Two Diskless Workstations
The new top-of-the-line Dell System 325 is a flagship worth putting out in front of the fleet.

February 14, 1990
**STANDARD FEATURES:**
- Intel 80386 microprocessor running at 25 MHz.
- Choice of 1 MB, 2 MB, or 4 MB of RAM expandable to 16 MB (using a dedicated high-speed 2-bit memory slot).
- Advanced Intel 82385 Cache Memory Controller with 2 KB of high-speed static RAM cache.
- Expanded, affordable access to 386 architecture.
- 5.25" 1.2 MB or 3.5" 1.44 MB diskette drive.
- Dual diskette and hard drive controller.
- 8 industry standard expansion slots (6 available).

**STANDARD FEATURES:**
- Intel 80386SX microprocessor running at 16 MHz.
- Choice of 1 MB, 2 MB, or 4 MB of RAM expandable to 16 MB (8 MB on the system board).
- Page mode interleaved memory architecture.
- VGA systems include a high performance 16-bit video adapter.
- Socket for 16 MHz Intel 80387SX math coprocessor.
- 5.25" 1.2 MB or 3.5" 1.44 MB diskette drive.
- 200-watt power supply.
- 8 industry standard expansion slots (6 available).

**STANDARD FEATURES:**
- Intel 80386 microprocessor running at 25 MHz.
- Choice of 1 MB, 2 MB, or 4 MB of RAM expandable to 16 MB (8 MB on the system board).
- Page mode interleaved memory architecture.
- VGA systems include a high performance 16-bit video adapter.
- Socket for Intel 80387 math coprocessor.
- 5.25" 1.2 MB or 3.5" 1.44 MB diskette drive.
- Enhanced 101-key keyboard.
- 8 industry standard expansion slots (6 available).

**STANDARD FEATURES:**
- 80286 microprocessor running at 20 MHz.
- Choice of 1 MB, 2 MB, or 4 MB of RAM expandable to 16 MB (8 MB on the system board).
- Page mode interleaved memory architecture.
- VGA systems include a high performance 16-bit video adapter.
- Socket for Intel 80387 math coprocessor.

Technically speaking, the Dell System 325 is one of the most advanced 386" computers available. And, according to PC Magazine, it's one of the most advanced 386 computers they've ever tested.

In benchmark after benchmark, the 25 MHz Dell System 325 ran circles around

**THE FIRST PERSONAL COMPUTER THAT'S REALLY PERSONAL.**

Of the more than 150,000 personal computers we've sold to date, each one has been individually configured to fit the needs of its owner.

The System 325 takes that idea to its logical extreme.

For example, it runs either MS-DOS, MS/OS/2, or our own Dell UNIX System V. Which is compatible with AT&T's System V Interface Definition. And the world of XENIX applications.

If speed is of the essence, we can include an optional Intel® 80387 or WITEK 3167 math coprocessor. And since nothing about this system is lightweight, the standard mass storage is a 100 MB hard disk drive. Or we can configure it with a 40, 150 or 322 MB hard drive.

As you might expect, the output is just as intense. You can choose between VGA Monochrome with
paper-white screen, VGA Color Plus, or Super VGA for high resolution colors displayed on a larger screen.

Even though the 325 gives you all this performance, it still leaves you six open slots for whatever else you might want to add.

And once you’ve told us what you want, we’ll make sure what you want works—by burning-in the entire system unit.

COMPUTER RETAILERS ARE NO KNOWS.

There are some good reasons computer retailers won’t know much about the System 325.

First, with all the new and increasingly sophisticated systems they have to keep up with on a daily basis, you can hardly expect them to know everything.

Second, because Dell sells direct.

Which means you now have the unique opportunity to talk directly with the people who make them. And ask things like, “What is page mode interleaved memory?” or, “How much SIMM RAM should I add?”

In other words, the kinds of details that are important to people who make computers and people who use them.

So dealing direct not only can save you up to the 35% mark-up, but 100% of the frustration.

WE COME WHEN WE'RE CALLED.

One of the things that very clearly sets Dell systems apart from other computers is not just how they’re sold but how they’re supported.

Overkill was one description used in a recent PC Week article.

Perhaps.

But then, we think you’ll agree, when something goes wrong, you want as much help as possible, right?

MAYBE YOU SHOULDN’T BUY ONE AFTER ALL.

No matter how many reasons we give you to buy a Dell system, sometimes it makes more sense to lease one instead.

Whether you need a single computer, or an entire office

BEST OF ALL, YOU WON’T HAVE TO EXPLAIN TO A COMPUTER RETAILER WHAT ALL THAT MEANS.

Which is why every Dell system comes with a toll-free technical support line and self-diagnostic software. We’re able to solve 90% of all problems right over the phone. The other 10% receive next-day, deskside service. Thanks to our new alliance with Xerox Corporation.

And you get all this help for a full year—whenever you need it—at no extra charge.

As you’ve probably guessed, one of the things that drives us most is customer satisfaction.

So we’d like to give you the ultimate guarantee:

Try a System 325 in your office for a month. Run your roughest applications. Put it through its paces, at your pace. If you’re not completely satisfied, send it back anytime within 30 days. And we’ll refund your money.

We come when we’re called.

One of the things that very clearly sets Dell systems apart from other computers is not full, there is a leasing plan for your business that is just like 100% financing.

And just as we can custom configure your computers, we can see to it you get a custom designed lease plan to fit your exact business needs. A fact that has not gone unnoticed. Especially by the Fortune 500. Over half of whom now own or lease Dell systems.

And just as we welcome their business, we welcome your business, too.

Just call us, toll-free. And don’t be afraid to ask us the tough questions.

That’s the part we like best.

PC WEEK, July 1989, 
"Based on a series of benchmarks run 
last week on Advanced Logic Research, 
Inc.’s prototype 486 desktop system, 
ALR will enter the 486 market with a 
bang."

At ALR, we will never rest on our laurels. We strive to be the best, as 
proven by our past achievements. Now with the introduction of the 
new ALR PowerCache 4™, we’ve designed a system that is far 
beyond comparison. Again, we have taken PC-microprocessing power 
a step further by designing a unique proprietary PowerCache 4 cache 
controller using ALR’s custom ASIC chips which deliver the fastest 
processing speed ever.

More important, PowerCache 4 is the first PC to fully utilize 128-bit 
burst mode and a “read and write-back” 128KB cache design, providing 
a better than zero wait state performance as compared to the i386. 
Furthermore, the ALR PowerCache 4 is 100% IBM® PS/2® Micro 
Channel™-compatible supporting bus mastering devices and giving

you a more efficient system for a variety of multi-user and filesver applications. Like most ALR computers, the PowerCache 4 is a truly balanced system. The fastest power is achieved by enhancing our PowerCache 4 design with the industry’s fastest disk drives and interface. The PowerCache 4 systems come standard with a high-speed 15MHz ESDI and 32 KB hard disk cache on the disk controller. What more could you possibly need.

It’s no wonder ALR remains ahead of the pack with our innovative design expertise. As far back as 1986, we’ve been recognized in the industry as a leader in performance. Recently, the highly acclaimed 386/220 won us “Best of 1987” from PC Magazine. 1988 brought us the honor of receiving the PC Magazine Award for Technical Excellence for designing the industry’s most advanced cache architecture. As for 1989 we’ve already begun to excite the industry with the PowerCache 4.

Now, what else would you expect from a company who is so committed to innovation and high-performance technology that we take you a step beyond. At ALR, we are concerned with your processing needs. Our technical support staff is available to assist you by one simple phone call. All our systems are backed by a one year warranty. WYSIWYG What you see on screen...
We'd like everyone who's using Windows applications on a part-time basis to please stop.

The trouble with using Windows™ applications every once in a while, is that you're only amazingly productive every once in a while.

This has got to stop. Which is why there's the Microsoft® Windows environment—the first and only graphical environment to let you work with multiple Windows or DOS applications without ever closing a single file, or quitting a single program.

You may never see your C prompt again. Just give Microsoft Windows a 40-hour work week and you'll be pointing, clicking, cutting, pasting and flying through your work with the greatest of ease. Cut from a spreadsheet and paste onto a word processing document—without scissors and a copy machine. Exchange information, link files and programs, then watch your data get updated automatically, or if you prefer, at your command.

The end of the year produces a flood of new products

You've probably heard naysayers speaking of a slump in the computer industry. One aspect of a slump is a drop in sales volume, a critical issue to vendors, but not what matters most to end users.

Rather, it's the drop-off in innovation and a slowing in the pace of product announcements that can be unsettling to those of us who are hungry for ways to improve our own productivity and that of our companies.

On toward midyear, there were three or four months where nothing much seemed to be happening. We saw some minor upgrades arrive, some new niche products emerge, a couple of disappointing releases of long-delayed major products, and a relative handful of really interesting, meaningful new products. I don't know about you, but toward the end of the summer, I was thinking dark thoughts about the state of innovation in our industry.

50 EISA and/or 80486 Machines?
But with the arrival of fall, new products and technologies are crawling out of the exode. Just one example: By the end of this month, we expect to see something like 50 new machines using either the new Extended Industry Standard Architecture bus or the 80486. Some, like the Hewlett-Packard Vectra 486 machine that appears on this month's cover, use both.

Machines based on the 80486 are springing up in such abundance that we're already seeing price wars: See this month's First Impressions of amazingly low-cost 80486 boxes from Cheetah and ALR.

A Unix Workstation for Cheap
Innovation isn't limited to Intel-architecture machines, however. Although the 68040 is still not available to compete against the 80486, some nice 68030-based systems are appearing.

For example, Apollo (which is now a subsidiary of Hewlett-Packard) recently introduced the first full-featured 68030-based Unix (System V version 3) workstation priced at less than $4000.

The new Apollo Series 2500 personal workstation “entry-level” system, which lists for $3990, includes a 20-MHz Motorola 68303, a 68882 floating-point coprocessor, 4 megabytes of RAM, and a 15-inch paper-white display with a maximum resolution of 1024 by 780 pixels.

All the features of the 2500 are built onto a single motherboard that is approximately the size of a full-size IBM PC AT board.

This model comes without a disk drive because most 2500s will be networked: Apollo built Ethernet, IBM Token Ring, and Apollo Token Ring support into the 2500. (You can, however, add a drive if you choose.)

Consulting editor Stan Miastkowski, who covered the story for BYTE, says “Apollo hopes to ship the new system by the end of this year.”

Chip Advances
There's some welcome activity at the chip level, too, which portends some interesting new products in the not-too-distant future.

For example, Intel announced a new version of its 80960 embedded microprocessor, one that can execute up to three instructions at a time. The result, according to Intel, is a 33-MHz CPU with a top speed of nearly 100 million instructions per second and a routine speed of some 66 MIPS.

The microprocessor is likely to begin showing up in some computation-intensive PC peripherals in the next year, including scanners and laser-printer controllers. That should radically improve the speed of laser printers when they're printing using page-description languages like PostScript.

Rival Motorola announced the 68302 Integrated Multiprotocol Processor, a low-power CMOS package that runs at 16.67 MHz and includes a 68000 processor, a microcoded RISC-based communications controller, three independent serial I/O channels (each with two on-chip direct-memory-access channels), RAM, and a special-purpose synchronous communications port that allows the 68302 to interface directly with components like microcontrollers, digital signal processors, and coders/decoders. The 68302 will be used in a wide range of applications, including LANs, fax machines, modems, telephone switching equipment, computer I/O systems, and even satellite communications equipment.

Speaking of LANs...
Recent LAN developments include some amazing software from VXM: The software can transform a LAN into a parallel-processing “network supercomputer.” The software currently works only on TCP/IP networks, but VXM says the connected configuration can consist of IBM PC compatibles, Macs, Unix workstations, and mainframes.

VXM claims that using its software, a 25-node network of PCs and Macs can deliver the effective processing power of an IBM 3090 mainframe. With 25 RISC workstations, you could have the power of a Cray supercomputer, the company says.

There's lots more—and that's the good news. There is indeed lots more. The midyear slowdown is over, and it looks like we're in for some interesting times in the months ahead.

At last, an assistant that follows your directions

Wouldn’t it be great to delegate your routing?
You can! We know your time is valuable. That’s why Wintek pioneered comprehensive and affordable CAD packages for IBM personal computers. HiWIRE-Plus continued that tradition, integrating schematic-capture features and printed-circuit-artwork capabilities into one versatile package.

New autorouter.
The Autorouter for HiWIRE-Plus is powerful enough to handle the most demanding design problems, yet simple enough for a casual user. Just turn it loose on your design. It’s hassle free because it works long hours, without supervision or errors.

100% autorouting.
The autorouter for HiWIRE-Plus rips-up, reroutes, and with appropriate design rules, racks up 100% completion.
 Forget gridded routers. This autorouter places vias and traces anywhere your design rules allow. With 1-mil resolution.
 Vary trace width and spacing for individual networks. Route 1, 2, 3, or more tracks between IC and connector pins.
 Set up boards from 1 to 250 layers, up to 60” × 60”.
 Specify shape, size, and type of vias, layer-by-layer: through-hole, blind, buried, micro. Specify via types for individual networks.
 Use fewer vias and layers than comparably priced autorouters.
 For use on your IBM PC, XT, AT, PS/2, or compatible with 640K RAM.

Why pay more for a 100% autorouter?
Compare the features and performance to packages costing five times more. HiWIRE-Plus and the Autorouter for HiWIRE-Plus sell for $895 each. Both have a no-nonsense, 30-day money-back guarantee. With unlimited, toll-free, no-charge technical support.

Let HiWIRE convince you that it makes a great assistant. Call us toll-free at (800) 742-6809 today and put HiWIRE-Plus and the Autorouter for HiWIRE-Plus to work for you tomorrow.

The least a local area network can give you is time for lunch.

Some food for thought.
Getting all the information from all your equipment to all your people can occupy all your time.
That's where the IBM Token-Ring Network can help.
With our new 16-megabit bandwidth, it provides remarkable new speed in moving everything from bulk data to mail to graphic images.
IBM's Token-Ring Network fits into most existing environments. It's compatible with today's popular software, connecting your workstations, including PCs and PS/2s®, midrange computers, mainframes and peripherals.
We've also designed it for reliability. With IBM software, it's easy to diagnose, isolate and correct problems, without affecting the rest of your network.
It's another reason why no other company connects more companies with more equipment to more people than IBM.
For more information on IBM local area network solutions, contact your local IBM Advanced Product Dealer or your IBM marketing representative.
We can help your entire organization run more smoothly and productively. And that means you can devote your time to other important matters.
Bon appétit.

"Borland's Debugger outshines Microsoft's Codeview." PC Week, May 15, 1989

It's two winners in one.

Turbo C, the core of Turbo C Professional, was the outright winner in PC Week's Poll of Corporate Satisfaction on C compilers. Overall, Borland won with 81, Microsoft placed second.

Turbo Debugger, also included in Turbo C Professional, was the outright winner in EVERY category in PC Week's Poll Of Corporate Satisfaction on Debuggers. And, once again, we topped the score with 84, overall. Microsoft came in second-best, 11 points behind.

Get Borland's Turbo C Professional and get the best of both worlds: our top-rated C compiler and our top-rated Debugger.

Call (800) 345-2888 and we'll send you both PC Week polls and technical specifications on Turbo C and Turbo Debugger.

Turbo C Professional includes both Turbo C 2.0 and Turbo Assembler & Debugger.

At last!
A new HP LaserJet just for you.

At only $1495; it's got your name on it.

The HP LaserJet printer family has expanded—in a small way.

The new HP LaserJet IIP (as in Personal) fits right on your desk. And, with a price almost half of the multi-user LaserJet Series II,* into most budgets.

Its simple front panel gives you easy, push-button control over the menu, the 14 internal fonts, form feed and other functions. It handles four different paper sizes: letter, legal, executive and A4, as well as envelopes. In portrait...
or landscape configurations. At four pages a minute. From one or two paper bins (the second is optional).

The 512K standard memory is upgradeable to 4.5 Mbytes for more complex graphics and publishing programs.

And, of course, our new printer is compatible with the HP LaserJet Series II and virtually all popular PC software.

So call 1-800-752-0900, Ext. 277J for your nearest authorized HP dealer. Then introduce people at your company to their very own HP LaserJets.

There is a better way.

The new HP LaserJet IIIP printer.
If you've ever tried to combine windows, menus, forms, and text entry to create an effective user interface, you know how challenging it can be.

Perhaps you've turned to a third-party library for help. Only to run into restrictions, limitations, and dead ends. So you had to compromise your design. Or modify the library source code. Or start over.

Which is precisely why we designed Vermont Views™, the new generation of Windows for Data®, the best-selling C library for user interfaces.

Vermont Views offers unbridled, unrestricted creative license.

The Human Interface Of Your Dreams

Vermont Views offers an unparalleled set of interface building blocks that you can combine in unlimited ways:

- Menus can be created in any style you choose, made scrollable vertically and horizontally, and nested to any level. Features include n-th character selection, checkmarks, and unavailable items.
- Data entry forms can be bigger than their display windows, have scrollable regions for the entry of variable lines of items, lists of choices for data entry, context sensitive help, and special decimal, date, time, and toggle fields.
- A mini word processor can be attached to a field window in a form or used as a pop-up note taker.

You're In Charge

Because you can write and attach functions to the beginning and end of menus, forms, fields, and to keys, you're always in control.

Use these control functions to call up subsidiary forms and menus, change field values and the active field, exit or abort a form, do almost any task you can imagine.

All interactive capabilities of Vermont Views use a unique system of accessible keytables, so you can easily change or disable key assignments - even add to the functions provided for menus, forms, text entry, and windows.

One For All

Vermont Views is available for DOS, OS/2, UNIX, XENIX, and VMS. Maintain the same user interface on all of these operating systems with the same source code.

Vermont Views provides international portability as well, with full support for IBM international characters, flexible date and time formats, and changeable decimal and thousands separators.

Novice Or Expert

Despite its depth and flexibility, Vermont Views is easy to learn and use. Each major facility is covered in a single, self-contained section of the manual, so you only need to learn capabilities as you use them.

To help you become an expert in no time, we include a free copy of the Norton Guides™ Engine and our own comprehensive Pop-Up Reference™. You'll have immediate, on-line access to function names, reference pages, structures and tables.

No-Time-Limit Guarantee

We've only touched on a fraction of what makes Vermont Views special. The only way to know it is to use it. Try Vermont Views on your hardest problems. For as long as you want. At no risk. If not fully satisfied, return for a full refund. Anytime.

To Order Today
Call 1-800-848-1248

Prices: DOS $395; with Source $790. UNIX, XENIX, VMS, OS/2 please call.
Computer Scientists Warn of Physical Limits

Conquering the future frontiers of computing won't be easy, especially with something as big as physics getting in the way. That's the message four researchers delivered to fellow computer scientists at the eleventh World Computer Congress held in San Francisco recently.

Tommaso Toffoli of MIT said that in about 10 years, ICs simply won't be able to get any smaller. Toffoli and Teuvo Kohonen, of the Helsinki University of Technology, both pointed out that the density of microprocessors has been increasing by a factor of 10 every five years. That means that in 10 years, each transistor in a CPU will be one one-hundredth of its current size. But as those transistors get smaller, designers will face the problem of "tunneling"—electrons that won't behave in the expected ways—which means that physical CPU errors would become much more common.

To make computers work accurately beyond that level, Toffoli said, they'll have to depend on the microscopic physics of two electrons rather than the statistical mechanics of millions of electrons. "Maybe in 20 or 40 years we'll have computers where each bit is a quark, and then they will be reliable again," he said.

Kohonen proposed leaving conventional deterministic computers behind in favor of neural networks, using analog systems and a statistical description of data. But, Kohonen admitted, "You wouldn't want to use a neural net to keep your bank account; they're not accurate enough for that."

Gen Matsumoto, of Japan's Electrotechnical Laboratory, offered another alternative: "biocomputing." While neural networks mimic brain activity in computers, biocomputing attempts to electronically duplicate the actual structure of the brain.

Matsumoto said that biocomputing work has been going on for five years as part of Japan's "fifth-generation computer project," but at $2 million it's only about 1 percent of the ambitious endeavor's budget.

In an informal poll, Toffoli asked the audience of researchers if they thought that within 10 years it would be possible to hold an extended intelligent conversation with a computer. Almost no one in the audience said yes.

Although digital computers have changed greatly in form over the centuries, said Vladimir Cerny of Comenius University in Czechoslovakia, they haven't changed in function. "We've called it accounting, then calculating, then computing, and now data processing—but the way we do it hasn't changed that much," he said.

"Perhaps there is a bigger variety of dynamical systems that can be used for computing," the question isn't whether a machine can compute numbers, Cerny said, but whether it processes information; that's what makes them interesting, he added.

And what happens when machines get much, much better at processing information of all kinds? As Toffoli put it, "Eventually some computers may be interesting enough that they will be able to say, 'Look, leave me alone and let me think about what I want to think about.'"

TI Chips Will Cut Cost of 33-MHz 80386 Systems

Texas Instruments (Dallas) has developed a set of chips that will cut considerably the number of components that it takes to build a 33-MHz 80386-based computer. Most computer makers currently have to design their own discrete logic components to drive the high-speed 80386, and that means from 30 to 60 chips on the system board. But TI's new TACT83000 reduces that chip total down to eight (plus the 80386 CPU). The TACT83000 package is also suitable for 80386SX-based computers, in which case only three "glue-
Send lawyers, guns, and money, but no computers: With the recent lifting of restrictions on computer exports to some countries, the prohibited list has gotten shorter. According to rules published in the Federal Register, American computer makers cannot legally send computers to Cuba, Cambodia, North Korea, Vietnam, Libya, South Africa, or Namibia.

Seiko Instruments (San Jose, CA) now has a Macintosh model of its color thermal printer. The new QD5500 printer incorporates a QuickDraw device driver that supports a set of 35 scalable outline fonts, similar in concept to the fonts that Apple says it will supply with System 7.0 next year. (Seiko will support Apple’s outline fonts when they become available, a Seiko official said.) Resolution is 300 dpi. Seiko claims the unit has a print speed of 1 page per minute. Depending on page size and memory capacity, the printers range in price from $7000 to $14,000. The Seiko printer costs about $2000 less than comparable color thermal units from Tektronix and QMS, but it doesn’t have its own processor and doesn’t support PostScript.

Hevlett-Packard (Palo Alto, CA) and Samsung (Seoul, Korea) plan to jointly develop low-priced workstations based on HP’s Precision Architecture. The RISC-based Unix systems will start at about $500, an HP official said. The deal calls for Samsung to manufacture the products that result from the shared development work, which will then be sold by HP on an OEM basis. HP and Samsung say they’ll have their first codeveloped workstations by 1992.

Intel (Santa Clara, CA) is sampling its 32-bit LAN coprocessor chips for file servers, multiuser systems, and workstations. The 82596 uses the same bus interface signals as the 80386 and 80486 processors; it off-loads the host CPU and transmits data at the 32-bit bandwidth of the system bus. The chips are designed for being built right into the system board.

logic chips” are required.

The new four-chip set requires only four additional off-the-shelf glue logic chips to form a complete 80386 system. The TACT83000 package will make it possible to build a complete 33-MHz 80386 system on a 4- by 5-inch board, according to TI product manager Gerald Wineinger. The chip set will also allow manufacturers to reduce their design and production costs, Wineinger says.

The chip set consists of the memory control unit (MCU), the data path unit (DPU), and the AT bus interface unit (ATU), a single 208-pin chip that drives the standard AT bus. The ATU is “truly asynchronous,” Wineinger said, requiring no wait states or slower clock frequencies. The DPU is a “cascadable” 16-bit unit, allowing multiple DPUs to be configured to form wider data paths. The 32-bit 80386 implementation requires four chips rather than three because two 16-bit DPUs are needed. Since the ATU is a separate chip, TI says that it will be easy to offer “sibling” chip sets that support the new Extended Industry Standard Architecture (EISA) and the Micro Channel architecture bus interfaces. TI is also working on a version that will support the “burstmode” 64-bit data transfer capability of Intel’s 80486 chip.

TI will be competing with Chips & Technologies and Headland Technologies, which have 33-MHz 80386 chip sets under development. But TI marketing manager Stephen Tang-Kong says that TI will be the first to deliver. “We’re already working with beta boards and will have customers demonstrating systems at Fall Comdex,” he says. Tang-Kong claims that the competitors’ offerings will require from 9 (Headland) to 30 (C&T) additional logic chips for a complete system.

TI hopes to woo the “HPs, NCRs, and Olivettis of the world” with this new chip set, Tang-Kong says. He claims the chip set could cut prices of 33-MHz 80386 systems in half.

Cypress Claims 40-MHz Chip Fastest SPARC Yet

Cypress Semiconductor (San Jose, CA) has developed what it claims is the fastest RISC processor based on Sun Microsystems’ SPARC design. The chip maker says that its new 40-MHz 7C601 RISC chip is capable of performing 29 MIPS.

The new CMOS chip is 20 percent faster than the 24-MIPS version Cypress introduced earlier this year, according to Steve Goldstein, director of marketing of Cypress’s Ross Technology subsidiary. Increased performance is a “result of enhancements in clock frequency,” he said.

The 7C601 incorporates a large windowed register file (136 general-purpose 32-bit registers), which reduces the number of load and store operations and frees up bus bandwidth, Goldstein said.

In 100-piece quantities, the 7C601 costs $895.

Cypress sees bright days ahead for the SPARC chip, which Sun is trying to establish as the standard architecture for RISC workstations. According to Goldstein, SPARC will eventually be the top RISC choice because of the relatively large number of software applications already running on SPARC-based workstations. Goldstein predicted that the number will climb to 1000 by the end of this year.

After ISDN, We Can Wait for IBCN

Although ISDN has barely penetrated the communications structure, work is under way to develop the next step beyond: a more functional system called Integrated Broadband Communication Network.

ISDN runs on standard telephone cable at 9600 bps, while IBCN would run on broadband cable at up to 150 million bps by 1995 or so, says F. J. Kuehn of the Institute for Communications Switching and Data Techniques in West Germany. That speed will reach 600 million bps sometime after the year 2000, Kuehn predicts. With the greater bandwidth, users could see such functions as TV and radio programs, videoconferencing, voice or video mail, and interactive videotex delivered to their house, Kuehn says.
Until now there was only one way to integrate C and Assembler.

While C and Assembler give you power to burn, switching back and forth between them can leave your brain feeling a little fried.

All that stopping. And starting. And constantly retracing your steps.

Well, relax. Now there's Microsoft® QuickAssembler. Available with our clever QuickC® Compiler in one location: the first integrated environment for C and Assembler.

For the first time, you can save time with an integrated editor, compiler, assembler and debugger that let you create C programs, mixed C and Assembler programs, or Assembler programs that stand alone.

To make sure you feel at home in your new environment, we've designed Microsoft Quick Advisor, a hypertext electronic manual that coaches, coaxes and guides you on screen.

Quick Advisor gives you access to information on all ROM BIOS and MS-DOS® calls. And it even lets you cut and paste sample programs, so you can make both C and Assembler subroutines part of your routine in no time.

For more details on the incredible integrated power of QuickAssembler and QuickC Compiler, call (800) 426-9400. If you own QuickC Compiler version 2.0 already, we'll tell you how to add on QuickAssembler quick. And take a load off your mind.

