Protection. Another plus in the diesel Oldsmobile. As part of the Olds new car limited warranty the diesel engine is covered for 3 years or 50,000 miles, whichever comes first. Subject to a deductible after the first 12 months—12,000 miles.

Test-drive a V6 diesel Cutlass Ciera for 1984 at your Oldsmobile dealer. The way you'll feel behind the wheel will be the final and most convincing test of all.

There is a special feel in a diesel

*Use the estimated mpg for comparison. Your mileage may differ depending on speed, distance, weather. Actual highway mileage lower. Estimates lower in California. Some Oldsmobiles are equipped with engines produced by other GM divisions, subsidiaries or affiliated companies worldwide. See your dealer for details.

Using Computers in Clinical Practice
Marc D. Schwartz, M.D., ed.
The Haworth Press, New York, 1984, 510 pages, hardcover, $34.95

Reviewed by Eviie Wilson

Are you a mental health professional unwilling to accept the thought of using computers to do the sensitive, sometimes intuitive, work of psychotherapy? At the same time, if your sense of futuristic mental health practices intriguing you, then you would be interested in reading Using Computers in Clinical Practice. Without resorting to a hard-sell approach, the 66 contributors will lead you objectively through various stages of getting acquainted with the possibilities computers offer. In what is a surprisingly readable format, even humorous at times, this book presents selected, relatively brief articles by experienced mental health professionals who use computers in varying degrees in their practices.

The articles in this book are grouped under 14 topics and, fortunately, do not always agree with each other. The reader is thus exposed to various pro and con points of view. Nevertheless, the main goal of the editor, Dr. Marc D. Schwartz, is not to cause readers to choose an all-or-nothing stance, but to present in an unbiased manner the experiences, successes, and difficulties encountered by the pioneers currently introducing computers to the field of psychology. Because these people are mental health professionals first and computer specialists second, they tend to discuss the issues pertinent to clinical psychology using the language of the profession even though their prime focus, in this book, is on technology and computerization. This helps the more therapeutically oriented reader like myself become more involved, even absorbed, in the discussions.

Some of the articles listed in the table of contents that immediately piqued my interest were reviews on "A Probabilistic System for Identifying Suicide Attempters," a "Computerized Analysis of Verbal Behavior in Schizophrenia," and on "A Direct Assessment of Depression by Microcomputer," the latter being one of several articles contributed by the editor of this volume.

This is actually a handbook that provides an overview of the multiple uses of computer hardware and software as they currently apply to mental health. For example, it includes discussions of the time-saving advantages of word processing and how to preprogram the routine phrases or diagnostic definitions necessary for repetitive report writing. It covers extensive considerations of the value, drawbacks, and unknowns related to computerized assessment, diagnosis, and testing procedures that have heretofore been tedious pencil-and-paper methods.

Seeing the World
Not all is portrayed as rosy, however. The authors raise substantive legal, ethical, and humanistic questions. For instance, how will a depressed, depersonalized client react to being assessed by a machine rather than a caring human being? Will computer-using professionals begin to treat their microcomputers and software as authorities or become reluctant to introduce innovation into stable programs that have taken years to perfect? What happens to worker satisfaction when human interaction is exchanged for a full day of computer interaction?

On a more optimistic note, how about computerized fantasy games in child therapy? Or educational systems for cognitive rehabilitation in neuropsychology? Self-help via bulk mail? Or just plain old improvements in billing procedures and cash flow for the psychotherapist as a small-business owner?

Keeping in Mind
Considerations are many in this relatively unexplored area; that is why this book is essential. It invites you to be aware of various options and warnings that you may not even have begun to imagine. In addition to words of caution, the editors also include helpful suggestions. It seems that the editor wants to make certain that once you invest in a computer, you will be able to take full advantage of it and not relegate it, unused, to a dusty corner due to unanticipated frustrations. This is reason enough to read this book, since your investment can range from $2000 to $20,000.

What are some of those suggestions? Consider, for example, Parts I and II entitled "An Overview" and "Dealing With People," respectively. Once you have decided to go ahead and merge technology with the humanities, apparently the first roadblock is likely to come from other office personnel and colleagues who may feel professionally threatened. The authors offer insight into this fairly com-
Micromint. Supporting the varied projects that appear in Steve Clarcia's monthly article in BYTE Magazine, "Clarcia's Circuit Cellar." Offering a wide range of computers and peripherals designed to meet the exacting demands of the hobbyist as well as worldwide corporate clients.

**The Micromint Collection**

**TERM-MITE ST SMART TERMINAL BOARD**

As featured in Clarcia's Circuit Cellar

BYTE Magazine, January & February 1984

All you need to build a Smart Video Terminal equivalent to the types advertised for $300.00 or more is a turn-key ST circuit board, scanning or parallel keyboard, video monitor and power supply

- Lists brand new Text 80M S/54A Terminal Processor
- 24 lines by 68 characters, 256 reverse-video styles
- Upper & lower case, 72/43, 7/7 graphics
- Selectable data rate, parity, & display options
- Reverse-video, half-integer, double height & width, underlined, blinking and/or blink character
- Output test terminal ST Display Processor

Circle 289 on Inquiry card

**Z8 BASIC SYSTEM CONTROLLER NEW!!!**

As featured in Clarcia's Circuit Cellar

BYTE Magazine, July & August 1984

The Z8 Basic System Controller is an updated version of our popular SCC03. The price has been reduced and features added. The basic computer is a 4" by 4" box and includes a BASIC interpreter, up to 64 kilobytes of RAM, and one RS-232C serial port with swappable baud rates and two parallel ports. BASIC or machine language programming is accomplished simple by connecting a CRT terminal. Programs can be transferred to Z8 EPROMs with an optional EPROM programmer for auto start applications. Additional 70 peripheral boards include memory expansion, serial and parallel I/O, real time clock, a joystick controller and a printers program. A basic computer assembly for various computers

SC02I Assembled & Tested .................................. $200
SC02J Complete Kit ........................................ $440

**MPX-16 MICROCOMPUTER IBM IP Compatible**

As featured on the cover of BYTE Magazine. Also featured in Clarcia's Circuit Cellar November, December 1982 & January 1983

The Computer With A Split Personality

- Uses 32 K of IBM's ROM chip and directly boots PC DOS 1.1 and accepts all expansion boards designed for the IBM PC
- Uses its own powerful 8088 single board computer for all IBM system applications. Just add serial terminal, disk drive and power supply. Directly boots CP/M-86.

BUY the MPX-16 in the form that best meets your needs or budget. As a bare board, as a wave soldered board that contains all components less ICs, as an assembled and tested circuit board or as a complete system.

- Directly boots PC DOS 1.1 and CP/M-86
- Most IBM PC software executes with no modifications
- IBM PC bus compatible + 9 expansion slots
- Intel 8086 16-bit microprocessor
- Optional Intel 8087 math coprocessor
- 256K byte board memory
- One or two 250 / GB wheel memory
- Up to a megabyte of system memory
- Up to 64 I/O's system ROM/EPROM
- 5 RS-232C Serial & 3 Parallel I/O ports
- Disk controller for 51/4" or 8" drives
- Sixteen levels of seasoned interconnects

MPX-16 Circuit Board Assembled w/8K RAM .................................. $1,020
MPX-16 Circuit Board Assembled w/16K RAM .................................. $1,100
MPX-16 Bare-32K (wave soldered circuit board less 8K & 32K RAM) Complete Kit of ICs w/32K RAM .................................. $585
MPX-16 Unpopulated (bars) PC Board .................................. $360
CP/M-86 Operating System .................................. $80
MPX-16 Switching Power Supply .................................. $300
MPX-16 Technical Reference Manual .................................. $50
MPX-16 Keyboard Interface Adapter .................................. $300
Intel PCl Keyboard Interface Adapter .................................. $300
MPX-16 Keyboard Interface Adapter .................................. $300
Shipping & handling additional on all MPX-16 orders.

**Z8 MEMORY/1.O EXPANSION, CASSETTE INTERFACE**

- 8-bit bytes of additional RAM or EPROM
- Three additional 8-bit parallel ports
- Cassette interface—300 baud Baud/K C Standard
- Software real time clock

S8C005 Assembled & Tested .................................. $150
S8C006 68K RAM Assembled & Tested .................................. $180

**Z8 EPROM PROGRAMMER**

- Transfer BASIC or Assembly Language Application programs from RAM to Z831 or Z832 EPROM
- Comes with programming utility routines on EPROM
- Program BCC03 Z8 Expansion Board for operation

S8C Assembled & Tested .................................. $140

**Z8 ANALOG TO DIGITAL CONVERTER**

- Uses Analog Devices 7510 IC's 8-channel 8-bit
- Adds process control capability to the Z8 system
- Over 1,000 conversions per channel per second
- Motion & analog signal ranges

S8C13 Assembled & Tested .................................. $140

**Z8 SERIAL EXPANSION BOARD**

- Adds additional RS-232C and sote-isolated 20 ma current loop serial port to the Z8 System
- Runs at 75 to 19,200 baud at all protocols
- Comes with listings of sample serial I/O routines

S8C08 Assembled & Tested .................................. $100

**Z8 SERIAL MEMORY EXPANSION BOARD**

- Adds additional RS-232C and sole-isolated 20 ma current loop serial port to the Z8 System
- Runs at 75 to 19,200 baud at all protocols
- Comes with listings of sample serial I/O routines

**Z8K MEMORY EXPANSION BOARD**

- Adds up to 16K of additional memory, RAM or EPROM to your Z8 System Controller at any multiplex
- Accepts 1966, 1616, 2716 or 2722 memory types
- Four 16K cards may be installed on the Z8 System board (or basic memory)
- BCC04 Assembled & Tested w/RAM .................................. $120
BCC05 Assembled & Tested w/EPROM .................................. $150

**Z8 CROSS ASSEMBLERS**

From Micro Resources

IBM PC, APPL0 Disk Systems 51/4" 
CP/M-2.1 

From Alfer Axtley

TTL-16 Model I, II, Hubertbau 8" 
CP/M-2.2

**Z8 FIVE SLOT MOTHERBOARD**

- Expand your Z8 BASIC System with minimum hardware
- Contains five slots complete w/4 pin connectors

M802 Assembled & Tested .................................. $59

**TRIPLE VOLTAGE POWER SUPPLIES**

- +5V @ 300 ma. 
- +12V @ 25 ma.
- +15V @ 1 Amp

- USP31 Assembled & Tested .................................. $32
USP31 Complete Kit .................................. $56

**SPEECH SYNTHESIZERS**

MICROVUX TEXT-TO-SPEECH SYNTHESIZER IC

- The SC-01A Phonetic Speech Synthesizer IC
- A complete self contained word slate device that phonetically synthesize continuous speech of unlimited vocabulary
- Used in Micromint and Sound-Talker

SC01 Quantity: 1-49 .... $75 
50-199 .................................. $66
200-999 ............................... $60

**MICRO D-CAM DIGITAL TV CAMERA**

As featured in Clarcia's Circuit Cellar

BYTE Magazine, September & October 1983

GIVE YOUR COMPUTER THE DIMENSION OF SIGHT
- Enables, enhances and stores images
- 325 x 128 digital image sensor
- Plug-in boards for IBM PC, APPLE II or IV
- Software includes utilities for auto exposure, multi-level gray scale, frame dump and image enhancement

DCI IBM PC Assembled & Tested .................................. $295
DCI IBM II Complete Kit .................................. $295
DCI APPLE II Complete Kit .................................. $295

circle 298 on inquiry card

**300 BAUD ANSWER ORIGINATE MODEM KIT**

Micromint's latest 300 Baud Mode Kit is a crystal controlled, uses the TI TMS5625C, contains a 25 pin and requires no calibration or adjustments. Use with acoustic coupler or direct connectModel CO02 Complete Kit as shown

CO02 Transformer for Direct Connect Mode .................................. $20
ACR Acoustic Coupler Kit .................................. $20

**E-Z COLOR GRAPHIC INTERFACE WITH SPRITES**

APPLE II E-COLOR plug-in board with Graphics Editor on a 3.5 disk

EZ21 Assembled & Tested .................................. $150
EZ22 Complete Kit .................................. $150
APPLE II E-COLOR Plus

- Allows the use of a single monitor or TV set

EZ21 Assembled & Tested w/Graphics Editor .................................. $200
IREL LOGO for E-COLOR and E-COLOR Color
Supports Sprite Graphics

EZ21 Knit LOGO w/trustcode .................................. $289
Animation Software for E-COLOR Plus

- Draws with Sprites using Joy-cube or Scal Pad
- Keypad Sprites from your own BASIC program

EZ22 Animation Software .................................. $49
ST00 E-Z Color Graphics Board

- With sound generator and joystick interface
- Works with the 6000 series

EZ22 Assembled & Tested .................................. $289

To Order: Call Toll Free 1-800-645-3479
For Information Call: 1-516-374-6793
Call: Monday-Friday, 9-5 PM
mon reaction and suggest ways of introducing your new ideas in stages that are easier to accept.

In addition, precautions are raised in Parts I and II regarding facets of professional computerization that have apparently thwarted more than a few enthusiastic, though uninformed, potential computer users. First, although computers have the capacity to capitalize tremendously on the power of information, they can be subject to inconvenient programming limitations. Second, you may need to learn how to program your own software, because ready-made software is not always available or appropriate to specific needs. Finally, you are made aware that contracting a programmer to develop an operational program is very different financially from receiving a functional program. The former means simply that the program runs. The latter means the programmer stays on the job long enough to work out unforeseen bugs in the system. A misunderstanding of this contractual wording can result in a $40-per-hour charge for program modification costs until all the data is printing the way you want it.

For those readers who are employed by larger operations than private practice, such as hospitals, community-planning agencies, or mental health centers, this book contains valuable advice from those with previous experience. The authors emphasize that clinicians must be quite familiar with the computer systems in their agencies in order to adequately input their programming needs. Otherwise, programmers and administrators could set up programs that are not relevant to clinicians’ information needs or are not sensitive to the human elements in therapeutic work. Then the result is potentially more, meaningless paperwork for the clinician, or you are stuck with a system that is woefully underused by the agency. The writers of the “Administrative and Clinical Information Management” chapters are both helping other professionals in the field to avoid the pitfalls they have experienced and expressing satisfaction with their accomplishments.

Selected articles in “Choosing a Computer” continue in the effort to offer guidance. Although the language in this article includes more technical terms than in any other portion of the book, it should not deter you. Yet this is the next to last of the 14 sections, so if you have read thus far and are ready to choose your computer, you need to know, in spite of technical terms, such considerations as how an Apple II compares with a Vector 2600.

Broadening Horizons
I recommend reading this book candy-box style. Pick out intriguing articles for the pure enjoyment of learning more about some fascinating applications of computers in mental health. Did you know, for instance, that computers can be programmed to respond as Rogerians, or Gestalt or Rational Emotive therapists? To date, these artificial-intelligence therapists are not the real thing, though. A set of repetitive yes statements by a human tester elicits a series of hilarious, though empathic, reflective-listening statements from the computer. Did you know a Lithium Information Center exists? Or that computers are beginning to read minds by decoding brain-wave patterns that are produced by merely thinking of a word? You say, shades of 1984! Perhaps—but what about disabled people whose perfectly good minds are trapped in bodies that cannot move well enough to speak or write? A final chapter under “Other Issues” discusses tax tips for computer owners—another reason to invest in this book before computerizing your profession.

Few Criticisms
As I read, I carefully watched for drawbacks in Using Computers in Clinical Practice, though, I must admit, I really couldn’t find many. It seems to contain something for everyone ranging from the uninitiated to those with serious purchasing intentions. If anything could have been expanded, however, I would have liked to have read more about client reactions, e.g., case studies, articles by clients, and quotes. I found one of the most engaging articles to be “A Computer Assisted Therapy Game for Adolescents: Initial Development and Comments” because it did briefly cover clients’ behaviors and attitudes. Other articles that brought in clients’ reactions to some extent were those on self-help sex therapy and a review of “Talking to a Computer About Emotional Problems.” I had hoped the chapter “Eliza and Her Offspring” might satisfy my desire to hear from clients, but as I read I discovered Eliza is herself (itself?) an artificial-intelligence psychology program.

In sum, this book is outstanding and timely. It is a thorough overview that is both easy and enjoyable to read. It is well bound and clearly printed on nonglossy pages. It contains references at the end of many chapters as well as an extensive, categorized bibliography. Because of the overall writing style, the novice as well as an experienced user can learn a wealth of information almost effortlessly.

According to one article, it seems that during the 1970s panels designed to discuss computer use by the American Psychological Association were not very well attended. In 1980, however, these panels drew huge crowds of new computer owners who, having purchased the hardware, needed someone to show them what to do with it. Conclusion: Computers are a growing facet of the mental health practice. If you are a clinician, it is time to find out what you may not already know, and Using Computers in Clinical Practice is an excellent first step.

Eve Wilson (POB 258, Gilsum, NH 03449) is a psychotherapist, a clinician at a mental health service, and a professor of psychology at Hanover College in Antrim, New Hampshire.

BYTE is always looking for qualified book reviewers. Submit queries and proposals accompanied by a resumé, writing samples, or a list of computer-related interests and expertise to BYTE’s Book Review Editor, POB 372, Hancock, NH 03449.
Collector Edition
BYTE COVERS

The Byte covers shown below are available as beautiful Collector Edition Prints. Each full color print is 11 in. x 14 in., including a 1 1/2 in. border, and is part of an edition strictly limited to 500 prints. Each print is faithfully reproduced from the original painting on museum quality acid-free paper, and is personally inspected, signed and numbered by the artist, Robert Tinney. A Certificate of Authenticity accompanies each print attesting to its quality and limited number.

Collector Edition Prints are carefully packaged flat to avoid bending, and are shipped first class. The price of each print is $25, plus $3 per shipment for postage and handling ($8 overseas). The prints are also available as 4-print sets: Set 9-12, Set 13-16, and Set 17-20. Each set costs $80, plus postage and handling.

To order your own favorite Byte cover as a beautiful Collector Edition Print, use the convenient coupon below. Visa or MasterCard orders may call 1-504-272-7266.

The Power Of:
SuperCalc, 2nd ed.
Robert E. Williams and Bruce J. Taylor
Management
Information Source Inc.
Portland, OR, 1983, 232 pages, softcover, $14.95

Reviewed by
Jack Bishop

The idea of a book designed to teach you how to make user-friendly software work really boggles the mind. Philosophical questions aside, a book is an old, familiar, and reliable companion, whereas the computer sometimes requires two microcomputers, side by side, to present a computerized tutorial.

Expectations
A user's manual is expected to focus on the commands of the program. In any handbook on computer software, I look to the author to either provide an introduction that explains the workings of the software in a unique way or to develop special and powerful insights (tricks of the trade) that go beyond the scope of the user's manual. The Power Of: SuperCalc seems to sit astride these two poles but leans toward the former, a beginner's manual. The introduction clearly states that the goal of this updated edition is to demonstrate SuperCalc functions, rather than to illustrate specific problem-solving methods. And it uses a dozen exercises to do so.

A Misnomer
The Power Of: SuperCalc is thus misnamed by my standards. Based on its contents, A Simple Tour of SuperCalc would be a more accurate description. Such a simple tour is not intended to be derogatory, for simple tours are worth a great deal. But to earn its name, I expected this handbook to take me more deeply into applications of SuperCalc (see table 1). When I see the word "power," I also expect to be led through an appreciation of the limitations of a program. I can imagine any user trying to expand any one of the exercises to a business use, only to find that limitations of the calc structure lead him or her into a dead end, and often when it is least convenient.

Exercises
The Accounts Receivable Aging Report is an exercise that develops a simple report with columns for several categories: Current Billing, Over 30 Days, Over 60 Days, Over 90 Days, and Total Due. The report is clean and fits on the 80-column screen or printer without a fuss. The use of the Execute file to update the report each month will pay for the cost of the book in one update session. The addition of titling and multipages could give you a no-frills report for about 150 customers.