You can easily add extra memory, a modem, AT expansion board, plus additional 20MB or 40MB removable hard drives whenever you see fit.
Now Your Decision On Which Laptop To Buy Doesn't Have To Be Final.

Epson's new laptop computer doesn't just go with you, it grows with you. The new Equity™ LT/286e starts with a 3.5" floppy drive, easy-to-read "paper-white" display, 286™ processor and one megabyte of RAM, all standard. You decide between a 20 megabyte or 40 megabyte removable hard drive. Where you take it from there is entirely up to you. Add more memory, a modem, expansion card or change hard drives, whenever your business demands it.

The new Equity LT/286e is part of a growing line of quality laptop computers from Epson. "The final word in value."
Neuron Data Systems (Palo Alto, CA) has developed a HyperCard front end for its Nexpert Object program, allowing the “expert” to input the rules and objects of the expert system as a series of HyperCard stacks. The company also has announced a Presentation Manager front end. Neuron Data has designed a “client/server architecture” for Nexpert Object that will allow PCs and workstations to access knowledge bases residing on a server or host mainframe. According to company official Patrick Perez, a key element in LAN-based expert systems is the use of “shareable image technology,” in which a snapshot of the centralized database and knowledge system is processed locally on the network station or PC.

Tumbling price: Dell Computer cut the price of its 80386SX system by $430 to $2839. Sanyo lowered its 8088-based 16EX computer to $905 and its 8086-based 17Plus5E to $1689. Boca Research eased the pain of memory by dropping its 8-megabyte BocaRAM/AT Plus memory board down to $2915, from $3395; the 4-megabyte board is now $1915 instead of $1795; the 2-megabyte model is now $965, $300 less than before. Orchard Technology also lowered memory board prices; its 2-megabyte RamQuest Extra 16/32 dwindled from $1499 to $1197. Applied Engineering cut 26 percent off the price of its MS-DOS coprocessor board for the Apple II series; the PC Transporter is now $499.

Microtec Research (Santa Clara, CA) said at UniForum in Boston that it will come out with a C compiler and other programming tools supporting the Motorola 88000 RISC processor. The tools will run on Sun-3, VAX/VMS, and IBM PC-compatible hardware.

AT&T is going to start letting colleges produce and distribute binary copies of AT&T's C++ Language System 2.0 to students for $25 each. A license for C++ source code will cost $300 per CPU. For more information, dial (800) 828-8649.

Although critics of ISDN charge that it's already outdated in terms of data capacity, even IBCN won't be able to support such high-volume data generators as high-definition TV, Kuehn says. HDTV already requires a capacity of more than 150 million bps.

During this migration from ISDN to IBCN, different countries will stress certain communications functions above others, says H. Ikeda, of Nippon Telephone & Telegraph in Japan. The U.S., for example, is likely to stress data transmission capabilities over voice or video transmission, Ikeda says. Consequently, evolution scenarios will differ from country to country, but vendors and standards bodies have to make sure that the underlying architecture works with all of them, Ikeda notes.

So what about ISDN? Although ISDN has been used little so far, that's going to change, says R. G. F. Aitchison, of ICL Network Systems. While ISDN lines cost 1.3 to 1.7 times the price of standard telephone lines, that's a “trivial element” compared to the technologies ISDN can provide, Aitchison says.

Computers Get Good Grades in This Study

Maybe it depends on whom you ask. Researchers and teachers attending the National Educational Computing Conference this summer indicated uncertainty about the usefulness of computers in the classroom (see October Microbytes, page 17). But in a study released recently, most of the teachers questioned gave computers good grades.

Two-thirds of the teachers in the U.S. say that use of computers in school should be drastically increased, according to a study published by IBM and conducted by The Wirthlin Group. Titled “Computer Report Card: How Teachers Grade Computers in the Classroom,” it's the most extensive study ever done of teachers' attitudes about computers in the classroom, IBM says.

Here are some of the results from the study: 82 percent of teachers polled said that the use of computer-based writing and reading programs could improve the illiteracy problem; 85 percent said that computers have already had a positive effect on the quality of education; 82 percent said that computers improve student motivation; 74 percent said that students who are not “computer literate” won't be adequately prepared for college; 60 percent of the teachers said that they feel inadequately trained in computer use, and 52 percent said that their students are more computer-literate than they are; 88 percent said that some sort of government funding should exist to expand the use of computers in the classroom, while 70 percent said that the greatest roadblock to more effective use of computers in schools is limited finances.

James Dezell, IBM's vice president of Educational Systems, said that by the time the average student graduates from high school, he or she has spent 20,000 hours in front of the TV and only 12,000 hours in the classroom. He claims that computers give teachers the resources to compete for students' attention “and win.”

The nationwide telephone survey of 1100 teachers was conducted in July. All 1100 respondents in the survey were full-time teachers of grades between kindergarten and high school; 66 percent said they currently use computers for instruction.

Quarterdeck Eases RAM Cram with QRAM

Quarterdeck (Santa Monica, CA) has developed a new PC utility designed to squeeze more memory out of DOS computers. QRAM (Quarterdeck pronounces it “cram”) is a $59.95 utility for XT and AT compatible with expanded memory conforming to the EMS 4.0 or EEMS specifications. QRAM can locate unused space in “high memory”—the area above DOS's 640K-byte limit, but below the 1-megabyte limit of the 8088 microprocessor—and lets you load device drivers and TSR programs there.

The idea is to ease “RAM cram.” Ordinarily, drivers and TSR programs take up part of the 640K bytes of memory that's available to DOS.
Introducing the everything-but-the-kitchen sync.

Presenting a multiscanning color monitor so advanced it's compatible with virtually all the video standards to date. And with video standards to come, like SuperVGA and IBM® 8514/A.

It's the C1391 PanaSync™ color monitor. And whether your office PCs are running Hercules™, CGA, EGA or VGA, this 14" Panasonic® monitor will display each to its best advantage.

Of course, the PanaSync monitor is comfortable in virtually any IBM or [with an optional cable] Apple Mac™ II environment. And we've given as much thought to your comfort, as well. With an ergonomic design. Featuring front-mounted controls. Tilt/swivel stand. And text color switching from green to amber to paper white in TTL modes. The affordable PanaSync C1391 monitor. The future on display.

Shifting the Balance
Of Power in Database Management

There's a new leader in the relational database management world. Its name is FoxPro.

FoxPro is the first and only microcomputer database management system that combines astonishing performance with a sleek interface of amazing power and beauty.

- FoxPro offers all the elegance and accessibility of a graphic-style interface, yet operates at the stunning speeds possible only with character interfaces.
- FoxPro is so easy to learn and use, even beginners can become productive immediately; yet it's powerful and sophisticated enough to satisfy the needs of the most demanding developers and power-users.
- FoxPro gives you choices instead of limits: use a mouse or a keyboard; type commands or use the object-oriented interface; run in one window, or hundreds.
- FoxPro is so efficient, it runs in a 512K PC-XT, yet it's able to take advantage of the speed, expanded memory and extended video modes of the most advanced machines available. You don't even need a graphics card or special windowing software.

Nothing is Faster

Fox Software products are famous for their unmatched execution speed. FoxPro extends that tradition.

FoxPro is up to eight times faster than dBASE IV — more than 15 times faster than dBASE III PLUS!

And that blazing speed translates into unprecedented power. Now you can efficiently process gigantic databases with hundreds of thousands—even millions—of records.

Protecting Your Investment

With FoxPro, your existing FoxBASE+ or dBASE III PLUS programs will run perfectly—first time, every time, no excuses. And FoxPro is language-compatible with dBASE IV. But FoxPro doesn't stop there. It has over 140 language enhancements not found in any version of dBASE. We've outdone ourselves by adding more than 200 language enhancements you won't find in FoxBASE+.

Best of all, FoxPro opens up whole new worlds for your applications by letting you move them onto a variety of different platforms.

The Tradition Continues

Fox Software is committed to excellence—our products prove it.

We've been producing superb database management software since 1983. And our products for both the PC and the Macintosh continue to win awards worldwide.

We've taken everything we know about software engineering, databases and interface design, and focused it into one remarkable product—FoxPro.

FREE Demo Disk

Shift the balance of power in your favor by trying FoxPro for yourself.

Call (419) 874-0162 now to get your free demo disk. Or ask for the FoxPro dealer nearest you.

See for yourself: Nothing Runs Like The Fox.

FoxBASE+ Users: Call About Our Liberal Upgrade Offer!

System Requirements: FoxPro operates in 512K RAM (640K recommended) with MS/PC-DOS 2.0 or greater and an 8086, 8088, 80286 or 80386 microprocessor. For optimum performance, FoxPro takes complete advantage of any available EMS (expanded memory) or a math coprocessor.

**Tandy** (Fort Worth, TX) expected to start selling this month a new portable word processor that's based on a 5.5-MHz Z80 chip, weighs 3.1 pounds, and is priced at $350. The new WP-2 is physically reminiscent of the Tandy Model 100/102 but has a bigger screen (an 80-character by 8-line LCD) and a 62-key QWERTY keyboard. Built into the computer is a word processing program (more sophisticated than the simple text editor in the Model 100, Tandy says), a 100,000-word spelling checker, and a 200,000-word thesaurus. Using the two function keys in combination with number keys, you can cut, copy, and paste; search and replace; center and justify text; send output to a printer; and initiate telecommunications. The diminutive unit has 32K bytes of memory, of which 22K bytes can hold documents. The WP-2 is powered by four AA batteries; Tandy estimates the operating battery life to be 12 hours. A lithium battery backs up the RAM.

While most of the specialized software used to gather and analyze the data from the Voyager spacecraft during its recent Neptune encounter was custom-written, scientists at the Jet Propulsion Laboratory (Pasadena, CA) used several off-the-shelf applications to make their work easier. With a Unix package called DataViews from V. I. Corp. (Amherst, MA), running on a Sun-3/260 workstation, they were able to graphically display live data on solar wind, atmospheric conditions, and various energy parameters. DataViews is a set of graphical interface application and development tools; the JPL scientists used it to create images for internal use and for the TV networks of nongraphic data using flow patterns, histograms, and spectrograms. They were "essentially doing two-dimensional representations of three-dimensional data in real time," JPL programming manager Pat Liggett told Microbytes Daily. The billions and billions of bits of data coming from the spacecraft were stored using a standard SyBase relational database manager.

**Speech More Important Interface Than Graphics, Media Lab's Negroponte Tells SIGGRAPH**

Nicholas Negroponte, director of MIT's Media Lab, came to the year's biggest computer graphics show and pronounced that the most significant development in the human/computer interface during the next five years will be in speech technology and not in computer graphics. In his keynote address at SIGGRAPH '89, Negroponte said that in the future, "the primary means of communication with computers will be through speech, not through graphics."

Part of the reason that speech-recognition capabilities have not advanced to the point where people can converse with their computers is that "people in the speech-recognition industry are fundamentally not interested in communication," Negroponte said. Because so many people involved in computer research are "not interested in communication," the computer remains "sensory deprived," he said.

Negroponte urged the SIGGRAPH audience, which consisted of researchers, scientists, engineers, designers, and artists at the forefront of computer graphics, to be more concerned with "how people communicate with computers instead of drawing teapots." "("Teapots" was a reference to the half-solid/half-wire-frame kettle in the SIGGRAPH logo, which had been shown rendered with various surfaces in a presentation preceding Negroponte's talk.)

Another development in what Negroponte calls "the sensory apparatus of computing" will be vision capabilities that will enable the computer to receive and interpret visual clues from the user. Right now, if we take our hands off the keyboard, the computer doesn't know if we're just pausing or leaving for the weekend, he said.

Although the desktop metaphor is dominant in the human/computer interface today—"Some people even have the temerity to go to court over it," Negroponte said—that's going to change because the desktop metaphor doesn't work. "Any quantity of data and it starts to fall apart," he said.

Negroponte described a day when the interface will simulate efficient procedures that people are already familiar with. Finding a stored document, for example, won't involve "mousing around," he said; it will be similar to what he does now: He calls his secretary through the speakerphone and asks her to please bring in a copy of the needed document. But instead of asking his secretary to find the document, he'll use his voice to ask his computer.
NEW! AT&T C++ RELEASE 2.0 SPECIFICATION

NEW! MS WINDOWS COMPATIBILITY

NEW! EASY PORTABILITY FROM MICROSOFT C

NEW! C++DEBUGGER & EXPANDED C++ TOOLS

NEW! OS/2 UPGRADE AVAILABLE NOW!

We listened carefully to what you wanted in a next generation MS DOS C++ compiler. The answer is Zortech C++ V2.0 Developer’s Edition. You wanted the latest AT&T V2.0 features with the power offered by multiple inheritance and type safe linkage, so here it is.

You wanted compatibility with MS WINDOWS, we added it.

You repeatedly asked for easier portability from Microsoft C, we got the message, and have written the library functions you need.

You wanted the world’s first MS DOS C++ source level DEBUGGER, and now the wait is over.

You wanted expanded and improved documentation, we both listened and delivered.

You wanted to be able to upgrade to an OS/2 version compiler supporting Presentation Manager, you did not want it to cost a fortune, so it’s available for $150.

For many, EMS programming support, built into the compiler is important, so it’s in there too.

You were happy using the 18 classes provided in C++ TOOLS, but we revised and expanded it anyway.

You never asked for a free TSR library to be included, but we knew you’d love to use our neat little package, so we included it free. You liked our FLASH GRAPHICS package for its speed, but wanted a C++ Class interface, so we’ve written it.

The NeXT™ Computer System is the first computer in the world (and so far the only) to use read/write/erasable optical storage. While PCs today are typically equipped with Winchester drives that store 20 to 40 MB, a single optical disk can store 256 MB. Plus, it is removable, for portability and added security. This dramatically new technology provides storage that is simultaneously vast, reliable and cost-effective—a combination unmatched by computers of any size.

NeXT has made the power of UNIX® usable by mere mortals. UNIX is the high-performance operating system used by workstations to achieve true multitasking and superior networking. Unfortunately, it has always been the antithesis of user-friendly. NeXT has given UNIX a revolutionary new interface—one that is both visual and intuitive. Now computer users of every level can instantly wield this tremendous power, with no technical knowledge whatsoever.

To achieve the power needed for the 90s, NeXT bypassed traditional workstation architecture and went directly to that of a mainframe. This eliminates bottlenecks and attains an extraordinary level of system "throughput"—the true measure of computer performance. Only through the use of VLSI (Very Large Scale Integration) technology could this architecture be reduced in size so that it could fit inside a desktop computer. It's a mainframe on two chips.

While PostScript® has long been the industry standard for printing, NeXT has made it fast enough to also be used on the display. This "unified imaging model" ensures that what you see on the display is precisely what you will get on paper. All your work, in any size type and any degree of rotation or magnification, appears with perfect 92-dots-per-inch clarity on the NeXT MegaPixel Display. And with laser precision at 400 dpi on the NeXT Laser Printer.

IN THE 90s, WE'LL ONLY TEN REAL BREAKTHROUGHS HERE ARE SEVEN
The NeXT Computer System is the first to be capable of producing CD-quality sound. Without requiring any additional equipment, this feat is made possible by a chip that has been specifically designed for the task of manipulating sound—the Digital Signal Processor (DSP). Because this processor is standard on every NeXT machine, software developers will be able to call upon its power to enrich programs we use every day. Now computers will not just be seen, but heard.

NeXT Mail takes electronic communications beyond anything you've seen on a personal computer before. Now you can send and receive multimedia mail—including text (with varied type fonts, styles and sizes), graphics and voice messages. And despite its high level of sophistication, NeXT Mail is so intuitive, you may not ever need to open the manual. NeXT Mail is built into the system, along with Ethernet and TCP/IP so the NeXT machine can quickly become a part of existing networks.

Programmers can create software on the NeXT Computer up to ten times faster than on any other computer—the result of a breakthrough called NextStep. It gives software developers the power to create the graphical user interface portion of their applications (often the most time-consuming and difficult part) without any programming at all.

This revolutionary environment means we will see more programs, and better ones, in less time than ever possible before.

These seven breakthroughs will change the way we use computers in the 90s. Which is why Businessland, the leading supplier of computers to corporate America, chose the NeXT Computer System as the workstation they will offer. Call us at 800-848-NeXT and we'll send you a 28-page brochure describing the NeXT Computer. We'll also give you the address of your nearest Businessland Center. There, you can experience for yourself the first seven breakthroughs of the 90s. And get a good idea where the next three will come from.
Vortex Controller Takes Different Approach to Reconstructing Disks After Disaster

Vortex Systems (Pittsburgh) has designed a new disk drive controller card that could significantly affect disk backup systems. Vortex says that its new RetroChron controller will continuously back up data and will allow system administrators to restore a disk to the exact state it was in at any previous time. Although the first version of the board will be expensive—about $5000 in single-unit quantities—the RetroChron could be useful on large network file servers, and its technology will surely migrate to less expensive controllers.

The RetroChron is essentially an enhanced SCSI disk drive controller for AT-compatible systems. The board has a small cache and can control three SCSI drives, which can appear to system software as one giant "perfect" virtual drive. It differs from other disk drive controllers in that it keeps a time-stamped record of every sector of this virtual drive, and it records every new version of the sector that the system writes to the drive.

With this information, the RetroChron can reconstruct a state of the virtual drive at any previous time by returning the version of each sector that was current at that time. As in the case of a disk-mirroring system, backup is continuous. And, like a tape cartridge system, the Vortex approach maintains a chronological record of the state of the disk. Every time a new version of a sector is written, it must be written twice—one on the primary drive and once on the backup drive.

"How come nobody's worried about the Mac interface?" asked Dooling, president of AT&T's Unix Software Operation. "I'm worried about it," he said. Although computer users are currently concerned with interoperability between Unix systems and IBM-compatible systems, they will soon start demanding that these connected environments include the Mac. It's "the most important user interface today on the desktop," Dooling told his audience of Unix users and developers. "I think we've got users out there who are going to demand that we address interoperability with those systems as well."

Mac's a Part of the Puzzle, AT&T Unix Exec Says

Meanwhile, as Voyager brushed past Neptune, earthlings were able to see images of the distant planet and its moons on IBM PS/2s at several museums around the U.S. The computers were running DOS-based image management software called PicturePower, from PictureWare (Bala Cynwyd, PA). The software stores and indexes images and lets the user annotate and manipulate them. Images can be imported in several formats and tied to textual dBASE records. The latest version of PicturePower sells for $1995. An optional image compression board, which uses the TI DSP 320C10, is $2000.

Although Logitech (Fremont, CA) thinks its TrackMan "stationary mouse" will be popular, "it will not replace the mouse" as the standard pointing device, company president Pierluigi Zappacosta said. So what will? Doug Engelbart, who invented the mouse in 1962, was at Logitech's briefing when it rolled out the new trackball-equipped TrackMan; he said he is a "great believer in evolution. Eventually the mouse will probably pass, and something else will replace it."

The operating environment that dominates desktop computing in the next decade will have to be able to handle four things, Quarterdeck president Terry Myers says: "communications, graphics, video, and voice." Those in the running right now, Myers said in an interview, are DOS, Digital Research's DR DOS, Microsoft Windows, OS/2, and Unix.

Apple's new $1.5 million corporate TV studio occupies the building where the Macintosh design team once roosted. In those days, they flew a pirate flag from the roof. The remodeled building now houses Apple TV, which will produce in-house training programs and videos for employee inspiration. Apple is currently installing a fiber-optic network throughout its buildings; combined with real-time video cards, such as the new Micro TV from Nolan Bushnell's Aapps, every Mac at Apple could be an Apple TV set.
NOW YOUR SOFTWARE CAN TEST ITSELF.

Your customers expect software that works. All the time. The key to software quality is exhaustive testing. It's also an engineer's worst nightmare. But it doesn't have to be. Because now you can automate your software testing.

Introducing the Atron Evaluator. The first and only non-intrusive automated PC-based software testing tool.

The Atron Evaluator automatically runs your software regression testing programs. All of them. All day. All night. Giving you thoroughly tested, higher quality software.

The Atron Evaluator is hardware-based. And since it's non-intrusive, software behavior is tested without the risk of alteration. Once your tests have run, you can refer to automatically generated test reports to double-check test results.

The Atron Evaluator saves time. And time makes you money. Development cycles are shortened, so your software gets to market sooner. And while your test programs are running, you can be more productive. Start a new project. Or go home.

For more information about the Atron Evaluator, call us at 1-800-283-5933. And put an end to your worst nightmares. Automatically.

I read Don Crabb’s “Smalltalk Can Be Cheap” (April) with great interest, and I’m looking forward to the appearance of the course next year. Of course, not having the product is something of a deterrent. Consequently, I suggest that Crabb put together a good book or reference material to be sold with Smalltalk/V for either the Mac or an IBM PC or clone. The possibility of the 80286 should also be kept in mind. In this way, many versions of Smalltalk could be sold, and we’d be able to follow more closely what is being presented in the course. Making object-oriented programming available would be a great service.

Ultimate or Penultimate System?
I just finished reading “The Ultimate Upgrade” by Stanford Diehl (June). As an avid (sometimes rabid) hobbyist, I was very surprised at the upgrade approach that Diehl took—and even more by the total cost.

In May, I completed the upgrade of an old XT clone to a mighty 80386-based machine. My goal was speed with lots of capacity and room to grow. Here’s what I got for less than half what you paid.

Aside from the Ethernet abilities of your machine, there’s not a lot of difference in what yours and mine will do.

I started with an XT form-size 80386 motherboard by Hauppauge Computer Works. This board has a 20-MHz 80386 processor and 1 megabyte of RAM, a Phoenix BIOS, a coprocessor slot, an internal clock, and all the other normal goodies. It cost me $1895. In the 32-bit slot, I added a card for up to 8 megabytes of memory and loaded it with 4 megabytes of 80-nanosecond RAM for $1080.

For storage, I settled on the Seagate 4096 hard disk drive with 80 megabytes of storage and a 28-millisecond access time for $549; I chose it mainly due to price and my knowledge of the product. I replaced the standard 5 1/4-inch floppy disk drive with a TEAC 360K-byte 3 1/2-inch dual floppy disk drive for $110. To make backups easier, I added an Everex 40 AT 40-megabyte tape streamer for $349.

For a controller to run the floppy disk drive, hard disk drive, and streamer, I chose the Western Digital WDL1006Y-MM2 (it controls two hard disk drives and two floppy disk drives with an 89K-byte look-ahead cache, has a 1-to-1 interleave, and is 16-bit) for $255.

Most of my work is text-related, so I wanted a graphics adapter and monitor that would not give me eyestrain. I selected the combination of a 14-inch color Taxan 770 Plus Monitor (multisync) and an ATI EGA Wonder adapter. These give me all the colors I need in WordPerfect, Lotus 1-2-3, and Harvard Graphics, as well as 132 columns in Lotus 1-2-3. I paid $248 for the card and $930 for the monitor.

I dropped in an I/O card with two parallel ports and two serial ports ($28) to take my printer and mouse and leave me some spares. For long-distance communication, I added the ATI 2400 modem for $152.

Just to make sure that there wouldn’t be any problems in the power department, I replaced the XT power supply (175 watts) with a 220-W model for $46. As a last present to myself, I added a 20-MHz 80387 coprocessor for $395.

The only remaining piece of the XT is the flip-top case. Everything else is different.

Total price: $6037 plus 2 1/2 hours for assembly and setup.

For the hobbyist willing to take the
Introducing the first color PostScript printer priced to keep you in the black.

The QMS ColorScript 100 Model 10. Just $9,995.

Show-stopping presentations, powerful projections and crystal clear calculations in hard copy or transparency form. Everything your business needs to stand out from the crowd. All in a full spectrum of color for just $9,995. The QMS ColorScript™ 100 Model 10 easily connects to your Mac® or PC to add full color and the power of true Adobe® PostScript to your business — and, at this price, it helps you stay in the black! It's another first from QMS® and a breakthrough in color PostScript® printers.

Limitless Possibilities. The new QMS ColorScript 100 Model 10 allows you to have total control over the final appearance of your hard copies and transparencies. The Model 10 includes 35 resident typefaces that, thanks to PostScript, can be scaled to virtually any size and shape. Put that together with its ability to print over 16 million color variations and you'll see an entirely new dimension to composition.

Exclusive Advantages. The compact Model 10 gives you advantages you won't find with the competition. For example, PC users can put the Model 10 to work without adding any additional boards. And Mac users simply plug the Model 10 into the AppleTalk® port. The Model 10 prints at 300 dpi for near typeset quality presentations that spring to life in colors that adhere to PANTONE® Color Standards. If you need to expand your printing capabilities or memory, the Model 10 is designed to easily accept a 1 MB or 4 MB RAM upgrade. The Model 10 also features an SCSI interface that makes adding enough memory to store the entire PostScript typeface library as simple as plugging in a lamp.

OS/2 on the Cheap
In his article entitled “OS/2 for Cheap” (April), Mark Minasi went to great lengths building an “inexpensive workstation that supports Presentation Manager,” yet his total price for a 10-MHz 80286 machine was $3444. Cut me a break!

First of all, why would anyone buy a slow 80286 when he or she could buy a 20-MHz 80386 for less money than Minasi spent? I would suggest that he carefully read Steve Apiki and Stanford Diehl’s article “80386s for the Masses” (October 1988).

Second, Minasi spent $300 extra on an 80-megabyte hard disk drive (the approximate price difference between a 40-megabyte and an 80-megabyte hard disk drive) when a 40-megabyte drive would have done just fine.

Third, everyone knows that PM and all the application software being written for it will be graphics-based, yet Minasi chose to save money by buying a monochrome monitor.

I suggest that Minasi forget the 80-megabyte hard disk drive and buy a VGA monitor, recheck the mail-order prices for 20-MHz 80386 machines, and read his copies of BYTE more carefully.

William Vantine
Arlington, VA

You seem to be saying three things: Buy an 80386, because it will be cheaper than the 80286 that I recommended; buy a VGA graphics system; and don’t buy an 80-megabyte drive—buy a 40-megabyte drive and save $300. I’ll cover these points one at a time.

First, I said that a 4-megabyte 80286 system with a hard disk drive controller, keyboard, and 1.2-megabyte floppy disk drive would cost about $2390. Sure, you can find 20-MHz 80386s for about $2000, but you’ve got to add 3 megabytes more of RAM at that point, which cost about $1600 in December 1988, when I wrote the first column. In “Election the PM” (February), I said, “To simply boot the PM with the compatibility box requires 2.6 megabytes, and you’re best with a minimum of 4 megabytes.” Refer to point 3 in your letter.

Second, you seem to be confusing the notion of a monitor type with a graphics board type, which is a common and quite understandable confusion. You see, merely having a monochrome monitor does not imply that you do or do not have graphics capabilities: It is the video board that determines what level of graphics you can support. As I said in my column, the Paradise Monochrome EGA card, as you would expect, supports full EGA graphics on a monochrome monitor. You get the full functionality of an EGA card and monitor—the only difference is that you see shades of gray rather than colors. Sure, VGA monitors are nice, but they’re also pricey. The Paradise board and a monochrome monitor can be found discounted for about $270. For a little more money, my fellow columnist L. Brett Glass speaks highly of the MultiSync GS, a monochrome multisampling monitor that can display VGA as shades of gray.

Third, how large a hard disk drive to buy is a matter of personal preference. Continued...
The Ultimate Business Computers

In 1986, CLUB American Technologies introduced the first personal computers designed for heavy industrial and commercial use. Since then, over 175,000 CLUB computers have been installed worldwide and have been well accepted by the Fortune 500, Government Institutions and thousands of small businesses.

This overwhelming success in CLUB's computers is a result of excellence in engineering during which no details are overlooked from the initial design to the final product. Also during manufacturing, each system is subject to an intensive SCBI process followed by In-Circuit Simulation Field Testing.

The reason that I recommended 80-megabyte drives is that they seem, at the moment, to be an excellent buy in terms of bucks per megabyte. For example, the advertisement on page 358 of the June BYTE for Mead Computer shows that a Seagate 4096 80-megabyte drive sells for $649. And Mead sells its 40-megabyte 4053 for $519. Paying $180 for 40 megabytes is a deal that I just can’t refuse. And the Seagate 4096 can be had for even less—the one in the machine that I’m now working with cost me $550.

Remember, hard disk space is like all the good things in life—you just can’t get enough of it. —Mark Minasi

Nectar in a Sieve
Nick Pelling’s letter describing a more efficient algorithm for the Sieve of Eratosthenes (“Algorithm Optimizing,” May) fired my imagination, with startling results. In the Sieve, all multiples of numbers greater than 1 are cleared in an array of flags. The remaining flags are prime numbers.

Pelling made the following points: In choosing numbers whose multiples to test, only prime numbers need to be used; each prime number used can begin the search at its own square; and the highest prime to use in this way is the square root of the size of the array.

This was the fastest prime-number algorithm I’d ever seen, and I got excited. After a while, this led to an inspiration: While each prime is testing its way through the array, every second test is against an even number. If these are eliminated, the speed of the algorithm doubles.

Pelling’s BASIC program was similar to this (I’ve added line numbers for reference):

```
1 max=8192 : root=INT (SQR(max)) : DIM flags(max)
2 FOR num=1 TO max
4 flags(num)=TRUE
5 NEXT num
6 FOR num=2 TO root
7 IF flags(num) THEN
8 FOR mult=num*num TO max
9 flags(mult)=FALSE
10 NEXT mult
11 END IF
12 NEXT num
```

I changed three of the lines:

2 flags(2)=TRUE
3 FOR num=1 TO max STEP 2
8 FOR mult=num*num TO max
   STEP num+num

The altered program runs twice as fast as the original.

A second idea is to compress the array. The new algorithm never uses the even-numbered flags, so they don’t have to be there. By having the flag array represent successive odd numbers, twice as many primes can be found in the same amount of memory.

Intelligent Database Tools are Here!

Is your Database an Asset or just a File?

As your database grows, its potential value increases. Your challenge is to keep it error-free, understand it, and use it to make effective decisions. These are the tools you need:

**DATABASE SUPERVISOR**

Maintain data quality and data integrity. Keep your database error-free. Database/Supervisor analyzes your databases and identifies suspicious data items, and patterns which are out of the ordinary. It automatically detects errors which violate statistical or logical integrity constraints. If your database is being corrupted, Database/Supervisor will show you where.

**IXL The Machine Learning System**

Discover hidden patterns and unexpected relationships in your large database. IXL analyzes your database and generates easy-to-read rules using artificial intelligence and statistical techniques. While Database/Supervisor detects errors, IXL produces rules and decision-making insight. The solutions you are looking for may already be in your database, waiting to be discovered.

**NEURAL/QUERY**

Query are perfect partners. IXL generates rules which can be exported. However, Neural/Query analyzes your large database, builds a network of partial matches, and provides the closest matching answer to your database queries. Use the full informational content of your database.

**Intelligence Compiler**

Develop your intelligent application quickly and efficiently, then run it on multiple operating systems. The built-in relational database combines expert system logic with SQL-based object oriented queries. Accomplish in hours what would otherwise take weeks.

Don't deny yourself inexact, but potentially valuable, answers to your database queries. Close matches are more valuable than no response. IXL and Neural/Query are perfect partners. IXL generates rules which can be exported. However, Neural/Query analyzes your large database, builds a network of partial matches, and provides the closest matching answer to your database queries. Use the full informational content of your database.

**Experts love our software:**

The Intelligence/Compiler is a powerful state of the art system for real-world applications. Its intelligent editing and debugging facilities are a bonus. *AI/Expert Magazine*, February 1988.

Considering the variety of features that the Intelligence/Compiler provides, it is hard to believe that you can get better value for your money. *PC/Expert Magazine*, June 1989.

Having used IXL on a large database of geological test data, we were surprised by the many relationships it found. This has greatly helped us to interpret our Oil Company database. Mr. James Brown, Oil Industry Consultant, July 1989.

We make a super VGA monitor

NEC presents the MultiSync® 2A, the best VGA monitor you can buy.

It's the first monitor from the leader in the color monitor industry that's been customized to the needs of the VGA user.

The MultiSync 2A is affordable and uncompromised. And compatible with all VGA modes. In short, it performs brilliantly. But what's equally important, it allows you to move effortlessly to the next major graphics standard: SuperVGA. That's something fixed-frequency monitors like IBM and Compaq can't do.

All this in a monitor that gives you a 14" non-glare screen on a tilt-swill base, for nearly 30% more viewing area than standard 12" screens, as well as a new, ergonomically designed cabinet.

MultiSync 2A. One super VGA monitor.
that's also a SuperVGA monitor.

But that's only part of the story. NEC also presents the best SuperVGA monitor you can buy. MultiSync® 2A.

The monitor that senses the software you're using and makes the switch from a VGA monitor to SuperVGA, the new standard developed by NEC and recognized by VESA. SuperVGA delivers a maximum resolution of 800 x 600, which is 56% higher than VGA.

After all, since you're most likely buying a board that goes beyond VGA, your monitor should too.

The MultiSync 2A is also available in a gray-scale version called the MultiSync GS2A monitor, with a 14" paper-white flat surface screen.

Either way, it's one super SuperVGA monitor. For literature call 1-800-826-2255. For information call NEC at 1-800-FONE-NEC.

Digitron Telecommunications is a small computer engineering company specializing in audiotex and automated telemarketing systems. Since it is our innovative technology that sets us apart from our much larger and well-established competition, we viewed patents as a logical way to protect our innovative technologies. After consulting with patent attorneys, we soon found that the picture wasn’t nearly so rosy as the article would have us believe.

Obtaining a patent for a piece of software typically costs between $3000 and $10,000. This is more expensive than patents for mechanical devices because of the flow charts and other software-specific documentation required. Most companies, even small ones like ours, can afford this price. However, once you have obtained the patent, you are not out of the woods yet. If one of your competitors challenges your patent, the costs of defending it can easily run into several hundreds of thousands of dollars. If one of the megacompanies (e.g., IBM, Computer Associates, or Microsoft) comes after a small software company, it can bury the small company in the legal costs of defending the patent.

Also keep in mind that by patenting a technology, you release your trade secrets, so that everyone has access to the details of your work.

In the end, we decided not to patent our software, since we don’t want to give it away for free and we couldn’t afford several hundred thousand dollars in legal fees to defend our patents.

Like so many things in our litigious society, the patent process defends the mighty at the expense of the weak. The eventual outcome of widespread software patents will be to kill innovative small companies and to ensure a software monopoly for the few megacompanies who can outspend everyone else in court.

Praising the Pioneers
I enjoyed Rick Grehan’s “Directory Assistance” (Parts 1 and 2, May and June) but lamented his omission of the pioneering TRS-DOS and LS-DOS systems on the TRS-80s. While these veteran operating systems may not hold the market share they once did, they provide many useful and sophisticated features that their more popular contemporaries sorely lack.

For instance, file specifications are hashed to an 8-bit value and indexed in a table occupying one directory sector. Once it has located the information, the disk operating system goes directly to the directory entry and wastes no time wading through all the other directory entries. Thus, the TRS-80 has faster file access than many of its 16-bit rivals.

Directory sectors use a unique data address mark so that the system can distinguish them from data sectors, making it nearly impossible for an application inadvertently to destroy the directory.

The flexibility that TRS-DOS and LS-DOS afford is also noteworthy. Though it predates 3½-inch floppy disks, it automatically recognizes them in a system (there’s no need for CONFIG.sys device specifications). The directory is normally located on the center cylinder, but the user can specify any cylinder at format time (BOOT.SYS on track 0 points to the directory). Until I learned of MS-DOS’s insistence on putting the directory on track 0, I wondered why the drives chugged so much before doing anything!

From the user’s perspective, however, the most important feature of any disk operating system is the friendliness and utility of its file-handling features. Here the TRS-80 disk operating systems surpass many popular systems. TRS-DOS and LS-DOS go far beyond simply assigning attributes and access levels to files. Owner and user protection is provided, and a password may be assigned to protect the entire disk as well.

BACKUP outperforms many commercial backup products I’ve used under MS-DOS. An irritating feature of MS-DOS (and CP/M) is the archaic need to “log into” a drive and then set up a path to overcome this deficiency. TRS-DOS and LS-DOS will automatically search all on-line drives until the file is found (this means there can be no subdirectory structures, but that’s easily overcome by disk partitioning). The meager MS-DOS DIR display has always irked me; TRS-DOS and LS-DOS use the full video display width to show useful information like the number of extents, number of records, protection level, logical record length, and end of file (in addition to the usual stuff).

The TRS-80 Z80-based family has never received the recognition that it deserves for efficiency and functionality. I only hope that the new Z-280 isn’t too late to change that.

Sony Singled Out?
We were quite distressed to read Hugh Kenner’s review of Fred Warshofsky’s The Chip War (June).

Warshofsky’s original text was incorrect. Although his quote was based on an interview with William Taylor, we suspect that Taylor may have been using the Sony name as being symbolic of all Japanese manufacturers. The bottom line in the story Taylor relates is not “how Sony got into the [TV] business,” since Sony never sold private-label TVs to either Sears or RCA.

Growing Old Gracefully
May the Macintosh never grow old gracefully.

The day that Apple implements Don Crab’s suggestions (“The Mac Interface: Showing Its Age,” Macintosh Special Edition, June)—most notably the command-line interface that he seems so fond of—is the day I stop buying and recommending Apple computers.

It’s not that I wouldn’t appreciate some way to batch up repetitive tasks, but I already have that in any of several macro tools (including one that comes with the computer). I cannot think of anything that grep will do for me that direct manipulation or a quick HyperCard program won’t do better (with a lot less chance of destroying more data than any virus ever did).

High-Energy Help
I am a computer science major interested in robotics and high-energy physics. I am seeking any information regarding what past issues of BYTE may have had Circuit Cellar projects concerning these subjects. My local libraries and school libraries carry BYTE only from 1985 on. I remember several years ago reading an article in BYTE that dealt with the technical aspects and considerations of constructing a robot manipulator arm. I cannot recall what issue that was in.

There have been precious few Circuit Cellar articles on topics in high-energy physics. In fact, that’s a subject we rarely cover in detail anywhere in BYTE. As for robot manipulator arms, a search through BYTE’s back issues revealed “A...” continued

Price

Gateway 2000 offers the most aggressive prices in the industry. We offer fully loaded machines for the same price as most vendor's stripped down models. One customer wrote "I'm surprised that the computer media haven't mentioned anything about your prices relative to the rest. You don't merely edge them out you blow them away"—Clarence Larson. Look at our prices on the back page of this ad, shop around, compare apples to apples, then call Gateway 2000's knowledgeable sales staff to discover the GATEWAY DIFFERENCE. "I chose Gateway after much research because I felt that the product was the best value for the money and the sales staff was very patient with my never ending list of questions and and inquiries"—Keith Lazan.
Quality

Gateway 2000’s quality standards set us apart from our competition. From the top quality name brand components used in our systems to the painstaking quality assurance tests we run on our machines, you are guaranteed a top quality computer. Our complete line of computer systems are hand built in our factory located just outside Sioux City, Iowa. State of the art technology is used to provide you with a combination of performance, compatibility, and reliability that few vendors can match. One customer recently wrote: “The quality of your work is exemplary and frankly has made a lot of others jealous because they bought systems which were comparable in quality but with a stiff price difference”—George Syty.

Service

Gateway 2000’s service policies are the best in the industry. We stand behind all of our systems with a 30 Day Money Back Guarantee and a 1 Year Warranty. We also offer Lifetime Toll-Free Technical Support, and Free Federal Express Shipping of replacement parts. If our technicians can’t solve your problems over the phone or Fed-X you a solution we can dispatch a technician to most locations to provide Free On Site Service. Our policies are great, but it’s our people that really set us apart from the competition. Look at what our customers write:

“Thank you very much for kind attention and help. I am highly recommending your corporation to colleagues for your quality and service”—Herbert Markley.

“I’ve always heard your forte is customer service, and now you have definitely proven it to me”—Jose De Jesus.

“I am really glad I chose Gateway 2000”—Jerry Langland.

“I feel compelled to express my gratitude to your company for the impeccable service and support I received”—Andrei Weissmann.

“It is a pleasure indeed, to work with a computer sales company that exhibits a genuine desire to satisfy the customer”—Ron L. Kinney.

**Desktop Publishing**

I am the computer operator for a small realty company, and we need a good, powerful desktop publishing system and a hand-held graphics scanner. We have an IBM PS/2 Model 50 with 1 megabyte of memory, a 1.44-megabyte 3½-inch floppy disk drive, a 20-megabyte hard disk drive, and a monochrome monitor. We also have an Okidata Microline 320 printer.

Kevin C. Redden
Vanceburg, KY

The Model 50 should be more than capable of handling either PageMaker or Ventura Publisher, both of which are excellent desktop publishing software packages. To install PageMaker, you will also need to buy a full copy of Microsoft Windows 286. PS/2 mice are available from a number of sources.

The Okidata Microline 320 can be purchased as either Epson FX-80-compatible or IBM Graphics-compatible. If you choose PageMaker/Windows, you could try either the IBMGRX driver or the EPSON9 driver. As I recall, Ventura Publisher supports the printer directly.

Take a look at "Handy Scanners" in the June BYTE for a review of popular hand scanners. After you scan your image, convert it to either PCX or TIFF. From there, either PageMaker or Ventura Publisher can merge your scanned images into your layout. The only problem you might run into is disk space—desktop publishing programs and files take up a lot of it.—H. E.

According to Compaq, your Compaq Portable 386 provides for only one floppy disk drive, which can be your choice of either 3½-inch or 5¼-inch. The only way to get the second drive connected is through a second floppy disk drive controller. You'll need one that responds to a continued

secondary device address. The CompatiCard I from Micro Solutions (132 West Lincoln Hwy., DeKalb, IL 60115, (815) 756-3411) may be just the beast you’re looking for.

To install it, you need a card slot. On the Portable 386, that means buying the expansion box that bolts onto the back of your computer. On the drive side, you’ll have to locate a 5¼-inch disk drive in an external housing with a power supply. Find or make a cable that attaches to the external connector on the CompatiCard.

The only hard part here is finding the external drive. The expansion box comes from a Compaq dealer. The dealer may be able to get you the external floppy disk drive. A number of mail-order places advertise here in BYTE, or you can probably find what you want at a local computer flea market. —H. E.

Bad Drives

I own an 8-MHz IBM AT compatible that I bought in the U.S. in May 1986. I would like to add an internal 3½-inch floppy disk drive to this machine. I tried installing a 1.44-megabyte Chinon drive but ran into serious problems.

After configuring the system with SETUP (I told it I had a 720K-byte drive, since it doesn’t know about newer 1.44-megabyte drives), I discovered that only DIR and CHKDSK would recognize the drive. Copying files to or from the drive produced a “Sector not found” error, while FORMAT complained, “Invalid media or Track 0 bad—disk unusable.” The disk I used had been previously formatted for 1.44 megabytes on an IBM PS/2 Model 80. Trying other disks didn’t help, either.

Since the same drive functions flawlessly in an MCI AT compatible, I am assuming that my disk drive controller is at fault. It could be that I have an older model that can’t handle these drives properly. Judging from all the “WD” part numbers on the chips, it is probably a Western Digital controller. It is labeled “FIXED DISK - FLOPPY DISKETTE ASSY. 61-031099-00 Rev. X7A.”

Assuming that the controller is otherwise in order, is there any way (e.g., jumper settings or some work with a soldering iron) to make it work with a 1.44-megabyte drive? Is it possible that a drive from another manufacturer might work?

Failing all the above, is there a cheap floppy disk drive controller that I could add just for the new drive? I’d hate to junk an otherwise perfectly functioning controller for the added convenience of 3½-inch disks, despite the recent low prices for such drives.

Dr. A. C. Kridiotis
Köln, West Germany

In describing your problem, you failed to mention which versions of DOS are running on your AT and MCI AT compatibles. I’d guess that you are running PC-DOS 3.1 or an even earlier version of DOS on your PC AT. If so, upgrade your system to PC- or MS-DOS 3.3. This newer DOS has the DRIVER.SYS device driver that will enable DOS to recognize add-on disk drives.

Once the newer DOS is on your system, you can add the following line: DEVICE = DRIVER.SYS /D:N (where D is 2 for the new second drive and N is 3 for a 1.44-megabyte 3½-inch floppy disk drive) to your CONFIG.SYS file. The new drive will then be assigned as drive D. —S. W.

Bits Across the World

Our newspaper, *YABALASH*, in the State of Qatar on the Arabian Gulf, has a circulation of 50,000 worldwide. Consequently, our office does a lot of correspondence with remote locations daily. We are looking for a good computerized system to manage our day-to-day office work. We would like to feed it all incoming and outgoing mail and would like to be able to access mail by date and company category. A scanner would also be helpful in handling the mail.

Do you have any suggestions?

A. S. Ahmed
Doha, Qatar

A custom application written for any good database system should be able to manage the mail flow. If this seems unworkable, look around for an office automation consultant. This is a relatively new field, made up of people who specialize in installing office management systems. One of these consultants should be able to point you toward a vertical application specifically geared toward mail management.

As for the scanner, one of the best low-cost optical character recognition systems we've seen here at BYTE is the TrueScan system from Calera Recognition Systems (2500 Augustine Dr., Santa Clara, CA 95054, (408) 986-8006). It's an OCR board and software that work with many flatbed scanners. We've tested it on the Hewlett-Packard ScanJet.

The project you suggest is not a simple one—it will take some time to identify the issues and pick your solutions. A good consultant will make that much easier.

Another Task for Hercules

I have an IBM PC AT-compatible system (Advantech SP/AT-800) with a Samsung MA256 monochrome display and a Juko G7-A multidisplay I/O adapter. I have set the adapter to Hercules monochrome graphics mode. My GWBASIC supports monochrome text but does not support Hercules graphics mode. I use the computer mainly for scientific calculations and word processing, so this is not a serious problem. However, my son is crazy about graphics.

Where can I get a version of GWBASIC that supports both the monochrome text and the Hercules graphics modes? Also, can I set the multidisplay adapter to CGA mode without damaging my monochrome monitor?

Ren Yanru
Beijing, China

GWBASIC does not support the Hercules graphics modes, but many of the compilers do. You should take a look at Microsoft’s QuickBASIC or Borland’s Turbo Basic. Both of these products are GWBASIC-compatible and extend the graphics support to include the Hercules card.

I’ve been unable to dig up any information on your display card. I’ve seen other CGA-compatible cards that handle the monochrome monitor perfectly. What does the Juko documentation say about it? The street price on a monochrome monitor around here is less than $60. At that price, I’d risk trying it.

Other multidisplay cards that I’ve seen require DIP switches to select either Hercules or CGA emulation. Switching to CGA mode will let you run GWBASIC and your son’s games, while losing the ability to use the higher-resolution Hercules mode available in QuickBASIC and Turbo Basic.—H. E.
Now QuickPascal makes this software go even faster.

Even the quickest minds tend to brake suddenly when confronting new languages.

Enter new Microsoft QuickPascal Compiler:

The first Pascal that is not only powerful but easy, intuitive and 100% headache-free.

For example, our new hypertext QuickPascal Advisor offers on-the-job training: by cutting and pasting sample code you can learn to program in Pascal from scratch. And if you do hit a snag, the Quick Advisor can straighten everything out right on the spot.

To accelerate your thought processes even more, all of our processes are seamlessly integrated; no other Pascal offers you easier access to your editor, debugger and compiler.

What's more, QuickPascal is the first PC Pascal to offer Object Oriented Programming, or OOP. With objects, you can easily assemble whole programs from modular building blocks of code and data. And once you know Pascal, OOP is a snap. Which means, you get maximum productivity with minimum effort.

Naturally, our Pascal is also fully source compatible with Turbo Pascal.

So stop by your Microsoft dealer soon. You'll find our software is on the same wavelength as yours.

Supporting Supercomputers

Dear Jerry,

I noted a bit of incredulity in your April Computing at Chaos Manor with regard to the fact that computer science and related computer topics and the Cosmic Cube.

Sadly, Congress is now convinced that it is heavily supporting computer science research through the supercomputing centers. It is unwilling to provide significant additional funding for computer science; thus, while ours is the discipline with the greatest expansion in total researchers in the last 20 years, it has seen a net decrease in available federal research funding. The only agency that currently supports any large, focused programs in computer science is the Defense Advanced Research Projects Agency, through its Information Sciences and Technology Office. However, DARPA’s budget is also being heavily cut, since the current military cutbacks, as always, are being concentrated on programs with short-term contracts to save those with long-term obligations, such as aircraft carriers and stealth bombers.

Thus, your call for support of increased funding for the supercomputing centers, while it may give the physicists some new toys to help them design their new Superconducting Super Collider, is likely to result in further reductions to the basic research that makes supercomputers work. The $100 million that you told people to ask their representatives to allocate will likely be used to buy the next generation of supercomputers from Japan.

Your efforts would better serve the long-term interests of the country if they were directed at increasing support for basic computing research. $100 million per year would move 10 of our better computer science departments into the upper echelon of research currently inhabited only by MIT, Carnegie Mellon, and Stanford. Alternatively, it could be...continued

used to build a fiber-optic network that would allow real-time transmission of digitized images across the country, or to buy 20 of the largest parallel processors for computer science and AI research.

I hope that in the future you will use some of your broad influence to encourage others to back increased support of computer science research in addition to computational support for other sciences. Senator Albert Gore is one key official who is leading such a drive, and he would probably welcome additional popular exposure of his plans.

Dr. Charles Weems
Senior Research Scientist
University of Massachusetts
Amherst, MA

I suspect you exaggerate my influence, although one of Gore's key people turns out to be a former student of mine.

I'm not sure how one goes about "supporting computer science"; a lot of government programs tend to have effects opposite to what was intended. After all, we have the Connection Machine. As to ARPANET. I agree that it was a Good Thing, but I can't write about it any longer: They closed out my account.

The problem, it seems to me, isn't my support of the supercomputers; it's that scientists see the science budget as a zero-sum game. That's the wrong approach. Go convince them that support of your project is a good investment.—Jerry

And think about OST, the European leader in the field of private X.25 networks! Our PC XNET card, an option/adapter card for personal computers, provides two channels, each supporting 128 virtual circuits and speeds to 64 kbps. The PC XNET card provides a level of performance never before reached in a personal computer.

Easy access via MS DOS, XENIX and NETBIOS makes the PC XNET card the perfect tool for emulating terminals and file servers or providing a gateway to Local Area Networks. Fully compatible with many protocols such as X.25, X.32 and X.21, the PC XNET card enables computers to be connected to any type of network.

Furthermore, applications programs you develop on the PC XNET card can be transferred to the PC SNET card, OST's ISDN interface card.

So, if you are thinking of X.25 capability for your computer think about OST.

Wallaby Gets Mac-Compatible with Laptop

The trick to the Wallaby's Macintosh compatibility is that you must take the ROM chips out of your Macintosh Plus or SE and put them into the laptop system. This feat is performed by the dealer when you purchase the laptop. A connector board is then installed in your Mac.

The fully configured 15-MHz 68000-based Laptop System from Wallaby Systems weighs less than 10 pounds, including the battery, the keyboard, the backlit LCD, and the optional 20-megabyte hard disk drive.

The 12- by 8- by 4-inch unit is also IBM-compatible, in the sense that the standard 80K-byte Wallaby floppy disk drive can read and write IBM-formatted disks as well as Macintosh-formatted disks, the company claims.

In portable mode, you take the Laptop System on the road and leave your Mac at home or in the office. In the office, you boot your Mac SE or Plus from the Wallaby.

Programs can also be stored in a proprietary "silicon disk" that is based on nonvolatile RAM. Up to 16 megabytes (using 4-megabyte single-in-line memory modules) of program storage is possible on the Laptop System without the use of a hard disk.

Besides a full megabyte of RAM (upgradable to 4 megabytes), the Wallaby laptop comes with a printer, printer and communications ports, an 800K-byte 3½-inch floppy disk drive, and an Isopoint device instead of a mouse.

The Wallaby keyboard is linked to the monitor through infrared signals. The monitor has a 640- by 400-pixel black-on-white display.

Price: $2995.

Compute on the Commute

The Electronic Portable Information Center (EPIC) appears to be a 23-pound leather briefcase. But tucked inside is a communications center, complete with a 12-MHz AT-compatible keyboard; an 11-inch, paperwhite, VGA-compatible, backlit LCD; a cellular phone; a 1200-bps Hayes-compatible modem; and, later this year, optional fax capabilities.

The AT-compatible has 1 megabyte of RAM, a 1.44-megabyte 3½-inch floppy disk drive, and 20-megabyte hard disk drive.

EPIC comes with DOS and software for word processing, database, spreadsheet, communications, graphics, and general business functions.

Price: $8495.

NEC Announces Three Desktop Systems

PowerMate 286, NEC's low-end system, has its own Super EGA built into the motherboard. It comes with a 10-MHz microprocessor with one wait state (software-switchable to 8 MHz), 512K bytes of RAM (expandable to up to 16 megabytes), a 5.25-inch floppy disk drive, a keyboard, and room for one 3½-inch half-height and two 5½-inch half-height drives and four full-size, 16-bit, add-in cards.

Ports include the keyboard port on the front panel, a parallel printer port, a serial printer port, and an RGB video port. Its dimensions are 14 by 16 by 5 inches, and it weighs 21 pounds. Optional equipment includes an 80287 math coprocessor, your choice of floppy and hard disk drives, and your choice of tape backup systems.

The PowerMate 286 Plus is the same as the standard 286 except that it features a faster (12-MHz) zero-wait-state microprocessor (switchable to 8 MHz and one wait state), 1 megabyte of RAM (expandable to 4 megabytes of 80ns or 12 megabytes of 120-ns RAM), and 640- by 480-pixel resolution in 16 colors built into the motherboard. The 286 Plus also includes DOS 3.3.

The PowerMate SX includes 2 megabytes of RAM (upgradable to 16 megabytes), a 1.2-megabyte 5¼-inch floppy disk drive, and a keyboard.

Price: 286, $1299; with Super VGA, $1499; 286 Plus with one 1.2-megabyte 5¼-inch floppy disk drive, $1999; with 42-megabyte hard disk drive, $2899; SX, $2699; with 42-megabyte hard disk drive, $3599.

The Short Tower with Pizazz

The CCS 286-12 is a 12-MHz 80286 system in a short tower chassis. It's big enough for two floppy disk drives of your choice (1.2-megabyte 5¼-inch or 1.44-megabyte 3½-inch), a hard disk drive, and three 16-bit slots and an 8-bit slot.