Invoicing from Inventory uses a multiple-table look-up to find pricing for 16 products as well as volume discounts. Cost Recovery for an equipment-rental company provides an example of recording "...a declining balance as entries accumulate against the fixed value." Rents received are used to offset the purchase price of each piece of equipment, the profit margin reflecting the difference between rents and initial cost. The use of the Execute command to update the worksheet is a good example of the power of SuperCalc.

Production Scheduling extends the concept of comparing a value to a fixed base (as in the previous example) and to a variable base, in the scheduling of operations for a manufacturer of stained glass lamps. The SuperCalc worksheet is set up to allow customer orders to be shifted from week to week to evaluate the effect on the schedule.

The Estimating exercise on machining and cost estimating for a small shop provides an example of using the calculation sequence in SuperCalc. The example calculates values for a table, uses the table for reference, and finally selects values from the table for further calculations. The cleverness of the example is hidden in the excellence of the worksheet's layout.

Checkbook Ledger is a simple ledger, illustrating posting and maintaining a balance.

Engineering Formula uses a simple vector calculation to illustrate the ability to calculate mathematical formulas easily. While using only the cosine, square root, and exponentiation functions, engineers should have no trouble generalizing (if they needed the example in the first place).

Payroll Reporting illustrates the updating, storing, retrieval, and use of multiple worksheets.

Monthly Inventory reports the ability of SuperCalc to develop a daily report, then update totals and clear the report for the next day. The use of a logic command (IF) provides the key for reordering the product.

Financial Forecasting and Accounts Payable exercises provide further examples of functions already illustrated.

Insights
The most powerful feature of the examples is the experience with the Execute file to update, reorganize, and clear a worksheet. Beginning calc users will not appreciate the power of this ability for a while, but the multiple examples should give everyone a feeling of confidence in this capability of SuperCalc.

The Power Of: SuperCalc provides three insights I believe will prove valuable to many readers. First, the look-up table is a very powerful and, I suspect, underused aspect of the various calc spreadsheets. The several illustrations of its applications should provide the background to increase its use. Putting a zero at the beginning and end of the table is

Table 1: The coverage of The Power Of: SuperCalc is fairly complete but ignores a few key commands (such as NPV, LN, LOG).

Insights

The most powerful feature of the examples is the experience with the Execute file to update, reorganize, and clear a worksheet. Beginning calc users will not appreciate the power of this ability for a while, but the multiple examples should give everyone a feeling of confidence in this capability of SuperCalc.

The Power Of: SuperCalc provides three insights I believe will prove valuable to many readers. First, the look-up table is a very powerful and, I suspect, underused aspect of the various calc spreadsheets. The several illustrations of its applications should provide the background to increase its use. Putting a zero at the beginning and end of the table is
the sort of trick of the trade I look for in a book of this sort.

Second, the calendar feature, while not a specific function of SuperCalc, is a simple way to ensure that the end-of-the-month change is handled smoothly and effortlessly. It is well described and laid out in this book.

Finally, the power of the example, discount taken versus the cost of borrowed money, is the simple idea of comparing the discount to the cost of borrowing the money, and using the SuperCalc to lay out the results simply, easily, and clearly.

Format

The Power Of: SuperCalc is laid out with commands on the left, explanations on the right. The commands are spelled out, as is the word Return. More than one reader will issue oaths when discovering that typing the letters return is not what the author intended. (Ever wonder why we have carriage returns on the keyboard? That's another story!) I would've gladly paid more for this book to cover the costs of highlighting the commands in color and for necessary typesetting improvements. The commas and colons tend to get lost unless your eyes are very young and the light is good and your arms are short and.... For example, the manual contains a Repeat Text command that appeared unworkable. Then I realized the squiggle at the other side of the page was an apostrophe, not a comma, and the mystery was solved.

All in all, the book is well worth the price. While The Power Of: SuperCalc provides a good short tour, the real power of SuperCalc lies beyond the horizon for self-discovery. For a few, the payoff of The Power Of: SuperCalc will come in just having spent a few dollars to have a security blanket on the shelf. For others, the author's slightly different approach to the material in the SuperCalc user's manual will be sufficient. Teachers will benefit from accompanying overhead-projection transparencies ($49.95) and a floppy disk ($64.95). A final group will find one or more of the 12 exercises applicable to their special needs. With some modification, these worksheets will provide greater individual productivity as well as the opportunity to learn several aspects of the language of SuperCalc. For the price, you are getting honest examples carefully done.

Dr. Jack Bishop (Bishop Associates, 2000 Sherman Ave., POB 311, Evanston, IL 60201) is a management consultant specializing in corporate planning and economics.

ESPRIT.
WE GIVE YOU MORE THAN TECHNOLOGY,
WE GIVE YOU PEACE OF MIND.
Nowadays, technology is advancing so rapidly that today's latest breakthrough may be replaced as soon as tomorrow by something even more revolutionary.

**PEACE OF MIND**

**A NEW DIMENSION.**

To the rapidly-changing world of high technology, Esprit—the company with more experience in terminal technology than any other—would like to introduce a new and un-changing dimension: peace of mind.

Designed right into every terminal in Esprit's complete line are the features, the functions and the flexibility that make it not only user-friendly but systems-friendly. In other words, the kind of comfort, quality and trouble-free technology that can provide real peace of mind.

Backed up with an extensive nationwide service force and our own special toll free service number (800-645-4508)—so you can reach us about anything that concerns you—to insure your own peace of mind.

**PEACE OF MIND FOR THE NEXT GENERATION IN TERMINALS.**

One look at the Esprit ESP 6310 and you'll recognize the next generation of terminals. With performance and features far superior to other terminals in its price category. And the kind of quality you can feel comfortable with.

**DESIGNED FOR PEACE OF MIND.**

From the sleek and stylish lines of its ergonomic design to the sculptured lines of its low-profile keyboard with its 11 user-programmable function keys—shiftable to 22—in non-volatile memory back-up, that can be programmed directly or down-line loaded from the host computer.

From its high resolution, green phosphor display with a well defined character font, in a large 7 x 11 dot matrix, in an 80 column x 25 line format to its screen saver feature which deactivates the screen after 20 minutes of inactivity.

From its tilt and swivel monitor to its smooth scrolling and line graphics capabilities.

Our ESP 6310 provides enhanced performance and incorporates emulations of the TeleVideo 925/910 PLUS*, ADDS Regent 25/Viewpoint* and Lear Siegler ADM3A*, as well as the popular Esprit series.

**PEACE OF MIND PRICE. $695.**

That means even our low price is designed to give you peace of mind. And so for your own peace of mind, please fill out the coupon below or call.

Opportunity for Kids
The San Pablo Computer Club, formed by the San Pablo Institute, a nonprofit public-service organization, is devoted to making computer education available to economically disadvantaged young people. The club offers programming instruction and an environment in which youngsters can meet and share ideas. Because it does not charge membership dues, the club relies on donated computer equipment, peripherals, and software. For information, write to the San Pablo Institute, 234 Mullen St., San Francisco, CA 94110.

Tipping the TIPC User
TIPC, a group of Texas Instruments Professional Computer users, meets every month in Houston, Texas. Group members wish to contact TI PC users nationwide to share software and hardware information, develop a software library, and assist in the publication of a newsletter. For further details, contact Stephen Gay, TIPC, 1608 Elmen, Houston, TX 77019, (713) 520-6990.

Participate Locally
Computer Users is a quarterly newsletter produced in cooperation with the Computer Users Federation (CUF) of Southeast Wisconsin. Participation in local events is facilitated due to the newsletter's listings of a regional club and group directory and computer-related activities. An area calendar of classes, seminars, shows, and meetings is posted on a telecommunications system made up of two local bulletin boards.

Serving the Victor
SI Vic-9000, a newsletter for Victor-9000 users, has reports on new software and hardware releases, user critiques, a technical question-and-answer column, gameware, and personal-use software reviews. Interviews and feature articles of interest to Victor-9000 users are included. A charter subscription is $24 a year. For details, contact Michael McNeilley, SI Vic-9000, Suite 456, 3277 Roswell Rd. NE, Atlanta, GA 30326.

Sooner's Form Commodore Clubs
The Greater Oklahoma Commodore Club comprises three chapters: Oklahoma City, Midwest City, and Edmond. More chapters may be added later. A newsletter, OK Commodore Connection, is produced. For further information, contact Randy Hill, Greater Oklahoma Commodore Club, 1401 North Rockwell, Oklahoma City, OK 73127, (405) 789-3229.

Unir Project Is for Unix Users
Membership in the Unir Project, a user group for people interested in the Unix operating system and in the C programming language, is open to anyone fascinated by interactive computer systems. A $25 membership fee entitles you to receive a copy of the current quarterly newsletter and a certified UNID (a Universal Numeric Identifier) used to order reports and software from the Unir Project and to access the members' database. Subscriptions to the newsletter alone are $24. To become a member, send your name, address, and phone number plus a brief description of your interests to Unir Corp., Suite 106, 5987 East 71 St., Indianapolis, IN 46220, or call (317) 842-7014.

Pick Ideas and Tools
Logio Zircon, a monthly newsletter for Pick users, provides a source for ideas and tools to improve the performances of operating systems. Each issue explores such themes as security, offers creative programs, or reports on design improvements. In addition, each issue contains programming tools. An annual subscription is $59.95. For further information, contact Catherine Hill, Zircon Co. Inc., 215 Salem St., Woburn, MA 01801, (617) 935-6901.

Micro Library Up and Running
The Library Micro Clearinghouse is a national nonprofit endeavor to promote library management through the exchange of library-application templates for use with public-domain software. Librarians are encouraged to duplicate the templates they receive, adapt the programs to meet their needs, and share them with other libraries. Templates come in single- and double-disk versions for $5 and $7.50, respectively. To donate application templates for public-domain distribution or for further information, contact Eric Anderson, Micro Computer Libraries, 145 Marica Dr., Freeport, IL 61032.

Stamp Out Sour Computer Experiences
The Lemon Byte Society assists personal computer users by combating some of the shortcomings of the computer industry. Aimed at users who are stymied by severe deficiencies encountered in using software or hardware, the professionals who comprise the Society act as go-betweens.
for the user and supplier. They document the problem, contact the parties responsible for the defect, and print their findings and results in a monthly bulletin available to all members. Annual membership is $32, which entitles you to all the Society's services. For further details, contact The Lemon Byte Society, POB 558250, Miami, FL 33155, (305) 386-3479.

WUE Has Recipe for Success
The World Users Exchange (WUE) assists user groups in their efforts to promote computer knowledge. As a result of a recently conducted survey, WUE found that several user groups needed help in improving their programs and in planning services to members. One way WUE helps user groups is by offering possible solutions to organizational snafus in each issue of its newsletter, The Exchange. User groups are encouraged to share their solutions to problems so that they may be avoided by newer organizations. For details, write the World Users Exchange, POB 12132, Roanoke, VA 24002.

Health-care Applications Supported
The Micro MD Journal is a monthly newsletter for novice and experienced computer users in the health-care field. It focuses on applications for clinical and diagnostic areas, office management, and personal-investment fields. A catalog listing medical and dental software, hardware, and accessories is provided and purchase discounts are offered. A charter subscription is $36 annually; $60 for two years. Send inquiries to Micro MD Publishers, POB 2500, Chesapeake, VA 23320.

Users Converge in Toms River
The Computer Club of Ocean County (CCOC) New Jersey welcomes users of any personal computer to attend its meetings. Held at 7:30 p.m. on the first Friday of each month in the Ocean County Municipal Building in Toms River, CCOC meetings include speakers, presentations, and magazine swaps. The club produces a quarterly newsletter and an annual membership directory. An electronic bulletin board, (201) 244-2259, is open to the public from 4 p.m. to 7 a.m. weekdays and 24 hours a day on weekends. It supports 300- and 1200-bps (212A) operation and offers special privileges to club members. Downloading and uploading of text or programs and general-message storage/retrieval are supported and running on a Heath-Z-89. For further details, contact Stuart MacDonald, CCOC, 6 Whitaker Dr., Toms River, NJ 08753, (201) 240-9323.

Meet with Fellow HP 80 Users
All users of the Hewlett-Packard Series 80 personal computer in Orange County, California, are welcome to attend meetings offered by the HP Club 80. Members meet on the first Wednesday of the month in the Irvine area. There are no dues. For details...

Clubs and Newsletters

Volunteers Host 64 Users
The ET 64 Users Group is a club in Tennessee dedicated to learning about using the Commodore 64 computer. For further details, contact Walt Turner, ET 64 Users Group, POB 495, Knoxville, TN 37901, or call (615) 966-8478.

Garden of Software Created for Adam
Sage Enterprises has created a public-domain software library and exchange for owners of Coleco's Adam personal computer. In addition, Sage Enterprises will offer a bimonthly newsletter of information about the public-domain software, user groups, and new products. For further information, contact Sage Enterprises, Route 2, Box 211, Russellville, MO 65074.

Microcomputerists Gather In Memphis
The Memphis Area IBM PC Users Group meets on the fourth Wednesday of the month in room 233 of the Dunn Building on the campus of Memphis State University in Tennessee. Address further inquiries to Peter Vermilye, Memphis Area IBM PC Users Group, POB 241756, Memphis, TN 38124-1756, or call (901) 345-8760.

Commodores at Golden Gate
The San Francisco Commodore Users Group provides beginners with an introduction to programming skills, hardware modifications, and software for the Commodore 64 and VIC-20. For further details, contact Roger Tierce, San Francisco Commodore Users Group, 278 27th Ave. #103, San Francisco, CA 94121, or call (415) 387-0225.

Sanyo Strong In Boston
The Sanyo Users Group/USA (SUG/USA), located in Boston, Massachusetts, gives support to Sanyo computer owners via a bimonthly newsletter and distribution of public-domain software. Sanyo products are reviewed, and software patches, articles from users about various applications, lists of public-domain software, and book reviews are included in the newsletter. Future plans call for access via Compuserve and a computerized bulletin-board service. SUG/USA will act as a referral service to help Sanyo users form local chapters. Contributions of articles and public-domain software are welcome. The membership fee is $15 annually. Write to the Sanyo Users Group/USA, POB 8069, Boston, MA 02114-8069.

Sanyo Group Seeks Your Input
The Sanyo PC users group collects and welcomes information from business and personal users of the Sanyo 550 or SSS PC. A newsletter is planned. Send inquiries to Roger Wilcox, 425 Woodlawn Ave., Zanesville, OH 43701.

MS-DOS Users Rally In Zürich
The PC-Club Zürich was started for users of IBM, Columbia, Corona, and other MS-DOS-based systems. For more information, contact Kurt Führer, PC-Club Zürich, Kuenzlistrasse 38, CH-8057 Zürich, Switzerland.

Texans Form TRS-80 Club
The TRS-80 Club meets at 7 p.m. once a month at the McLennan County Library in Waco, Texas. The H.O.T. TRS-80 Club Monthly Newsletter contains meeting dates, articles, editorials, and advertisements for purchase discounts available only to members. For further details, write to The TRS-80 Club, POB 1923, Waco, TX 76703.

Giving blood is everyone's business. After all, company blood drives provide a vital part of our nation's blood supply. They benefit everyone. Your community gets much needed blood. Your employees get a lift when they give blood. And your company gets the good will.

So please have your firm start planning for a blood drive today. And you can help save many lives tomorrow.

Now you can reach anyone with your small computer.
At last, there's a practical way to enjoy the benefits of "electronic mail." It's Western Union EasyLink service.

With it you can literally reach any business or any person in writing, almost anywhere on earth. With EasyLink service, you can link your personal computer or word processor to almost any other, to the global Telex network and to anyone, nearly anywhere, with an array of rapid delivery Western Union message services.

EasyLink can increase your equipment's usefulness, improve office productivity and dramatically cut message delivery time.

**Links to the WorldWide Telex network.**

EasyLink subscribers have a direct link to Western Union's WorldWide Telex. Through this service, you can reach any of the 1.5 million businesses who are Telex subscribers in 154 countries.

Your message arrives in just minutes, in writing, for a fraction of the cost of a long-distance phone call. And you will get your own number to receive messages from anyone on the worldwide network.

**Available now.**

EasyLink service is now available. Let us demonstrate how easy it is to send and receive messages from your communicating desktop terminals. Call us toll-free at 800-336-3797, Ext. 348.* Or contact Clyde Meador, Western Union, One Lake Street, Upper Saddle River, New Jersey 07458.

You can write and edit letters and documents, make financial calculations on spreadsheets, and keep important information on disk. For the Ile; floppy disk, $250. Apple Computer Inc., 20525 Mariotti Ave., Cupertino, CA 95014.

Basic Accounting, a financial-management system for use in business and at home. You can keep track of checkbooks, charge cards, savings books, cash accounts, and business accounts. Update, search, edit, print, and even secure your system using a secret password. For II, II Plus, and Ile; floppy disk, $89. Practical Software Inc., 31245 La Baya Dr., Westlake Village, CA 91362.

Beat the Street, a stock-market technical-analysis training simulator. Beginning or experienced investors can practice playing the market without real capital losses on poor investments. Learn point and figure charting and interpret the price pattern as it unfolds based on actual price histories of over 175 stocks on the big board. Simulation can take the place of years of experience in trading stocks. For II and Ile; floppy disk, $49.95. MEA Software Associates, POB 2385, Littleton, CO 80161.

The Bluestoad, a strategic adventure game. In a futuristic setting of 39 levels and 44 combat fields, your job is to help mankind survive in a violent world. Barbarian battles are fought man to man or man against robot. For the Ile; floppy disk, $39.95. Data­most, 8943 Fulbright Ave., Chatsworth, CA 91311-2750.

Calculus, an educational program for use in both schools and business to solve calculus problems. This second edition program contains 22 user-friendly and self-contained working programs in BASIC. For II Plus and Ile; floppy disk, $39.95. SassoCo, 5004 Glen Forest Dr., Raleigh, NC 27612.

Caverns of Callisto, an arcade-type game. Save your space station from aliens who are attacking you and running off with your ship's panels and the ion drive. Try to retrieve your ship parts and fight off the aliens so you can repair your ship. For II, II Plus, and Ile; floppy disk, $34.95. Origin Systems Inc., 1545 Osgood St. #7, POB 99, North Andover, MA 01845.

Compu Ped, a database program for dog breeders. You can keep track of three to five generations of pedigree dogs even if you are a computer novice. Log in the dog's name, birthdate, AKC number, sex, and the dog's parents' names. For II Plus and Ile; floppy disk, $37.50. B L Mac, 132 Patton, Rich­land, WA 99352.

DaPoma GB, a gradebook-emulation program. A teacher's tool that keeps track of up to 50 students' grades and averages for the academic year. Each student's record has 42 individual scores that are divided into three categories that include test and exams, homework, and any other items you need to consider. For II Plus and Ile; floppy disk, $49. DaPoma Inc., POB 23192, Honolulu, HI 96822-0910.

Endus: Ultima III, the third in a series of role-playing adventure games. You are sent out to conquer treacherous foes in the realm of Sosaria. With new powers, you must create characters from a variety of attributes, form and disband an adventure party, and restore peace. For II, II Plus, and Ile; floppy disk, $59.95. Origin Systems Inc. (see address above).

Flight Simulator II, a flying-simulation package. Once you've learned to maneuver a Piper during day or dusk, land in various cities, and perform aerobatics, you can test your skills in a World War I aerial-battle simulation. For II, II Plus, and Ile; floppy disk, $49.95. Sublogic Corp., 713 Edgebrook Dr., Cham­paign, IL 61820.

Forecaster-Buy II, an inventory-control package for business use. This program lets you monitor inventory orderings to reduce overstocking for faster turnover and cash flow. Features include printout of data-entry worksheets, updating, and monthly forecast reports of parts or material that consider reorder lead time. For II, II Plus, and Ile; floppy disk, $800. Alesi Data Technology, POB 4, Neen­dh­am Heights, MA 02194.