Standard equipment includes $12K bytes of RAM (upgradable to 4 megabytes), a Phoenix BIOS, an EGA video controller, a floppy disk drive controller with your choice of two 3½-inch or 3½-inch floppy disk drives, a parallel port, two serial ports, and a PS/2 mouse port.

Also standard is a 101-key keyboard and a monochrome monitor.

Price: Basic configuration, $1399; with a 20-megabyte hard disk drive, $1629.

**N/Hance Introduces Operating-System-Independent Drive**

The 5120 is a 1280-megabyte random-access WORM (write once, read independent.) drive that's designed to be operating-system- and processor-independent.

The Write-Once File System software is compatible with DOS 3.0 and higher, Novell, Unix, and OS/2.

The 5120 features 640 megabytes per side (the average access time is rated at less than 90 ms) and removable disks. It weighs 4 pounds and measures 5 1/4 by 7 by 15 1/2 inches.

**Erasable Optical Drive Features 1 Gigabyte**

Storage Dimensions says its plug-and-play version of Maxtor's Tahiti 1 rewritable magneto-optical disk system is the fastest example of this new technology on the market.

The LaserStor, for the IBM PC and PS/2s, the Mac, and NetWare servers, is rated at an average seek time of 35 ms. It's available only as an external unit with its own power supply, fan, and SCSI connector to the host microcomputer. The full-height drive uses removable 5 1/4-inch optical cartridges that can hold either the industry-standard 650 megabytes or Storage Dimensions' proprietary 1 gigabyte of data on two sides, depending on the format used.

PC and PS/2 models are supplied with AT- or Micro Channel-bus SCSI boards, and all versions appear as a standard hard disk drive to the operating system.

For PCs and PS/2s, LaserStor comes with SCSI host bus adapters and SpeedStor software that permits DOS to address the drive as a single partition or as several volumes. With the Macintosh, the LaserStor plugs directly into the external SCSI port and is supported with Macintosh software.

**Price:** $7995; 650-megabyte cartridges, $295; 1-gigabyte cartridges, $395.

**A Gigabyte of Storage Space for Your Mac**

For Mac aficionados with a need for really large storage space, MicroNet Technology has introduced the first 1-gigabyte hard disk drive for the Mac. The SXB-1000, based on Imprimus Technology's Wren VII drive, is a full-height 5 1/4-inch SCSI drive with an average access time of 15 ms.

You can install the SXB-1000 inside a Mac II or Ix, or it can also be mounted in an external box for use with other Macs.

**QMS Ships Low-Priced Color PostScript Printer**

The ColorScript 100 Model 10 is a color PostScript printer that uses thermal-transfer technology and can attach to either IBM or Macintosh computers.

It can produce a 300-dpi four-color page in about 1 minute, the company says, with the help of the Mitsubishi G370 print engine. The G370 can create up to 16 million color combinations.

The printer, about the size of the original Apple LaserWriter, includes an internal controller based on a 16-MHz 68020 processor, plus 4 megabytes of RAM (expandable to 8 megabytes), and 1 megabyte of ROM containing 35 fonts. Standard interfaces are RS-232C serial, Centronics parallel, and AppleTalk/RS-422 ports, and an external SCSI port that allows connection of up to seven hard disk drives.

The Model 10 uses rolls of wax-based ink for the color thermal-transfer process and requires special paper that costs roughly 6 cents per sheet. It can also print on transparencies.

**Price:** $9995; extra memory, $595 (1 megabyte) and $1495 (4 megabytes).

**Color Your Computer Overheads**

In Focus Systems claims that its 480C PC Viewer is the first LCD panel that projects full-color computer images through an overhead projector. It sits atop your overhead projector and delivers eight-color presentations at VGA resolution.

The PC Viewer uses subtractive LCD color technology similar to color photography. Starting with a white pixel, the display selectively subtracts primary colors to produce a full spectrum of hues. This technique detracts little from the brightness of the original image, In Focus claims.

The PC Viewer also has a rotating palette that lets you select color mapping and manipulate the color display to suit your preference. A built-in temperature compensation system comprises heat filters and a multispeed fan.

You interface the PC Viewer through the monitor port of your IBM XT, AT, or compatible. For Macs, you'll need optional adapters that attach to graphics boards.

And, if you want to see the image on your computer screen as well as on the projection screen, you'll need an optional "loop-through" adapter, which doubles as the Mac II adapter.

**Price:** $4995; Mac Plus and SE adapters, $1195; "loop-through" adapter, $249.95.

After centuries of practice, mankind perfects engineering calculations: MathCAD.

Announcing MathCAD 2.5: The Dawn of a New Age.

What the historians will call it, only time will tell.
Perhaps the Century of Speed, or the Era of Ease. But whatever the name, this is the age of MathCAD 2.5, the only math package that looks and works the way you think.

MathCAD 2.5 includes 3-D plotting, HPGL sketch import, and PostScript output.

MathCAD is far and away the best-selling math package in the world. Because it lets you perform engineering and scientific calculations in a way that's faster, more natural and less error-prone than the way you're doing them now—whether you're using a scratchpad, calculator, spreadsheet or program that you wrote yourself.

And now we've made the best even better. MathCAD 2.5 is a dramatically improved version that includes three-dimensional plotting, enhanced numerical analysis, and the ability to import HPGL files from most popular CAD programs, including AutoCAD. And now you can print on PostScript compatible printers.

And like before, MathCAD's live document interface lets you enter equations anywhere on the screen, add text to support your work, and graph the results. Then print your analysis in presentation-quality documents.

It has over 120 commonly used functions built right in, for handling equations and formulas, as well as exponentials, differentials, cubic splines, FFTs and matrices.

No matter what kind of math you do, MathCAD 2.5 has a solution for you. In fact, it's used by over 60,000 engineers and scientists, including electrical, industrial, and mechanical engineers, physicists, biologists, and economists.

But don't take our word for it; just ask the experts. PC Magazine recently described MathCAD as "everything you have ever dreamed of in a mathematical toolbox."

And for Macintosh users, we present MathCAD 2.0, rewritten to take full advantage of the Macintosh interface. Entering operators and Greek letters into equations is pure simplicity!

Look for MathCAD 2.5 at your local software dealer, or give us a call. For more information, a free demo disk, or upgrade information, dial 1-800-MATHCAD (in MA, 617-577-1017).

Available for IBM compatibles and Macintosh computers.

Some pointing devices feel quite alien.
When we put our minds to designing the next generation of pointing devices, we started with our hands. It turns out that thumbs have over twice the muscle and agility of other fingers—which only go up and down.

We tested dozens of prototypes. None beat the body you see before you. A trim 4.25" x 5.25" fully equipped with a low-inertia, lightweight ball (placed under the thumb), three buttons (under the fingers), and room to rest the hand.

TrackMan is smart, too: adjustable from 50 to over 15,000 d.p.i. resolution (default at 300); on-the-fly ballistic driver; lots of built-in menus to speed up popular keyboard based applications. Even a shell for Lotus 1-2-3.

Simple to install, this stationary mouse is compatible with all other top-selling mice. TrackMan is guaranteed to work with any application on a 256K IBM (or compatible) personal computer. Price? $139* complete with Satisfaction Guarantee, and 7-Days-A-Week Product Support.

MCA QuickCapture Now Has AT Counterpart

Data Translation's Micro Channel architecture-based QuickCapture frame-grabber board now has an AT-based counterpart.

Like the PS/2 version, the QuickCapture AT captures, stores, and displays images from video cameras, VCRs, and still-video cameras. Both cards use the same software-based QuickCapture frame-based counterpart.

QuickCapture AT captures video images in real time (one-thirtieth of a second) and includes a phase-locked loop circuit for jitter-free image capture from VCRs. And when it's used with external video devices, QuickCapture automatically genlocks to the video source or to a separate composite synchronous signal. It can also supply a synchronous signal to display stored images.

You can display the images in real time on any RS-170 RGB (National Television System Committee) analog monitor, with 256 shades of gray and VGA resolution. Each board includes 512K bytes of RAM and an on-board processor. An overlay processor lets you mix text and graphics.

Audio Comes in Three Channels with Sound Master

The Sound Master PC is an inexpensive audio board and speaker system that lets you mix sound files with moving graphics on your IBM AT or XT.

It features a music/sound chip from Micro Chip, a direct-memory-access-driven 8-bit digitizer, a stereo amplifier, and dual digital joystick ports. Sample rate is variable from 10 Hz to more than 100 kHz. The frequency range has 16 bits of resolution and is adjustable from 50 Hz to ultrasonic.

There are three independently programmable analog output channels with separate frequency and envelope controls for each channel. The audio amplifier produces 250 mW per channel into 8 ohms. Frequency response is flat to 5 kHz. Total harmonic distortion is 0.2 percent. Each channel has separate, digitally controlled, 4-bit gain stages for adjusting volume or for panning. You can connect the board to an external stereo, booster speakers, or headphones.

The 2 1/4-inch speakers have an impedance of 4 to 8 ohms and a maximum input of 0.3 W. Frequency response is 50 Hz to 12 kHz.

Mac II Graphics Acceleration to 600 Percent

The Radius QuickColor Graphics Accelerator board for the Mac II works in tandem with Radius video boards to boost the performance of Apple's 32-Bit QuickDraw by as much as 600 percent, Radius claims.

QuickColor Accelerator uses both the modular design of QuickDraw and capabilities built into Radius video display boards to speed drawing on a Mac II.

The QuickColor board moves the bulk of the drawing operations onto the NuBus by patching some of the QuickDraw bottleneck procedures and using a 5-million-instruction-per-second RISC processor. It loads multitasking code into the RISC processor's static RAM.

Big Blue Goes Multimedia

IBM's Audio Visual Connection (AVC) software, coupled with two new Micro Channel add-in boards, brings multimedia capabilities to PS/2s.

They let you combine, edit, and store high-resolution still pictures along with text and full-range audio for multimedia presentations in educational and business applications.

In addition to creating presentations, you can use AVC to develop applications that manipulate business data, such as an audiovisual home database for realtors.

The AVC software offers exact synchronization and mixing of audio, video, and text, plus 256-color image enhancement. You can also change the size and location of screen images, move text over an image without disturbing the graphics, and even animate the image by rapidly displaying a series of graphics. The package uses a hypertext-like technique that lets you link text with related images and audio.

AVC requires an IBM PS/2 with at least 2.5 megabytes of RAM and OS/2 1.1 or DOS 4.0 or higher. It's also IBM Token Ring-compatible. AVC is designed to work with the PS/2 Video Capture Adapter/A, which captures, digitizes, and stores individual images from standard video or computer graphics sources. For the audio side, you'll need IBM's PS/2 Audio Capture/Playback Adapter for analog audio input.

**Price:** Audio Visual Connection, $495; Video Capture Adapter/A, $2250; Audio Capture/Playback Adapter, $565.

Kurzweil Reading System Available on PC Platform

The groundbreaking Kurzweil reading machine, which uses a scanner, optical character recognition, and speech synthesis to read documents to the blind and disabled, has finally migrated down from a stand-alone product and is available on a conventional IBM PC platform.

The new PC/KPR products include software, a desktop scanner, and an XT- and AT-compatible interface card. They require a PC with 640K bytes of RAM, DOS 3.0 or higher, and a hard disk drive. The only thing missing that was on the original stand-alone reading machine is a speech synthesizer, which you must purchase separately.

Like its stand-alone predecessor, the PC/KPR reads aloud scanned documents and can store text files for conversion to Braille or transfer the files into standard word processing applications.

Models 15 and 25 both use 300-dpi Ricoh scanners. Price: Model 15, $3995; Model 25, $4995, optional document feeder, $595; Model 35, $7995; optional document feeder, $1595.

PostScript Emulation in a Font Cartridge

PacificPage is a font cartridge that inexpensively turns your LaserJet Series II printer into a PostScript-compatible printer, Pacific Data claims.

You just plug in PacificPage, and, with PostScript interpreter emulation from Phoenix Technologies, it takes over the LaserJet II's 8-MHz processor for PostScript printing. There's no need for add-in boards, cables, or software manipulation, the company reports.

PacificPage gives you access to 35 Apple LaserWriter-equivalent fonts in many point sizes. It also provides all the PostScript capabilities: reversed text, scaled fonts, text rotation, and graphics such as arcs, circles, screens, templates, and halftone images, according to Pacific Data.

You need at least 2 megabytes of RAM in your printer, and you're limited in print speed because the code in the font cartridges works off the LaserJet's 8-MHz three-wait-state processor.

Price: $665.

Reduce Macintosh Fan Noise with the Fan Controller

If you're tired of the loud fan noise from your Macintosh II or IIx, you might try the Nova Fan Controller from Nova International. The company claims that by continuously varying the fan speed, the Controller can reduce your fan noise by as much as 50 percent.

Nova says that the Mac II fans are factory-set to cool a fully configured system, but a less-equipped system doesn't require the fan's default speed. The Fan Controller installs on the power supply, and a separate sensing unit attaches to your hard disk drive.

November's NOVELL month in

Novell, the technology leader in the network industry, provides a full array of programming tools designed to streamline the development of distributed applications. Novell's data management tools, connectivity tools, system-level application programming interfaces, and network compilers are optimized for the NetWare environment, so you and your users enjoy the flexibility, reliability and performance you expect from NetWare. When you are ready to build applications that fully exploit the power and flexibility of the NetWare environment, turn to Novell and Programmer's Paradise!

XQL and NetWare SQL

NetWare SQL is an open interface relational database engine that has been tightly integrated with the NetWare operating system to provide back-end database services to a wide variety of front-end applications including database managers, 4GLs, accounting systems and spreadsheets. Build your own front-end applications for NetWare SQL using XQL, an open programming interface that provides you with relational access to NetWare SQL databases through two programming levels: ANSI-standard Structured Query Language (SQL) statements and powerful, low-level relational database primitives. By making simple subroutine calls from C, Pascal, BASIC or COBOL, you can access data by field name, move forward or backward through the database, compute fields from other fields or constants, and even manipulate composite records built from multiple, joined data files. XQL provides a wide range of data types and application-defined buffering for fast data retrieval.

NetWare RPC

NetWare RPC (Remote Procedure Call) is a set of sophisticated tools designed to assist you in creating distributed network applications. NetWare RPC extends application procedure calls across a network by automatically generating a set of subroutines that allow remote procedure calls to look and act like local procedure call routines. NetWare RPC raises your development efforts above communication details and frees you from writing to complex IPC interfaces, thereby shortening the development cycle and decreasing the cost of developing distributed applications.

C Network Compiler

C Network Compiler gives you a direct link into NetWare, the leading network operating system with the world's largest installed base of network application users. This 100% ANSI C optimizing compiler is based on technology from WATCOM Systems Inc., and produces object code that out-performs any other C compiler for DOS. In addition, the C Network Compiler kit includes Express C, a C Graphics Library, a Network Application Design Tutorial, an enhanced text editor, linker, debugger, and other utilities, plus a library of over 300 NetWare application programming interfaces (APIs), including those for the Btrieve record manager.

Using standard programming techniques and this complete development kit, you can build applications that take full advantage of the NetWare environment.

InterLan Software Links NetWare to LAN Manager

LMN Server allows Novell NetWare nodes transparent access to an OS/2 LAN Manager file server, InterLan claims.

LMN Server runs as a service under OS/2 on any OEM version of LAN Manager. Features include command-line utilities that are similar to NetWare utilities and limited support for NetWare menu utilities, such as SYSCON and FCONSOLE.

Transparent access from LAN Manager nodes to NetWare files, however, isn’t yet an LMN Server feature, InterLan concedes, although there is an LMN Server utility for simple file transfer.

Requirements for the LMN Server include an IBM AT, Compaq, or compatible with 4 megabytes of RAM, an InterLan data-link controller (add-in board for 802.3 Ethernet), OS/2 1.0, LAN Manager 1.1, and Novell NetWare 286 version 2.15.

Price: $1295.

Microsoft Adds Store-and-Forward Messaging to E-Mail

Microsoft Mail 2.0, for Macs and IBM PCs, features store-and-forward messaging to send E-mail even when another server isn’t available.

The Mail 2.0 server keeps trying at specified intervals and returns the message with an error if it’s not received in a specified time. This method, which Microsoft says is also used on global networks such as Internet, means that users don’t need a permanent connection to every mail server.

The servers, rather than the users, also handle directory management. When servers are brought onto the mail system, they automatically exchange directory information with the other servers. Microsoft says that Mail 2.0 works on any networking hardware or software that supports AppleTalk networking protocols, including AppleTalk and Ethernet hardware.

Mail 2.0 ships in five packages: a starter kit (Mac server and one workstation), a single-node pack, a 20-node pack, a gateway to MCI Mail, and a gateway to AppleLink.

Price: Mail 2.0 server starter kit, $395; node pack, $125; 20-node pack, $1495; MCI Mail gateway, $595; AppleLink gateway, $295.

MacRing SE Runs as a Token Ring Node or Bridge

Because Apple Computer’s recent connectivity announcements included NuBus adapters and nothing for Mac SEs, h-three Systems has made that SE connection.

The MacRing runs your SE as a Token Ring node, giving you the benefits of 4-megabit-per-second data rates and AppleTalk applications. It also runs your SE with Apple’s AppleTalk Internet Router software bridge to transparently tie your AppleTalk network to your Token Ring and Ethernet networks.

Each MacRing board includes 128K bytes of RAM and Texas Instruments’ 4-Mbps Token Ring networking chip. Software requirements include Macintosh System 6.0.1 or higher.
Price: $895.

Mac Connection for Sharp’s Wizard

The new Organizer Link for the Macintosh lets you transfer your Macintosh files to your hand-held Sharp Wizard computer and vice versa. File transfer was previously possible only with DOS-based machines.

The physical link is through the Macintosh’s modem port, and the data transfer rate is 9600 bps. Cables are included in the package.
Price: $149.99.

Here's How We Protect Your Software And Profits Better:

Because our key-interrogation routines are encrypted, and our hardware is custom-wired to distinguish each of our clients' keys, our clients have the highest degree of security available.

Unlike other manufacturers, our routines assume responsibility for all hardware, software and timing issues. And what this means is that your engineering time and money won't be wasted reinventing protection schemes.

We offer two high security products for copy control: the KEY and the MEMORY KEY.

Our protection devices can also be used for serialization techniques, software leasing, modular software management, creative revenue collection, demo control and a path for future upgrades.

The information stored in the MEMORY KEY can be conveniently reprogrammed by your application software or at the end user's site via software disk or modem.

All our products attach conveniently to the printer port, are transparent and allow for unlimited back up copies.

For serious software protection, call now: And start protecting your profits. Hands down, we're better.

D NA Adds Abilities to Its LANs

D NA’s new LAN offerings have many of the same basic features of the company’s flagship product: proprietary hardware, proprietary software incorporating poll-process collision elimination, a daisy-chain physical configuration, and twisted-pair wiring.

Enhancements to DNA 3.36, with the resulting product dubbed MicroNet, include a menu system; NetBIOS compatibility; messaging capabilities; support for shareable fax machines, fax boards, and modems; and the ability to farm out program executions to other workstations. Memory requirements are 120K bytes at the file server and 12K bytes at the workstation, or you can load parts of both programs in either extended or expanded memory.

Enhancements to the company’s hardware include increasing the data transfer rate from 1.25 megabits per second to 2 Mbps. A MicroNet file server can theoretically handle 64 users, but DNA suggests the average installation of 16 users. MicroNet is also available as a two-user kit, which includes a file server card, software, and a workstation card. You can also purchase the workstation card separately.

An entirely new product, which also works with DNA 3.36, is MegaNet. It’s a 10-Mbps network for up to 256 users. As with MicroNet, the cards support distances of 500 feet with unshielded twisted-pair cable, and 5000 feet with shielded twisted-pair cable.

Price: $6695.

Speedy Network Backup for Your Macintosh

The MaxStream MS2200e is a SCSI-based tape backup system that stores up to 2.2 gigabytes of information on 8-mm cassettes the size of audio cassettes. Data transfer is rated at 233K bytes per second.

Features include compatibility with AppleShare, TOPS, 3Com, and Novell 286, and software for automatic backup. It comes ready to install, the company says, with all the necessary cables and terminators.

Mark 386 Unix-Based System Supports 64 Users

The 25-MHz Mark 386 is a Unix-based, 64-user desktop (or optional tower) system that’s built for what used to be classified as minicomputer applications.

Standard equipment includes 4 megabytes of RAM (upgradeable to 24 megabytes), a 1.2-megabyte 5½-inch floppy disk drive, two serial ports, a parallel port, an AT-style keyboard, and room for up to five half-height storage devices. Model 10 is the bare-bones system. Model 40 adds a 170-megabyte ESDI hard disk drive, a controller, and a 150-megabyte streaming tape drive. Models 60 and 80 feature 382- and 765-megabyte ESDI drives. The tower chassis lets you have three additional half-height storage devices.

Price: Model 10, $7400; Model 40, $14,100; Model 60, $12,400; Model 80, $16,300; add $1000 for tower style.

QNX®
The OS for over-achievers®

QNX programmers have a decided advantage.

You see, people who use QNX enjoy the freedom that comes only with a flexible, modular OS. They appreciate the elegance of a message-passing architecture. And they marvel at the fact that QNX runs so lean — under 150K — yet out-performs any other PC operating system.

QNX users never worry about whether their applications will make it at runtime, because they know QNX has proven itself again and again in the real world.

It's no wonder that QNX users have achieved so much since the product was first released for the PC in 1982: over 80,000 systems installed in 47 countries world-wide, in all kinds of applications — from making cars to selling books to handling online credit card transactions.

One reviewer dubbed QNX “The multi-everything OS.” Now, you might expect multuser and multitasking, but realtime? And integrated networking? And true distributed processing? Best of all, these terms take on a new meaning with QNX.

Multuser, for instance, means up to 32 terminals per micro. Multitasking cashes out as 150 tasks per machine. Realtime means not only priority-driven, preemptive task scheduling, but also speed: at 6,896 task switches/sec on a 16MHz 286, QNX is at least a full order of magnitude faster than a typical UNIX system. Integrated networking means you won't need another layer of software to set up a LAN, and you can use any mix of Intel-based micros—from vintage '81 PCs to PS/2s.

Distributed processing with QNX sounds too good to be true. But it is: Any task can access any resource — programs, files, devices, even CPUs — without going through the bottleneck of a central file server.

Besides the satisfaction that QNX developers get from using a fast, powerful, and flexible OS, did we mention that they also enjoy free technical support?

If you're wondering why you don't already know all about this great OS, you could try asking the over-achievers who are smugly guarding the secret of their success.

Better yet, give us a call. We'll tell you everything you need to know to become an over-achiever yourself.

Finally. An input device based on your input

Introducing SummaSketch II.

The new SummaSketch II tablets have been created with one thing in mind — you, the people who use tablets every day. You told us what you wanted in the ultimate tablet, and we put it all into SummaSketch II.

We kept all the features that have made SummaSketch the industry standard — features that have led to more SummaSketch tablets being used today than any other brand.

You said you wanted a complete plug and play package, not a basic tablet with a list of optional extras. So we’re giving you the works — both in PC and Macintosh® SE and II versions. A 12” by 12” or 18” by 12” active area tablet; your choice of a four-button cursor and two-button stylus or 16-button cursor; utilities diskette and more. The PC version includes interface cables for the IBM® PC, PS/2, AT and compatibles, while the Macintosh version has a unique Apple® Desktop Bus interface device to connect the tablet to the computer.

When asked about the one key benefit you look for in deciding on an input device, your answer was productivity. And SummaSketch II delivers.

Unlike a mouse, our stylus gives you a more natural “pen-to-paper” feel for free-hand drawing. Our 4- and 16-button cursors can be programmed to move you quickly through the most sophisticated software. For the PC market, we offer a free tablet template (US and Canada only) that puts hundreds of software commands in view... and at your finger tips. No need to memorize commands or scroll through two or three screen menus to use the functions you want.

IBM Compatible inquiries circle 342; MAC inquiries circle 343, and dealer inquiries circle 344 on Reader Service Card.
No tablet offers more software compatibility than SummaSketch. Our tablets work with over 250 PC programs and all Macintosh SE and II software written under the Apple Software Developers guidelines.

Since we are the standard, most competitive tablets offer software compatibility by emulating Summagraphics tablets (just look it up in their manuals). In fact, in a recent article comparing IBM PC version tablets, all nine competitive tablet manufacturers emulated Summagraphics in order to provide software compatibility.

But that's not all. Our PC version utility diskette also includes diagnostic test and reset software, an Autodesk® Device Interface™ driver, Universal Mouse Emulator™ and a Microsoft® Windows driver.

When it comes to digitizing, the one deciding factor every tablet buyer wants (and every tablet manufacturer touts) is accuracy. SummaSketch II tablets have an accuracy measurement of ± 0.015 inches. This figure is based on the average accuracy found over the entire SummaSketch II surface — not just a “sweet spot” found in the center of the tablet. And both the 4- and 16-button cursors come with an easy-to-view cross-hair sight for precise tracing.

SummaSketch II tablets also come with high proximity so you can trace from documents up to 1/2” thick. And selectable resolution of up to 1,016 lines per inch (or twice the degree of resolution needed for most graphics applications).

Add up all the benefits, then add in convenience features such as a power/proximity light, on/off switch, wedge shape design for easy use, lightweight construction for portability — and it’s easy to see why SummaSketch has been, and will continue to be, the best selling tablet in the world.

Whatever the application — CAD/CAM/CAE, business or design graphics, animation, cartography, cost estimating and more — SummaSketch is the overwhelming choice of today’s computer professionals. Simply stated, you can’t go wrong or be “second-guessed” when you choose SummaSketch, which is why more people make that buying decision than any other.

The deciding question — price. Would you pay more to get a tablet that has everything in the box, that gives you the most software compatibility, a choice of cursors and includes added productivity tools?

That’s the one decision you don’t have to make, because SummaSketch II tablets come with everything you need, all at an affordable price. And that makes our new SummaSketch II tablets the easiest buying decision you have to make.

Why not find out more about SummaSketch II today? For literature and the name of a local dealer call 1-800-888-2028, Ext. 304. For technical information call 203-881-5400.

The most software compatibility.

The choice of professionals.

Tools and Utilities for the DSP96002

Intermetrics' newest version of InterTools, the optimizing C compiler, assembler, cross debugger, and utilities library, will support the DSP96002, Motorola's 32-bit, IEEE-standard, floating-point digital-signal-processing (DSP) chip. The new version of InterTools and the DSP96002 should be available in the first quarter of 1990, both companies report.

The 32-bit 96002 is an architectural superset of Motorola's 24-bit 56001 chip. The DSP96002 is compatible with Motorola's 56001 fixed-point products, but it offers speeds of up to 40 million floating-point operations per second and on-chip test and debugging functions, Motorola reports.

The InterTools compiler supports embedded systems development, and the macro cross-assembler provides an interface between 96002 assembly language and C. Utility programs include a linker, a locator, a formatter, a librarian, a symbol lister, and a symbol mapper.

Intermetrics reports that the first development platforms that InterTools will support will be the IBM PC and Sun workstations. Versions will follow about a month later for other platforms, including other Unix workstations, the VAX Ultrix, and the VAX/VMS. Running on the IBM PC, InterTools' compiler requires about 260K bytes of RAM and DOS 3.1 or higher.

Price: $3500.

Compile Applications for the NeXT Computer

Absoft's FORTRAN 77 compiler is optimized to run on the NeXT system, allowing you to port programs written for the VAX/VMS, IBM/V8, Sun, and Apollo machines to the NeXT. You can use the program to compile and execute from the standard Unix interface, or you can add a graphical interface to a standard FORTRAN program with the NeXT Interface Builder and the object-oriented superset of FORTRAN 77.

An object created with Object-Oriented FORTRAN can be used the same way as an object created in Objective-C, Lisp, or the Interface Builder. Absoft reports the compiler uses the same function-calling interface, allowing it to work with C functions. FORTRAN 77 currently supports version 0.9 of the NeXT operating system; Absoft reports that it will support 1.0 when that is released.

Price: Universities, $750; retail, $1000.

Contact: Absoft Corp., 2781 Bond St., Rochester Hills, MI 48309, (313) 853-0050.

All three compilers are switch-selectable to emit assembly code for the 68000 family of processors and instructions for the 68881 floating-point coprocessor. Price: $1500 each.

Help for HyperCard Programmers

ICOM Simulations' HyperTMON lets you single-step through HyperTalk scripts line by line, including XFCN and XCMD extensions, so that you can detect mistakes and set multiple breakpoints to isolate bugs before they cause problems. Once you discover a bug, you can immediately modify the offending code.

Once you've installed HyperTMON in HyperCard or the Home Stack, two new menu items appear on the menu bar: HyperTMON and Debug. After you've invoked HyperTMON, HyperCard-like floating windows appear, letting you examine a button's script or examine the contents of variables. You can set breakpoints in the script or single-step through it.

If a script is called by another script, HyperTMON follows it up the hierarchy. As the script executes, the Expressions windows update and displays the present value of local and global variables. You can enter any HyperTalk expression for HyperTMON to evaluate in real time.

Price: $99.95.
Inquiry 1160.

Somatic's ScriptEdit improves the script-editing capabilities of HyperCard's basic script editor. With ScriptEdit, you can open and edit as many script windows as your available memory can handle, and you can use Find and Replace functions to search through the open scripts. You can also use the Find and Replace functions on all scripts of the current card.

Other HyperCard functions, including all navigation commands, are available while ScriptEdit is open, and the program saves all font, size, and window positions for each script. Script windows contain an index to all stack objects and are instantly updated when changing cards.

Here's the first thing you should do with the new Microsoft® Mouse.

Bring up the expanded control panel. Set it for "Fast." And then, with a very slight movement of your hand, watch the cursor scoot all the way across the screen.

You'll be hooked.

And don't worry about control. We upped the resolution to an extremely accurate 400 points per inch. In other words, the cursor practically reads your mind.

To help even more with accuracy, the tracking ball is in front. And the patented design fits comfortably in your hand.

What it all means is you get more out of your software. By being able to quickly and efficiently click through even the most sophisticated applications.

In fact, we put OS/2 support in our upgraded driver. Making the Mouse ready for whatever the future of software brings.

To complete the package, you also get a choice of Microsoft Windows/286® or Microsoft Paintbrush®, two useful Mouse programs.

So visit your Microsoft dealer for more details and a complete demonstration.

Now, you may not want to let your boss know just how little room you need for a Microsoft Mouse. You could lose your shot at a bigger desk.

**Project Management on the Mac**

According to Symmetry, the problem with most project management programs is that they are designed for those who already know how to manage a project. If you're new to the profession, project management programs have a steep learning curve. With that in mind, the company developed KeyPlan, which lets you start your project management with nothing but a to-do list.

KeyPlan’s integrated outline lets you outline and attach data to tasks that you can then convert to a PERT or Gantt chart. To create charts, you select and drag tasks, bars, headings, and other elements into place. The program creates a Gantt chart automatically from your outline.

The program lets you track actual against planned time lines. When you plot your data in a bar chart, you can highlight a peak area (e.g., an inordinate number of delays) and click on it to display the cause.

KeyPlan supports color, all installed fonts (including PostScript), and the Clipboard. It works on the Mac Plus or higher.

Swell.

The developers are all over your mini. Which is all well and good, as long as you have another machine for production stuff. But you don't. So your mini bogs down. And who do people complain to? You. Before you know it, the whole world's on your case to buy another mini.

No problem. What's another $500,000 out of your budget?

Professional ORACLE® on a PC is exactly like ORACLE on a mini or mainframe. Same tools, same documentation, same everything.

Which means anything developers can do on the mini, they can now do on a PC. Only faster. And without slowing down the production system. And with no changes, they can port the new application to the mini.

You can have Professional ORACLE for only $1,299. Or the Trial Version for $199.

Which frees up the mini to be what it was meant to be—a production platform.

And if, after 30 days, you're not happy, send it back for a full refund.

Call 1-800-ORACLE 1, Ext. 4955 to order. And enter the computing environment of the 90's.

What better way to run Novell's 386 NetWare.

Novell's new 386 NetWare® will do for networking what gunpowder did for negotiating leverage. Provided you've got a 386 machine that's designed to be 100 percent compatible with it.

Not to worry.

Samsung's LAN hardware was co-designed by Novell®. Which should put any compatibility concerns to rest. That's why the Samsung/Novell co-label is on our 386AE Fileserver and our PCterminal/286 LAN workstation.

NETWORKING vs. NOTWORKING.

Both the Samsung 386AE and PCterminal/286 have been tested exhaustively by Novell for compatibility with popular networking hardware and NetWare products. In fact, no other LAN hardware has ever undergone such extensive testing.

But then Samsung and Novell didn't set out to design just another make-do desktop computer.

Samsung's 386AE Fileserver, for example, was designed from the bus up to be a high-performance fileserver, starting with its Novell-developed BIOS. It also sports eight expansion slots for the inevitable inventory of interface and controller cards. Plus an oversize power supply capable of driving the requisite 100 megabyte-plus hard disk, tape backup system, etc. And it includes 4 megabytes of high-speed RAM for disk caching.

A TOTAL LAN SOLUTION.

To maintain NetWare compatibility throughout
your network, choose Samsung's PCterminal/286, a Novell-tested LAN workstation. Inside you'll find a built-in Ethernet interface adapter, and functional features like Novell's NetWare Autoboot EPROM.

THE NO BOTTLENECK ETHERNET CARD.
Our new SE2100 Ethernet interface eliminates the network bottleneck. Designed by Samsung, this high-performance 16-bit card provides twice the throughput of other Ethernet interfaces. And you can retrofit your existing workstations and fileservers with the SE2100 for dramatic improvements in your network's productivity.

LOOK FOR THE CO-LABEL.
The partnership between Samsung and Novell has created a hardware/software compatibility standard unparalleled in the industry. That means your network can experience all the speed of Novell's new 386 NetWare without being subjected to a lot of hardware hiccups.
Just look for the Samsung/Novell co-label. You'll find it at your nearest reseller. For the location, call 1-800-366-7472.

Uniplex Windows will support any X Window 11.3-based implementation, Uniplex reports.

Uniplex to Run Under X Windows

Uniplex, the Unix multiuser office system with word processing, spreadsheet, E-mail, and relational database capabilities, is now available running under the X Window graphical user interface (GUI). The new version will allow X Window or compatible terminals to display Uniplex Business Software through multiple overlapped windows with icons and mouse commands.

Uniplex Windows works like a terminal emulator: What you see is a view of the program through an X Window GUI. The same Uniplex application that runs on character terminals drives the X terminals, with Uniplex Windows acting as the intermediary between Uniplex source code and what you see on the terminal. If you have terminals that support X Window, and others that support character-based programs, Uniplex Windows will let you use both, the company reports.

The program will support any X Window 11.3 implementation, and the new release uses the Athena Toolkit and technology from IXI Limited for the GUI. Uniplex reports it is also working on a version to support Motif.

Price: $175 to $300 per user.

Database for Legal Case Notes

For Legal Case Notes is a database that lets you track case notes and statutes of note. You can use the program to find cases and statutes by topic, case name, or subject. You can print reports on cases and statutes by criteria that you specify. HomeCraft reports that the program, which is designed for people who aren't DBMS experts, can handle up to 10,000,000 cases and allows you to cross-reference notes. For Legal Case Notes runs on the IBM PC with 256K bytes of memory.

PHOTOGRAPHY FOR THE COMPUTER GENERATION.

Computer graphics. Desktop publishing. They're the hottest things going. And Canon has the hottest way to make the most of them; the Canon Still Video System.

A Canon Still Video Camera like the new RC-470, looks, feels and works just like the 35mm Canon cameras you know and love.

Introducing computer photographies. You know and love. Except that you don't use film—you use video floppy disks that store up to 50 images. Then with a Canon Still Video Player, these images can be downloaded into any computer that has a compatible NTSC video interface board.

Then you're ready to use your computer's graphic capabilities. Make better presentation graphics, expand your desktop publishing abilities, create an image library; the applications are limited only by your imagination.

Canon has a wide range of still video cameras. There's the Xap Shot, a basic combination recorder/player that's easy to use. There's the RC-470, with extra high resolution that can potentially raise horizontal resolution to 400 lines! And there's the RC-760, with a 600,000 pixel CCD—the highest of any still video camera.

When you want hard copy, Canon has a full color printer that connects directly to the system.

Best of all, Canon Still Video systems are within your reach. If you would like some more information, call 1-800-221-3333, ext. 313.

The Surveyor, a coordinate geometry program for surveyors and civil engineers, can handle sites as large as San Francisco.

**Survey and Coordinate Geometry Program**

D.C.A. Engineering developed the Surveyor for civil engineers and surveyors who need a coordinate geometry program to process raw field data and use it to develop site plans. After you've manually entered the data from field notes or downloaded it from a hand-held computer through your IBM PC's serial port, the Surveyor's subroutines will perform all necessary geometric calculations, such as intersection points and traverse adjustments.

After the program has reduced the raw data, you can use it to subdivide a lot into smaller lots, design rights-of-way, and position houses.

The Surveyor can handle up to 250,000 lots; other capabilities include complete point protection, automatic calculation of lots, building ties, and setbacks, lot and polygon storage, and automatic lot recalculations.

The stand-alone program is compatible with D.C.A.'s civil engineering programs, such as Design, DTM, and EarthWork (for site design, digital terrain modeling, and earthwork calculations). The Surveyor runs on the IBM PC with DOS 3.0 or higher and 640K bytes of RAM. Price: $2995.

UNITize 1.3 runs on the Mac 512KE or higher.

Getting a network off the ground is easy with AIX™. Because AIX, IBM's enriched version of the UNIX® operating system, brings a whole new standard of performance, documentation and security to the open systems environment.

**AIX gives you a very high degree of flexibility.** AIX lets you create a transparent network between platforms from a broad range of vendors—from SUN® to DEC® to AT&T® and HP®.

It also lets you link up a broad range of IBM systems—from the PS/2® to the RT®, all the way up to the System/370™.

**All for one, and one for all.** AIX can integrate a network so effectively, you'd swear it was a single system.

Distributed Services on the RT lets everyone in the network share files, programs and devices. And to optimize your PS/2 and System/370 investment, AIX's Transparent Computing Facility lets you shift power from one processor to another, as the need arises.

And since AIX allows you to merge DOS and UNIX functions, you protect your software investment, too.

**AIX's ease of use also sets a new standard.** AIX is well documented, easy to learn and provides connectivity through multiple communications protocols.

So if you want to raise the quality of your networking, connect with your IBM marketing representative or IBM Business Partner today about AIX. The one system that connects the flexibility of open standards with all the classic strengths of IBM.

For more information, call 1 800 IBM-2468, ext. 148. AIX from IBM. Making your business come together.

Mass2 can calculate the weight of a container, what’s inside it, and the combined weight of both.

What Does It Weigh?

Mass2 is a mass and volume calculator that you can use to calculate the weight of an object or a shape. The program calculates the volume of any geometrically defined shape and uses its database of materials to calculate the final weight.

The program accepts input in decimal, fractional, or scientific notation. It has a center-of-gravity calculator and can determine mass if the volume is already known. The program’s database has over 700 entries, including construction materials, gases, plastics, rocks, and minerals.

Mass2 works on the IBM PC with 384K bytes of RAM.

Engineering and Drafting on the Mac II

Ashlar says that Vellum, its new Mac II design and drafting program, is software that thinks. It simplifies mechanical engineering, design, drafting, graphics, and technical illustration tasks with the Drafting Assistant.

The Drafting Assistant automatically pinpoints and aligns geometry as you draw. For example, if you're drawing a symmetrically shaped object, Ashlar Vellum will pick up midpoints, intersections, perpendiculars, and so on, and align them based on the geometry already entered. You can make rough sketches of an object, and Vellum will align it for you and let you attach values to it. You can also enter variable dimensions into a drawing and then store the variable parameters for repeated use.

With Vellum, you can create and edit nonuniform rational B splines. It gives you double-precision floating-point accuracy to 16 decimal places. Other features include 256 layers, seven colors, eight line widths, and 11 line styles. The program supports drawing sizes A through E.

Vellum requires a Mac SE/30 or higher with 4 meghexabytes of memory and a hard disk drive.

Now you can produce precise, high quality plots without the wait required by pen plotters or PC-based emulations. Pacific Data's Plotter in a Cartridge is the newest and fastest way to emulate HPGL on your laser printer. In fact, it's as much as 100 times faster! Complex engineering or architectural plots taking 10 to 20 minutes on a plotter can be completed within 10 seconds! Crucial when multiple revisions and check plots are needed.

But there's more to Plotter in a Cartridge than speed. In addition to standard pen plotter features, Plotter in a Cartridge enables you to define 20 pens and 48 widths, automatically scales to fit envelopes, letter and legal size paper and improves resolution to 1/300 inch. And, you can produce up to 99 quality copies and use virtually any media source.

Because the cartridge plugs right into your printer, you can plot directly from CAD/CAM, engineering, or graphics software.

Plotter in a Cartridge combines plotter precision with laser speed.
Fishing for Ideas on the Mac and PC

IdeaFisher, the database tool that helps you generate new ideas when you've reached a mental block, will be available in a Macintosh version this month, Fisher Idea Systems reports. The program consists of 66,000 keyword phrases and 373 broad categories, such as "controversy" or "action/motion." Each category points to a list of subsidiary words and other categories, letting you cross-tabulate entries from different categories. With the cross-reference ability, you can link more than 575,000 direct associations. The program is already available for the IBM PC.

The program's developer says the program is good for coming up with a new idea or product name. If the problem is hazy or you're having trouble framing exactly what you want, you can use the program's QBank.

QBank asks you a series of up to 3700 questions to clarify the exact problem you're trying to solve and compare the ideas it generates with the original objective. After you've developed a list of central ideas, you use the IdeaBank to generate idea associations.

On the Macintosh, you'll need a Mac Plus or higher with at least 6 megabytes of storage and 1 megabyte of RAM. On the IBM PC, you'll need DOS 3.1 or higher, 640K bytes of RAM, and 1 megabyte of free space on your hard disk drive.

Xerox to Add Foreign Language Options to AccuText

Xerox is adding seven foreign language options to its AccuText recognition software. Each foreign language option will have its own 50,000-word lexicon, which you can customize by adding an additional 10,000 words. Xerox says it will ship versions designed specifically for the French, Spanish, Italian, and German languages in the fourth quarter of this year. Dutch, Swedish, and Norwegian versions are expected for the first quarter of 1990.

AccuText uses Kurzweil AI technology. With a supported scanner, you can use the program to scan text in its original format, including tabs, and the program can be set to automatically avoid graphical images. Six expert modules work on the text. The program can handle fonts from 8 to 24 points, and when scanning, it opens up the font in your word processor that most closely resembles the font of the scanned document.

Scalable Fonts at 300 dpi Without Big Bucks

Express Publisher, Power Up!'s low-end desktop publishing program for IBM PCs, offers scalable fonts, support for 300-dpi scanned images, and the ability to link text frames and pour copy across multicolored, noncontinuous pages.

AGFA CompuImage developed the fonts, which are device-independent. You can change font styles, attributes, and type sizes (from 6 to 144 points) for everything from a single letter to an entire page on the fly, the company reports.

You can import clip art and graphical images in TIFF, PCX, EPS, IMG, and ART format into a document and then crop, flip, or rotate the image. Express Publisher can wrap text around irregularly shaped images.

The program's import filters can import text with formatting intact from Microsoft Word, WordPerfect, WordStar, DisplayWrite, and ASCII and DCA (Document Content Architecture) text. The program also works directly with Microsoft Works.

You can run Express Publisher on any IBM PC with 640K bytes of RAM, a hard disk drive, and DOS 3.0 or higher.

Switch Among 100 Programs and Files

PC task switching is not a new product category, but Better Software's Switch-It program lets you switch among 100 programs on a standard IBM PC. The program itself uses only 24K bytes of RAM and doesn't require an 80286-based machine with 3 or 4 megabytes of memory to run efficiently, the company reports.

When you install Switch-It, the program automatically scans your hard disk for programs it recognizes and builds a list of applications among which you can navigate. The program is compatible with Microsoft Windows, Ventura Publisher, and OS/2 in real mode. With Switch-It, you can execute any DOS command as you run an application. It also remembers your last 30 commands, which you can recall, execute, or edit.

Switch-It supports extended and expanded memory.

New Dauphin LapPRO-386SX Packs a Powerful Punch for the Price

Dauphin Technology, an aggressive new Midwest-based laptop manufacturer, has come up with a high-performance 386SX-based laptop that offers 386 power at a 286 price. The price alone will turn a lot of heads. But a closer look at the machine itself reveals first-rate engineering, exceptional performance, and loads of standard features that would cost extra on most computers.

With a list price of $4,995 and an introductory price of only $3,695, Dauphin Technology has strategically positioned itself to compete head-on with rival 286 models in the same price range. Since 386SX technology provides both present and future applications, the choice between a 286 and a 386SX of comparable cost will be an obvious one for many. Users opting for the LapPRO-386SX will have a laptop with more power, speed, memory and versatility along with the technology to serve them through the next decade and beyond.

Among its many prominent features is a 40 M-byte, 28 millisecond hard drive and 2 M-bytes RAM. Its ability to facilitate DOS, multitasking and multiuser functions, plus all the new 32-bit 386SX software makes it a necessity for anyone who requires the power of a high-end desktop model while away from the office.

Last Fall, Dauphin introduced its first laptop model based on an 80286 microprocessor. Though a late-comer to the market, the LapPRO-286 earned considerable praise for combining the most advanced features with quality engineering and price performance.

Both models from Dauphin Tech offer a 40 M-byte, 28 millisecond hard drive, a 3.5" floppy drive, two serial ports, one parallel port, a high contrast blue on white CGA/EGA LCD, an internal power supply offering four power options including battery pack, and a dedicated numeric keypad. Options include a 2400 or 4800 BAUD internal modem, math co-processor, 100 M-byte hard disk drive, and external floppy drive and keyboard ports.

The LapPRO-386SX sports a processor speed of 10 and 8 Mhz with zero wait states. It offers 2 M-bytes of RAM on board expandable to 4 M-bytes. Its external monitor port supports CGA, EGA and VGA.

The LapPRO-286 provides 1 M-byte RAM which is expandable to 4 M-bytes and an 80286 processor running at 8 or 12 Mhz with zero wait states.

Both models offer the highly acclaimed Digital Research Operating System (a.k.a. DR DOS) which is similar to and compatible with MS DOS. The more distinguishing advantages of DR DOS include on-line help, system utilities such as file retrieval, special security features and an ability to embed software in ROM. AlphaWorks integrated software and LapLink file transfer software are also included with each laptop.

Dauphin Technology has priced its 80386SX laptop to compete head-on with rival 286-based models.

Features include:
- 80386SX Processor, 8 & 16 Mhz, Zero Wait States
- Multitasking Capabilities
- Multiuser Access
- 32-bit Software Compatibility
- 40 M-byte, 28 Millisecond Hard Drive
- 3.5" Floppy Drive
- 2 M-bytes RAM, Expandable to 4 M-bytes
- Internal Modem Option

Judging by its first two laptop offerings, Dauphin Technology could very well be on its way to becoming a major player in the hardware arena. Though Dauphin Technology is relatively new to the computer industry, Alan Yong, founder, is not. In 1981, Yong incorporated Manufacturing and Maintenance Systems which is now recognized as the leading manufacturer and distributor of industrial alignment systems worldwide. The MMS REACT Alignment Systems, used to align rotating equipment in manufacturing plants, employ a proprietary portable computer and software for alignment calculations and maintenance records.

Given Yong's prior experience in portable computer development, the shift toward developing laptops seemed like a natural move. Yong is determined to build another successful company and his determination shows in the design configurations of these first offerings, a promising start.

Distribution channels for Dauphin Tech products are indeed far reaching and ambitious and include dealers, VARs, OEMs (for private label distribution), along with corporate, educational and government sales. The private label arrangement offered by Dauphin represents an ideal opportunity for OEMs to get into the fast-moving laptop market quickly. And the discounts on corporate quantity purchases are so generous that corporate managers of information systems will undoubtedly regard Dauphin as a serious contender for their business.

In keeping with its aggressive sales approach, Dauphin Technology is currently offering an unbeatable introductory price on both models. End-users would be well advised to invest in a high-performance laptop from Dauphin Tech now.

For more information on Dauphin Tech's laptop line, contact Dauphin Technology in Lombard, Illinois at 312-627-4004. And in the meantime, watch for more surprises from this up-and-coming manufacturer.

The Definitive Choice
The PROCOMP SCSI controller family provides the complete solution to your SCSI drive handling needs. From embedded SCSI hard drives to the newest Erasable Optical and WORM CD drives, under Novell NetWare 386 and 286, OS/2 or DOS, on the fastest 286/386 ISA and PS/2 MCA computers, PROCOMP provides the solution. The PROCOMP M-DCB and M-DCB/2 controller products offer full Novell DCB compatibility, with more features, unsurpassed reliability and expanded support.

PROCOMP software, like DCBSET that lets you use any SCSI drive with NetWare, SERV + that lets you access NetWare drives from DOS, and DCBOS that lets you have terabyte disk subsystems under OS/2, all make PROCOMP the intelligent choice.

Our primary business is SCSI controllers. Our engineers are experts. You can be assured of our commitment to support you now and in the future. PROCOMP is the definitive choice in SCSI controllers. Call us now to learn more.
"should be very useful for DOS users who are straining the limits of the 640K barrier."
—BYTEweek June 12, 1989

DESIGN PHILOSOPHY

- The Teletek X-Bandit was specifically designed to utilize the advanced features of the Lotus/Intel/Microsoft EMS 4.0 Specification. Further, the X-Bandit's Segmented Memory Mapping capability allows the user to extend DOS size beyond the 640K barrier. It is available in both 8 and 16 bit versions for use in the IBM XT, AT, and compatibles.

MEMORY

- Segmented Memory Mapping allows the user to fill out unused memory segments between 640K and 1024K. By "claiming" unused portions of memory in 16K increments, the user effectively increases TPA size. LAN or custom software modules, for example, can be loaded into these high memory areas thus relieving the lower 640K of TPA for other application programs.
- Split Memory Addressing allows the user to fill out conventional memory to 640K.
- Extended Memory Addressing is available for the PC/AT version.
- 2 MB capacity in a single slot. Up to 8 MB per system.
- Parity checking.

SOFTWARE

- Easy menu-driven auto configuration software.
- Device driver includes print spooler and RAM drive.
- Supports multitasking with the appropriate shell-resident software package.

SPEED

- 6/8/10 MHz speed with 0 wait states. 12 MHz speed with 1 wait state.

WARRANTY

- One year parts and labor.
- Now includes SYSTEM SLEUTH™ from DTG, Inc. A $149.00 value.

An Ethernet/VT100 Interface in Your Monitor

The LANTerm Model E (for Ethernet) is a smart diskless workstation that includes VT100 terminal emulation and features an 8-MHz V40 microprocessor. It comes ready to boot itself on your Novell network through a built-in, thick coaxial, multiaccess unit, the company says, although you can use it with other Ethernet-compatible operating systems.

Features include 768K bytes of RAM, a 64K-byte EPROM in the white- phosphor 14-inch monitor, and an AT-style keyboard.

In PC mode, you get HGA graphics and Monochrome Display Adapter text. There's also a serial port and a parallel port.

Price: $1195.

Security System for Stand-Alone PCs

Hands Off the Program is a security utility that protects your hard disk drive, subdirectories, and files by preventing unauthorized persons from booting off the hard disk drive, using the DOS FORMAT command, and other DOS file-based access. The program also automatically locks the hard disk drive when someone boots the PC from drive A.

The program establishes a security system for up to 64 subdirectories. Each user receives a security rating between 0 and 8. Access to a private subdirectory is allowed only if you have a higher number than the private subdirectory. You can also designate important system files as read-only, or hidden, and no DOS command or utility can change the file attribute, according to Systems Consulting, the utility's developer.

Other features include an automatic or manual keyboard lock. In automatic mode, the program will freeze your keyboard after a set period of inactivity; only by entering the correct password can you regain control.

Hands Off the Program works on all IBM PCs with DOS 3.0 or higher and uses about 7K bytes of RAM. The company reports that it is developing a new Toolbox program that will let you run Hands Off on a network.

Price: $89.95.

Meet Marvin, the Scanning Assistant

Scanning text and graphics from documents is becoming much more commonplace with lower-cost and higher-quality scanners.

Marvin is a Windows-based utility that offers a user interface, database functions, and compression techniques to assist you in processing scanned text and graphics. Marvin also lets you save documents in a variety of formats, including TIFF and CCITT, so you can pop documents into your scanner and send them out as faxes.

Upcoming products from ImageTech include Marvinet and Marvin Jr. Marvinet runs on Novell networks, supports 25 hand-held and desktop scanners, and exports and imports PC Paintbrush, Dr. Halo, and TIFF files, according to the company. Marvin Jr. is a single-user version of Marvin, intended for laptop users.

Marvin works with all 80286-based IBM PCs and higher and requires a document processing card or 2 megabytes of memory, EGA or VGA, and 640K bytes of RAM. A mouse is also recommended. Marvin Jr. will work with floppy-disk-drive-only systems and will also require 640K bytes. Marvin Jr. is scheduled for release in the first quarter of 1990.

Accelerate AutoCAD on the PS/2s

Panacea's DLD-8514/A for AutoCAD transparently replaces the 8514/A driver that's included with AutoCAD release 10, resulting in a performance increase of up to 15 times in redrawing, panning, and zooming, the company reports. The DLD-8514/A supports IBM's 8514/A graphics adapter at the register level and will work with any hardware that's 100 percent compatible with the 8514/A.

The DLD-8514/A also has built-in support for AutoShade and AutoSketch.

Price: $149.

Explore the Universe on Your Macintosh Desktop

Carina Software calls Voyager 1.2 a "desktop planetarium" because it recreates the features of a planetarium on the screen of your Macintosh. With the program, you can view the sky of the past, present, and future; simulate the motion of the planets; or travel across the solar system. Voyager gives you three views of the sky. The Star Atlas View lets you explore the heavens from pole to pole, using your screen as a window into a large star atlas. Local View displays the sky and horizon from an earth-bound location of your choice. It changes with the passage of time and the seasons. Finally, the Celestial Sphere View displays an entire hemisphere of the sky.