Mastering the SAT, a self-paced preparation course for the Scholastic Aptitude Tests in verbal, math, and standard written English skills. Endorsed by the National Association of Secondary School Principals (NASSP), this program analyzes students' answers and provides study and practice in skills covered on the SAT. For II Plus and Ile; floppy disks, $150. CBS Software, One Fawcett Place, Greenwich, CT 06836.

Micro-Dynamo, a system-dynamics modeling language. This program lets you build a mathematical model of a hypothetical situation and simulate its behavior on a computer. When the simulation is complete, the program outputs the results in tabular or graphic form on the screen or printer. For the II; floppy disk, $245. Addison-Wesley, 6 Jacob Way, Reading, MA 01867.

One-on-One, a basketball-simulation game. Choose from four levels of play: park and recreation, varsity, college, and professional basketball. Test your scoring skills against another player or against the computer. Action is sparked by comments from Julius Erving and Larry Bird from the game-development sessions. For II and Ile; floppy disk, $40. Electronic Arts, 2755 Campus Dr., San Mateo, CA 94403.
These children can write size, and scaling intervals. A spoken, or printed on the display, or terminal, functionality for disabled children. It functions such as language and FORTH that combine and interface with other languages to allow translators to be written with a simple keystroke. For II; Floppy disk, $99.95. Linnerton Systems, POB 784, Dahlgren, VA 22448. (This program's description was listed incorrectly in the March "Software Received," page 463. We regret any inconveniences this may have caused.)

ICAMS, an integrated condominium- and apartment-management system. You can perform property-management calculations, with features that include semi-automatic billing and payment receipt, account updates, and 10 current reports. It can search for specific word clues and customization is an option. Floppy disk, $119.50. Advanced Management Approach Inc., POB 8576, California, CA 91302.

LeBug, a C-based assembly-level debugging tool. With this program, breakpoints do not need to be removed to resume execution because they are already transparent. You can manipulate arithmetic and symbolic expressions, address expressions using register contents, and benefit from nondestructive memory tests, error codes, and build-in disk protection from overwriting. Floppy disk, $80. Lehey Microcomputer Systems, Postfach 145, 6365 Rosbach 1, Germany.

Mailr, Version 1.2, a mailing-list management package running on the CP/M 2.2 operating system. This program can read in address files created by word-processing and mailing programs to create new files. A screen form simplifies data entry and updating, delimit-
Commodore

Attack of the Mutant Camels, an arcade-type game. As the pilot of a combat ship, you must destroy enemy droids, deadly pods, and 20 attack waves of Cosmic Cameloids. You win an extra ship for every wave of challenges you encounter. Be prepared for the enemies’ bizarre psychological disorientation tactics. Requires a joystick. For the VIC-20; cartridge, $29.95. Human Engineered Software, 150 North Hill Dr., Brisbane, CA 94005.

Commodore 64 BASIC Programs, an introductory programming package. Complemented by a seven-chapter book, this package includes 30 programs that demonstrate the intricacies of the computer. You are encouraged to make modifications to improve program development and learn its techniques. For the 64; cassette, $16.95. Howard W. Sams & Co., 4300 West 62nd St., Indianapolis, IN 46268.

TheDisk Librarian, a utility program designed to keep track of disk directories. You can search easily for a given directory attribute, catalog up to 150 disks, and easily back up the disks with a trilogy program. You can choose from nine facilities on the menu, including read and catalog, edit, display, print, comment line, and print disk labels. For the 4000/8000 Series; floppy disk, $49.95. Computer Field Service, 660 Longview Lane, Falatine, IL 60067.

Kindercomp, a collection of six learning games to encourage computer skills in children between the ages of 3 and 8. As they create colorful pictures or find letters or numbers on the keyboard that match those on the screen, children are improving their reading readiness and counting skills. Pictures and sounds promptly reward each successfully matched shape or completed number sequence. For the VIC-20; cartridge, $34.95. Human Engineered Software (see address above).

Lazer Zone, an arcade-type game. You try to control two lasers against encroaching aliens. After you learn firing technique and movement, try to score as high as you can in 31 levels of increasing challenge. Requires a joystick. For the VIC-20; cartridge, $29.95. Human Engineered Software (see address above).

Musical Sound 1 Synthesizer and Sequences, a music-creation program. With or without a musical background, you can learn, play, compose, and understand music, rhythms, and sound produced by a synthesizer. You can use this program as an instrument, a songwriting or compositional aid, a music-theory generator, and more. For the 64; floppy disk, $74.95. Waveform Corp., 1912 Benita Ave., Berkeley, CA 94704.

Synthesound 64, a music-synthesis program. Create music or special sound effects that include bagpipes, outer-space panic, footsteps, or chirping birds. You play keys on one of two keyboards: solo or accompaniment. Features include high-resolution piano-keyboard display, real-time clock, voices and filter modes, and storage of 256 patches. For
the 64; floppy disk, $34.95. Human Engineered Software (see address above).

Time Money Manager, a dual financial- and time-management program. In Finance 64, you can make informed decisions on buy versus lease options, payback analysis, profit margin, and future of present values. In Schedule 64, plan days or years in advance, get daily or weekly scans, or zoom in for detailed views. For the 64; floppy disk, $69.95. Human Engineered Software (see address above).

VIC-20: 50 Easy-to-Run Computer Games, a collection of educational games. Each one of these 50 easily entered programs contains less than 30 statements and offers games that help you explore many facets of programming and debugging your computer. Choose from Hurray, Beethoven!, Bird Watching, and the Backward Test, to name a few. For the VIC-20; cassette, $12.95. Howard W. Sams & Co. (see address above).

IBM Personal Computer

Autosort 86M, a sort/merge/select utility program that places no limit on file size. Designed for large files with fixed-length fields within fixed-length records, this program can be used as a stand-alone sort routine with options that include nine modes of sort/select. Multis users can sort simultaneously as long as they use different identification numbers. Floppy disk, $150. Computer Control Systems Inc., 298 21st Terrace SE, Largo, FL 33541.

Catalog-Master, a disk-management system. You can create and maintain a master-file directory of your disks to locate a desired file when you need it. The directory can include file descriptions, sort alphabetically by filename, and you can select only certain groups of files to output by using a file-selection template. Floppy disk, $29.95. Generic Software, POB 790, Marquette, MI 49855.

Data Evaluation System, a data-evaluation utility package. A series of three routines that plot and fit data into a variety of mathematical models by nonlinear least squares. The results can be printed in full color. The menu and special-function keys are combined to easily select designed routines and also various options within each routine. You can also manipulate data. Floppy disk, $250. R & L Software, 1299 Beacon St., Newton, MA 02168.

Decision Maker, a logical-analysis program. Make informed decisions by seeing graphs to help you determine the most logical choice. Input alternatives and factors, and the computer shows you the best decision in detail, summary, or graphic form. Floppy disk, $12.95. HCS, 3616 Danuys Lane, Alexandria, VA 22311.

Encore, a financial-modeling, spreadsheet-analysis, and decision-support system. Features include color graphics, plotting, printing, slide shows, and a graphics editor. Generate a formal report with one function key. The eight sections include an editor, spreadsheet, English modeling language, function library, an exec programming language, a report writer, a graphics system, and computation and analysis. Floppy disk, $695. Ferro Software Systems Inc., Suite 611, 1201 North Fort Myer Dr., Arlington, VA 22209.

Executive Assistant, an office-management record-keeping system. By accessing the flexibility of Lotus 1-2-3, this information-management system is ready for you to run without previous programming experience. It can store information on five files, including people, to do, calendar, events, and projects. Floppy disk, $100. Reston Publishing Co., 1140 Sunset Hills Rd., Reston, VA 22090.

Exette, a data-retrieval system. You can restore up to 18 sectors on single- or double-sided disks that have been lost due to media wear, scratchings, or other errors. The three functions include encode, verify, and restore. Data recovery transfers all information to a new disk containing corrections. Floppy disk, $80. Errex Inc., 5 Re-

search Dr., Ann Arbor, MI 48103.

FABS/PC, an assembly-language subroutine program. With Fast Access Breeze Structure (FABS) you can access large data files containing up to 65K records in one second or less. The speed of execution is due to balanced key structure where keys do not need resequencing. A few of the commands include include, open, close, search, insert, delete, replace, build file, and more. Floppy disk, $150. Computer Control Systems (see address above).

Frieze Graphics, a printing and storing graphics-utility program. Without generating graphics, Frieze will produce a variety of screen dumps from an existing graphics display or save and retrieve pictures while a program is in progress. This program will work with nine assorted printers, producing up to 16 shading patterns on black-and-white printers and 256 colors on color printers. Floppy disk, $55. ZSoft Corporation, 370 Hermitage Court SW, Marietta, GA 30064.

Frustration, a learning game of memory and skill. Try to guess the secret alphabetical sequence as you practice typing letters in ascending order. Improves memory and typing skills simultaneously as you try to light up 25 little boxes. Floppy disk, $29.95. Asmara Productions, POB 1199, Noble, OK 73068.

Incubula, a strategy game set in an ancient civilization. As your civilization advances and establishes arts and technologies, it develops from a tribe to a clan, a nation, and finally an empire. Disasters along the way reduce the population as you fend off enemies. In the struggle toward civilization, only the selection of wise laws will

IntCalc, an electronic-spreadsheet program. With three-dimensional, split-screen capability, you can customize-program or sort sample worksheets. Additional features include formula analysis by rows, columns, and pages; four numeric types; commas and floating dollar signs; and adjustable column widths for clarity. Floppy disk, $295. Schuchardt Software Systems, 515 Northgate Dr., San Rafael, CA 94903.

Move-It, a communications program for use in transferring data between computers. Move important documents between locations via modem regardless of hardware. The low error rate is due to error checking, auto-dial support, unattended operation, and online help. The directory display ensures disk integrity. Combines with Speedstart, a load-and-go system. Floppy disk, $150. Digital Research (see address above).

The Organizer, a file-link utility system for use with Lotus 1-2-3. Create a branching-tree file-selection menu system to organize and instantly access files. An easy-to-edit menu board with handy commands. With push-button menu selections on a file-link master menu, you can access up to six files that provide access to an additional six files. Floppy disk, $89. The Whiterock Alternative, 8255 15th Ave. NE, Seattle, WA 98115.

Outbliette, a fantasy-adventure game. This role-playing game uses text and graphics in ten dungeon levels of increasing challenges. You control six adventurers in their quest for gold and glory. But when you enter the dungeon there is one escape and occasional encounters with monsters. Floppy disk, $39.95. Human Engineered Software (see address above).

PlanStaz, a financial-planning and reporting package. Functioning like a visible calculator, this program stores data or arithmetical relationships at each spreadsheet position for financial modeling. It separates data from calculation rules allowing for sequential logic. You can specify calculations in English rather than matrix notation. Reports and graph formatting do not take up unnecessary spreadsheet space. Floppy disk, $595. Micropros International Corp., 33 San Pablo Ave., San Rafael, CA 94903.

Reportmaker, a business tool for use in writing and presenting reports. The main menu offers several commands: a pie-chart generation program that can be cancelled without destroying data, the graph generator that is for bar charts with various shading methods, and a heading generator that lets you format. You can also design logos on the grid. Floppy disk, $130. Krepec Software Inc., Suite 208, 5460 Royalmount, Montreal, Quebec H4P 1H8, Canada.

RL-1 Relational Database Management System, an integrated operational data-storage package. An interactive English-language type is used for the manipulation of data. A relational editor inputs and updates records into database. The report generator creates customized reports. And the program interface enables applications to be written in any high-level language. Floppy disk, $495. ABW Corp., POB M1047, Ann Arbor, MI 48106.

RXSet, a printer-interface program. You set format and printer-control codes through interactive screens. In turn, receive a status report and access help screens to print numerous text files requiring different printing parameters. This program does not include graphics capabilities. Floppy disk, $15.25. On-Disk Software, POB 382, Lincoln, MA 01773.

The Sales Edge, a business-strategy success program. You can evaluate the human factors affecting your sales performance by learning customer buying styles, being aware of your own behavioral techniques, and preparing customer-specific strategies for opening, presenting, and closing of sales negotiations. Floppy disk, $250. Human Edge Software Corp., 2445 Faber Place, Palo Alto, CA 94303.

Silver Software Series, four business-applications programs. Silverwriter is the word processor for editing, creating and merging a mailing list, and printing. Silverbudget is the accounting and budgeting program. Silvercalendar is a multidimensional scheduling section. And Silverfolio is the personal inventory section. The portfolio also offers financial functions such as net-worth statement, lists of property, and amortization schedules. Floppy disk, $399. Douthett Enterprises Inc., 200 West Douglas, Wichita, KS 67202.

Softplot/BGL, a graphics library for Microsoft BASIC. Enhance systems with graphics displays and add hard-copy graphics capability to any system with a dot-matrix printer or plotter. Improve technical, business, educational, or other applications with a set of high-level commands to build graphics programs. Floppy disk, $99. Graphic Software Inc., POB 367, Kentmore Station, Boston, MA 02215.

SuperCalc 2, an electronic-spreadsheet package. Without typing in commands, you can format and make backup copies of your disks, rename and erase data files you create and display them on the screen, and find out how much workspace is left. You can also set up what-if modeling spreadsheets. Floppy disk, $295. Digital Research (see address above).

Target Financial Modeling with Speedstart, an electronic spreadsheet for financial modeling in accounting, marketing, finance, and banking. Features include forward referencing, conditional logic, column referencing, communication, data and statement consolidation, a report generator, and pre-written financial models. Floppy disk, $325. Digital Research (see address above).

Ten Key, a concurrent calculator program. Integrated inside your computer, this calculating program lets you interrupt any application by pressing a command key. Press the key again, and the
former application is restored. It also has the ability to transport total files back to the original application. Floppy disk, $48.50. Photon Software, POB 1408, Bellevue, WA 98009.

TMP/Free Form, an information storage and retrieval system for management planning. Regardless of the drive you entered on the command line, you can specify what drive you want to access for storing, listing, and deleting files without losing your program. Because the program will use the drive you specify, you can use any number of drives. Floppy disk, $225. United Software Co., 2431 East Douglas, Wichita, KS 67211.

TMP/Manager I, a structured database-management system. Two master disks contain the following program tools or functions: dictionary, edit, select and sort, transfer, report maintenance, report writer, catalog and label writer, and a database directory. Using tags instead of index files, you can speed up the process by selecting and sorting only a portion of your database. Floppy disk, $995. Micro Architect Inc. (see address above).

WSSORT, an interactive program. Select, merge, and sort sequential files, manage a database, or select up to 20 specifications and 20 levels of sorting simultaneously. The amount of information processed is disk based, and is thus not limited by memory. Floppy disk, $69.95. Nugget Software Inc., POB 440979, Aurora, CO 80044.

μ-Series Assemblers, Linker, and Librarian, cross-assembler programs for program development. Several relocating macroassemblers and a few compilers are supported by a single universal linker named XLINK. A special symbolic format exists that contains module names, globals, and locals to use with external emulators and debuggers. XLIB, a universal librarian, is included to create and maintain object-code libraries. Floppy disks, price not available. IAR Systems AB, POB 23051, S-750 23 Uppsala, Sweden.

Word-X, a word-processing package. Features include full-screen editor, word wrap, print text formatter, merge facility, function keys, help command, global changes, and the ability to obtain multiple copies. This program is compatible with other office-integration systems such as the database manager and executive information systems. Floppy disk, $98. Micro Architect Inc. (see address above).

WSSORT, an interactive program. Select, merge, and sort sequential files, manage a database, or select up to 20 specifications and 20 levels of sorting simultaneously. The amount of information processed is disk based, and is thus not limited by memory. Floppy disk, $69.95. Nugget Software Inc., POB 440979, Aurora, CO 80044.

TRS-80

Accounts Payable, a business-accounting program. This can handle four standard general-ledger accounts plus an additional 14 expense accounts that you define. It can contain up to 1,100 transactions on file, 75 vendors, and an unlimited number of invoices per check. It automatically calculates due dates, discount dates, and can print in several formats. For the Model 4; floppy disks, $199.95. Radio Shack, 1400 One Tandy Center, Fort Worth, TX 76102.

AgDisk (Crop Management), a financial agricultural program. Designed to be used with Visicalc spreadsheets, this program helps in informed decision making of business crops. A few of the 11 templates include grain marketing, corn yield, gross margin, growing days, field calculations, pivot application, and fertilizer needs and costs. Combined with a calculator program with a grid 63 columns by 254 rows, you can construct formulas that ensure success. For the Model III; floppy disk, $69.95. Radio Shack (see address above).

AgDisk (Feedlot Cattle Management), an agricultural management program. Templates on the feedlot cattle management disk include cattle feeder, steer marketing, carcass evaluation, protein supplementation, and ration formulation. Combined with Visicalc spreadsheets, you can keep up with changes and evaluate data for future reference. For the Model III; floppy disk, $69.95. Radio Shack (see address above).

Assembly Language Development System, a tool for developing Z80 programs. The five systems this program contains are a text editor, an assembler that converts source programs to Z80 object code, a linker, a debugger, and a file-transfer system. Previous knowledge of assembly language is suggested. For the Model II and 12; floppy disk, $249. Radio Shack (see address above).

Business Graphics Analysis Pak, a colorful graphics package for business presentations. Enter data, select a chart type, format your specifications, and print the screen. Choose from four types: line charts, bar charts, pie charts, and scatter charts. Select variations such as automatic scaling, formatting, labeling, chart width, straight or curved lines, solid or dotted lines, shading, frames, and numeric scale labels. You can also manipulate data. For the Model II and 12; floppy disk, $249. Radio Shack (see address above).

Executive Calendar, a time-management program. Plan your daily and weekly schedules or display and print any month of the year. The dates of 17 holidays are programmed in the calendar section, and the calculation ability lets you figure the number of days needed to complete a specific project. For the Model 100; cassette, $19.95. Radio Shack (see address above).

Graphcom, a graphics-design program. You can create, edit, and transmit pictures and text. Written in FORTRAN and designed for the novice user, you let the graphics guide you through the program. This program can even facilitate communication between people of different languages. For the Color Computer; floppy disk, $24.95. Spectrum Projects, 93-15 86th Dr., Woodhaven, NY 11421.
Software Received

Payroll, a payroll system for small businesses that tracks earnings, deductions, and taxes for each employee. You can customize your system to meet local, state, and federal tax laws. It keeps historical records by current period, quarter, and year for all employee earnings and deductions, plus all employer liabilities. It lets you design reports or print reports for audit trails. For the Model 4; floppy disk, $199.95. Radio Shack (see address above).

Starblaze 100, a space-arcade game. With one of your three ships, you must move from planet to planet. You can fire up to three missiles at a time with the spacebar. Be certain not to move when you are in the transporter or your ship will be destroyed. For the Model 100; cassette, $19.95. Radio Shack (see address above).

Spectacular, a calculator program. Your screen becomes a worksheet with rows and columns. You can budget and forecast, do statistics, and even do math homework. Prepare a table format with formulas for easy recalculation to avoid retyping. It can print any or all of a document. For Models I and III; cassette, $34.95. Radio Shack (see address above).

Videoex Plus, a communications package. You can communicate with a variety of information services and host computer systems. The three modules include an interactive terminal and data communications program, a specialized program for use with store and forward information services, and a program to prepare auto-log/auto-dial procedures. You can print hard copies with a printer-control feature. For the Model 4; floppy disk, $49.95. Radio Shack (see address above).

Other Computers

MorseKey, a Morse code to ASCII converter. Written for disabled children, this program is valuable for anyone wishing to use a computer as a communications device. For the Epson Notebook

This is the final "Software Received" section in BYTE. It will be replaced by expanded coverage of software in our "What’s New?" section beginning in June. This expansion will include color pictures in "What’s New?" and the relocation of the beginning of this section to the front of the magazine. Color transparencies (slides), 35mm or larger, stand a better chance of being used than color prints. Publishers who want their software to be considered for inclusion in "What’s New?" should send information or products to New Products Editor, BYTE, 70 Main St., Peterborough, NH 03458. Of course, we will continue to do full reviews of software also. Publishers who want their programs to be considered for a full review should send a copy of their product to the Product Review Editor at the same address.