Written in MacForth and assembly language, Voyager is the fastest commercial astronomy program available, its maker claims. At its heart is a database of some 14,000 objects, including the 9100 stars in the Yale Bright Star Catalog, 3000 deep sky objects, 88 constellations, 1600 binary stars, and 160 variable stars. A real-time rotating earth will show a solar eclipse path across the surface of the earth, and lunar eclipses can be shown with the moon passing through the earth's shadow.

The Voyager window is resizable, to take advantage of large-screen monitors, and you can save any screen display as a MacPaint document. Voyager runs on the Mac Plus and higher and requires 1 megabyte of RAM and one 800K-byte floppy disk drive. Price: $124.50.

Voyager 1.2 displays Pluto and the outer planets from 55 astronomical units as displayed by Voyager 1.2.

Stop Squinting at Phone Lists

Complementary Solutions developed TeleMate-Phone Book for companies that have a computer on most desks but still distribute phone lists the old-fashioned way—on a computer printout that's often outdated by the time it reaches your desk. TeleMate-Phone Book lets you put a phone directory on your PC or network that you can pop up in an application when you need to call someone in your company. TeleMate-Phone Book lets anyone in a company access the phone list. However, only the system administrator can make changes to it, preventing unauthorized edits. The program provides fields for name, job title, extension, department, division, cost center, company, and mailing address. Other fields are provided for alternate phone numbers and comments.

You distribute the inquiry program can search by partial name, extension, and department. TeleMate-Phone Book is a TSR program that needs 30K bytes of RAM on your IBM PC with a hard disk drive and DOS 3.0 or higher. The administrator module needs 340K bytes of free RAM. TeleMate-Phone Book is compatible with any DOS-compatible network and comes in two versions: a site license and a single version for a switchboard operator.

Banyan Makes VINES/386 MCA-Compatible

A new version of VINES/386, which includes Unix under the VINES 3.10 networking system, lets you use Micro Channel-based systems as file servers. Banyan simply added Micro Channel architecture device drivers.

The immediate technical advantage of VINES/386 on MCA is better 16-Mbps Token Ring performance than is possible by using IBM PC ATs with 16-Mbps Token Ring hardware, Banyan says. VINES/386 for ATs (as well as the version for Banyan's proprietary file-server hardware) already takes advantage of 32-bit central processing and 32-bit memory addressing—something only NetWare/386 can do.

How Long Can You Survive Without Your Data?

A few hard drive users go for years without experiencing a potential drowning situation. Most users, however, have had to tread water for a while waiting for their failed hard drive to be fixed. And their data? Those who anticipated the unexpected had backups. They only had to go through the downtime and restore process. Those that didn’t, may have used an emergency data recovery service like ours or went down for the count.

SHADOWBAK AND A SECOND HARD DRIVE CAN SAVE YOUR LIFE

By relying on a two hard drive system and SHADOWBAK, there is a built in lifesaver that will be there when you need it. With SHADOWBAK installed, data is written simultaneously to both drives. When one fails, the other is readily available.

A FAULT TOLERANT SYSTEM

It’s an effortless way to backup, it reduces downtime when the hard drive fails, and you can choose the hard drives.

SPECIAL INTRODUCTORY OFFER

Mention that you saw this ad with our order and purchase SHADOWBAK for $99.00. Suggested list is $149.00.

Boca Research Throws Its Hat into the VGA Ring

The VGA by Boca board is register-level-compatible with the IBM VGA and fits into the 16-bit slot for accelerated performance compared to an 8-bit connection, Boca Research reports. You can use either an 8- or 16-bit connection on your 80286- or 80386-based computer.

The board comes with 256K bytes of RAM and provides 640- by 480-pixel resolution with 16 colors. An optional resolution of 320 by 200 pixels is available if you want to display 256 colors from the palette of 262,144 colors. A diagnostic test program is included with the board.

Price: $345.

Display Adobe Fonts On-Screen with Draw 1.1

Corel Draw 1.1, the illustration package that runs under Microsoft Windows, now lets you display and manipulate Adobe fonts on-screen in WYSIWYG format. The program's typeface-creation program, WFNBOSS, converts typefaces for on-screen kerning, special effects, text curving, and letter editing. Once the text is converted, you can print to any Windows-supported output device, a PostScript printer, plotters, and film recorders. Corel has also added Windows clipboard support and a CGM (Computer Graphics Metafile) import/export utility to Draw 1.1.

Prior to Draw 1.1, when working with fonts on-screen, you had to show Adobe fonts with a bit-map approximation. That approach often resulted in jagged-edge fonts on-screen. Draw 1.1 lets you show, stretch, manipulate, and refine the fonts on-screen before you print them.

WFNBOSS also supports the Bitstream Fontware, Agfa Compugraphic, and DigiFont libraries. If those aren't enough fonts, Corel has added 45 typeface outlines from 14 type families.

Other additions to Draw 1.1 include 300 clip-art images and support for SCODL (Scan Conversion Object Description Language). By supporting SCODL, Draw 1.1 can create a slide for a presentation if you have a Matrix or Genegraphics film recorder.

Draw 1.1 requires an IBM PC AT or higher with Windows 2.0 or higher, 640K bytes of RAM, and a Hercules, EGA, or VGA graphics adapter.

Price: $595.

GOfer 2.0 Goes 50 Percent Faster

GOfer 2.0, a text-search-and-retrieval program for the Macintosh, searches 50 percent faster than the previous version, Microlytics reports. The company also added a wildcard function, a search-set feature, and compatibility with FullWrite Professional, MacWrite II, Word 4.0, and Microsoft Works 1 and 2.

Microlytics says the speed increase is due in part to the new version's ability to search for text strings without converting the entire document. The search-set feature lets you retrieve information on a certain subject from a variety of sources, without requiring you to sift through an entire downloaded document. You could, for example, download all weekly stories on a topic into a separate file and then perform a more-specific search of the document.

GOfer 2.0 runs on the Mac 512KE or higher and supports HyperCard and MultiFinder.

Price: $79.95.

Program for Advertising Agencies

Working Computer has updated its Clients & Profits for Advertising Agencies 4 program to include enhanced financial accounting, custom invoices, estimates and purchase orders, and multuser support for Ethernet and Novell NetWare users. The program, an accounting and trafficking package, is now compatible with MultiFinder.

Clients & Profits uses a worksheet metaphor called a job ticket, which tracks specifications, schedules, budgets, estimates, purchase orders, and other agency functions for each client. The company added year-to-date and percentage-to-total report capabilities to version 4, and accounts no longer must be closed at the end of the month. A job's profit or loss is updated automatically.

Clients & Profits 4 lets three users work simultaneously over any AppleTalk network. The number of potential users is limited by system memory. The purchase of additional workstations lets you increase the multiuser capacity of the system. The program requires a Mac Plus or higher with 1 megabyte of RAM, a hard disk drive, and an ImageWriter or LaserWriter printer.

Price: $3795; additional workstations, $295; single-user version, $2495.

It's not your 386 keeping the lid on productivity...
It's your operating system.

It's taken a long time for the PC to be treated like a serious business machine. What it really needed to match mini-computer potential was the capacity to multitask, to handle more than one program at the same time. This flexibility would allow one user, or many, to dramatically increase productivity.

The hardware hurdle for PCs is history. Thanks to the 386's true multitasking design, flexible and inexpensive microcomputer class PCs stand ready for power users and workgroup environments.

The last barrier has been an operating system advanced enough to truly implement the 386 design. Early multitasking attempts, and those based on the 8088, were forced to partition RAM to achieve basic multitasking.

It's a real waste.
Since most programs use a small fraction of the 640kb partition needed to accommodate them at any point in time, the remaining RAM was literally wasted. In addition, partitioning made program switching and protection a nightmare.

The operating system wait is over. Vmos/3 is the first true 386 protected mode virtual operating system kernel for DOS. Not just a task switcher or DOS extender, Vmos/3 fully implements the 386 design.

Using demand paging, Vmos/3 allocates tiny 4kb memory units to programs only when needed from any available location in memory.

Furthermore, its virtual paging feature swaps non-current pages to disk, freeing even more memory resources.

The result is lean and mean. These advances allow effective multitasking in 1mb machines. With more RAM, the performance curve zooms.

RAM for those programs that need expanded memory. Tasks run in Background and Foreground simultaneously, without program redrawing.

Why a DOS based system?
Estimates put the investment in DOS software at over $30,000,000,000. Business doesn't have time to trash budgets or productive hours to retrain on complex, variable standards or systems already made obsolete by the 386.

There's MultiUser, too.
Now, Vmos/3 has a partner, Vmos/MU. That same 1mb machine can provide an effective platform for a multiuser system where each user multitasks.

We're not kidding. Compare that ability to other multitasking systems limited by static memory partitions. The large RAM requirements and task limits per user reveal the real inefficiencies of partitions.

Advanced hardware opens the way.
Vmos/MU uses intelligent interface boards to reduce overhead, conserving CPU. Intelligent serial interface cards allow connection to inexpensive terminals. Alternatively, video extender interfaces let you use standard PC video monitors and keyboards for graphics intensive applications, each with the performance of a dedicated system.

Look out LANs, here we come. These relatively inexpensive interfaces and peripherals, plus modest memory requirements, make Vmos/MU an extremely attractive alternative to LAN systems, without the LAN hassles and price tag.

With all this emphasis on value, what does Vmos/3 cost?
$199 for Vmos/3, with an introductory price of $99 more for Vmos/MU. Plus, we offer a 30 day money back guarantee, and free ongoing support. What a deal!

So, what's the catch?
1. No catch. We want to make it easy for you to buy Vmos/3.
2. We don't think you have to pay big bucks for us to make money. But it does help to have a great idea. Or, in our case, two or three.
3. Frankly, we want to knock the PC industry on its ear, and bring mini-computer performance to the 386 market at PC prices. The potential is enormous to bring powerful computing into every business, large and small. The way we see it, we've built a star ship.

Who is StarPath, anyway?
4. Our last reason for emphasizing value: We know we're new to you. (But not strangers to mainframe internals, or PC design.) In fact, our principals cut their teeth on front end communications and mainframes nearly twenty years ago. Now there's multitasking experience.

Call us at (800) 456-8667.
Buy a ticket on a star ship and see what your 386 can really do.

The Laptop with More POWER
More Performance: Speed, Storage, Display, and Expansion...

Chicony®
LT3400

In the past, Laptop Computers were not expected to have power, limited, as they were, by CPU speed and memory and storage capacity. Today, Chicony's LT3400, a full power laptop computer, can do more work and do it faster.

It's CPU runs at 16MHz with no-wait-state. It has 1 MB memory (upgradable to 5MB) and also supports EMS memory & Shadow Ram (enabling its BIOS and Video to run 300% faster). It's 40MB harddisk runs at 28ms while others run at 35ms, and it is upgradable to 100MB. In addition to the built-in 3.5"-1.44MB floppy drive, it also comes with an external 5.25"-1.2MB floppy drive which allows you to backup or transfer data between different disk types. It's 12" gas plasma screen out-performs LCD screens on speed as well as clarity. With the external video port, you can hook up an additional monitor to use high resolution full color screens, with simultaneous display. Besides two serial and one parallel port, it has an external keyboard port allowing connection of your regular keyboard when you are at your office or home. The LT3400 also provides the user with one standard AT-style 16-bit slot for expansion with third party boards such as fax or network cards, etc.

With all this, you can run Lotus 1-2-3, dBASE, or Autocad about 50% faster than on Toshiba's T3200. But you will pay much less than you think! For more detailed information, call 1-800-999-1CPU. For dealer information, call (415) 583-7222.

Transform Your PC into a Personal Supercomputer with MULTIS Parallel Processing Cards

Harness supercomputer power for your IBM PC, XT, AT or compatible with the MULTIS TABS (Transputer Architecture Board Series) parallel processing cards.

A single TABS-MMC supplies power and communication switching control for up to two TABS-SPD or four TABS-SPZ processor modules, yielding up to 50 MIPS of processing power. Each SPD or SPZ processor module provides one or two megabytes of ram for a T425 or T800 Transputer.

Add up to sixteen TABS-MMC's and dramatically expand your systems capacity. With room for 64 processors, the TABS-MMCs will provide you with 640 MIPS of processing power, equivalent to the CRAY 1 supercomputer.

With the MULTIS TABS design, your system is never obsolete. As applications demand more processing power, simply plug in additional processor modules. Or, customize your own expandable system with high resolution video and other peripheral modules.

MULTIS TABS series products are fully compatible with other B004 Link boards. Each MULTIS product comes with a full year warranty and complete technical support. To find out about these and other upcoming products call (508) 459-9303. FAX # (508) 937-8051.

Entry-Level Word Processor Features Multilaunching

New Horizons' WordMaker, an entry-level word processor for the Macintosh, is now available in a multilaunch version, allowing several users on a network to use the program simultaneously.

WordMaker is compact enough to run off a single disk if your Mac doesn't have a hard disk drive. Its features include a WYSIWYG display, print merge, multiple-line headers and footers for left and right pages, color, multiple document support, and a 100,000-word spelling checker. You can also wrap communications.

The program supports all available system fonts. It supports only one column, but it can read and write MacWrite files and is compatible with PageMaker. WordMaker runs on the Mac 512KE or higher.

Price: Single-user version, $124.95; multilaunch version, $1325; eight additional keypads, $800.

MNP Software Now Includes More Utilities

MagicSoft's MTE 2.1 is a communications program that adds Microcom Networking Protocol error control and data compression to MNP 5 to ordinary modems. New add-ons now allow special terminal emulations and file transfer protocols that are necessary for mainframe and CompuServe communications.

MTE 2.1 lets all modems appear to be an MNP modem, while also doubling the data rate, according to MagicSoft.

Price: MTE 2.1, $79; new add-ons, $19.

Networking from the Field with GRiD

The FieldNet series is a wide-area-network store-and-forward system designed to link field-service personnel with portable computers to office-based networks.

It operates on Banyan's VINES network operating systems as a Unix service. GRiD software replaces the protocol and application layers.

The resulting software lets traveling professionals do batch processing when they can get access to a telephone line. The FieldNet Secretary function compiles all the necessary information in a form for quick processing.

FieldNet servers are available in three models. The 20-MHz 80386 and the 80386SX both support six (standard) to 12 (optional) modems. The FieldNet/EXP (a GRiD/Case 1535 EXP laptop) is for one-to-one communications in the field.

Price: FieldNet/386, $25,950; FieldNet/EXP, $21,450; FieldNet/SX, $19,450; GRiDMail Plus, $175; FieldNet API, $1950 per developer.

Express Your Opinions Honestly at Board Meetings

You're at the board meeting or presentation, and a fellow worker is presenting the marketing strategy for the company's next big product. You know the person worked long and hard on the presentation, but your experience tells you the strategy will surely fail. The president asks the group what they think about the strategy. What do you do?

A company called Option Technologies thinks it has the answer for ensuring 100 percent honest feedback for business questions with political baggage. OptionFinder consists of a software program and keypads that let meeting attendees respond to up to 52 items developed before or during the meeting. You can present questions, which can be projected on a wall with a video projector, in several forms: yes or no; traditional rating scales; true/false; and multiple choice. You can connect up to 120 participants.

OptionFinder works on the IBM PC with 640K bytes of RAM, DOS 3.2 or higher, and two floppy disk drives or a hard disk drive.

Price: Software, $89.95; eight keypads and software driver, $1325; eight additional keypads, $800.

Contact: Option Technologies, Inc., 200 Carleton Ave., East Islip, NY 11730, (800) 645-2287 or (516) 277-7000. Inquiry 1011.

CodeTrack Shames Software Pirates

A program for software publishers and other businesses fights the illegal duplication of software programs with the weapon of embarrassment. The first time you run an application called CodeTrack, it runs you through a registration procedure. To qualify for customer support, you must send a registration card to the respective software publisher and quote the serial number and password for each call.

What CodeTrack does is display in big, bold letters on the IBM PC's screen the customer's name every time the program or a copy of it executes.

Price: $195.

Ease-of-use + Power = Productivity

In today's tough design environment, good engineering tools aren't good enough. You need the best to get the job done.

**OrCAD/SDT III offers the power**

SDT III comes with the options you'd expect to pay extra for:

- **Completeness:** A library of over 6100 parts that you can browse through in a breeze. Utilities to generate Bill-of-Materials, Electrical rules check, create custom library parts.
- **Compatibility:** Over thirty netlist formats, over 50 supported display adapters, over 50 printer drivers, a dozen plotter drivers. We conform to your system better than anyone.
- **Complexity:** 4000+ sheet design capacity for single designs, 200+ levels of hierarchy. Great support for small, simple designs to large, complex hierarchical systems.
- **Control:** SDT III gives you the ability to customize the work environment to make you more productive. This includes user definable macros, text/object sizes, sheet sizes, graphical object editor, even the colors on the screen.

**OrCAD/SDT III makes it easy**

The lightning fast operation saves time. The intuitive, pop-up menu displays your most likely next action. This means a short learning curve and immediate productivity.

OS/2 Gets a Spreadsheet

The new Excel, an upgrade to the powerful spreadsheet, joins the OS/2 bandwagon. After testing a prerelease version, I came to the conclusion that Excel for OS/2 with Presentation Manager is distinguished from its DOS ancestor less by its feature set than by the underlying benefits of OS/2.

Among those benefits are large memory addressing, support for virtual memory, built-in Dynamic Data Exchange (DDE), multitasking, and a richer graphical environment, including more fonts, more accurate screen representation, and an IBM common-user-access-compliant interface. Large memory permits a different working style, in which many spreadsheets are loaded and open at the same time. With multitasking, you can be sorting a worksheet, while scrolling on areas in each sheet that are then dynamically linked to a summary sheet. To my disappointment, this feature was not intuitive nor well documented.

Other additions in Excel PM are quite minor. A nice menu item called Window Show Clipboard lets you see the contents of the clipboard, and modifications to existing commands permit greater customization of the work environment. New commands necessary to interact with OS/2 (e.g., a menu item to call the Control Task Manager) have been added, while several macro functions have been modified to comply with PM. The file load and save commands will support the 32-character filenames in OS/2 1.2. And Q+E, Microsoft's new SQL querying tool for Excel, will ship with every copy of the PM version.

In performance, the beta version of Excel PM that I tested was comparable to the Windows version in recalculations—sometimes faster, sometimes slower, but never by more than 10 percent—but its speed was substantially slower in two key areas: file loading and saving, and screen movement. Loading a 600K-byte file under OS/2 took 70 percent longer than under Windows, and a test of scrolling right took 31 percent longer. In all comparable benchmarks, Excel PM was much slower than the 2.x DOS version of Lotus 1-2-3 (using the same files converted to .XLS format) and was a little slower than Lotus 1-2-3 release 3.0.

Is Excel PM worth it for DOS/Windows users looking to upgrade? When you consider that you will need an 80286 machine or higher (an 80386 really helps), at least 2.5 megabytes of RAM, a large hard disk drive with 12 megabytes of free space, OS/2, and the application itself, the cost may not be justified now. But when OS/2 becomes a standard, and more applications that use multitasking and DDE enter the market, this new Excel will likely be a must-have program.

Andrew Reinhardt

A Cornerstone for Building Documents

A fter writing for years about the advent, and finally the arrival, of the new age of desktop publishing, it was time to install a DTP program of my very own. But my old-faithful IBM PC AT clone was slow, lacked sufficient memory, and had a tiny amber monitor—definitely not suited for the rigors of Windows/286 or PageMaker. The solution to that problem was to increase speed with a new motherboard, beef up the memory with an expanded memory board, and add a full-page monitor.

I chose the Cornerstone SinglePage XL subsystem, complete with a four-shade gray-scale portrait monitor that measures 15 inches diagonally and includes a Hercules-compatible add-in card and associated software. TrueFonts, Cornerstone’s proprietary screen fonts, include Helvetica, Times Roman, Courier, and Symbols. My four-shade system uses smoothing for crisp on-screen characters. However, a less-expensive two-shade monochrome system is also available.

The installation was easy. There’s only one jumper on the two-thirds-length add-in card (for single or multiple monitors), which, although it requires an AT, fits into any 8- or 16-bit expansion slot. From there, I just hooked up the video cable and power and turned the computer on. Software installation is also uncomplicated. Drivers are included for Microsoft Windows, GEM/3, Ventura Publisher, AutoCAD, AutoSketch, AutoShade, Lotus 1-2-3, Symphony, WordPerfect, and WordStar. A DOS driver allows other DOS applications to run in full-page mode. But because many programs bypass the BIOS and write directly to the screen, don’t expect wonders. For example, Norton Commander and XyWrite refused to run in anything but their normal 25-line configuration.

After I finished installing Windows/286, its custom driver, and PageMaker, I was eager to see how a full page looked on-screen, and I wasn’t disappointed. The screen surface is flat, with no obvious glare or distortion, and the noninterlaced resolution (768 pixels horizontally by 1024 pixels vertically) more than meets my DTP needs.

Cornerstone is an apt name for this monitor. It measures 16½ inches high and 12½ inches wide, with a depth of 13½ inches. It looks great on my desk and has attracted the curiosity of many (jealous) fellow editors. The only small complaint I have about the SinglePage XL is the contrast, which I haven’t been able to adjust to my liking. But that’s something I can live with, and I realize it’s not completely the fault of the monitor, since it’s competing with the extensive light in my office.

If you need to work with text and graphics, as in DTP, and can do without color, the Cornerstone SinglePage XL is for you.

Pictorial Programming on the Mac

Prograph 1.2 from Gunakara Sun Systems is a pictorial development system that radically changes the rules of the game. You build programs with a pictorial diagram editor similar to what many computer-aided software engineering tools provide. However, while CASE diagrams typically specify code, Prographs are code.

An application builder, an interpreter, and a debugger support the pictorial language. The key elements of Prograph are object orientation, data flow, and a well-integrated environment. The object orientation is, in some respects, not too different from what you find in C++ or Object Pascal.

Class icons have left and right mouse-sensitive regions. Double-click on the left one, and an object editor reveals attributes that belong to the class at large and to the current instance of the class. Double-click on the right one, and another editor shows the methods in the class. The System Classes window is where you create new classes and—by rubber-banding them to existing ones—specify inheritance relationships.

There’s virtually nothing in the system that corresponds to the normal concept of a variable. Thus, there are no variable names to invent, type, and misspell. It also means, however, that you’ll spend much time in object editors unpacking attributes—since that’s the continued
How to choose a 68000 C compiler for your ROMable code development

These twelve important CrossCode C features could make the difference between success and failure.

It's hard to know ahead of time what features you'll be needing in a 68000 C compiler. But if you're using CrossCode C you won't need to think ahead, because CrossCode C is already equipped with these twelve important features for your ROMable code development:

1. A 100% ROMable Compiler: CrossCode C splits its output into five memory sections for easy placement into ROM or RAM at link time.

2. Integrated C and Assembler: You can write your code in any combination of C and assembly language.

3. Readable Assembly Language Output: The compiler generates assembly language code with your C language source code embedded as comments, so you can see each statement's compiled output.

4. Optimized Code: CrossCode C uses minimum required precision when evaluating expressions. It also "folds" constants at compilation time, converts multiplications to shifts when possible, and eliminates superfluous branches.

5. Custom Optimization: You can optimize compiler output for your application because you control the sizes of C types, including pointers, floats, and all integral types.

6. Register Optimization: Ten registers are reserved for your register variables, and there's an option to automatically declare all stack variables as register, so you can instantly optimize programs that were written without registers in mind.

7. C Library Source: An extensive C library containing over 47 C functions is provided in source form.

8. No Limitations: No matter how large your program is, CrossCode C will compile it. There are no limits on the number of symbols in your program, the size of your input file, or the size of a C function.

9. 68030 Support: If you're using the 68030, CrossCode C will use its extra instructions and addressing modes.

10. Floating Point Support: If you're using the 68881, the compiler performs floating point operations through the coprocessor, and floating point register variables are stored in 68881 registers.

11. Position Independence: Both position independent code and data can be generated if needed.

12. ANSI Standards: CrossCode C tracks the ANSI C standard, so your code will always be standard, too.

There's More
CrossCode C comes with an assembler, a linker, and a tool to help you prepare your object code for transmission to PROM programmers and emulators. And there's another special tool that gives you symbolic debugging support by helping you to prepare symbol tables for virtually all types of emulators.

CrossCode C is available under MS-DOS for just $1595, and it runs on all IBM PCs and compatibles (640K memory and hard disk are required). Also available under UNIX, XENIX, and VMS.

TekColor Lets You Really See What You Get

If you own a color printer, chances are you’ve been disappointed on occasion by the lack of similarity between the screen colors created by your RGB monitor and the output of your color printer. What appeared on-screen to be a violet flower, for example, may appear to be blue on paper. Unfortunately, the colors on your monitor often can’t be reproduced exactly by your color output device. CRTs, electronic printers, scanners, and film recorders produce colors from electronic signals based on mathematical models, but devices vary considerably in their ability to produce color.

To solve this problem, Tektronix has introduced its TekColor for the Macintosh color-matching system. TekColor is designed to help you pick screen colors that your printer (or other output device) can duplicate. While color-matching systems aren’t new, Tektronix says that TekColor is the first device-independent color-matching system to appear on the market.

TekColor will provide color-matching information for most Mac-compatible RGB monitors and any color output device (e.g., printers and film recorders). However, your printer must be compatible with the TekColor color-matching system. Currently, only the Tektronix low-end $2499 ColorQuick ink-jet printer includes the necessary TekColor software, although Tektronix plans to bundle TekColor with its higher-end printers in the coming months.

Included with TekColor is the Picker, a color-selection and color-editing interface that lets you select a “hue leaf” showing a range of shades within a given color set. The TekColor interface includes two color boxes. One shows you the original color; the other shows the effects of your color editing. The interface, as you would expect for a Mac application, is intuitive and easy to use. If your monitor can’t reach a selected color, TekColor will display the nearest color in the current color box and flag it for you.

To develop a truly device-independent color model, Tektronix linked its color-matching system with the standards outlined by the CIE (Commission Internationale de l’Éclairage, or International Commission on Illumination). TekColor is based on the Tektronix TechVC (for Hue-Value-Chroma) color model. It’s designed to accommodate color-matching systems, although Tektronix also introduced its TekColor color-matching system. New Flight Simulator lets you put wings on a 747 and redefine the word "lift."

Brave souls can light up the Manhattan skyline with the most radical jet this side of the B2.

It's a known fact that Microsoft® Flight Simulator® provides the most realistic, exhilarating flying experience you'll find on a PC. Desktop pilots have taken to the skies in all kinds of different aircraft, from a WWI Ace to a modern-day jet.

Now we've added features to the new Flight Simulator 4.0 that'll throw you for a loop. Literally.

For starters, you can design your own plane. Which gives you the chance to investigate the acceleration characteristics of a 1000 horsepower Cessna. Or the lead-balloon characteristics of a wingless sailplane.

Equally adventurous is the weather. New Flight Simulator randomly creates clouds, wind, storms, you name it, when you least expect it.

We've also added an array of air and runway traffic, including a Boeing 767. You even get runway clearance from the control tower; to make every landing a happy one.

According to Tektronix, the greatest need for a color-matching standard is in industries where color hard copy is most essential (e.g., graphic arts and professional publishing). Currently, the TekColor system is supported by Mac software and hardware developers like Aldus, E-Machines, and RasterOps. However, creating a computer industry standard is tricky business these days—every company has its own "standard" it's trying to push.