BYTE’s Bits

Used Equipment Repository

The Harvester is a nonprofit organization that places used computers in service with other nonprofit organizations for use by those unable to afford them. Donations are tax deductible, and reimbursements for shipping fees are available.
Kaypro Composite Video

Dear Steve,

I would like to know how to connect a Kaypro II to a monitor that accepts 1-volt composite video. I have not been able to obtain schematics. Is there any way around this? Thanks.

Henri J. Poché
New Orleans, LA

The Kaypro II video output cannot be sent directly to a composite-video monitor. You will have to combine the Kaypro's horizontal sync, vertical sync, and video signals into a composite-video signal first.

The separate video signals are available at the following pins of connector J1:

Pin 1 horizontal sync
Pin 2 (key)
Pin 3 video
Pin 4 vertical sync

An example of a good video-combiner circuit can be found in an Intel application note titled "A Low Cost CRT Terminal Using the 8275." The number of the application note is AP-62, and it can be obtained from Intel Corporation, 3065 Bowers Ave., Santa Clara, CA 95051.

Kaypro schematics and a manual on the theory of the Kaypro's operation can be obtained from Micro Cornucopia, POB 223, Bend, OR 97709.

Steve

80 by 24 on an H-19A

Dear Steve,

After reading "Build the Micro D-Cam Solid-State Video Camera" in the September 1983 BYTE, I realized that my system was deficient because I had no high-resolution graphics. My system consists of a Heath H-39A terminal, Heath H-8 computer with 60K bytes of RAM, and a disk system. My terminal is connected to the computer via RS-232C.

What determines the 80-column by 24-line format in the display? And if I want high-resolution graphics, what modifications can I make to accomplish this? Will I be able to retain an 80 by 24 display with these modifications? Any help will be appreciated.

John Loong
Oak Park, IL

Most computer terminals have a similar set of components that allows characters to be displayed on a video-display screen. The components generally consist of:

1. A keyboard controller that converts key closures into ASCII (American National Standard Code for Information Interchange) code.
2. A memory system to store the input data.
3. A video-display controller to access the data and properly position it on the video display using timing circuitry.
4. A character generator that converts the data into readable characters on the video display.
5. A UART (universal asynchronous receiver/transmitter) to send the input data to the computer.

When a character is entered at the keyboard and converted to ASCII code, it is simultaneously sent through the UART to the computer and to the internal memory in the terminal. If the terminal displays 24 lines of 80 characters, the size of the memory system is usually 2K bytes (24x80=1920 bytes—it's rounded up to an integer power of 2). The video-display controller then continuously accesses data from the memory system and sends it to the character generator for display on the video display.

Each line of characters on the screen is composed of a number of "scan lines." Typically, several hundred scan lines are presented on the screen in a fraction of a second, which makes the display look like it is being presented all at once. These scan lines are composed of a number of dots that represent one slice of each character on the display line being presented. For example, depending on the character generator, the letter "T" might have five dots in the first scan line and a single dot in the next five scan lines, using a 5-by-7-dot character generator.

Terminals constructed in this manner cannot be used for high-resolution graphics unless significant modifications are made to the circuitry. One reason is that the amount of memory needed in a stand-alone terminal would have to be much larger than the 2K bytes built into the terminal. This doesn't mean it cannot be done. A good reference on the subject is a book written by Donald E. Lancaster, Son of Cheap Video, which can be obtained from Priority One Electronics or other advertisers in BYTE. An article in Microcomputing magazine shows how to use the TVT 6 5/8 terminal discussed in Don Lancaster's book with the Heath H-8 computer system (see "Cheap Video for Your Heathkit H-8," Microcomputing, March 1979, page 28).

Also, Heathkit is now offering a color graphics board for the H-8 computer that has three color display modes and 192-by-192 pixel resolution. This board is for use with a video device that accepts NTSC (National Television Systems Committee) composite video.

Steve

A Faster Z-89

Dear Steve,

How much would it entail to upgrade a Z-89 to operate at 4 or 6 MHz using a new crystal and a Z80A or Z80B in place of the original Z80? What else would have to be done?

Fred Ernst
Skokie, IL

Some care must be exercised whenever a piece of commercial equipment is modified to increase its speed. In some cases, it may be as easy as replacing the crystal and upgrading the processor. However, in most cases, the memory chips also must be replaced to be compatible with the new memory access times derived by the processor. Depending on the new processor clock rate, chips with access times of 150 to 200 nanoseconds will be needed. The existing chips should be checked to verify if their access time is compatible with the new clock rate. This also includes any ROM (read-only memory) chips in the circuit.

The schematics of the device should also be checked to verify that the new chip is used only by the processor and not by other circuitry such as the video controller and disk drives. In most cases, all clock frequencies in a device are derived from the same master oscillator.

Steve

A 2716/2732 Programmer

Dear Steve,

I have finally realized that, for me, the era of the 2716 EPROM (erasable programmable read-only memory) is about over. Having stocked up on some 2732s and still having only a 2716 programmer, I'm looking for an easy method or an adapter that
Figure 1: Programming the 2732 as two separate 2K-byte segments.

As shown in figure 1, A11 is produced at the 2732 socket by a switch that selects either the upper 2K bytes or the lower 2K bytes of the 2732. This is not a terrible inconvenience because the 2716 programmer works with a maximum 2K-byte block of data. 

Table 1: A truth table.

<table>
<thead>
<tr>
<th>Mode</th>
<th>CE/PGM</th>
<th>OE</th>
<th>CE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Read</td>
<td>low</td>
<td>low</td>
<td>low</td>
</tr>
<tr>
<td>Standby</td>
<td>high</td>
<td>high</td>
<td>high</td>
</tr>
<tr>
<td>Program</td>
<td>pulse</td>
<td>high</td>
<td>low</td>
</tr>
<tr>
<td>Verify</td>
<td>low</td>
<td>high</td>
<td>low</td>
</tr>
<tr>
<td>Inhibit</td>
<td>low</td>
<td>low</td>
<td>high</td>
</tr>
</tbody>
</table>

There is no direct method of converting a 2716 EPROM programmer into a 2732 programmer by using the existing 2n6 socket. Another address line, which does not appear on the 2716 socket, is needed for the 2732 (A11).

Figure 1 is a circuit diagram that shows how to get around this problem if you are willing to program the 2732 as two separate 2K-byte segments. The circuit assumes that you have a standard 2716 programmer and are going to convert it to program Intel-type 2732 EPROMs. To make the conversion, the functions of pins 18, 20, and 21 of the 2716 must be modified before they are sent to the 2732 programming socket. The following table shows the functions of these pins for the two EPROMs:

<table>
<thead>
<tr>
<th>Pin</th>
<th>2716</th>
<th>2732</th>
</tr>
</thead>
<tbody>
<tr>
<td>18</td>
<td>CE/PGM</td>
<td>CE</td>
</tr>
<tr>
<td>20</td>
<td>OE</td>
<td>OE/Vw</td>
</tr>
<tr>
<td>21</td>
<td>Vw</td>
<td>A11</td>
</tr>
</tbody>
</table>

As shown in figure 1, A11 is produced at the 2732 socket by a switch that selects either the upper 2K bytes or the lower 2K bytes of the 2732. This is not a terrible inconvenience because the 2716 programmer works with a maximum 2K-byte block of data. Vw now must be routed from pin 21 on the 2716 socket to pin 20 on the 2732 socket. The problem is that the Vw pulse for the 2716 varies from +5 volts (V) to +25 V, and the voltage levels for OE/Vw on the 2732 vary from 0 V to 25 V. The transistor shown in the circuit performs this voltage translation. If you intend to use 2732As in the circuit instead of the standard 2732, the maximum voltage must be reduced from +25 V to +21 V at pin 20 of the 2732 socket.

To produce a proper signal at the CE pin of the 2732, the truth table (see table 1) must be used.

The 4016 CMOS (complementary metal-oxide semiconductor) transmission gates and the 4049 CMOS inverters shown in figure 1 perform this translation. CMOS chips were selected to keep the power consumption from the 2716 programmer low, but equivalent TTL (transistor-transistor logic) or LS (low-power Schottky) chips can be substituted.

All other lines from the 2716 socket should be routed directly to the 2732 socket....Steve

Starting Points

Dear Steve,

I want to buy test equipment so that I can start building computer kits and learning about digital electronics, but I don't know which instruments I really need and
Dear Steve,

I am a fairly new subscriber to BYTE who has been intrigued by your Circuit Cellar projects. But while I have a good understanding of computers, I have virtually no knowledge of electronics. Can you suggest any books or materials that would help me get started? Also, which of your projects would you recommend for a beginner? I am interested in computer peripheral devices. Any information or advice would be truly appreciated.

Jeffrey S. Bond
Thousand Oaks, CA

Many good books are available to assist you in getting a better understanding of electronics. If you scan the advertising pages in BYTE, you will find just about everything you need, or you can obtain many of these books at a Radio Shack store.

If you have never worked with electronics, you could start with material that covers DC and AC circuit theory, then advance to books on digital electronics and linear circuits. However, a mix of reading and hands-on experience is probably the most enjoyable way to get started. A good book called Getting Started in Electronics by Forrest Mims uses this approach.

As you begin building circuits, you also may need technical data manuals that describe the functions of the devices you are using. Most chip manufacturers publish data manuals that cover TTL (transistor-transistor logic), CMOS (complementary metal-oxide semiconductor), and linear devices.

You also will need some tools of the trade when you actually start building and checking out your circuit. To get started, you should have at a minimum a good VOM, a soldering iron, some wire-wrap equipment, and a lot of patience.

As a first project, don't pick the MPX-16. Choose a simple circuit like the ECM-103 modem in the March 1983 BYTE or one of my other circuits with a low component count. You also can pick up a compilation of other Circuit Cellar projects in the volumes of Ciarcia's Circuit Cellar sold through the BYTE Book Club.

Dear Steve,

I have three questions that I hope you will answer. First, what is virtual memory? Second, what is a memory cache? Finally, what are the pros and cons of the new 32-bit microprocessors? Thank you.

Sanjoy Mahajan
Pittsburgh, PA

Virtual memory is a concept, as opposed to a physical entity. The concept allows running very large programs in a relatively small physical-memory space. It works by bringing small segments of a program into main memory from disk or drum storage and running those segments of the program. When these program segments have been run, new segments are brought into the same memory space and overlay those previously run. In this manner, virtually any size program can be run in a limited memory space.

Cache memory is a relatively small but fast RAM buffer physically located in the processor of a system. Portions of the relatively slow main RAM are brought into the cache memory where they are executed at high speeds. For example, a large main memory could consist of MOS (metal-oxide semiconductor) RAM chips with access times of 150-200 nanoseconds (ns), while the cache RAM could be ECL (emitter-coupled logic) chips operating with 45-ns access times. By running program segments in cache, a large increase in performance can be obtained.

The pros and cons of 32-bit microprocessors are numerous. I will touch on a few. The obvious advantage is that wider data buses offer an increase in speed because more bits can be manipulated with the same number of machine cycles. More powerful 32-bit instructions also make number crunching and string handling much more efficient. A disadvantage is that wider data buses and address buses mean carrying a lot more wires around the system. Another disadvantage, in the short term, is that software for the 32-bit microprocessors is not as available as it is for the smaller ones.

How much performance they should have. My main fears are that I will try an investment that I won't use a great deal and that I will buy an instrument that is not capable of the performance necessary for computer circuitry. I want to be able to work with processor clock speeds to 6 MHz.

I know I'll need a quality VOM (volt-ohm meter). Please help me choose other instruments that will get me started.

Thanks,

Tony L. Essman
Bartlesville, OK

As you start building and learning about digital and analog circuitry, you will find that your VOM will be the first piece of equipment you reach for when something doesn't work. It will be useful to determine if your power-supply wiring is correct and if your voltage levels are proper. Your decision to obtain a quality VOM is thus an excellent one.

A logic probe will also be important when analyzing digital circuits. You can obtain a good logic probe and pulse catcher combination from Priority One Electronics (see its ad in BYTE). The model number of the probe is 07GCSLP1, and the price is around $45. This probe will respond to a pulse train of 10 MHz and to a single pulse as short as 50 nanoseconds. The probe has pulse- or transition-level storage capability.

A good oscilloscope is expensive, but if you are serious about learning more electronics it will be a valuable item. Priority One Electronics also has a scope that will fill your needs. The model number is 07BKPL522, and the price is about $595 for a 20-MHz dual-trace scope. If you are interested in building a scope kit, you should look at Hoathki's 10-4550 dual-trace 30-MHz scope, which is advertised for about $470 in its 1983 catalog.

The ECM-103 Modem Revisited

Dear Steve,

I have your ECM-103 modem kit ("Build the ECM-103, an Originate/Answer Modem," March 1983 BYTE, page 26) and was wondering about the possibility of adding an autodial/auto-answer feature. Do you have any suggestions on how to accomplish this? I've seen inexpensive Touch-Tone chips advertised. How does the auto-answer mechanism work, and how could I go about integrating them?

Thanks.

Ian Cassell
Philadelphia, PA

Implementing auto-answer/auto-dial features in a modem can be quite complicated if the full power of these features is to be used. For example, a full-featured auto-dial modem resolves all the call-failure conditions that normally exist when making a call, such as busy signals and no-answer conditions. Simplified versions of these features can, however, be implemented with some available chips. Radio Shack is offering a set of telephony chips that can be used in these applications. They are the TCM1512A Ring Detector and the TCM5089 Tone-Dialing Encoder.

The TMS99532 modem chip
used in the ECM-103 has a pin that can be used for Touch-Tone dialing purposes. An analog signal present on the EXI (external input, pin 17) pin of the modem is passed through to the telephone line. You can make a simplified version of an auto-dial function by using this pin and the tone encoder. The EXI input is enabled when ATE is high, ALB is low, and SQT is high. For the ECM-103, these conditions are met when the originate/answer switch is in the originate mode prior to a valid carrier-detect signal.

The ring detector can be used to connect the output of the ECM-103 to the phone lines when a ring signal is detected. The ECM-103 also should be switched to the answer mode by this signal if it is not already in this mode. Circuitry can also be introduced that causes the modem to automatically hang up if a valid carrier-detect signal is not received in a preset time period.

Dear Steve,

Two of us bought your ECM-103 modem. My friend connected one to his Drake Theta 9000E terminal for amateur radio use, and I connected mine to my Kaypro II. We had some success, but not in the normal manner. When I use the Term program from Kaypro that converts my computer into a dumb terminal, I receive the signals originating from my friend but not my own ASCII characters.

I can send files through CP/M using PIP, transferring from the file in disk, to TTY: or PUN:; and using the echo feature I am able to see what I send. But I am able to do this only if I put the modem in the originate mode and connect the “mysterious jumper” between pins 5 and 6. Although we can communicate, we had not anticipated that the conversations would be only “one way.”

Here are my questions: What does the jumper do? Must one of us stay in the answer mode? We are using only the acoustic enclosures. Should we change to transformer coupling? Thank you.

Mario Handler
Caracas, Venezuela

First of all, let me clear up the question about the “mysterious jumper.” When a modem and computer are linked together, they must have some method of telling each other what they are doing and what they want to do next. These signals that are passed back and forth are generally termed handshaking signals. Pins 4, 5, and 6 of the RS-232C cable are handshaking lines and are generally called RTS (request to send), CTS (clear to send), and DSR (data set ready).

DSR in the ECM-103 is always set to a high level, telling the computer that the data set is ready (the modem is connected in this case). Normally, the computer sends a signal back through the DTR (data terminal ready) line to tell the modem that it is there. Both devices now know that the other exists. Note that the ECM-103 does not look for the DTR signal on pin 20 because it is assumed that a terminal exists. When you want to send data from the computer to the modem, the computer sends out an RTS signal to the modem. If the modem is ready to accept the data, it sends back a CTS signal, and the computer or terminal then sends the data to the modem.

If the RTS and CTS lines in the ECM-103 are jumpered together, as soon as the computer asks permission to send data by setting RTS, it gets an immediate “yes you can” signal from the CTS line. This should satisfy most applications. The other way this can be handled is to set the CTS line to a state where it is always telling the computer that it is ready. This is done by placing the jumper between pins 5 and 6. One of these two configurations will handle most cases where the terminal software needs a handshaking signal.

The ECM-103 was designed to be used in either the answer or originate mode depending on how the modem on the other end of the line was set. Both moderns cannot be set to the same mode or you will not be able to communicate properly. In general, the caller is set in the originate mode and the modem that is called is set to the answer mode.

You should not have to go to transformer coupling to get proper response from the ECM-103. However, if the modem noise is high on either end, direct connections would be helpful.

Cable Computing

Dear Steve,

I have been wondering if anyone has invented a modem for cable TV. Because the idea of tying up the phone for local communications by paying for my own phone line doesn’t excite me, I would welcome the development of such a device. I also would be interested to know if a device like this could have channels, not only so that you could switch to an empty channel, but so that different channels of computers could have designated channels.

Currently, our local cable company is letting a corporation and a community college use its cable as a high-speed link. I think it would make sense to make use of these frequencies.

Joel Stevey
Nyang, NY

Taking advantage of the cable TV frequencies for computer communication is going to be one of the next big areas in home-computer technology. In fact, it has already begun, as you mentioned, with cable stations being used for high-speed links. Teletext services also are being offered by networks and independent stations that send information in the vertical interval of regular TV broadcasts. However, decoders for this information are still very expensive, with prices ranging around $2000.

The home computer may soon see systems from Matsushita Electric that will include a combination feletext decoder and personal computer for communication over cable TV stations. This equipment would be rented by the cable company for use on its channels carrying this type of information service. Standards for this type of service are still being worked out, and the system may use the full TV channel rather than the vertical interval.

Full communication between computer users over cable networks will probably be next with all this activity in the area. A good source for keeping up with this type of technology is the Video Electronics column of Radio-Electronics magazine, where new developments in this area are periodically discussed.

SOFTWARE

Music-Writer Scores with Apples

Passport Designs is marketing Polywriter, a music-writing program for Apple II series computers. Polywriter generates and outputs to a printer musical scores of whatever is played on a Soundchaser keyboard. Diverse score formats can be printed: single treble line, single bass line, piano score, choral score, treble clef with piano, bass clef with piano, and full orchestral score.

Polywriter prints standard music notation. It handles note divisions, seconds, accidentals, ties, up or down octave adjustments, flags and beams, split stemming, triplet brackets, rests, any key signature, transposition up or down nine half steps, and up to 15 time signatures, including complex and asymmetrical. Its full-scale editor can manage lyric and chord symbols.

Minimum system elements are a Soundchaser Basic System, a floppy-disk drive, monitor, Grappler printer interface card, a dot-matrix printer with graphics capabilities, and an Apple II, II+ or IIe or equivalent compatible. The suggested list price is $595. Passport Designs Inc. is located at Suite 103, 625 Miramontes St., Half Moon Bay, CA 94019, (415) 726-0280.

File Sort for Visiscalc

A machine-language Visiscalc file-sorting utility is available from Keene Computing Services Company. XVCSort lets you sort any block of data made up of either strings or numeric constants. Sorts can be performed in ascending or descending rows or columns and with any number of columns or rows setting the sort-comparison order. This utility's only requirement is that the model's data be saved in a /DIF file.

XVCSort is compatible with systems running LDOS 5.1.x or TRSDOS/LDOS version 6. The suggested price is $25.00. When ordering, specify DOS and computer. Contact Keene Computing Services Co., Suite 43, 407 Nagle St., College Station, TX 77840, (409) 846-4426.

Circle 562 on inquiry card.

Church Management Programs Available

ACTS church financial and information management packages are available from Burr Computer Consultants. The financial programs are designed to handle all general and special income and expenses. They include provisions for checkbook accounts, payroll, and donation accounting. They also include five monthly financial statements.

ACTS information management programs provide utilities to maintain member profiles, directory listings, visitor follow-up, attendance tracking, and shepherding programs. They offer profile-search functions as well as the ability to generate mailing lists and interface with word-processing programs.

Distributed in dBASE II source code, ACTS' minimum requirements are two doublesided, double-density 48-tpi disk drives. Programs are available in most CP/M, MS-DOS, and PC-DOS formats. Churches with memberships in excess of 500 require larger disk capacities. The programs are $300 each, or both can be purchased for $500. Manuals alone are $30. Contact Burr Computer Consultants, 6402 Thoreau's Way, San Antonio, TX 78239, (512) 650-4342.

Circle 569 on inquiry card.

Program Orders
Disk Files

Catalog-Master organizes and maintains a master file directory of your floppy disks. It compiles directory reports sorted in alphabetic order by filename. Individual file descriptions can be merged with master directory reports.

Catalog-Master will index any disk volume supported by CP/M-80 version II. An 80-column by 24-line display and 48K bytes of memory are needed. Disk formats are available for Epson QX-10, Heath/Zenith 290, Kaypro II/4, and other CP/M-80-based computers. Catalog-Master is $29.95. For full particulars, contact Generic Software, Department 14P, 190 Timber, Marquette, MI 49855, (906) 249-980.

Peachpak 4 for 16-Bit Computers

Peachtree Software is distributing an updated version of its Peachpak 4 accounting package that's fashioned to run on 16-bit microcomputers. Comprising general ledger, accounts receivable, and accounts payable modules, Peachpak has been enhanced with expand and compress abilities that let you adjust your work for 80-column printing without exiting to DOS. In addition, the operators manual has been rewritten.

Peachpak 4 will run on the following 16-bit microcomputers: Compaq, Eagle PC, IBM PC, Texas Instruments Professional Computer, and Zenith Z100. It lists for $395. For more information, contact Peachtree Software Inc., 8th Floor, 3445 Peachtree Rd. NE, Atlanta, GA 30326, (800) 247-3224 or in Georgia, (404) 239-3000. Circle 550 on inquiry card.
What's New?

Statistical Simulators Released

Actuarial Micro Software has released two general-purpose statistical simulators for Apple II and IBM PC computers: Gass and Monte Carlo Simulations. Gass simulates as many as 10 Boolean, functional, or compound random variables can be incorporated into a spreadsheet program or manually by responding to a series of prompts. Monte Carlo Simulations can perform statistical analyses and construct models. It employs the chi-square goodness-of-fit test to match a set of raw data to a standard probability distribution. It features high-resolution graphics, color, and audio enhancements. Results of individual simulations can be incorporated into a spreadsheet to produce complex models.

Rainbow Graphs Suitable for Presentation

Infograph 100 is a presentation-quality graphics system for novice and knowledgeable DEC Rainbow 100/100+ users. This menu-driven package has integral decision rules that help you make consistent and accurate graphs. Data may be entered directly from a spreadsheet program or manually by responding to a series of prompts.

Cross-Assembler for NS16000 Announced

Program Concepts has announced a cross-assembler development system for National Semiconductor's 32-bit NS16000 microprocessor. Designed for use with the IBM Personal Computer, this package comprises four utility programs: cross-assembler, cross-link, debugger, and librarian. Program features include macro instructions, floating-point mathematics, a memory-management unit, and MMU support. Basic requirements are PC-DOS 2.0, 192K bytes of RAM, and dual 320K-byte floppy-disk drives. It costs $595. A manual is supplied. A C language source and a multitasking operating system for the NS16000 will be available soon. Contact Program Concepts Inc., POB 8164, Charlottesville, VA 22901, (804) 978-1850.

HP/IBM PC Link

PCCOM from DWJ Associates provides the IBM PC with Hewlett-Packard terminal emulation and communications capabilities. Operating modes and terminal- and printer-control functions are selected through a 13-menu function-key hierarchy. PCCOM generates a 48-line display memory with a 23-line by 80-character screen window. Terminal configuration is performed through keyboard entries that can be saved to disk for automatic power-on terminal configuration. Its full-screen editing capabilities include line and page insert, delete, and clear. Video attributes such as inverse video, blinking, high intensity, and underlining are supplied. Among its print features are adjustable margins and character line, or block operation in forms and nonforms modes. Fifteen transmission rates, ranging from 50 to 9600 bps, and even, odd, zero, mark, or no parity transmissions are provided. Eight user-programmable function keys with up to 16 character labels and 80 character-string definitions are available. Also offered are serial-port capture into or transmission from user-specified data files, and carriage return/line feed, ENO-ACK, and XON/XOFF pacing.

PCCOM is compatible with PC-DOS versions 1.0, 1.1, 2.0, and 2.1. It will emulate HP2622 and HP2624B terminals with the exception of their graphics modes and alternate character sets. It costs $450. The manual alone is $520. For more information, contact DWJ Associates Inc., One Robinson Lane, Ridgewood, NJ 07450, (800) 922-0090; in New Jersey, (201) 445-1711.

Circle 567 on inquiry card.

Research's GSX graphics extension of CP/M, which provides access to most standard graphics printers and plotters. It requires CP/M. This system costs $395, including GSX. For the name of the Infograph dealer nearest you, contact GMS Software, 113 East Savarona Way, Carson, CA 90746, (213) 217-0161.

Circle 553 on inquiry card.
Tektronix Compatibility for Lisa

A Tektronix-compatible applications program, Mesa Graphics' Tekalike operates on the Apple Lisa. Tekalike is a graphics terminal communications package that supports communications to remote computers as an ASCII terminal. It maintains the Tektronix 4010 family's graphics protocols for graphics terminal I/O and is said to be compatible with most mainframe graphics software that works with the 4010 terminals, including Isoco, Megatek, and SPSS/Graph. Tekalike also provides local facilities for zooming and plotting pictures. No modifications to the Lisa are required.

Tekalike is tailored for the Lisa, Lisa 2/5, and 2/10 with a hard-drive and 1 megabyte of RAM. It costs $350 and is available from Mesa Graphics, POB 506, Los Alamos, NM 87544, (505) 672-1998. Circle 555 on inquiry card.

Background Processing for IBM PC

The DoubleDOS operating system enhancer from Softlogic Solutions lets the IBM PC or PC XT run two tasks simultaneously. Acting as an extension to PC-DOS 1.1 or 2.0, DoubleDOS divides the PC's memory into two areas, one for each program running. Programs can be loaded into either memory area, where they are allowed to operate without requiring keyboard interaction. Program displays are trapped by DoubleDOS. When the background program screen is called up, any processing that occurred during operation is reflected.

DoubleDOS supports either monochrome or color display monitors. On PCs with both displays, it provides the option of using either one for background or normal applications. DoubleDOS also provides two 80-character type-ahead buffers.

DoubleDOS does not require software modifications or additional hardware. It can work with 128K-byte systems, but 192K bytes of RAM are recommended. The suggested price is $299. For more information, contact Softlogic Solutions, 530 Chestnut St., Manchester, NH 03101, (800) 272-9900; in New Hampshire, (603) 627-9900. Circle 568 on inquiry card.

Scribe Works with Notebook Computers

The Scribe word processor works with the NEC PC-8201 notebook computer's built-in Text program. Scribe features menu control, message prompting with defaults, automatic paging and numbering, text indentation, headers, inserts, double-width characters, margin resets, right justification on/off, and the ability to stamp each page with filename, date, and time. Print attributes such as user-selectable tractor-feed or single-sheet paper and the ability to print documents of any length from a combination of RAM or tape files are standard. A typical unjustified text can be printed at about 25 to 50 cps.

Scribe uses only 2.3K bytes of memory. It requires approximately 3.5K bytes to load and run. Scribe cannot underline or create superscripts or subscripts. It costs $29.50, plus $2 for shipping and handling. A version for the Radio Shack Model 100 can be ordered. Contact Chattanooga Systems Associates, POB 22261, Chattanooga, TN 37422, (615) 892-2339. Circle 566 on inquiry card.

Turtle Logo Paks In Two Sizes

The Kreil Turtle Logo Pak for the Apple II is available in two sizes: 20 and 40 disks. Each Turtle Pak contains "Alice in Logoland" disks and primer and utility disks with a host of MIT's Logo programs: Drawtrack, Shape Editor, Music Editor, and Sprite Drivers. In addition, the Pak has Logo command wallcharts. Dan Watt's Learning with Logo and the MIT technical manual, Logo for the Apple II.

The 20-disk version of Turtle Pak lists for $499.95. The 40-disk version is $899.95. For details, contact Krell Software Corp., 1320 Story Brook Rd., Story Brook, NY 11790, (516) 751-5139. Circle 564 on inquiry card.

Doodle with Graphics on Your Z-100

The Doodler Graphics Package for Heath/Zenith Z-100 computers works with color or monochrome displays. Doodler draws lines, boxes, circles, ovals, and mirror images and lets you move, copy, or erase portions of the screen. Text can be of variable width and proportionally spaced or scaled. Characters can be displayed in italics or with a back-slitant, and Doodler's font editor lets you build custom characters. The two-dimensional drawings created with Doodler can be saved to disk for later playback, editing, or merging with other programs.

Doodler is menu-driven, using single-keystroke commands. It comes with drivers for Gemini, Epson, C. Itoh, and similar dot-matrix printers. It costs $79.95. Contact Paul F. Herman, Data Systems Consultant, POB 535, St. James City, FL 33956, (813) 283-2227.

Passive and Active Circuit Analyzer

ACNAP is a general-purpose electronic circuit analysis program from BV Engineering. It analyzes passive and active circuits consisting of resistors, capacitors, inductors, controlled current sources, operational amplifiers, transistors, FETs, and so forth. It will analyze the response of any linear network consisting of up to 21 nodes and 60 components. ACNAP works with component tolerances to provide worst-case and Monte Carlo analysis. It can calculate minimum, maximum, mean, and three sigma points of a circuit's gain/phase response to any frequency input. Linear and logarithmic frequency sweeps can be specified. Additional calculations include the sensitivity of the gain/response to components at a frequency or range of frequencies. Calculation of any circuit's noise equivalent bandwidth is automatic.

Every ACNAP command is either menu-driven or program-prompted. Circuit data is stored to disk; both ASCII and binary file structures are supported. Calculating the re-
What's New?

Rainbow and TI Professional Business Software
State of the Art's FM Series of small-business accounting and word-processing programs are available for the Texas Instruments Professional Computer and the DEC Rainbow and Rainbow Plus. The FM Series is made up of general ledger (with bar-chart graphics), budget and financial reporting, accounts payable, accounts receivable, sales invoicing, inventory control, payroll, word processing, and professional time and billing modules.

These programs can serve as stand-alone modules or, for a complete accounting system, they can be integrated with each other. They can be customized to meet your organization's specific needs. Program highlights include information windows and on-screen prompts. For future expansion, all modules are designed to be easily expandable from a floppy-disk to a hard-disk-based MS-DOS system.

Individual FM Series packages range in price from $945 to $795. A hard-disk installation kit is $95. Versions of FM Series are also available for the IBM PC, PC XT, Corina, Compaq, and Columbia. For further information, contact State of the Art Inc., 3183-A Airway Ave., Costa Mesa, CA 92626-4618, (714) 850-0111
Circle 565 on inquiry card.

Function Key Program for Kaypro
Xtrakey from Xpert Software lets you redefine any key on your Kaypro's keyboard with character strings. It has a built-in screen dump that lets you produce hard-copy outputs of the current screen display while running another program. Xtrakey also provides variable-length strings (i.e., pausing), as well as clear-screen and two additional screen-dump functions. It comes with predefined key-string sets for a variety of programs and an editor for designing custom key strings. Xtrakey can also redefine cursor and numeric keypad keys.

With documentation, Xtrakey costs $39.95. Add $2 postage and handling when ordering factory-direct from Xpert Software, 8865 Poland Ave., San Diego, CA 92123, (619) 268-0112.
Circle 560 on inquiry card.

Generate Fonts with Plotters
Centerpoint's Sign-Plot program lets you produce six different type-set-quality letter fonts for use with pen plotters from such manufacturers as Hewlett-Packard, Houston Instrument, and Enter. Uppercase, lowercase, punctuation, and numbers are part of this menu-driven program. Any character can be slanted for an italic effect, and letter sizes are variable. Characters may be position vertically and horizontally in fractional inch increments. Additional fonts and symbols can be created.

Sign-Plot works with 128K-byte IBM Personal Computers with two disk drives and CPM/80-compatible systems. It also works with Amdek, Apple, ComцЬ, Mannesmann Tally, and Strobe plotters. Sign-Plot costs $149. For more information, contact Centerpoint Computer Applications, 500 North Michigan Ave., Chicago, IL 60611, (312) 467-0333.
Circle 570 on inquiry card.

Protact Processing and Control for DEC
Protact, a transaction processing and control system for DEC Professional computers, gives you terminal, file, and network management capabilities and lets one or two users access applications on a remote or local Professional, PDP-11, or VAX. Its terminal management presents a form to be completed by the user and verifies user-specified primary edit checks as each field is entered. Form definition is kept separate from the program. A dispatching system provides a hierarchical menu structure. Protact can route items to another computer for processing. This is said to be transparent to the user and applications programmer. Security is definable at both the local and remote level.

Protact's file manager uses DEC's Record Management Services as its file-access method. Transparent remote file access is supported, and file definition is maintained outside the referencing program. A restart/recovery system with start-and-commit-transaction logic is supplied. Protact comes in three versions. The Developer's Kit, priced at $2500, has the necessary components to write and carry out applications on the Professional. [Applications are written in any language that supports CALL statements.) The Protact run-time system is made up of components used while an application is executing. A license is $395. The Terminal Server, intended for Professional computers linked into an Ethernet network, has terminal- and network-management facilities. It costs $595.

P/OS V1.5 and V1.7 are required. Multiple processor and educational institution discounts are available. Contact Advanced Systems Concepts Inc., 22 Hudson St., Hoboken, NJ 07030, (201) 798-6400.
Circle 558 on inquiry card.

Spreadsheet Link for IBM PCs
Spreadsheet Link lets you download data from the Dow Jones News/Retrieval database into Lotus 1-2-3, VisiCalc, Multiplan, and other spreadsheet programs running on an IBM PC. This program works with the IBM PC, PC XT, and 3270 PC. Minimum memory requirements are 128K bytes; your spreadsheet may require more memory. With VisiCalc, Spreadsheet Link only needs a single double-sided drive; Multiplan and Lotus require two.

A monitor, acoustic coupler or 300/1200-bps modem, and a parallel or serial printer with an asynchronous communications adapter are required. The following modems are supported: Radio Shack TRS-80 Modem II, Hayes Smartmodem, and the Novation 103/212 Smart-Cat. The suggested retail price is $249. For further information, contact Dow Jones & Co. Inc., POB 300, Princeton, NJ 08540, (800) 257-514; in New Jersey, (609) 452-151.
Circle 563 on inquiry card.
What's New?

MASS STORAGE

60K RAM for Portable Computers

Portapac 100 from Crytronics expands a portable computer's memory by serving as a RAM disk. It comes with its own operating system and communicates with CP/M- and MS-DOS-based computers through its RS-232C serial port. It can access up to 32 separate files in a 60K-byte RAM, which is expandable to 252K. It can operate continuously for three hours and store data for two days before recharging the battery.

Portapac 100 is $395. It's available from Crytronics Inc., Suite 7, 11711 Coley River Circle, Fountain Valley, CA 92708, (714) 540-1174.

Apple Disk Drive and Controller Card Marketed

Concorde Peripheral Systems markets a single-sided 163K-byte floppy-disk drive and a disk controller card for Apple computers. The Concorde Model C-111 disk drive has the following technical specifications: 35- or 40-track capabilities; track density: 48 tpi; data transfer rate: 250K bits per second; rotational speed: 300 rpm; recording frequency: 1.8 megahertz. This single-head drive measures 6 x 3 1/2 x 9 inches and weighs 4 pounds. It plugs directly into the Apple II controller card.

The C-130 Disk Controller Card can accommodate four single- or double-sided Concorde or Apple-compatible drives. Its supplied software allows Apple DOS 3.3 to function with Concorde's line of double-sided disk drives. The C-130 operates with DOS 3.3, and 5 or 10 megabytes of removable-cartridge storage. With the addition of an 8-bit controller, Diskitris will work with such 8088-based systems as the Kaypro, North Star, and Televideo.

The 10-megabyte drive costs $1495. The 22.2- and 34-megabyte units are $2695 and $3495, respectively. The 5-megabyte removable-cartridge Diskitris is $1695; pricing for the 10-megabyte version, which will be available later this month, was not established at the time this was written. When drives are daisy-chained, additional controllers are not required, reducing the per-unit price. For details, contact Systems Peripherals Consultants, 9747 Business Park Ave., San Diego, CA 92131, (619) 693-8611.

SYSTEMS

33-Megabyte Winchester for PC

Interface Inc.'s Disksystem provides the IBM PC with 33.3 megabytes of formatted disk storage. This 5 1/4-inch Winchester hard-disk drive records at 640 tpi and offers an average access time of 40 milliseconds. System features include a 512-byte buffer, an architecture built around a microprocessor, a double shock isolation system, and error checking and correction of 32 bits. Its physical dimensions are 5 1/2 by 8 1/4 by 15 1/4 inches.

Disksystem requires PC-DOS 2.0. It comes with its own power supply, cable, connector, and I/O adapter. The suggested list price is $2795. For more information, contact Interface Inc., 7630 Alabama Ave., Canoga Park, CA 91304, (818) 341-7914.

Line of Hard Disks Can Be Daisy-Chained

Diskitris systems offer low-profile line of hard-disk drives for IBM PC/XTs, Sanyo 550s, and PC-compatible portables. Diskitris' interconnect cables can be removed or daisy-chained up to four drives. The basic system chassis measures 2 1/4 by 6 by 12 inches.

Diskitris' formatted storage capacities are 10.8, 22.2, and 34 megabytes of fixed storage and 5 or 10 megabytes of removable-cartridge storage.

The Colby PC-3 stand-alone portable computer is compatible with the IBM Personal Computer. A 26-pound unit, the PC-3 measures 8 1/2 by 16 1/2 inches. Its 9-inch amber monitor has an 80-column by 25-line display format and IBM PC graphics capabilities. Standard are 128K bytes of RAM, a real-time clock, serial and parallel ports, and a SASI hard-disk interface. Dual 360K-byte double-sided, double-density floppy-disk drives provide mass storage. A carrying handle eases transportation and serves as a bit stand. Up to 1 megabyte of RAM and 3 1/4 internal slots constitute this computer's expansion possibilities.

The Colby PC-3 lists for $2795. For complete information, contact Colby Computer, 849 Independence Ave., Mountain View, CA 94043, (415) 968-8140.

Transportable PC-Compatible

The Colby PC-3 stand-alone portable computer is compatible with the IBM Personal Computer. A 26-pound unit, the PC-3 measures 8 1/2 by 16 1/2 inches. Its 9-inch amber monitor has an 80-column by 25-line display format and IBM PC graphics capabilities. Standard are 128K bytes of RAM, a real-time clock, serial and parallel ports, and a SASI hard-disk interface. Dual 360K-byte double-sided, double-density floppy-disk drives provide mass storage. A carrying handle eases transportation and serves as a bit stand. Up to 1 megabyte of RAM and 3 1/4 internal slots constitute this computer's expansion possibilities.

The Colby PC-3 lists for $2795. For complete information, contact Colby Computer, 849 Independence Ave., Mountain View, CA 94043, (415) 968-8140.

What's New?