We tried a beta version of TekColor for the Mac on a Mac II equipped with 5 megabytes of RAM along with a SuperMac Spectrum/24 video board and its 19-inch color monitor. The installation is simply a matter of copying the TekColor.cdev and a folder that holds the TCDD files into the System Folder. From the Control Panel, you select whether to use Apple's standard Color Picker or the TekColor Picker.

Once the TekColor Picker is selected, it pops up whenever you double-click on a color to modify it. Two curves, which represent the hue leaves that plot the color range of the printer and monitor, appear. At a glance, you can see if the color you're working with will reproduce properly on the printer. TekColor worked inside PixelPaint 2.0 and PhotoMac 1.1 without problems.

TekColor for the Mac looks like a good product. It's well designed, inexpensive, easy to use, and certainly very helpful if you find color matching essential.

**FormWorx Goes GUI**

Forms-processing packages have simplified the previously painful process of designing and filling out forms. One of the first such packages was FormWorx.

**FormWorx System 2** is an impressive package. While the beta version that I tested was lacking some planned final features, it made the process of both laying out and (more important) filling out forms a real pleasure.

While many companies say
Reach for ultimate portability

200 MBytes of power, speed and security in a revolutionary, removable hard drive.

At last, the Disk Pack gives you everything you've always wished for in a data storage system. The speed and high storage capacity of a hard drive. The ease and convenience of a floppy diskette. And the safety of a tape backup. All wrapped up in a state-of-the-art rugged unit, about the size of a paperback book. Designed to make your life a lot simpler and more secure.

True portability is here
Just picture this: With the Disk Pack you carry your whole work environment with you, wherever you go. All your files, all your data stay organized and configured just the way you created them. Between your office and remote sites. Or home. Or another department. You can even mail a Disk Pack. It's that rugged.

Total security for your data
Simply slide out a Disk Pack module and lock away your entire business customer base and payroll figures in a drawer or safe. Same for lawyer, banker or accountant sensitive data and Uncle Sam confidential information. All fully secured in a snap.

Blazing speed
Rock-solid reliability
Limitless expansion
Breakthrough technology makes the Disk Pack four to five times more reliable than other removable products. Access times as low as 13 ms make it one of the fastest hard drives on the market. The Disk Pack doesn't limit you to a single storage capacity either. You can interchange 20-, 40-, 80- or 120-MByte modules in your system and between systems. Link modules up for a whopping Half-GByte + of on-line data. Store them for unlimited off-line data. And do lightning-fast data backups. That's not all. The Disk Pack turns a shared computer into your fully personal machine within seconds. It's ideal for space grabbing applications such as color graphics, CAD, or music. One Disk Pack module does the job of 100 diskettes. Ten times faster. And with a lot less hassle.

And thanks to the Disk Pack's unique architecture, you'll use it equally well on any Mac, Apple, PC-compatible or PS/2 computer. It's that advanced.

For more information call 1-800-322-4744

The Disk Pack is ideal for data security. Lock it away and forget about accidental or intentional data loss.

SHORT TAKES

that they use object-oriented constructs, the reality is often different. With FormWorx System 2, "object-oriented" is more than a buzzword. Objects are the key to the package's surprisingly literate user interface. Laying out a form is simplified because the company has included about a dozen constructs that it calls common form objects. These go beyond the simple grids used in competing products. There are objects for all the common form areas (e.g., headers, lists, and signature blocks). I found that I could quickly design a form without the steep learning curve that was needed with other packages I've used.

A form in FormWorx System 2 consists of four planes: draw, edit, paintbrush, and data. This separation of pow-

ers makes a great deal of sense, and it's one of the main reasons why the package is so easy to use. After I worked with the individual planes, they all came together in a finished product.

Another stunning feature of the package is its forms-filling abilities. Other forms packages let you import data from dBASE (or delimited ASCII) files, letting you print out a bunch of finished forms at one time. But FormWorx System 2 takes the concept much further. The company has essentially designed an easy-to-use front end to dBASE III Plus (or dBASE IV), and you don't even need dBASE to use it.

But FormWorx System 2's biggest surprise came when I exited the program. Because it stores forms as a combination of pointers to objects, the amount of space needed to store your finished forms is miniscule. For example, a standard invoice file took up only 548 bytes of storage. This is a far cry from other forms packages, which store forms as bit-mapped images, often taking up as much as 300K bytes for a single form.

FormWorx System 2 is a package that shows what careful design coupled with the latest wave of object-oriented programming technology can do for software. And for only $299, it's a software system that delivers even more than it promises.

When you buy a computer, about 35% of your money goes to the store. But we'd much rather see your money go to somebody who deserves it a lot more. You.

So we give you a completely different kind of computer store. The Dell Computer Store.

Instead of a crowded, high-overhead showroom, you get our brand new 44-page catalog. Which gives you a full line of 386 and 286 systems, printers, peripherals, software, and accessories.

And since you buy direct from the manufacturer, you save about 35%.

But there's a lot more to it than saving money. We offer you the most complete service and support in the industry. Including a 30-day money-back guarantee. A toll-free technical support hotline. Self-diagnostic software. And next-day deskside service from Xerox Corporation.

If you read our ad in the front of this magazine, it will tell you a lot more about the systems we offer. And the service we put behind them. So if you'd like a much more intelligent way to buy a personal computer, have a look at our ad. Or call us at 800-426-5150. Or send us the card on this page.

And we'll send the best computer store you've ever seen. One you don't have to set foot in.
If time could be manufactured, you'd buy it. Weitek's Abacus 3167 math coprocessor comes close. It can give a 386-based computer 2X to 3X its normal speed—workstation-level performance—for less than $1,000. It's quickly installed in machines from Compaq, H-P, AST, Zenith, Dell, Everex and numerous other manufacturers. It's supported by high-end CAD, CAM, engineering and math applications like VersaCAD, Anvil-5000pc, CADKEY, Mathematica and many more. And by the most widely used programming tools—from vendors like Phar Lap, MetaWare and MicroWay. To learn more about the 2X to 3X speed that means twice as much time for you, call Weitek Corporation at 1-800-HOT-3167 or see your dealer. Soon.
We’ll give you 30 days to plug our product.

Try our multi-user/multi-channel communication boards (and our promises) for 30 days with no risk.

You’re looking at multi-user systems. You want high performance. High reliability. Great service and technical support. And real value. Trouble is, that’s what every board company promises.

But whose promises can you afford to stake your reputation on? Ours. Because only DigiBoard dares to let you try us in the real world. With no risk.

With DigiBoard you can order any DigiCHANNEL multi-channel communication board and evaluate its performance for a full 30 days. Choose basic boards or the industry’s fastest intelligent boards. PC-Standard or Micro Channel. Four, eight or 16 ports. Even a Synchronous option on some models.

While you’re evaluating the performance of our boards, we hope you’ll benchmark our technical support too. Customers tell us it’s as great as our engineering. But enough talk. The only way to see how good we are is to try us. And now, you can plug us in without risking a penny. Just plug into your nearest DigiBoard distributor.

Ask your DigiBoard distributor for our FREE booklet, How to Do Multi-User Right.

EISA Arrives

HP leaps to the forefront with an 80486-based system built around the controversial EISA bus

After its unsuccessful attempt to take the lead in the PC market with its touchscreen HP-150 back in 1983, Hewlett-Packard settled for the role of builder of solid, reliable PC clones, while leaning heavily on its entrenched positions in the minicomputer and electronic equipment markets. Now, however, the company is embarking on a new strategy of product innovation and market leadership.

On the software side, HP has taken the lead in developing the Unix-based Motif user interface for the Open Software Foundation. It has also started shipping its innovative NewWave user environment for Microsoft Windows.

On the hardware side, the first evidence of HP's new strategy is its Vectra 486 PC, a powerful 80486-based desktop system that may be the first machine on the market to feature the long-awaited Extended Industry Standard Architecture bus. (For more details on the EISA bus, see this month's Under the Hood column.)

HP gave BYTE an early look at a preliminary version of the Vectra 486, and it is indeed an impressive machine, offering excellent performance and broad flexibility. The Vectra 486 is equally well suited for use as a high-performance CAD workstation, a network server, or a host for a multiuser system. And, as you'd expect, it can run Unix, DOS, and OS/2.

From the outside, the Vectra 486 looks

continued
identical to the Vectra RS/20C and RS/25C (the 80386 deskside models of the Vectra series). The floor-standing, 24-inch-high system cabinet weighs in at a hefty 60 pounds and includes six half-height storage bays, allowing up to two full-height hard disk drives and four floppy disk drives and/or tape backup storage devices to be installed in the system.

The system is powered by a 360-watt power supply. The Vectra 486 comes standard with 2 megabytes of RAM, one 1.2-megabyte 5¼-inch floppy disk drive, two serial ports, one parallel port, a PS/2-type mini-DIN keyboard, and mouse ports.

The inside of the Vectra 486 is what sets it apart from other members of its family. The main components of the Vectra 486 system are the 80486 CPU, an eight-slot EISA bus, and a special high-speed bus that drives the system memory and the high-performance Super VGA video controller. The system diagram of the Vectra 486 is shown in the figure, and the main system board is shown in photo 1. Note that the 80486 is located on a separate CPU board that plugs into the high-speed bus.

The 80486 CPU
The heart of the Vectra 486 is Intel's new 80486 CPU, which features on-chip floating-point and memory management units, as well as an internal 8K-byte cache (for an overview of the 80486, see Microbytes, June BYTE). Unlike some of the other recently announced 80486 machines (e.g., those from Apricot and Advanced Logic Research), the Vectra 486 does not include an external cache but relies entirely on the 8K-byte internal cache of the 80486.

According to HP's R&D manager for the Vectra 486, Rich Archuleta, the internal 8K-byte cache "gave us the best cost/performance trade-off on a 25-MHz system." Archuleta added that a "pretty big" external cache is needed to obtain a significant gain in performance. I'll discuss the performance of the Vectra 486 later in this article.

I should mention that the system board does not include a socket for an auxiliary floating-point coprocessor such as the Weitek 4167, which supports the 80486 and is reportedly much faster than the FPU built into the 80486 (see Microbytes, July BYTE, page 26). According to Archuleta, the system board was already in its final design stages when Weitek announced the 4167; HP will support the 4167 in a later version of the system board.

High-Performance Host Bus
The Vectra 486 uses a custom, 32-bit high-performance system bus, or "host bus," to access system memory as well as HP's Super VGA video controller. The host bus operates synchronously at the clock speed of the CPU, allowing a theoretical data transfer bandwidth of 100 megabytes per second (25 MHz, or mil-
COVER STORY
EISA ARRIVES

lor cycles per second multiplied by 4 bytes per cycle). Of course, the actual bandwidth is limited by transfer protocols, CPU resets and interrupts, and other performance penalties. But HP claims that the host bus can access system memory with a bandwidth of 50 megabytes per second using the burst mode of the 80486.

The system memory comes on a separate memory board (see photo 2), which plugs into the host bus. HP custom-designed its own memory controller chip that takes advantage of the burst mode of the 80486. System memory is available in 80-nanosecond, 1-megabit single in-line memory modules, allowing a maximum of 32 megabytes of RAM (in 1- or 4-megabyte packages), or in 4-megabit SIMMs (8-megabyte packages), which allows a maximum of 64 megabytes of RAM.

HP's New VGA Controller
As I mentioned earlier, the Vectra 486's host bus supports high-speed access to HP's new Super VGA video controller. The video controller plugs directly into the host bus but also takes up one EISA bus slot (the board extends across one of the EISA slots). The new VGA adapter is actually a "superset" of the VGA standard, supporting resolutions of 800 by 600 pixels and 1024 by 768 pixels, as well as the standard VGA resolution of 640 by 480 pixels. The controller displays 8 bits per pixel for a maximum of 256 simultaneous colors (16 colors in 1024- by 768-pixel mode) and includes 512K bytes of video RAM.

I did not have a chance to see the new video controller because it was still in production at the time of this writing. However, HP's Archuleta told me that it would offer about 10 times the performance of a standard VGA controller. The machine I saw used a standard 16-bit, AT-type VGA board plugged into the EISA bus.

Before moving on to other features of the Vectra 486, I want to point out that the high-speed host bus is a critical component of this system, particularly because of its high-performance graphics capabilities. Unlike the EISA bus—or other I/O buses, for that matter—HP's host bus offers a much faster and more efficient path to the CPU because it does not have to bother with bus arbitration protocols and other performance penalties associated with bus I/O. Thus, the system can support much higher block transfer rates from system and video memory. In high-resolution graphics systems, continued
MapInfo software can find, display and analyze your data geographically. See your prospects, customers, facilities—anything in your database. Find addresses by street, ZIP code, city, etc. (We can even supply the maps.)

Many point or region on the map can have a complete record of data behind it. See your actual DBASE data in a window to view, edit, and print. Draw your own graphs. Add titles and legends for high-quality presentations.

Perform analyses on your data to sum, average, or count your database records by location. Color sales territories by volume of orders, ZIP codes by numbers of leads, countries by your demographic data.

From street-level to worldwide, MapInfo can merge your databases with maps. Play visual "what if" with your data. See geographical views of your data. MapInfo now includes a map of the world and the U.S. with all ZIP code locations. Runs on IBM PCs or compatibles with 640K memory, a hard disk drive, and graphics, and comes network-ready.

C's power and portability make it the language of choice for software developers. Unfortunately, learning C can be a very costly proposition. Classroom instruction is, in a word, expensive. And many C video courses carry hefty price tags.

The top C video course at the lowest possible price
But now, there's The Complete C Video Course from Zortech. It's the ultimate C training tool for home or work. And all it costs is $295.

The Complete C Video Course
You get ten videos with 36 lessons covering all levels of programming skill. A comprehensive, easy-to-follow 365 page workbook. And even a free C compiler.

Free C compiler included
Yes, that's right. The Complete C Video Course includes our famous C compiler (it runs on any MS-DOS machine) with linker, library manager, full graphics library and on-line help. It's the choice of professional programmers everywhere for fast code, fast development and fast debugging.

Learn C in as little as two weeks
Speaking of speedy, with The Complete C Video Course you can learn C in only two weeks. Compare that with the up to four months it can take to learn C in class.

Each lesson averages 17 minutes of clear, concise instructions. Used in conjunction with our workbook you'll find they provide everything you need to know to become proficient in programming in C.

Save your company thousands
If you think The Complete C Video Course is a great way for you to save money learning C, think about how much it could save your company. Use it instead of sending programmers to school and you'll save thousands. What's more, The Complete C Video Course is even tax deductible.

C is unquestionably the most valuable programming language you can master. And now you can get everything you need to become productive in it from course to compiler to tools for an economical $295. Mail the coupon or call our hotline to receive it ASAP.

A "Plug In" 32 Bit RISC workstation with 1024 x 768 display spells VOOM for PCAD™, OrCAD™, PADS-PCB™ and PROTEL™ software.

The VectorScan RISC is the only 32 bit RISC co-processor that includes 1024 x 768 (or 768 x 544) video display system. By combining the RISC and video display on a single single PC card set, access to both PCB layout structures and video display memory are free of limitations imposed by bus bandwidth or 640K DOS limits. This combination provides faster screen redraw, zoom and searches through the megabyte data structures required in PCB layout software.

DOS video compatibility is insured since the VectorScan RISC uses your EXISTING display adaptor for DOS compatible modes. On board video switches allows a single monitor to support both RISC and DOS operation. Wanna Buy an 80486 Cheap?

Cheetah and ALR alter the price/performance ratio in the buyer's favor

When the power goes up, you expect the price to follow. It happened with the first 80286-based machines and the first 80386-based machines. But the crop of personal computers based on Intel's new 80486 CPU might buck this trend, if companies like Cheetah International and Advanced Logic Research (ALR) have their way.

Cheetah's new 25-MHz 80486 tower system comes standard with 4 megabytes of memory, a 60-megabyte hard disk drive, a VGA controller and monochrome VGA monitor, and a 1.2-megabyte 5 1/4-inch floppy disk drive. For this you pay $4995.

ALR's PowerFlex Model 40 begins life as a $1495 12-MHz 80286 system with a 40-megabyte hard disk drive and 1 megabyte of memory standard. With the addition of a $2995 plug-in module, it becomes a $4490 80486-based system, albeit one with a 16-bit data bus.

If these prices don't impress you, check out what similarly configured 25- and 33-MHz 80386 systems cost. You'll find that you could pay several hundred to several thousand dollars more. With the prospect of inexpensive 80486 systems, you could see significant price restructuring in some vendors' product lines—good news indeed for consumers.

Cheetah Gold 33: 
An Economical Powerhouse

Michael E. Nadeau

My first impression of the Cheetah Gold 33 was that it is a well-engineered system that uses top-shelf components. Its designers also added thoughtful extras, such as a detachable wide plastic base and a speed-adjustable cooling fan. In short, it looked like a good $8000 to $10,000 system. Cheetah, however, seems perfectly happy to sell its new 25-MHz 80486 tower computer for $4995.

This is not a "stripper" system. The price includes 4 megabytes of 1-megabyte-by-1-bit-SIMM (single in-line memory module) RAM, a 2-megabyte 5¼-inch TEAC floppy disk drive, a 40-megabyte Mitsubishi hard disk drive and Adaptec controller, a Trutec VGA controller, one serial and one parallel port, and a Samsung monochrome VGA monitor. You wonder how Cheetah can sell the system for so little and make a profit.

Several factors are working in Cheetah's favor. Hardware prices, most notably memory prices, have been going down recently, and Cheetah is keeping its profit margin small. The 80486 itself, with its built-in cache and math coprocessor, is actually cheaper than a 33-MHz 80386 with those options added. (See the text box "AII'R's Other 80486s: the PowerCache 4 Duo" on page 112 for more information about the 80486 versus the 80386.)

Cheap, But No Slouch

The prototype system we saw had a 106-megabyte Imprimis hard disk drive, an optional DPT SmartCache controller with 4.5 megabytes of RAM, a second 1.44-megabyte 3½-inch floppy disk drive, another serial port, a beta version of Video Seven's 1024i VGA adapter, and a Seiko CM-14 VGA monitor (see photo 1). Cheetah prices this configuration at a modest $8495. The DPT controller dramatically improves disk I/O speed and, consequently, its overall application performance. The BYTE disk I/O index was 9.49, the fastest we've seen, but you pay a hefty premium for that speed.

Since the 80486 CPU in the Cheetah was itself a prototype, the BYTE CPU index of 6.52 should be considered tentative (see table 1). That rating is not the continued

fastest—ARL’s PowerCache 4 tower system holds that honor—but it is respectable. The BYTE FPU index of 21.49 is consistent with those of other 80486 systems we’ve tested, and the BYTE video index of 5.57 is very good.

We did not run the BYTE application benchmarks on the Cheetah, but judging from the low-level indexes, we estimate that it would easily beat the current champ, the SIA 386/33, which also used the DPT controller with 4.5 megabytes of RAM. The SIA’s cumulative application index is 32.64.

Cheetah takes advantage of the 80486’s burst mode. The burst mode keeps the 8K-byte on-board cache filled, making memory accesses faster. Cheetah chose the burst-mode route over an external cache; ALR and Apricot have used external caches in their 80486 prototypes and seem to achieve better CPU speed as a result. With 8 megabytes of system RAM, the burst mode allows for zero-wait-state operation. (For more information on the 80486’s burst mode, see “The 80486: A Hardware Perspective,” IBM Special Edition, Fall 1989.)

Lots of Chips
The Cheetah’s entire cover lifts off in cowl-like fashion, revealing all the system components and the tower’s rugged frame (see photo 2). The main system board takes up the bottom half of the unit. The 80486 CPU card, which also holds all the 70-nanosecond SIMM memory—up to 16 megabytes—installs in its own 32-bit slot at the bottom of the system board (see photo 3). Eight more 16-bit slots are available for expansion, although one is for internal use only.

A 250-watt power supply and fan (the only fan in the system) reside in the upper rear corner, behind the six mass storage device bays.

The system board has a high chip count. Cheetah prefers the flexibility of designing its own discrete logic over using ready-made third-party chip sets; this allows for more experimentation while designing the system and for making mid-production changes if necessary. Cheetah also claims that using a third-party chip set would be more expensive.

Cheetah uses the Award BIOS, modified for the 80486 CPU. The BIOS is cached in memory to boost performance. A power-on self test utility in the BIOS feeds a two-character LED readout on the system board; if the system fails, the code on this LED indicates where the problem lies.

The CPU board is actually two boards...
QuickCapture gives you a choice of host platforms.
Now you can keep your options open when it comes to choosing a computer platform for image processing.
Because QuickCapture™ on the PC AT® and PS/2™ is strictly software, file, and function compatible.
Just think, applications developed on one machine can be used instantly without modification on the other.
So, add QuickCapture to your choice of platform and you’ve just added the industry’s most versatile frame grabber for all your scientific and commercial applications.
QuickCapture for the PC AT or PS/2. The likeness is uncanny.

sandwiched together: The GPX-486 CPU board is on one side, and the BMA (for burst-memory array) memory board is on the other. Cheetah engineered the two-board unit to minimize distance between components, providing a small performance gain. This design will become more significant as the clock speed on the 80486 increases.

An important feature of the Cheetah design is its flexibility. Installing a faster CPU or slower memory requires changing a DIP switch—adding a wait state. This allows all the various components to synchronize to the faster clock speed.

Although the Cheetah has eight slots, you have only five free once you've installed the serial/parallel I/O board, the VGA controller, and the hard disk drive controller. But for most applications, five slots will be adequate.

The case itself is a clean, attractive design, but with one potential flaw. The on/off switch is located on an extended portion of the front and is vulnerable to errant legs, feet, or other moving objects. Cheetah said that the switch design is not final and might be changed in the production version.

Power to the Proletariat?
The high end of the Intel-based personal computers have served mainly the most power-hungry users: engineers and architects using CAD, financial analysts, software developers, and so on. But Cheetah has priced its state-of-the-art screamer within reach of small-business users.

Small-business folk generally don't need 80486 power; given the software that they tend to use and their applications, small businesses won't see enough productivity gain to justify buying the top of the line. But once the Cheetah and other low-priced 80486 systems become available, developers might see an opportunity for more powerful software on the low end of the application scale. In short, consumer acceptance of a low-cost high-end system would raise the lowest common denominator for basic computer applications software.

Oddly enough, the low price might be Cheetah's biggest problem. The concept of "perceived value" comes into play; potential customers might think that it isn't as good as Brand X's personal computer because it costs less. Judging from what we've seen, that would be an unfortunate assumption.

The PowerFlex Model 40 is an IBM AT compatible that uses a 12.5-MHz 80286 CPU—hardly big news in a world glutted with AT clones. What’s news is that you can upgrade this inexpensive system to either a 16-MHz 80386SX or a 25-MHz 80486. With prices starting at $1495 and running up to about $4500 for an 80486 system, the PowerFlex is the most versatile system on the market.

The entry-level version of the PowerFlex is a standard small-footprint AT clone (see photo 4). It comes with 1 megabyte of RAM standard, upgradable to 5 megabytes on the motherboard and a maximum of 16 megabytes using memory boards. The Model 40 also has a socket on the motherboard for an 8-MHz 80287 math coprocessor, and it has built-in parallel and serial ports and floppy and hard disk drive controllers.

The system comes with a high-density 3½-inch floppy disk drive and a 40-megabyte, 40-millisecond hard disk drive. The built-in controllers can handle a second drive of each kind—there is space for a total of four. ALR offers optional floppy disk drives (5¼- or 3½-inch) and a 150-megabyte tape backup system.

There are six expansion slots—one 8-bit and five 16-bit. You’ll have to fill one with a video card, leaving five free for additional expansion.

But the PowerFlex also has a slot for plug-in processor cards. For $295 you can get a 16-MHz 80386SX card, which includes a socket for an optional 16-MHz 80387SX math coprocessor (which costs another $300 to $330). Once the 80486 is available in quantity (probably by the end of this year), ALR will also offer a 25-MHz 80486 plug-in card for $2995 (see photo 5). That’s twice the price of the computer itself, but the total cost of about $4500 will still make it one of the least-expensive 80486s on the market. If you decide to upgrade to the 80486 card from an 80386SX card, ALR will buy back the 80386SX card for the full purchase price.

The No-Cache Catch

There is a catch, though: Being an AT clone, the PowerFlex has a standard AT-style 16-bit bus. That doesn’t hurt the machine’s performance with the SX upgrade, of course; the SX was always intended as a 16-bit version of the 80386. The BYTE benchmarks (see table 1) show that with the 80386SX upgrade, the PowerFlex is a reasonable, though not spectacular, performer.

However, the benchmarks also show how the narrow bus bottles up much of the 80486’s power. Compared to the other 80486 computers and upgrade boards we’ve seen, the PowerFlex with an 80486 runs the BYTE CPU benchmarks slower than any other 80486, and barely half as fast as its larger cousin, the PowerCache 4.

There are two reasons for this. First, every memory access through the PowerFlex’s 16-bit bus takes twice as long as through a 32-bit bus. Second, the PowerFlex has no external cache; it depends entirely on the 80486’s 8K-byte internal cache. Although the on-board cache helps performance, we’ve found that 80486 machines with a large external cache simply run faster than those without, especially when working on real-world applications in which all data won’t fit in the 8K-byte on-board cache.

But although it’s the slowest 80486, its CPU index is still higher than those of most 25-MHz 80386 machines. FPU performance, which isn’t significantly affected by cache size, is more than twice as fast as a 25-MHz 80387—and 40 percent faster than the 33-MHz version.

Plug and Play

The PowerFlex CPU upgrades are, for the most part, remarkably simple to install.
The 80486 screamers are beginning to pile up. First, IBM showed its Power Platform upgrade for the Model 70-A21. Then British computer maker Apricot demonstrated an 80486-based machine with prices starting at around $18,000. Now, we've seen Advanced Logic Research's first entries in the sweepstakes, the PowerCache 4 line—a set of speedy number-crunchers that start at $9990.

From the outside, there's nothing but a nameplate to indicate anything unconventional about ALR's PowerCache 4 machines. The PowerCache 4 Model 130 is a small-footprint desktop machine with PS/2 styling; Models 150, 340H, and 650H are larger, tower-style versions (see photo). Inside, all the PowerCache 4 models use a 25-MHz 80486 CPU with a 128K-byte external cache and 2 megabytes of RAM, six Micro Channel architecture expansion slots, and the usual collection of built-in ports and controllers.

The six MCA expansion slots consist of two 32-bit slots and four 16-bit slots. Two of the 16-bit slots are taken up by a VGA video card (640- by 480-pixel graphics in 16 colors) and a disk drive controller card; the rest of the slots are free. On the motherboard are ports for a printer, a mouse, a keyboard, and one serial device (e.g., a modem or a graphics tablet).

ALR's proprietary memory-expansion slot lets you expand the system RAM to 32 megabytes. All versions of the PowerCache 4 come with a 1.44-megabyte 3½-inch floppy disk drive. The Model 130 includes a 130-megabyte SCSI hard disk drive with an 18-millisecond access time and a 32K-byte disk cache. There's room for as many as three removable-media drives, and a total of four bays for floppy and hard disk drives.