Zenith Data Systems' Z-100 PC series microcomputers are compatible with IBM Personal Computer expansion boards and software. The Z-100 PC line consists of three desktop computers and two portables. All are based on the 8088 microprocessor and contain 128K bytes of RAM, dual RS-232C serial ports, a single Centronics-type parallel interface port, RGB color output, an IBM expansion bus, and a detached keyboard. The Z-100 PCs come with power-up diagnostics, three scrolling modes, and high-speed text and graphics displays. System software includes MS-DOS and a ROM-based BIOS. Mass-storage capacities range from 320K to 360K bytes per drive, depending on recording format. RAM is expandable to 640K bytes. When fully configured, the Z-100s have four expansion slots remaining for future accessories.

The desktop Z-100 PCs are available with a single 514-inch floppy-disk drive, dual floppy-disk drives, or with a floppy-disk and 10.6-megabyte Winchester hard-disk drive. Prices are $2699, $3099, and $4799, respectively. Each desktop unit provides gray-scale monochrome output.

The portable systems are equipped with 9-inch amber monitors. They measure 19.5 by 8.38 by 19.13 inches and weigh approximately 33 pounds. They're offered in single and dual floppy-disk drive configurations. The prices are $2799 for the former and $3199 for the latter. For full details on these products, contact Zenith Data Systems, 1000 Milwaukee Ave., Glenview, IL 60025, (312) 391-8744.

AKA PC Offers IBM Compatibility

The AKA Personal Computer is a 16-bit, 8088-based microcomputer that's compatible with IBM PC hardware and software. Equipped with 128K bytes of RAM, the AKA carries a pair of half-height, double-sided, double-density floppy-disk drives; five expansion slots; one parallel and two serial ports; and a low-profile detachable keyboard. A choice of monochrome or color-graphics display boards is offered. Its cabinet has room for four additional expansion slots and two disk drives. User memory can be increased to 256K bytes.

The AKA Personal Computer runs under MS-DOS. The AKA Plus, a version outfitted with a 10-megabyte hard-disk drive, is available. The AKA PC lists for $3295. The AKA Plus has a suggested retail price of $4795. For further information, contact AKA Computers Inc., POB 36247, Charlotte, NC 28223. (704) 334-2504.

Portable PC and PC Cluster Unveiled

IBM recently unveiled a portable computer and a PC Cluster program for connecting up to 64 IBM PCs, PC XTs, Portable PCs, and PCjr.s. The Portable PC uses the 16-bit 8088 microprocessor and comes with 256K bytes of RAM, color graphics monitor adapter, a single 360K-byte slimline floppy-disk drive, and a universal power supply. It sports a built-in, 9-inch amber monitor; the display format is 80 characters by 25 lines. An optional slimline floppy-disk drive can use one of the Portable PC's five slots. IBM DOS 2.1 provides compatibility with most of the software available for the full-sized IBM PC. This 30-pound unit measures 20 by 17 by 8 inches. It lists for $2797, including a carrying bag.

The IBM Personal Computer Cluster program lets you send, exchange, and share messages and information among IBM PC workstations. Workstations can share information and storage space on a fixed-disk drive at one machine in the Cluster. An interconnecting cable is required. A number of support options for connecting different IBM PCs are available: an adapter board, a PCjr Cluster attachment, and a Computer Cluster Cable Kit, which contains the cables and connectors for hooking together a pair of PCs.

A program license, priced at $92, is required for each system in the Cluster. The Cluster adapter is $340, and the Cluster Cable Kit lists for $110. The
Havac Is an Apple Work-alike
Micros Corporation recently introduced an Apple II work-alike computer called Havac. This transporable computer, constructed around the 6502 microprocessor and a 164K-byte 5¼-inch floppy-disk drive, offers 64K bytes of RAM, 8K bytes of ROM, a 62-key detachable keyboard supporting uppercase and lowercase characters, four cursor keys, high-resolution color graphics, video connections, and printer, serial, and game ports. Among the supplied software are DOS, a card file, calculator, BASIC, and a variety of utilities. The manufacturer asserts that more than 1000 Apple II programs have been successfully run on the Havac.

A stand-alone floppy-disk drive is offered as an option. The suggested list price is $5850 and includes all the features outlined above. For further details, contact Micros Corp., 2158 South Hathaway St., Santa Ana, CA 92705, (714) 241-5600.

CP/M Computer Is Apple-Compatible
The Intertek System IV is a dual-processor, CP/M-based computer offering compatibility with Apple hardware and software. The System IV runs Microsoft CP/M 2.20B on its Z80A microprocessor while in the Apple mode; operations are handled by a 6502 chip. The system features 64K bytes of RAM, high- and low-resolution graphics capabilities, a built-in RF modulator, six free peripheral connectors, speaker, game paddle/joy stick ports, uppercase and lowercase characters, cassette interface, and diagnostics. It offers 16 colors and integer BASIC. A QWERTY keyboard is augmented with a numeric pad, function keys, and automatic repeat.

A variety of peripherals are available: 12-inch green or amber monochrome monitors, 13-inch RGB or composite-video monitors, 5½-inch half- and full-sized floppy-disk drives and controllers, serial or parallel 13-cps letter-quality printers, and joysticks. The suggested retail price of the base System IV is $849. For details, contact Intertek Systems Inc., 1210 West Collins Ave., Orange, CA 92667, (714) 633-3591.

S-100 Bus Systems for Industry
Industrial-grade mainframe computers engineered around 8- or 16-slot IEEE-696 S-100 motherboards are marketed by Futech International Corporation. The Futech 2000 Series provides up to 25 rear-panel DB25 connectors, front bezels to accommodate up to six floppy- or Winchester-disk drives, and switchable heavy-duty 100, 120, 220, and 240 V AC 50/60 Hz power supplies.

The 2000 Series' multiser, multiprocessor CP/M-compatible operating system supports concurrent hard disk and 8- and 5½-inch floppy disks. Batch processing, record and file locking, multilevel security, and automatic log are provided. It supports high-performance spooling of up to 16 concurrent printers and 16 print queues.

The 2000 Series can handle both 8- and 16-bit slave processors in the same enclosure. Each slave has a dedicated microprocessor, RAM memory, and I/O ports. Other standard features include on-board LED warning indicators, gold-plated 100-pin edge connectors, built-in EMI/RFI filter, line surge/spike suppression, and two filtered fans.

The 2000 Series can incorporate a front-panel LED that displays time, date, and internal and ambient temperatures. Additional options include auxiliary connectors for floppy- and hard-disk drives, a synthesized warning voice, and backup power supply. A variety of applications packages and operating systems are available. The base price is $730, quantity one. For complete specifications, contact Futech International Corp., Suite 1807, 2100 North Highway 360, Grand Prairie, TX 75050, (214) 660-1955.

ET Desktop with Software
The ET-2010 desktop computer comes with a software bundle comprising an enhanced DOS that's compatible with CP/M 2.2, Business BASIC, and word processing, spreadsheet, general ledger, accounts receivable, accounts payable, and payroll with job costing packages. The ET-2010, a 64K-byte machine assembled around a 4-MHz Z80A processor, has parallel Centronics and serial interface ports and a 76-key QWERTY keyboard plus a numeric pad. Its built-in 9-inch high-resolution green screen has an 80-character by 24-line display and strike-through, blink, blank, reverse, and underline attributes.

Optional system hardware includes 9511 and 9512 arithmetic coprocessors, DMA controller, the 6-MHz 2808, and a 10-megabyte hard-disk unit. A multituser, multitasking operating system and networking capabilities are also offered. A two-disk system costs $1349, including software, monitor, and keyboard. With a single disk drive, it's $1225. Options range from $25 to $1100. Contact ET Computer Systems, 8161 Broadway, Lemon Grove, CA 92045, (619) 466-1671.
**What's New?**

**PERIPHERALS**

**Dedicated Control Boards**

Adaptive Micro Systems' AMS-1000 series of single-board computers is intended for dedicated control applications in which the board serves as the development and target application system. Standard are an RS-232C port, dual 8-bit parallel TTL I/O ports, a pair of 16-bit counters/timers with interrupts, 2K or 8K bytes of battery-backed CMOS RAM, and a 44-pin expansion bus. An extra socket is available for 2K- or 8K-byte EPROMs or EEPROMs.

Programs can be automatically booted on power-up, and a wake-up feature for multidistributed process-control applications is provided. The fully socketed board measures 4 1/2 by 4 1/2 inches.

The basic board comes with a 6502 microprocessor and an extended version of FORTH and a 6502 assembler in firmware. The 2K-byte AMS-1000 costs $299. The 8K-byte version is $399. Documentation and FORTH tutorials are supplied. Further details can be obtained by contacting Adaptive Micro Systems, POB 965, Sandy, UT 84091.

Circle 595 on inquiry card.

**Apple Given Gold Card**

Digital Research has announced the CP/M Gold Card for Apple II series microcomputers. The Gold Card combines a 6-MHz 280B microprocessor, up to 192K bytes of memory, disk cache, and CP/M Plus on a single plug-in card. Standard are CBASIC, menu-driven utilities, 80-column display capacity, hash directory, time and date stamp facility, automatic loading, and console I/O redirection.

It comes with 64K bytes of memory, software application-development tools, and assembly-language utilities. The price is $495. An add-on disk cache advances the Gold Card's memory to 128K bytes. It's $325. A complete Gold Card package with cache is available for $775. For a full account, contact Digital Research Inc., POB 579, Pacific Grove, CA 93950.

Circle 588 on inquiry card.

**8-MHz 80186 Heart of SBC**

The Super 186, a high-speed, 16-bit single-board 5100 computer, is built around Intel's 8-MHz 80186 microprocessor. Manufactured by Advanced Digital Corporation, the Super 186 is capable of addressing up to 1 megabyte of RAM without requiring banking techniques. It is supplied with 256K bytes of on-board RAM with parity, four serial RS-232C ports, two parallel ports, a two-channel DMA controller, three uncommitted counters/timers, and a floppy-disk controller that lets you operate 51/4- and 8-inch drives simultaneously. It can be equipped with 64K bytes of monitor EPROM. Bus master or slave/temporary master capability and compatibility with CP/M-86, TurboDOS, and MS-DOS are standard.

Optional hardware available includes a clock/calendar, battery backup, dual-ported memory, and mathematics coprocessors. The Super 186 is $1995. For more information, contact Advanced Digital Corp., 5432 Production Dr., Huntington Beach, CA 92649, (714) 891-4004.

Circle 589 on inquiry card.

**Abort Printing Without Reloading**

The Passport Printer Emulator lets you quickly abort an ongoing print operation, preventing potential time and data losses. Passport has two operating modes: Print Pass-Through and Print Bypass. If you wish to cease printing or if you inadvertently invoke a printer operation, such as print screen, Passport's Print Bypass mode lets you terminate the printing without locking your keyboard or requiring a reload.

Print Pass-Through permits normal operations.

Passport functions as a standard printer device. It emulates most parallel printers that connect with an IBM PC or PC-compatible cable. Passport costs $29.95, plus $2 handling. It's available from Micro Computer Components, 8660-D Miramar Rd., POB 195, San Diego, CA 92126, (619) 453-3367.

Circle 597 on inquiry card.
What's New?

24 by 80 Terminal

The LCT-100 terminal from Data Terminal Service produces 24-line by 80-character screen displays in a 9- by 12-dot grid. It generates 129 upper case and lowercase ASCII characters and offers 12 video attributes, including blink, half-intensity, reverse, and underline. Miscellaneous features consist of a 58-key typewriter-format keyboard, 80 graphics characters, the ability to display control characters on screen, status displays of configuration switches and RS-232C interface settings, switchable automatic line feed upon receipt of a carriage return, and an RS-170-like composite-video interface. The RS-232C interface has 16 switch-selectable transmission rates and 7 data bits/words with 1 or 2 stop formats. Full-duplex or local-echo protocols are provided.

The LCT-100 costs less than $400. With an optional monitor, it's less than $500. For complete details, contact Data Terminal Service Inc., 715 Rankin Rd., Albuquerque, NM 87192. (505) 345-1611. Circle 602 on inquiry card.

16-Bit CPU Board for S-100 Systems

Seattle Computer's 8086 CPU board is purported to deliver true 16-bit high-speed performance to S-100 bus-based computers. It comes in 8-and 10-MHz versions. As a result of its 16-bit architecture and increased clock speeds, the CPU board can be used for enhancing the throughput capabilities of S-888-based systems, such as the IBM PC. It can operate with older 8- or 16-bit peripherals, including disk controllers and video units. The memory address range of the CPU board can be expanded up to 16 megabytes.

The board can be used as a stand-alone unit or as part of a three-card support/MMU set. Software support includes MS-DOS and Xenix. The 8-MHz board is designed for use with the 8087 numeric processor. The 10-MHz board is $795, and the 8-MHz board costs $695. Both prices include a support board. Dealer and OEM inquiries are invited. For complete specifications, contact Seattle Computer Products Inc., 1114 Industry Dr., Seattle, WA 98188. (800) 426-8936; in Washington, (206) 575-1830. Circle 607 on inquiry card.

New Life for Older PCs

A memory upgrade for older IBM PCs carrying the 16K-by 64K-byte CPU is obtainable from Add-Mem. With this upgrade, the PC's memory can be jacked up to 256K bytes without using an expansion slot. Upgrades of 128K, 192K, or 256K bytes are offered.

Add-Mem can install 256K bytes of RAM in your PC for $335, or you can order a do-it-yourself kit. The kit, made up of DIP sockets, capacitors, wires, documentation, and instructions, involves assembling and installing a small printed-circuit board and the soldering of nine jump wires. The basic kit is $69.95. With an assembled board, it's $99.95. For $5.85 each, you can order RAM chips. A protective, anti-static carton with board removal and shipping instructions costs $5. Call or write Add-Mem, 22151 Redwood Rd., Castro Valley CA 94546. (415) 886-5443, for more information.

Legacy Created for PCjr

Legacy Technologies is shipping an expansion box for the IBM PCjr called the Legacy. This modular unit is engineered around a power supply capable of accommodating either a floppy- or hard-disk drive, up to 512K bytes of RAM, and a four-slot, 80-pin bus for a variety of add-ons. Sixty of the bus pins are identical to the PCjr's; the rest are prepared to provide hookups for interrupt capabilities, control and synchronization signals for coprocessors, or specialized I/O functions.

The basic Legacy, priced at $395, comprises the power supply, an LED status panel, the expansion bus, and a cabinet. Options offered are a half-height disk drive, a 64K-byte RAM card that's expandable to 256K bytes in 64K-byte increments, a 10-megabyte hard-disk subsystem, and printer spooler board with a clock/calendar and parallel port. For hobbyists, a $199 L- Bus Developer's Kit with power supply, two wire-wrap cards, and manual are available.

With a half-height 320K-byte floppy-disk drive and controller (required), Legacy is $795. The 10-megabyte hard-disk version is $1595. The disk controller, floppy-disk drive, and the half-height hard-disk drive may be purchased separately for $187, $279, and $995, respectively. The RAM card is $299, with the 64K increments going for approximately $100. The clock/calendar card costs $159. Order directly from Legacy Technologies Ltd., Suite 100, 1414 O St., Lincoln, NE 68508, (800) 288-7257; in Nebraska, (402) 475-7257. Circle 591 on inquiry card.
Image Converter Serves as Camera/Computer Interface

The Model 450C image-processing scan converter serves as an interface between a video camera and a computer. The Model 450C has three video memories, any one of which can accept black-and-white images; all three are employed for a single color image. A total of 4096 separate lines are available. The Model 450C has a suggested retail price of $895. For technical specifications and ordering procedures, contact Robot Research Inc., 7591 Convoy Court, San Diego, CA 92111; (619) 279-9430.

68000 SBC Compatible with S-100

PSCE's X- tended 68000 single-board computer is compatible with the S-100 bus. The X- tended 68000 comes with an 8-MHz 68000 microprocessor, 16 megabytes of memory address space, 64K bytes of I/O address space, and 4K bytes of EPROM. Suitable for multiuser systems, X- tended's I/O controls include two RS-232C synchronous/asynchronous ports, both of which offer programmable data rates up to 9600 bps. One RS-232C port provides full modem controls. A Centronics-type parallel interface is standard.

For mass storage, X- tended's floppy-disk controller can handle a mix of four 8-, 5½-, or 3½-inch single- or double-sided, single- or double-density drives. Its software-programmable floppy-disk write precompensation can select one of six values for drive compatibility, and it can be optimized for the track being accessed. Also furnished are a DMA controller and two general-purpose undedicated 16-bit timers. Nonmaskable interrupts and three types of vectored interrupts are supported.

X- tended 68000 can work with a mix of 8- and 16-bit memory boards. A jumper option for generating the S-100 Mwrite signal and CP/M-68K with optimized BIOS, an editor, assembler, debugger, linker, librarian, and a C compiler with a full library are available. RAM is additional. The base price is $850. For more information, contact PSCE Inc., POB 8, Port Jefferson, NY 11777.

Circle 603 on inquiry card.

Inforite Recognizes Handwritten Characters

Inforite is a handwritten-character-recognition terminal, incorporating dynamic character recognition, mark-sense recognition, and graphics capabilities. Inforite is suitable for applications that require direct computer entry of data from handwritten forms. It's based on the 4-MHz Z80A microprocessor and contains 64K bytes of RAM, 56K bytes of ROM, and 48K bytes of battery-backed CMOS RAM.

Inforite can store almost 50 pages of data for more than three days. It transmits data to a local or remote computer through an RS-232C serial interface. Switch-selectable data rates range from 110 to 19,200 bps. DSR/DTR and XON/XOFF controls are supported. Standard features include a 32-character LCD display that identifies the field and the data, error messages, and a programmable calculator function that computes extensions, subtotals, totals, tax calculations, and percentages as a form is being completed. It operates with a ballpoint pen and accommodates three-part forms.

A forms-definition package that lets you create forms tailored to your business is available as a $450 option. Inforite is $2000. OEM prices quoted on request. Contact Inforite Corp., Suite 201, 1670 South Amphlett Blvd., San Mateo, CA 94402; (415) 571-8766.

Circle 605 on inquiry card.

Sound Processing System Polishes Apples

Decillionix's DX-1 lets you record, process, and play back ordinary sounds with Apple II series computers. Sounds can be entered through a microphone or other source and saved, manipulated, sequenced, and modified in any way you choose. Pitch, volume, direction, and sequence are software-programmable, and real-time sound can be played through the Apple's keyboard.

Major system components are a printed-circuit board, a high-fidelity pre-amp circuit, a connecting cable, and software. Key features include 8-bit
sample record/playback techniques, variable sound rates ranging from 0.78 kHz to 30 kHz, variable play times from 0.8 to 10 seconds, the ability to play continuous sound sequences, and independently variable record and playback rates. The system software disk comes with 22 prerecorded sounds. Echo, an optional software package with more than 40 key-selectable routines, adds echoing, reverb, and real-time sound processing. Direct control of all parameters by joystick is provided. Echo costs $149. A four-volume set of pre-recorded sounds can be purchased for $79.

DX-1 requires a 48K-byte Apple II or Ile with DOS 3.3 and Applesoft BASIC. List price is $239. For further information, contact Deciliconix, POB 70985, Sunnyvale, CA 94086. (408) 732-7758. Circle 592 on inquiry card.

TDrive works with systems that use bank-switched memory boards. It comes as a COM object file on either 51/2- or 8-inch CDOS floppy disks. TDrive installs directly under CDOS and makes all required patches within CDOS. All boards with a bank-switch feature, such as the Cromemco 64 KZ, are supported.

Teso's TDrive RAM disk I/O emulator is available in the United States for $98 from Aliion Industries, POB 7, Millersville, MD 21108. It's produced and manufactured by Tesco, POB 10, 8714 Wiesentheid, West Germany; tel: 09383/1237. Circle 609 on inquiry card.

What's New?

FORTRAN

Ram Disk Emulator for CDOS Systems

Tesco's TDrive RAM disk I/O emulator works with Cromemco computers. It serves as a single logical CDOS disk drive, providing access to up to 224K bytes of memory. Memory is partitioned into seven banks of 32K bytes (2K bytes are reserved for directory entries). It's compatible with 51/4-inch floppy-disk drives, and all CDOS software reportedly can be used on TDrive, including KSAM files under SBASIC.

Structure-Analysis Program Aids Civil Engineers

AMP80-REV8340 is a structure-analysis program for civil engineers. When given the general configuration of a structure, the geometrical properties of its proposed sections, and its loads, this FORTRAN program produces such design stresses and forces as shearing, compression, and bending moments, each in two or more elements. It lets you enter shearing walls and several kinds of materials in the same frame, and it will accept load groups, sinking supports, earthquake forces, tilted loads, and so forth. Combinations of loads can be requested in the same run, and AMP80-RVB6340 can give you analyses of stresses. For producing direct design values, it lets you introduce load factors into a run. Results provide placements and turns in every joint of the structure or at any intermediate point.

AMP80-REV8340 works with any 64K-byte machine with a FORTRAN compiler, such as the Apple II Plus and the Franklin. It comes on two floppy disks and with instructions and examples. The price is $1000. Order from Antonio, Gonzalez Davila, Medina Mora, S.A. de C.V., Nuevo Leon 209-601, Mexico IL, D.F., Mexico; tel: 516-0293.

Educational Robot Package for School and Industry

The Scorbot-ER I robot from Eshed Robotec Ltd. comes with a package of educational materials intended for technical schools, research laboratories, and industry. The complete system comprises the robot, textbooks, laboratory experiments, software, videotapes, slides, and overhead transparencies. The educational modules, which provide practical experiments, guide students from the principles of robotics through to state-of-the-art concepts.

Scorbot features an open-arm construction that lets students observe the operation mechanism. Its DC servo-motors with closed-loop control are under the direction of an eight-axis controller that's capable of exercising simultaneous control on all eight axes. The controller has provisions for eight inputs and eight outputs. Scorbot connects to a host computer through an RS-232C serial interface. The combination of the work envelope are as follows: 360°, body joint; ±150°, elbow joint; ±90°, pitch joint; 360°, roll joint.

Software to run Scorbot is available for a variety of microcomputers. For full details, contact Eshed Robotec Ltd., POB 28346, Tel Aviv 61 282, Israel; tel: (03) 340860; Telex: 361131 ESHEIL.

SBC Handles Mix of Chips

Brick from Dysys Inc. is a single-board computer suitable for sophisticated applications. Its 48K-byte memory space handles a mix of 2K-, 4K-, and 8K-byte RAMs, EPROMs, and EEPROMs. The Hitachi 6303 microprocessor, 33 I/O lines, a 16-bit timer/counter, an onboard UART for normal and multiam communions, an asynchronous serial I/O line with selectable data rates, three LED indicators, and a power indicator are all standard.

Brick is marketed in four versions. Brick-1 is a development system offering a bus interface, voltage regulator, and a wire-wrap area for twenty 16-pin integrated circuits. Brick-2 is a plug-in board for OEM production. STD bus-compatible. Brick-3 is suitable for development and production of large systems. Brick-4 can be integrated into an OEM's circuit board at the drafting stage. Board dimensions vary.

8088 Processor Card Incorporates
80130 RMX

DY-4 Systems Inc. has announced the availability of the DSTD-187 processor card to its line of products for the STD bus. The DSTD-187, an 8088-based card, incorporates the 80130 RMX processor and two RS-232C serial channels. A single Z8 pin byte-wide socket for a RAM, EPROM, or ROM is provided. Its onboard memory can be disabled under software control. The contents of dynamic RAM will be preserved during reset. Full 1-megabyte memory addressing is supported, and the DSTD-187 provides transparent dynamic RAM refresh, which permits the use of high-density quarter-megabyte memory cards. Other features include Z80 and 8088 bus architecture support and compatibility with other DY-4 DSTD series cards.

An 8087 mathematics co-processor is optional, and 8-MHz versions of the card can be obtained. The single-unit price is $584. Contact DY-4 Systems Inc., Marketing Department, 888 Lady Ellen Place, Ottawa, Ontario K1Z 5M1, Canada. (613) 728-3711. Circle 615 on inquiry card.

What's New?

A choice of Pascal or FORTH is available. Pascal provides an editor, interpreter, compiler, and run-time support. FORTH offers a screen editor, interpreter, and compiler directories. BASIC is optional.

Contact the manufacturer for pricing information on Brick-4. In lots of 10, prices for the other versions begin at $550. Further information is available from Dysys Inc., Suite 206, 961 South Bland St., Halifax, Nova Scotia B3H 2S6, Canada. (902) 423-5308. Circle 612 on inquiry card.

Easy-to-Use Mailing System

Orion Systems of Concord, Ontario, markets a computerized mailing system for use of the IBM Personal Computer. With Oscims, your client file can be added to, deleted from, and modified easily. This program has flexible facilities that let you print addresses on any type or size of label or flyer. Menu-driven, Oscims has the ability to prompt customer information and lets you select different customer types. A name-search option is included.

With user manual and distribution disk, Oscims costs $599.50. Write to Orion Systems, 110 Riviera Dr., Concord, Ontario L4K 1A9, Canada. Circle 611 on inquiry card.

Products for Disabled Outlined in Catalog

A catalog of technical aids and systems for disabled individuals is available from Tash Inc. This 37-page brochure outlines ability switches, computer aids, environmental controls, communications and educational aids, and mobility and living aids. A price list is provided. For a copy, contact Tash Inc., Unit 1, 70 Gibson Dr., Markham, Ontario L3R 2Z3, Canada, (416) 475-2212. Circle 628 on inquiry card.

Guide Probes Micropro Software

Jane Davis's Prostar Training Guide explains how to use a wide spectrum of Micropro office software. Programs covered are Wordstar, Spellstar, Datastar, Calcstar, Supersort, and Mailmerge. This 248-page book begins with an introduction to the computer, covering such topics as operating systems, floppy disks, and keyboards. Using step-by-step examples, Ms. Davis shows you how to type a letter in Wordstar, design a form and enter names and addresses in Datastar, alphabetically sort names and addresses with Supersort, and merge the letter and data file to produce form letters and envelopes using Mailmerge. Individual programs are then explored in greater detail, and advanced programming techniques are elucidated. Readers are also shown how to link the packages together.

The Prostar Training Guide is available for $45, postage paid, from Jane Davis Publications, POB 717, Richboro, PA 18954. Circle 618 on inquiry card.
Joseph Electronics has released the second edition of its Computer and Electronics Data Handbook. This 32-page booklet contains glossaries of computer, electronic, fiber optic, and cable terminology. In addition, the most commonly referred to electronic tables, formulas, and symbols are provided. Individual copies are $1.95. Contact Joseph Electronics, 8830 North Milwaukee, Niles, IL 60648, (312) 297-4200. Circle 623 on inquiry card.

Guide to Micro Periodicals
A 16-page guide with information on more than 100 microcomputer periodicals has been published. Fifty of the periodicals are profiled, while the remainder are organized according to the hardware, software, or topic they serve. Subscription prices and pertinent information are given for all the periodicals. The guide is $2.50. Order it from Microguide, POB 4363, Chicago, IL 60680, (312) 986-1536. Circle 624 on inquiry card.

Catalog Outlines Mail-Order Software
A catalog outlining brand-name software available through mail order can be obtained from 800-Software. This company markets packages from nearly 30 major software houses including Ashton-Tate, Continental Software, Digital Research, Fox & Geller, Micropro, Microstuf, Pickles & Trout, and Visicorp. Computers from such manufacturers as Apple, Cromemco, Dynabyte, Heath/Zenith, Intertec, Micropolis, North Star, Televideo, Xerox, and others are supported. Both 5¼- and 8-inch formats are offered, and most programs are sold at less than list price. The catalog also contains comparison charts of database, spreadsheet, and word-processing programs.

Customer backing includes a support department that answers technical questions and a customer service department to handle program updates, exchanges, and returns. Both telephone and mail orders are accepted. For your catalog, contact 800-Software Inc., Suite 14, 940 Dwight Way, Berkeley, CA 94710, (800) 227-4587; in California, (800) 622-0678 or (415) 644-3611. Circle 617 on inquiry card.

IC Master Lists 38,000 ICs
The 1984 edition of IC Master has been released by Hearst Business Communications. This two-volume, 3300-page reference book lists key specifications for more than 38,000 integrated circuits, microcomputer boards, microprocessor development systems, PROM programmers, and custom and semicustom integrated circuits included from over 200 manufacturers. Only products currently offered are described in the data tables; however, an alternate-source directory covers both new and discontinued devices, provides information on replacement parts, and lists approximately 60,000 IC substitutes.

IC Master is divided into 20 sections, such as microprocessors, memories, and linear integrated circuits, and each product group is organized by key specifications. Eleven technical-data sections, including military, digital, and interface, are arranged by function and parameters. An advertisers' product index, part-number index, and a manufacturer and distributor directory are among this set's eight supporting sections.

IC Master costs $95. It can be ordered directly from IC Master, Hearst Business Communications Inc., 645 Stewart Ave., Garden City, NY 11530. Circle 619 on inquiry card.

Information Resource
The Whole Computer Catalog, an illustrated guide to professional consultants, manufacturers, and associations, assists people seeking information on computers. Among the topics covered in this book are hardware in an evolving marketplace, available software, on-line information sources, computer careers, computer stores, the sociological impact of computers, magazines and newsletters, government publications, books, schools that specialize in computer science, and user groups. Each section begins with a discussion clarifying the scope of the topic presented.

Antistatic Wipes

Staticide Wipes are individually wrapped towelettes saturated with an antistatic solution that can reduce static buildup on terminal screens, computer housings, and peripheral cabinets. These low-lint, disposable towelettes can be used on any surface not adversely affected by water or alcohol. Static protection is provided at humidities as low as 15 percent. The saturating fluid contains a topical antistat concentrate, deionized water, and isopropyl alcohol.

Each 5½-by-8-inch Staticide towelette is packed in a small foil package. The suggested price for a box of 24 is $4.98. For a sample and more information, contact ACL Inc., 1960 East Devon Ave., Elk Grove Village, IL 60007; (312) 981-9212.

Solderless Prototyping Board for Micros

The EZ Board from Sabadla Export Corporation is a solderless breadboard system for building experimental add-ons for microcomputers. EZ Board's breadboarding area consists of 1460 tie points capable of holding sixteen 14-pin DIPs. Components with lead diameters of up to 0.032 inch can be plugged in and connected with ordinary hookup wire.

This glass/epoxy printecircuit board has four distribution buses, each with 50 tie points. The distribution buses can be used for power, ground, clock lines, and reset commands. A four-position DIP switch is mounted on-board, and each DIP position corresponds to a set of tie-point-block sockets. For rapid identification, EZ Board has an easily accessible array of tie-point blocks from which each pin of the computer's I/O channels is labeled.

EZ Board is available for Apple, Commodore, and IBM PC systems, and their respective compatibles. Models for other computers are in the works. Including cable and connectors, EZ Board is $174.95. Add $5 shipping when ordering from Sabadla Export Corp., POB 1132, Yorba Linda, CA 92686; (714) 630-9335.

Disks Meet ANSI Standards

Beck Manufacturing offers a line of single- and double-sided 5½-inch floppy disks. Beck disks meet ANSI standards and are backed with a seven-year warranty. A 25-pack of single-sided disks costs $54.75 ($2.19 each); double-sided disks are $69.75 ($2.79 each). The Beck 25-packs come with hub-reinforcing rings, envelopes, color-coded labels, and nonmetallic protect tabs. To order, call (800) 232-5634 or write to Beck Manufacturing, Box 111, Main St., West Peterborough, NH 03468; in New Hampshire, call (603) 924-3821.

Keyboard Replacement Has 90 Preset Functions

A detached extension 87-key keyboard, the Data Spec comes with 90 preprogrammed Apple II/I Plus functions and commands. By depressing the function key and a preprogrammed key, operating commands, programming key words, and operating-system commands are automatically entered into the Apple. Among the operating commands are BOOT, CATALOG, and INIT; programming keywords include FOR, NEXT, PRINT. Some of the operating-system commands are DIR, PIP, TYPE, and STAT. Dat Spec has a 10-key numeric pad, and a full ASCII character set with uppercase and lowercase. Overall dimensions are 7½ by 17¾ by 1½ inches.

The Data Spec Keyboard is supplied with a 10-foot coiled cable and a three-position tilt. The suggested price is $299.95. It's available from Alliance Research Corp., 18215 Parthenia St., Northridge, CA 91325; (818) 701-5848.

MicroRAM and OXKeys, you can purchase both packages factory-direct from Micronova. RR 5, Canning, Nova Scotia BOP 1H0, Canada, (902) 582-7016.

Financial Analysis for Professionals

CRT Associates’ MIFPADS (Microcomputer Interactive Financial Planning and Development System) is a financial-analysis package for professionals of Radio Shack's TRS-80 Models II, 12, 16, and 16B. It’s suitable for such functions as amortization, trade credit decisions, economic order quantity, capital budgeting, time value of money, current portion of long-term debt, and interest rate calculations. MIFPADS can perform the following analyses: risk, statistics, ratios, and bonds. Hard copy can be generated. Previous programming experience is not required.

MIFPADS is available in both single- and multuser versions. Apple IIe and IBM PC configurations are in the works. The price is $595. Contact CRT Associates, POB 372, Dollar Bay, MI 49922, (906) 482-1339. Circle 551 on inquiry card.

PCjr Word Processor Has Full-Screen Editing

Full-screen editing on the IBM PCjr is possible with CMA Micro Computer’s Docuwriter jr word processor. Some of its editing commands are block move, deletion, insertion, copy, and search and replace. Docuwriter jr lets you create reports as large as 130 columns. Wordwrap and justification are also available.

Standard PC-DOS spelling checkers can work with Document jr file. In addition, Docuser jr disk-file outputs are compatible with such word processors as Wordstar. All the PCjr’s keyboard editing-key operations, including cursor control, are retained. IBM graphics and thermal printers are also supported, although they are not mandatory.

Docuwriter jr requires 128K bytes of RAM and a single disk drive. The retail price is $79.95. More information can be obtained from CMA Micro Computer, 55722 Santa Fe Trail, Yucca Valley, CA 92284, (619) 365-9718. Circle 551 on inquiry card.

Apple ROMdisk Card

ROMdisk lets Apple II users store a full floppy disk of program files in EPROM. It can be used in on-line systems and permits Apple II computers to be used as workstations. ROMdisk comes with a menu-builder program that lets you select program files to be loaded and has the ability to automatically boot the menu or a desired program. Up to four ROMdisks can be used in a single Apple. Power is derived from the computer.

ROMdisk works with Apple DOS 3.3 or the ProDOS operating system. It costs $499. Further details are available from Curtis Inc., 22 Red Fox Rd., St. Paul, MN 55110, (612) 484-9183. Circle 604 on inquiry card.

Display and Print Scientific Graphs

GraphComm from Scientific Endeavors displays and prints scientific graphs calculated on the Corona or IBM PC. Written in C and assembly language, GraphComm provides 40 graphics routines that can be called upon to plot data or make text slides. Plots are created and stored in a 4096- by 3120-pixel Tektronix format. It has a zoom mode that can replay, shrink, enlarge, or shift a picture. Magnifications from 0.25 to 4.0 are available. Other features include five line types, eight curve markers, two fonts, and linear, logarithmic, and contour plots.

Tektronix-formatted plots from other computers can be replayed by GraphComm under certain conditions, and GraphComm files are compatible with mainframes that support Tektronix terminals. It operates with such dot-matrix printers as Epson FX/RX, C, Itoh Prowriter, and Okidata 91 and 93.

Presently, GraphComm works with the C-Ware Desknet C compiler. It requires a minimum of 192K bytes of memory. Although it can function on a single disk drive system, two double-sided, double-density disk drives are recommended. GraphComm costs $150 and is available directly from Scientific Endeavors, Route 4, Box 79, Kingston, TN 37763. Circle 571 on inquiry card.

[Note that SPSS/PC will use approximately 1 megabyte of hard disk storage] With documentation and demonstration disk, SPSS/PC costs $795. A version for DEC Professional Series computers is available. For more information, contact SPSS Inc., Marketing Department, Suite 3000, 444 North Michigan Ave., Chicago, IL 60611, (312) 329-2400. Circle 552 on inquiry card.

Statistical Package for Mainframes Ported to PC

SPSS/PC is a menu-format IBM PC version of SPSSX, a mainframe statistical-analysis and data-management package. SPSS/PC gives you univariate statistics, cross tabulations, correlations, multiple regressions, nonparametric tests, log-linear, and contour and scatter plot procedures. You can analyze factors and variance and generate tables and graphs, which can then be reformatted for display or presentation-quality hard copy. SPSS/PC can handle missing values, sort cases, and compute new variables. Up to 150 variables can be drawn upon. Cases are limited only by disk space. Help commands, an integrated report-writing facility, and an on-line tutorial are supplied.

An IBM PC or PC XT with 320K bytes of RAM, a hard-disk drive, 8087 coprocessor, and PC-DOS are necessary.

CP/M Computer Mounts on Floppy Drive

The Little Board, a single-board CP/M computer from Ampro, can be screwed directly onto the mounting holes of a 5/4-inch floppy-disk drive. Outfitted with a 4-MHz Z80A central processor, 64K bytes of RAM, a boot EPROM, floppy-disk controller, terminal and modem ports, and a Centronics-type parallel port, Little Board can support four single- or double-density, single- or double-sided, 48- or 96-ti drive drives. Through software, one of its serial RS-232C ports can put forth data at 75 to 38,400 bps, while the other administrator rates ranging from 75 to 9600 bps.

The Little Board runs under CP/M 2.2. A set of utility programs for formatting and copying data is furnished. A disk-translation utility lets Little Board read, write, and execute programs and data from Kaypro, Morrow Designs, IBM PC, and other computers.

Power requirements are +5 V DC at 750 mA and +12 V DC at 50 mA. Little Board lists for $349. CP/M BIOS source code is $49. Contact Ampro, 67 East Evelyn Ave., POB 390427, Mountain View, CA 94039, (415) 962-0230. Circle 594 on inquiry card. 

BYTE May 1984 513
68000 Coprocessor Speeds Apple Programs

Saybrook II, a 16-/32-bit 68000 coprocessor board, is said to execute Apple Pascal, UCSD p-System Run-time Unit version IV.13, Applesoft compatibles, 128K bytes of RAM, and support 12-5, and 14-MHz versions of the Apple II, IIe, IIc, and five program loaders. It's available in normal, advanced, and five 14-MHz versions.

Prices begin at $595. For a complete description, contact Peopleware Systems Inc., 5190 West 76th St., Minneapolis, MN 55435, (612) 831-0827. Circle 590 on inquiry card.

68008 STD Board

Peopleware Systems has brought out a 68008-based STD bus microprocessor board. The 68008, a 16-/32-bit processor running at 8 MHz, has approximately 60 percent of the throughput of an equivalent 68000 microprocessor. This board has buffered data and control signals for expansion and three 28-pin JEDEC sockets for 32K bytes of memory. One of the sockets is configured for 2764- or 27128-type EPROMs. Off-board memory access is facilitated by a one-of-eight decoder/driver that selects memory cards via a front connector. Up to 1 Mbyte of memory can be addressed. Two RS-232C ports with RTS and CTS signals are supported; the transmit and receive data rates can be individually set. All address, data, and control signals are TTL-compatible.

Prices begin at $595. For a complete description, contact Peopleware Systems Inc., 5190 West 76th St., Minneapolis, MN 55435, (612) 831-0827. Circle 590 on inquiry card.

Terminal Plug-Compatible with VT100

Tandberg Data's Series TDV 2200s editing/display terminal is plug-compatible with DEC VT100, Data General 6053, and other terminals. The basic TDV features an 8.75-MHz 8085/2 processor, a 50-Hz refresh rate, 8 K bytes of dedicated RAM, 512 bytes of non-volatile memory, 16 soft switches under user software control, bidirectional pedestal, height adjustment, 12-line maximum detachable keyboard, and a 15-inch screen. Characters are green-on-white; black-on-white is optional. The setup menu is written in plain English.

The TDV can be equipped with up to 56 K bytes of memory; some versions can store up to eight pages of data. An add-on controller enables the TDV to communicate through packet-switched networks using X.25 protocols. The TDV can transmit by character, page, block, or linefield. An optional plug-in card produces bit-mapped raster-screen displays with a resolution of 684 by 384 pixels. In addition, this arrangement emulates Tektronix 4010/4014 vector drawing, point plotting, and graphics-input modes. The TDV character generator can handle 128 characters. Latin, Cyrillic, and Greek alphabets are available, and mathematics and mathematical symbols can be obtained. Characters can be double height and width.

Other options include a 2K-byte print buffer and communications protocols. The Series TDV 2220s begins at $1875. For full specifications, contact Tandberg Data Inc., POB 99, Labriola Court, Armonk, NY 10504, (914) 273-6400. Circle 587 on inquiry card.

Development System for Adams

Frobco is marketing a software-development system for formatting 32K-byte Adam/Colecovision cartridges. This package contains a 32K-byte interface unit that plugs into the Coleco's expansion slot, an interface board for Apple slot number two, and a EPROM cartridge adapter board that connects with the Coleco's cartridge slot. Any program in the interface unit can be read, modified, and run through the Adam. Programs in the interface RAM can be stored on an Apple disk.

Frobco's system development software lets you transfer programs from the Apple disk or Coleco cartridge to the interface unit, access the Adam/Colecovision memory space and I/O channels, set breakpoints in code for initiating or halting graphics motion in real time, and observe and modify a cartridge's contents. A built-in Z80 disassembler lets you review a cartridge's object code.

With the EPROM cartridge adapter, you can create and run a prototype program. It has four 8K-byte 2764-type EPROM sockets. Detailed information on the Adam's operating system, memory map, display processor, and sound generator are supplied.

Minimum hardware requirements consist of an Apple II Plus or IIe, a floppy-disk drive, Microsoft-compatible 280 card monitor, and an Adam/Colecovision console. The list price is $1995. For more information, contact Frobco, Tri-Comp Polytechnical Inc., 603 Mission St., Santa Cruz, CA 95060, (408) 429-1551. Circle 600 on inquiry card.

Where Do New Products Items Come From?

The information printed in the new products pages of BYTE is obtained from "new product" or "press release" copy sent by the promoters of new products. In our judgment the information might be of interest to the personal computing experimenter and homebrewer who read BYTE. But we print it in some form. We openly solicit releases and photos from manufacturers and suppliers to this marketplace. The information is printed more or less as a first-in-first-out queue, subject to occasional priority modifications. While we would not knowingly print untrue or inaccurate data, or data from unreliable companies, our capacity to evaluate the products and companies appearing in the "What's New?" feature is necessarily limited. We therefore cannot be responsible for product quality or company performance.

This is the standard floppy Interface Card supplied to all systems not using Tape Back-up. It can access up to four drives in 48 or 80 track modes. The same high quality data separator as used in IBM™ counterparts, insured data integrity. 80A-8001-00

300/1200 Baud Modem
If this is your first computer, you will soon want to communicate over a wide area with the XPC-XT. Both half-duplex and full-duplex modems are supplied with the system. 80A-8725-00

SUPER 12 PK Multi-Function
Now you can have a full page of text in this fantastic card! Since we only have a little room, here are the features:
- HM™ compatible Joysticks Port (2), Real-Time Chronograph (Battery Back-up), Parallel Port, Serial Port, 64K to 384K Memory, Printer Spooler and RAMDISK software, and supplied with 5K of Memory. 80A-8602-00. 

MONOCROME ADAPTER
If you are impressed with all the rave reviews that the Hercules Graphics Card gets, you will love ours! Made expressly for the XPC-XT by Hercules themselves, it runs everything the Hercules Card does, and more. 80A-6500-00. $395.00

COLOR ADAPTER
Color and monochrome combinations can be run simultaneously, with a separate monitor, or using a color or monochrome system. 80A-6500-00. $395.00

COLOR
MONOCHROME

MONOCHROME

MONOCHROME

MONOCHROME

HARD DISK ONLY INTERFACE
A simple, quick solution to arranging a hard disk in your XPC. All you need is this card, a cable, and the drive. Kindly from 5 to 140 megabytes with minimum software configuration. Order with your System order later. Compatible with all the operating systems. 80A-8500-00. $375.00

ARCHIVE TAPE CONTROLLER
This package consists of a combination Interface Adapter and Archival Tape Controller as well as the Power Supply Controller. Two additional 5、4 term board accessories are included and mounted over the Tape Drive and Hard Disk. 80A-8700-00. $750.00

HARD DISK ADD-ON
Complete Packages
Includes BIOS Software, 3-1/4" Winchester Hard disk, mounting hardware, Interface P.C.B. for expansion slot, and all the necessary power and data cables (the Power Supply in the XPC-XT is Hard Disk ready). 10 Megabyte $995, 65 Megabyte $2495

20 Megabyte $1295, 105 Megabyte $3295

40 Megabyte $1795, 140 Megabyte $4195

When you're shopping for technology products, there's a lot to consider. Here are some key factors to keep in mind:

1. **Price**: Always shop around to find the best deals. Compare prices from different retailers to ensure you're getting the best value for your money.
2. **Compatibility**: Make sure the product is compatible with your existing devices and systems. Check the specifications to ensure it meets your needs.
3. **Customer Reviews**: Read reviews from other customers to get an idea of the product's performance and reliability. This can help you make an informed decision.
4. **Manufacturer Support**: Choose a manufacturer with good customer support and a reputable warranty policy. This can save you a lot of hassle in the long run.
5. **Energy Efficiency**: Look for energy-efficient products to save on electricity costs and reduce your carbon footprint.
6. **Upgradability**: Consider products that are easy to upgrade or expand. This can extend the life of your technology investment.
7. **Customer Service**: Ensure you have access to good customer service in case you need assistance or support.
8. **Sustainability**: Consider the environmental impact of the product. Look for products made from sustainable materials and with eco-friendly packaging.

Remember, technology is constantly evolving, so it's important to stay informed and make informed choices. Happy shopping!

**Insulation Displacement Connectors**
- Fully decoded data
- Compact 8 ½" x 11" size
- Durable credit card plastic
- Clear and concise two-sided tables for:
  - Full instruction set, disassembly, ASCII, binary, and much more...

**Micro Charts**

**JE750 4-Digit Fluorescent Alarm Clock Kit**

The JE750 Alarm Clock Kit is a versatile 12-hour digital clock with 24-hour alarm. The clock has a bright 0.5" high blue-green fluorescent display. The display will automatically dim with changing light conditions. The 24-hour alarm allows the user to disable the alarm and immediately re-enable the alarm to activate 24 hours later. The kit includes all documentation, case and wall transformer. Other features: flashing colon, alarm tone 500Hz once per sec., 10 minute snooze alarm, am/pm indicator.

Size: 9½"L x 3½"H x 1½"D.

Part No. JE750 Kit

**GENDER CHANGERS**

Used to connect 2 cables which have the same gender.

Simply #1 in Service & Reliability

**CONVERSE WITH YOUR COMPUTER**

If L E U S is a full-featured AMI research group at the original ELSA program is now available to run on your computer:

Created at MIT in 1986, ELSA has become the world's most-used research project in artificial intelligence. ELSA is a non-directed project in which participants can develop and test their own ideas. Each participant receives a free copy of the ELSA program, and the results are then made available to the public.

Designed to run on a large number of computers, ELSA has been used by researchers in a variety of fields to develop new algorithms and techniques, and to experiment with existing ones. ELSA is now available to anyone, with no limitation on the number of computers used or the amount of data processed.

Order your copy of ELSA today and see the difference it can make! Contact us today for more information or to order your copy of ELSA.

THE CCT EXCLUSIVE WARRANTY
With any system we build, we provide, in writing, an unconditional 12 month direct warranty on the entire system, including mainboard, boards, drives, power supplies, cabling and peripherals! We offer guaranteed 24-hour house-repair and/or replacement with just a tech-line phone call. We can offer this, since we are so sure of our level of quality and reliability. It's great to know that in the event of a problem, you're not out of business waiting on service turnaround. We deliver!

Our various OEM contracts with all the manufacturers of the components we integrate, allow us this unprecedented flexibility. No factory O.K.'s — just get it running — NOW!

Assembled and Tested

- ACP has sold over 1000 of these IEEE compatible, low-priced, high-reliability 64K Static RAM Cards.

S-100 64K "CMOS" RAMCARD

Unbelievable -- Price!

$299.00

- ACP has sold over 1000 of these IEEE compatible, low-priced, high-reliability 64K Static RAM Cards.

SIEMENS S61

You can now purchase Siemens compatible 8 Disk Drive below your Print Spooler and Spool Parallel Port (only $75.00 , Panasonic tec $55.00)

$169.00

DOT MATRIX PRINTER

COEX 80-FT

- B/W Dot Matrix, 80 CFPS.
- 26 Buffers Memory
- 150 Columns, Graphics and Black Printing
- Selectable Char Pitch, Line Sizing

$199.00

Apple II Compatible DISK DRIVE

$229.00

TO SHIEKI CORP., INC.

IBM PC MULTICARD™

"MULTICARD" multifunction card for the IBM PC & XT expandable to 256K. Thousands of this popular card have already been shipped by ACP.

- 64-256K
- Parallel Port
- Printer Spooler Software
- Serial Port
- Clock/Calendar
- 1 Year Warranty

$229.00 w/64K $229.00

**New Location**

California Digital has just purchased a new distribution center six times the size of its existing facility. The new warehouse and retail store is in the old Simpson & Company building at 17700 Figueroa Street in Carson. We are located just off the Harbor Freeway near the Green Line. Please drop by and visit our new store when you're in the Los Angeles area. Store hours are 10 AM to 5 PM Monday through Saturday.

**Shipping**

First five pounds $3.00, each additional pound $0.50. Foreign orders: 10% shipping, tax will be refunded.

**Overnight Delivery**

California residents add 8.5% sales tax.

Open accounts extended to state supported educational institutions and companies with a strong "Dan Bradstreet" rating.

**ENCLOSES**

California Digital offers an encryption of data and passwords on your application. The fee for this service is $50 per year. All orders are shipped by US Mail or Federal Express.

DRAGON $139
Your Choice
Second Drive or Monitor
SANYO
IBM COMPATIBLE
$995

Sanyo Electronics has just released the first IBM PC look-alike, the MBC-550. This is a complete microcomputer that includes 128K bytes of memory as a 16K-byte disk drive upgradeable to 32K bytes. It also includes both color and graphics interface, low profile keyboard and parallel printer port. IBM compatible software such as Sanyo Basic disk utilities, Wordstar word processing software, Calculator, spreadsheet and Edit Writer! MS-DOS is supplied with the Sanyo computer. Most programs written for the IBM-PC can be run on the MBC-550.
Along with all this California Digital offers FREE your choice of either a second disk drive, or a high resolution green or amber screen monitor. All at the super low price of only $895.
We are currently experiencing an initial shortage of the computer. Please allow your order to ship. The MBC-550 will be shipped within 30 days or less.

PRINTERS $289
Star Gemini

TERMINALS Perkin Elmer 550S
Sanjay Digital has recently introduced an OEM model of its new Perkin-Elmer 550S terminals. These units feature direct cursor addressing, numeric display, session or block transmission, and RS 232 printer ports. Self diagnostics and function keys make this terminal an excellent value at only $329.00. Performs the same functions as IBM 550S terminals.

APPLE $929

256 KILOBYTE MEMORY BOARD $495

256K Memories available using the two above boards or all three together.

### S-100 PRODUCTS

#### GT PRODUCTS

**GT 8" THINLINE MAINFRAME**
- Specifications for 2 x 8" thinline drives, 2 x 50 pin, 2 x 34 pin, 1 x Centronic, 1 x Centronics
- EMI filter fuses, 2 x AC outlets, +3.3V/5V, -5V/12V/24V/5V
- Stock price: $350.00

**GT 9" MAINFRAME**
- Specification for any 2-9" drives (hard or floppy)
- Stock price: $560.00

**GT 8" MAINFRAME**
- Specification for any 2-8" drives (hard or floppy)
- Stock price: $250.00

**GT STANDARD MAINFRAME**
- Specification for any 2-52" drives, 2 x 50 pin, 2 x 34 pin, 1 x Centronic, 1 x Centronic
- EMI filter fuses, 2 x AC outlets, +3.3V/5V, -5V/12V/24V/5V
- Stock price: $495.00

#### CPU BOARD S-100

- **CPU BOARD S-100**
  - Specifications for any 2-52" drives (hard or floppy)
  - Stock price: $250.00

#### MEMORY BOARDS

- **MEMORY BOARDS**
  - Specifications for any 2-52" drives (hard or floppy)
  - Stock price: $395.00

#### OPERATING SYSTEMS

- **OPERATING SYSTEMS**
  - Specifications for any 2-52" drives (hard or floppy)
  - Stock price: $150.00

#### CPU INTERFACES

- **CPU INTERFACES**
  - Specifications for any 2-52" drives (hard or floppy)
  - Stock price: $150.00

#### CPU BREAKOUTS

- **CPU BREAKOUTS**
  - Specifications for any 2-52" drives (hard or floppy)
  - Stock price: $150.00

#### CPU MEMORY BOARDS

- **CPU MEMORY BOARDS**
  - Specifications for any 2-52" drives (hard or floppy)
  - Stock price: $150.00

#### CPU BUNDLES

- **CPU BUNDLES**
  - Specifications for any 2-52" drives (hard or floppy)
  - Stock price: $150.00

572 BYTE May 1984
Circle 217 on Inquiry card.
UNCATEGORIZED ADS:

Readers who have computer equipment to buy, sell, or trade who are requesting or giving advice may send a notice to BYTE for inclusion in the Unclassified Ads section. To be considered for publication, an advertisement must be noncommercial (individuals or bona fide computer clubs only), typed double-spaced on plain white paper, contain 75 words or less, and include complete name and address information. Only typewritten notices are printed once only as space permits. Your confirmation of placement is appearance in an issue of BYTE as we engage in no correspondence. Please allow at least three months for your ad to appear. Send your notices to Unclassified Ads, BYTE/McGraw-Hill, POB 372, Hancock, NC 23649.
FOR SALE: Two Tandem TM 100-1 48/80 51/2-inch disk drives without enclosure. SSD 180K, includes manual. Will sell for $170 each or both for $225. UPS COD. Marty Brewster, 7540 Greens Dr., Westerville, PA 19106. (215) 793-0915

WANTED: Arm building a Basic/Four BBC-2 unit. Still need memory boards and a terminal. If you have parts or are sowing a unit, let me know. Sandie Hansen. 3171 Monson Dr., Burbank, Calif. 91501.

FOR TRADE: Please send a list of IBM PC software & supplies to POB 6074, Austin, TX 78704. 19220.

FOR TRADE: Radio Shack TRS-80 Model 100 (2414) in excellent condition and in original case. 1760 at best offer. Mark A. Conlon, 9374 Rosenwalt St., Clayton, PA 19024.

WANTED: High school student tests donation of a computer system, disk, books, software, and a printer for experimentation and programming. John White, Water APC, 11133 North J's, St. Joseph, OR 97291.

FOR TRADE: I will trade more than 25 games for the Apple II Plus, VIC-20, and Atari Pad. 319 Maple, Sanford, FL 32771. (904) 665-4378.

FOR SALE: Hewlett-Packard computer peripherals, software. and interfaces Series 80, for $500. B-7520 HP-232C interface. 1300 IDI 54050-200-cps printer. 1505 1930A 51/2-inch dot matrix for B-52B. 3300 For B-5. 867-10-3055 Sastics Pas. 1170. Writer text processor. 5102 88-9044 Data-Comm Pac. 1100 eBASE II $300. Also, want used Hewlett-Packard M-68A computer with built-in parallel interface. Randy Webster, 622 East 6th St., Bloomington, IN 47401, (312) 335-8558 or (312) 373-5611 after 5 p.m.

FOR TRADE: Expansion Interface for TRS-80 Model I Level II. Can trade Radio Shack, UNIVAC, Microcom, etc. Lala. Any amount of memory OK. Peter working, but will convene any condition. Peter male, please ask price, and condition. James Noth, POB 249158, Omaha, NE 68129.

CORRESPONDENCE

Address all editorial correspondence to the editor at BYTE POB 372, Hancock, N.C. 28432. Unsolicited manuscripts will be returned if accompanied by sufficient first-class postage. Not responsible for lost manuscripts or photos. Opinions expressed by the authors are not necessarily those of BYTE. Copyright © 1984 by McGraw-Hill Inc. All rights reserved. Trademark registered in the United States Patent and Trademark Office. Where necessary permission is granted by the copyright owner for libraries and other organizations registered with the Copyright Clearance Center (CCC) to photocopy an article herein for the flat fee of $5.10 per copy of the article or any part thereof. Correspondence and payment should be sent directly to the CCC, 21 Congress St., Salem, MA 01970. Specify ISSN 0196-5280/83. 51 50. Copying done for other than personal or internal reference use without the permission of McGraw-Hill is prohibited. Requests for special permission or bulk orders should be addressed to the publisher. BYTE is available in microform from University Microfilms International, 300 North Zeeb Rd., Dept. PR. Ann Arbor, MI 48106 USA or 18 Bedford Row, Dept. PR, London WC1R 4EJ, England.
To get further information on the products advertised in BYTE, fill out the reader service card with your name and address. Then circle the appropriate numbers for the advertisers you select from the list. Add a 20-cent stamp to the card, then drop it in the mail. Not only do you gain information on the products advertised, but also important data on how and where they are used. This helps bring you a bigger BYTE. The index is provided as an additional service by the publisher, who assumes no liability for errors or omissions. *Correspond directly with company.

First there was the Starwriter 40 CPS by C. R. Ahl, one of the world's most popular letter-quality printers. And deservedly so. Because it gives you more of just about everything than any other printer in its price range (and with a price tag about half of what Daddy charges).

The only major difference is speed.

Instead of 40 characters per second, the Starwriter 18 CPS typewriter tops 142 cps—more than twice as fast. And at just over 18 cps—which costs you about 30 seconds per average business letter.

But it retains the rest of the family resemblance: like low profile and low noise, plug-in compatibility with just about any serial or parallel microcomputer on the market, making it a perfect companion in a typical office environment.

And perfect for typical office chores like letters, memos, announcements—in fact the vast majority of stuff that can be typed.

Enough said?

If not, then this: the Starwriter 18 CPS gives you high-quality copy including boldface, underlining, sub and superscripts with your choice of motion feed or optional tractor feed for precise print positioning of tabular and graphic data, using easily available industry-standard ribbon cartridges and long-lasting plastic daisy wheels.

But if it also gives you something that's far from industry-standard:

A full year's warranty.

And for a mere half-a-minute per letter.

We think it's well worth the wait.

Radio Shack's TRS-80 Model 100 Comes with Five Built-In Programs!
- Personal Word Processor
- Appointment Scheduler
- Address/Phone Directory
- Telephone Auto-Dialer
- BASIC Programming Language

Since its introduction, the TRS-80 Model 100 has become the most highly-acclaimed lap-size computer ever. Why? Because it's a true portable that includes a built-in modem and full-size typewriter keyboard. And Model 100 works on batteries or with an optional AC adapter.

Ready to Use
Turn on Model 100 and select a program listed on the easy-to-read display. With the self-contained communication program and modem, you can send and receive data by phone. Add a cassette recorder and use ready-to-run software, too.

You can also expand with a printer, disk storage, standard video display and bar code reader.

Hurry—Sale Ends May 31, 1984