The tower versions have room for larger disk drives: a 150-megabyte, 18-ms ESDI drive (Model 150), or a 340- or 650-megabyte, 16-ms drive with a 15-MHz ESDI disk drive controller (Models 340H and 650H). Like the desktop version, these all come with a 32K-byte disk cache. Tower models have a total of five bays for one full-height, two half-height, and two 3½-inch drives. In short, these PowerCache 4 models look like conventional IBM PS/2 clones until you run software and the 80486 CPU starts working its magic.

When the Magic Begins
That magic showed up when we ran the BYTE benchmarks. The PowerCache 4 tower models ran the CPU benchmarks with an index of 7.37, while the desktop version ran with a CPU index of 7.34.

That makes them the fastest PC-compatible computers we've ever clocked—about 10 percent faster than any other 80486-based machine, and 7 percent faster than the previous speed champ, Everex's 33-MHz 80386 machine. As we've seen in the past, the 80486 difference is even more dramatic with floating-point benchmarks. The tower version achieves an index of 21.80 on the FPU tests, while the desktop version has an FPU index of 21.62. That's more than 35 percent faster than any 33-MHz 80387 we've seen.

How does the PowerCache do it? Like the 80486-based Apricot VX FT, the PowerCache gets its speed advantage from a large external cache—something
PSST! WANNA BUY AN 80486 CHEAP?

that, six months ago, neither Intel nor computer makers thought they'd need with the 80486. Here's why: The 80486 has an 8K-byte on-chip cache that, Intel says, can handle 85 percent to 90 percent of normal memory reads.

Software typically accesses memory on an 85/15 basis—that is, 85 percent of memory accesses involve reading the contents of memory, and only 15 percent involve writing to memory. Most memory accesses are reads. But if the 80486's on-chip cache handles most of the reads, the percentages break down differently. Out of every 100 software memory accesses, about 13 will be memory reads, 15 will be memory writes, and the other 72 will be handled by the on-chip cache.

In other words, with the 80486, there are far fewer actual memory accesses, and reads and writes are much more balanced. Intel originally thought that would make an external cache unnecessary, but designers are finding that an external cache can give 80486 performance a significant boost. However, they're also finding that the more balanced read/write ratio changes the rules for designing an efficient cache. ALR's solution is a "write-back" cache that uses a pair of custom cache-controller chips working in parallel and 128K bytes of 25-nanosecond static RAM.

Combining this cache design with the 80486's burst mode, the PowerCache 4 machines are fast enough to outrun everything else we've ever tested.

Just Another Fast Clone?
At $9990 for the desktop version with a 150-megabyte hard disk drive, the PowerCache 4 is more affordable than some 33-MHz 80386 machines, and it offers much better floating-point performance—making it a good choice for many scientific and CAD applications. And the tower versions (with a 150-megabyte hard disk drive for $11,490; with a 340-megabyte drive for $14,490; with a 650-megabyte drive for $16,490) should be good choices as network servers. It's odd to describe one of the first 80486 machines as "just another (extremely) fast 80386 clone," but that's what the PowerCache 4 is: a conventional PC with a very speedy CPU inside.

It looks like ALR's commitment is to putting that speed on (or next to) lots of desktops, and that suits us just fine.

stall, The 80386SX upgrade card is about the size of a short expansion card; the slot that it plugs into is keyed and the card is notched, so it's impossible to put the card in backward. A small plastic support runs through a hole in the card, helping to hold it in place. The prototype 80486 card we saw is similar, though longer—but still much smaller than IBM's Power Platform upgrade.

The CPU cards go in and come out of the computer quickly. With the cover off, it took just seconds to convert from a plain-vanilla AT clone to an 80386SX or an 80486 semi-screamer—with just one exception.

The most complicated part of the upgrade process is installing or removing the 80287 math coprocessor, if that's necessary. The 80287 goes into a DIP socket on the motherboard. Although the socket is not completely inaccessible, the math coprocessor still requires a good eye and a steady hand to install, and a chip-puller to remove—more equipment than the CPU upgrades require. However, ALR recommends removing the 80287 if you're using an 80386SX upgrade card with an 80387SX math coprocessor installed, or with an 80486. (You can also use the 80386SX upgrade without an 80387SX and with an 80287 installed on the motherboard.)

Except for removing the 80287, swapping CPUs took about 10 seconds—less time than it took to change video cards. ALR claims that its CPU upgrades are "plug and play," and we think that's a fair description. You probably won't want to do it every day—but when you need to, it won't take long.

The Ferrari Syndrome
These days, an AT clone isn't considered a high-performance number-cruncher. It's more like the Volkswagen Beetle of desktop computers—cheap and reliable, but not exactly a thrill machine. Adding an 80486 is like dropping a Ferrari engine into that VW—it runs faster, but it'll never be a Ferrari.

On the other hand, the PowerFlex offers the widest upgrade path that's currently available. You can start with an AT clone and—without major surgery on your computer—work your way up to a much more powerful system. The idea—an ambling AT clone that can be upgraded to a rocket-on-a-desktop—may be crazy. But it's the kind of craziness we like to see.

A PC in Your Pocket

The Poqet PC has all the power of an IBM PC—including a full-screen display—yet is as small as a videocassette.

Last August we featured the latest in portable machines from Zenith and Agilis. In fact, the title on the cover of that issue was "Small Wonders." But wonders never cease. Recently, a new start-up company called Poqet Computer introduced a full-fledged equivalent of an IBM PC that is small enough to fit into your coat pocket. Despite its size, the Poqet PC includes 512K bytes of memory, a 7-inch monochrome LCD screen, and a power supply reportedly capable of powering the system for about 100 hours.

The Poqet PC's power supply is one of the most interesting parts of the system. It consists of just two ordinary AA alkaline batteries. The 100-hour battery life translates into an average power consumption of only about 60 milliwatts—a truly remarkable accomplishment, considering that the Poqet PC powers a considerable amount of memory and a fairly high-resolution LCD display.

According to Poqet's vice president of engineering, John Fairbanks, who came to Poqet from Texas Instruments' calculator design group, the major breakthrough in the design of the Poqet PC was an order-of-magnitude (10 to 1) reduction in the amount of power required to drive the display, as compared to other laptop computers (about 10 mW versus the 100 or more mW required in other laptop designs). Poqet is in the process of applying for patents on its power management design and declined to disclose to us the technical details behind the design of the display power driver.

In appearance, the Poqet PC has the basic clamshell design used by most laptop systems (see photo 1). The machine folds up to about the size of a VHS tape cartridge (see photo 2). Its dimensions when folded are 0.925 by 8.75 by 4.3 inches. The price tag for the 1-pound system is about $2000.

The nonbacklit monochrome display measures 6.8 by 2.7 inches and has a fairly flat aspect ratio. It supports 90 columns by 25 rows with 640 by 200-pixel resolution in both CGA and MDA modes.

The machine has a 77-key keyboard with 12 function keys. The keyboard includes an embedded numeric keypad, which is accessed via a special "Poqet" function key. The keys are about one-half inch square and have a springy tactile response.

Inside is an Intel 80C88 microprocessor running at a clock speed of 7 MHz (40 percent faster than that of the original IBM PC). The BIOS and processor-support chip sets were custom-designed by...
Poqet. The Poqet PC uses credit-card-size memory cards as its storage medium and comes with 640K bytes of ROM and 512K bytes of RAM. The ROM is one of the key features of the Poqet PC, because it includes MS-DOS 3.3, GWBASIC, and a set of simple software applications developed in-house by Poqet.

These ROM-resident applications include a calculator, a simple text editor, a scheduler with calendar and alarm functions, a communications program for accessing data by modem, an address book, and a file manager and file transfer program. Because this software is all in ROM, it runs at the speed of the memory bus (there is no performance loss due to disk access). You can access the built-in applications via a hot-key sequence, which activates a pop-up menu.

Memory cards are the primary storage medium for the machine. The machine has two slots for sliding in cards, providing the equivalent of two floppy disk drives, with memory capacities ranging from 32K to 512K bytes. The memory cards come in two versions—RAM cards for storing data, and ROM cards for running software applications.

An important feature of the system is that software applications supplied on ROM cards will execute directly from the ROM cards. Conventional PCs load the applications from disk into RAM, but the Poqet PC leaves most of its 512K bytes of RAM available for data storage.

There are a couple of problems with these memory cards, however. The biggest problem is the price. The RAM cards cost about $1 per 1000 bytes of storage capacity, making a 512K-byte card cost over $500 (lower-capacity cards actually cost closer to $1.50 per 1000 bytes). Software applications written for Poqet's ROM cards will also be expensive. ROM cards will be sold to software developers in volume for about $80 apiece. According to Bob Gerwer, Poqet's vice president of sales, ROM-executable applications will cost about 15 percent more than their floppy disk equivalents.

Another hitch is that software developers must rewrite their applications to run on the ROM cards. Although you will be able to run standard DOS applications off RAM cards, which load the code into the Poqet PC's RAM, you won't get the performance and memory-saving benefits of ROM-executable software.

However, Poqet's chief software engineer, Ian Cullimore, told me that third-party software vendors are enthusiastic about porting their applications to the Poqet PC. He also said that applications written with "modern C compilers" or in assembly language are easy to port, requiring "basically a reccompilation." An inside source at Lotus Development confirmed that Lotus "has been working very closely with Poqet." One advantage to ROM-card applications from the point of view of software developers is that they are automatically copy-protected (you can't run a program that has been copied from ROM into regular memory).

The Poqet PC includes an 80-pin XT-bus card connector and comes with a special cable for connecting the connector to another PC or peripheral. The bus connector can attain RS-232C serial communications at up to 19,200 bits per second. The special cable has a Y connector at one end, with both DB-9 and DB-25 serial port connectors.

The Poqet PC's $2000 price includes the 640K bytes of ROM, the 512K bytes of RAM, the special bus and peripheral connector cable, and the built-in DOS, GWBASIC, and ROM-resident desktop applications. For an additional $395, Poqet is offering an external, battery-powered 1.44-megabyte 3½-inch floppy disk drive, with a battery life of about 20 hours.

Poqet is working on a memory-card reader that will plug into PC compatibles so that data can be copied directly onto the memory card from the host machine. The memory-card reader was scheduled to be available shortly after the Poqet PC began shipping in September and will cost a "few hundred dollars," according to Bob Gerwer.

The Poqet's memory is powered all the time to conserve data. Much of the system, however, stays in "sleep mode." According to Poqet, its special BIOS puts most of the system to sleep between keystrokes. The screen stays powered and the user doesn't notice anything unusual, but the CPU is put to rest until the next key is pressed. The only really active circuit is the keyboard scanner. After 2 minutes of inactivity, the display is...
powered down as well. A red key labeled "I/O" powers up the microprocessor and display when you want to use the computer again.

The screen has a set of visual indicators at the bottom, which include a low-battery warning indicator, as well as memory-card access, alarm clock, and function-key indicators. The system also includes a capacitor that keeps the system powered up for about 5 or 10 minutes while you change batteries. The memory cards have their own lithium backup batteries, which have a life expectancy of one to two years.

I had a chance to work with a prototype version of the Poqet PC. The screen on the unit that I tried was readable but suffered from lack of contrast. This should be improved on the final production unit by a tighter-fitting screen overlay. The keyboard was remarkably easy to use considering the size of the machine. Not all the built-in ROM applications were working in the unit that I tried, but a version of Lotus 1-2-3 ran normally. (In the near future, BYTE will follow up this article with a full review of a production version of the system.)

This machine has enormous potential for business travelers and others needing computing power on the road, in the field, or in the classroom. Basically, the Poqet PC brings the power and capabilities of a personal computer into the realm of pocket calculators. Indeed, the design of the Poqet PC is the result of a joint design effort involving specialists in consumer electronics, semiconductor packaging, and computer systems design.

Having worked with only a prototype, I find it difficult to pass judgment on the Poqet PC's reliability and performance. The high cost of memory cards, the machine's primary storage medium, is certainly a drawback. But this machine breaks new ground in portability and power consumption. And, as volume increases, memory-card prices will drop.

The Poqet PC could be a smashing success. This is, after all, a consumer electronics product. As with other breakthrough products, however, the keys to success are the degree of consumer acceptance and the time it takes to gain that acceptance. Although $2000 seems a fair price for the Poqet PC, it may not be cheap enough to attract large sales volumes. But we wish Poqet the best of luck. The Poqet PC is certainly the result of some brilliant engineering.

The quest for on-line reference materials is never smooth

Long ago, I reviewed a CP/M database program called Vulcan that caused me to invent the rating "infuriatingly excellent"; meaning that the program did something I very much wanted done, but I had to fight it every step of the way. The algorithms were far better than the user interface. Incidentally, that was the first review of the program that became dBASE II. George Tate once told me he bought Vulcan (and renamed it) as a result of my review.

This month I have another program I can only call infuriatingly excellent. I don't expect it to become another dBASE II, but showing why it's infuriating may prove to be a good object lesson for program designers.

Dictionary on a Disk
It started in Boston at the National Education and Computers Conference. There wasn't much good educational software. With few exceptions, what we saw either wasn't impressive for its educational value or wasn't well designed as software. I'm not sure why.

One thing that did impress me was a dictionary program. It ran on a hard disk, rather than a CD-ROM, and thus needed a lot of hard disk space; on the other hand, it was very fast. Better yet, it had a whole raft of dictionaries, including Funk & Wagnall's Standard Desk Dictionary, with all the auxiliary stuff (e.g., the Secretary's Handbook); a 26-language dictionary; and the McGraw-Hill science dictionaries, including computers, physics, chemistry, biology, and various engineering disciplines. All this information takes up disk space, but since I have a Priam 330-megabyte hard disk drive, I have disk space.

I didn't have time to spend looking at the demonstration, but that hardly mattered, because, as I explained to them, I don't write about stuff I don't have running at Chaos Manor. They collected my card, and I went on to the next booth.

A few weeks later there arrived a dozen boxes: one for each of the dictionaries. Each proclaimed itself part of the Induction Reference Series, and the back cover each had in boldface type the sentence, "So easy to use, you don't have to refer to the manual." All I need, says on the box, is 5 megabytes of disk storage, 256K bytes of RAM, and DOS 2.0 or higher. Wonderful.

It wasn't clear whether the various special dictionaries worked alone or were add-ons to one of the main dictionary programs, but that didn't seem important. (It turns out they will work together, but each is a separate stand-alone product.) I knew where to start: I opened the Funk & Wagnall's box. Inside was a reasonably thick manual. There were also 16 5¼-inch floppy disks, which wasn't too surprising—the box did say I needed 5 megabytes of disk space—but it was a bit intimidating.

A quick look through the manual made one thing clear: they'd better be right when they claim you don't need the manual to work the programs. The first 15 pages or so are in legalese and proved to be the license agreement, one so long that I doubt anyone but me has ever read it. Underneath all the jargon, it's pretty reasonable. After pages of legalisms, there were two pages about the theory of knowledge acquisition. The manual insists on explaining inductive and deductive reasoning before it tells bow to use the program. It doesn't explain why I would want to know this stuff. If the purpose was to discourage me from reading the manual, it nearly accomplished that.

Finally, way back in the manual were the installation instructions: take the first of the 16 floppy disks, put it in drive A, log onto that, and type Install. The program would do the rest.

Install produces a couple of screens of inquiries about colors and then gets down to business. What hard disk drive do you want this installed on? I told it drive D. What floppy disk will you install it from? Since Big Cheetah has only one 5¼-inch drive, that had to be A. Then Install displays a screen with four choices: standard-density 5¼, high-density 5¼, standard-density 3½, or high-density 3½. You choose one. Looking into the manual yields this advice: "Use the cursor key to highlight the desired entry, then hit the Enter key to select it."

Well, all right, Big Cheetah has a high-density 5¼-inch drive, so that's what I selected.

The Install program trundled for a while, in the process displaying the message, "Consult the license agreement in your user's manual to be sure you are not violating it." I thought that a rather unfriendly thing to say, but what the heck. After a while, it told me to insert disk 2. Then disk 3. Then disk 4. When it finished disk 4, it dropped me out of the Install program and into the new D:\KAS (Knowledge Acquisition System) directory it had created. No error message. No "finished" message. There I was, with 12 disks left over.

Try again. You have to start all over, of course. The Install program is not a batch file, so you can't even get inside and inspect it. Just start over.

That worked no better than the first time.

Well, I thought, maybe it knows something I don't. Might as well install the physics dictionary. It's only six disks.

The physics dictionary package had a manual identical to the one in the Funk & Wagnall's package. Obviously the instructions for installing it were also the same: insert disk 1, log onto it, and type install.

It asked the same questions. This time the
it wanted only two of the six disks before it dropped me out of the program and back to DOS. Curiouser and curiouser.

It was time to try the program.

Lockup Time
I thought I'd see what definition the physics dictionary had for the word *force*. First I had to figure out how to ask. The KAS program interface is strange. It uses terms I don't understand and isn't well explained in the manual. There are no error messages. I did what I thought was appropriate—and locked up the machine. Thoroughly. No way out but reset. Hardware reset.

I tried again. Same thing. No error messages. Just no results, and the machine hangs.

I got out the manual and tried following its instructions. Unfortunately, the example in the manual is for the 26-lane machine hangs. Like installing that, so I had to infer what its instructions. Unfortunately, the language dictionary, and I didn't much feel it wanted only two of the six disks before it dropped me out of the program and back to DOS. Curiouser and curiouser.

Could They Have Meant...
I was ready to put the program away when an idea struck me. Suppose—just suppose—when the Install program asked me about floppy disks, it didn’t want me to describe my drive at all? Suppose it was asking what kind of disk I was using to install the dictionaries? Suppose it had no way of knowing that I hadn’t loaded the entire 16 disks’ worth? . . .

"Naah," I thought. No one would be that stupid. But just in case, I got out the physics dictionary and went through the tedious Install program again. This time I told it I was installing from standard-density 5¼-inch floppy disks.

Voila! This time it wanted all six disks. Quickly I reinstalled the chemistry and computer science programs, noting that each time it copied the access program and then what it called "the decompression code" before copying the database.

When I tested the program, the machine hung again.

Well, I thought, there is that partial Funk & Wagnall’s dictionary on there; best to reinstall that, although the prospect of feeding the machine 16 floppy disks wasn’t very appealing. Still, it had to be done, so have at it.

I got out the box, put disk 1 into drive A, and began the imbecile Install program. It went along for five disks, flashed an error message about being unable to open a data file, and dropped me back into DOS. Now what?

Try Again
The Inductel manual says installation might fail for one of several reasons. First, you might not have enough memory. That wasn’t a problem. Second, not enough disk space. That wasn’t a problem either. Third, "the computer’s disk head is out of alignment." I have never had any problem with my high-density drive reading a standard 360K-byte floppy disk. You can get into difficulties trying to write to a 360K-byte disk with a 1.2-megabyte floppy disk drive, but reading always worked before.

Finally, the manual states that if all else fails, "then chances are you have a marginal or faulty disk in your software package." You can return it and get an exchange. The only problem is, this...
When You're Buying A Personal Computer, Make Sure You Know What's Built In And What's Left Out.

Circle 34 on Reader Service Card (DEALERS: 35)
column is due Monday morning and it's Saturday night.

I have a 360K-byte floppy disk drive on my Zenith Z-386. Moreover, I've got a WORM (write once, read many times) drive on both the Z-386 and Big Cheetah; I figured that if I got it all installed on the Z-386, I could make a safety copy onto the Maximum Storage WORM and then bring that WORM cartridge over to Big Cheetah and transfer the files.

It took about an hour to install all those dictionaries on the Z-386. I had a mild moment of panic: after going through the 16 disks of Funk & Wagnall's dictionary, the program very briefly flashed an error message and dropped into DOS. Of course, it also erased the error message, so I didn't know what it was; and I wasn't interested in feeding 16 floppy disks in yet one more time. This was getting as tedious as trying to install Microsoft Windows.

Fortunately, the program seemed to work. I decided this was just another imbecility of the Install program: it detects some kind of error to tell it that it's done with its job. Why not? I got out the other boxes of dictionaries. Eventually they were all installed. By then, it was 5:00 a.m. I'd used up hours installing the thing. Now to test the program.

Look It Up

It works surprisingly well. Once you tell it what you want it to do, the program is very fast. The problem is telling it what to do: it has as awkward a user interface as I have ever seen. Inductel's KAS manages to make the Oxford English Dictionary on CD-ROM (see my October column) look positively user-friendly.

What you must do is use the arrow keys (there's no mouse capability) to move among menus until you select a mode of operation. Then you go down into another part of the screen to select which dictionary you want to consult. Then you input the word you want looked up. That can also be a complex job using arrow keys, but fortunately you can shorten it: you type in the word with wild-card characters, get a list of terms it understands, and use the arrow keys to select the term; or, you can just type in the term yourself.

Once that's done, the answer is almost instantaneous. This thing is fast.

There's also a TSR mode: load the KAS as a TSR program and then go into your favorite word processor, put the cursor on a word, and press Alt-M. You will find yourself in the KAS command system. Now select a dictionary and input your word; or, possibly, it will already have a dictionary selected. That may be the wrong one, but as long as you're in the KAS command system, you can change the "active" dictionary to another. This is important because some terms will have quite different definitions depending on whether you are looking them up in the physics, biology, Funk & Wagnall's, or 26-language dictionary.

This all works very rapidly and very well on the Z-386.

Blowups Happen

By now I was almost ready to forgive Inductel for their imbecile Install program. I have paper copies of many of those science dictionaries, and I use them; this looked very useful. Moreover, I sometimes have a need to look up foreign words, and the foreign-language dictionary aspect of this thing is neat:

Introducing
The AST Premium 386SX/16.

When we designed the AST Premium 386SX/16, we had our sights set on building the best 386SX-based computer you could find.

Why? Because with faster processing and the ability to run 32-bit software, at a cost that's comparable to 80286 computers, 80386SX computers will quickly become the workhorses of the business computing world.

And that's what the AST Premium 386SX/16 is, a workhorse of the highest standards. To begin with, we've built in a high-speed memory cache, making this SX computer one of the fastest you can buy. Then, we added VGA graphics and support for EMS 4.0.

We also built in a future. The Premium 386SX/16 features AST's Cupid-32 architecture. So, when your needs grow, your computer can grow with you. From 25 or 33 MHz 80386SX computing, all the way to i486 processing power, with a single board swap. You don't have to buy a new computer, or lose your investment in peripherals.

So, if you're considering an 80286- or 80386SX-based computer from a manufacturer like Compaq or IBM, make sure you compare it to the AST Premium 386SX/16. After all, if your needs require a workhorse, shouldn't you buy a thoroughbred?
when you look up a word in, say, French, it gives you the translation to not only English, but Spanish, Finnish, Esperanto, Greek, and 20 other languages simultaneously! I was actually enthusiastic as I saved this huge subdirectory off onto the WORM cartridge.

It took quite a while—there are over 14 megabytes of dictionary files—but eventually it was done. I put the cartridge into Big Cheetah's WORM drive and copied the whole mess into the D:\KAS subdirectory.

The program didn't work. It said it couldn't find any database files. None. Zero. I mean, there they were, 14 megabytes' worth of them, but the program couldn't find any. Some kind of "copy protection"?

Nothing for it, then: back to Install. I selected the computer science dictionary, since it was the smallest. Put disk 1 into drive A. Answer the dumb questions. Swap disks. Get done with it, and test the program.

It worked. Try it in a DESQview window. It worked there, too. Now try it in TSR mode.

The machine hung. Time to reset.

For the next hour, I tried to get the program to work in TSR mode on Big Cheetah. I tried with and without DESQview. I tried doing things to the CONFIG.SYS file. I tried everything I could think of, each time having to fight the dumbest Install program in the free world. Then I'd try TSR mode, and the machine would hang. Finally, in desperation, I decided to reinstall the original Funk & Wagnall's dictionary, all 16 disks of it. This time I was able to get it to read them all, so the job was merely tedious.

With every disk swap came the message, "Consult the license agreement in your user's manual to be sure you are not violating it." The problem was, by then, I wanted to violate the license agreement. Then I wanted to find and beat senseless the person who invented that horrible Install program.

So...

The bottom line is this: the program works wonderfully on the Z-386. It works in direct command mode on Big Cheetah, including within a DESQview window; but for some reason, it will not work in TSR mode on Big Cheetah, with or without DESQview. Perhaps Big Cheetah is too fast for the program. Perhaps QEMM is interfering with it. Perhaps I haven't properly installed something. Perhaps any number of things; but frankly I am too weary of fighting that moronic Install program to care.

If you want a very large and incredibly fast set of on-line dictionaries, this program will do the job. The user interface is horrible, and the Install program is worse; it might not work in TSR mode on your machine.

But once you do have it up and running, it's little short of amazing. If they'd put the work into user convenience that they did in developing those access algorithms, they'd have a wonderful program. As I said earlier, infuriatingly excellent.

Bribes

The most interesting bribe I've received recently was a package containing a split of champagne, a package of pumpernickel, a jar of pâté de foie gras, cookies, and a CD-ROM of over 7000 public domain, freeware, and shareware programs, every one of them tested by the Chicago RBBS-PC. Quanta Press sells
The Best 386/33 Available.

The fastest class of 386™ computers runs at 33 MHz. But at the head of this high-performance class of machines is the AST Premium® 386/33.

In a recent InfoWorld magazine report card, the AST Premium 386/33 overwhelmed a selection of 33 MHz computers from vendors like Compaq®.

We weren't surprised. After all, the AST Premium 386/33 offers exceptional performance in a feature-packed, stylish chassis. Features like: zero wait-state cache, support for up to 36 MB of memory, support for 80387 and Weitek 3167 coprocessors and much more.

It's too bad that InfoWorld doesn't have a category for upgradeability. With a natural upgrade path to 486™ power using AST's Cupid-32™ architecture, the AST Premium 386/33 would be sure to earn even higher marks.

That's because Cupid-32 is AST's enhancement to the Industry Standard Architecture (ISA) that allows you to upgrade to new technology without buying a new computer.

So, if your company is looking for a 33 MHz computer, why not take a lesson from InfoWorld. Go straight to the head of the class.

this for $149 and “guarantees” the disk to be “virus free,” although what such a guarantee means I don’t know.

In any event, the Quanta Press RBBSPC in a Box CD-ROM certainly contains the shareware of the month: word processors, games, communications stuff (including programs to let you run your own BBS), databases—you name it, it’s all in there. I’ve had more fun digging through the programs on the disk than I did eating the cookies.

Disk Drive Blues
Back in CP/M days, we were plagued by an enormous variety of floppy disk formats. Not only were there 5½- and 8-inch drives, but each hardware vendor had its own proprietary data format and density. Then came IBM, and whatever else you could say about the PC, at least there was some standardization of the disk formats.

Now it’s a mess again: we have double- and high-density 5¼-inch formats, and ditto for 3½-inch. There are even a few oddball variations, like the Twister format for Atari 3½-inch disks, a trick that will get a bit more on each disk, although at the cost of being unreadable to those who don’t have the tricky little program.

The worst mess is in the 5¼-inch size: as I noted above, while a high-density (AT-style, 1.2 megabytes per disk) drive can read double-density floppy disks (PC and XT style, 360K bytes per disk), when you use a high-density drive to write to a 360K-byte disk, the results are unreliable. It works, in that the file is written in 360K-byte format and often can be read by the machine that wrote it; but transferability to any other machine, high- or double-density, is something else again.

The situation is similar but not quite so bad with 3½-inch disks; and there’s the problem of transferring files from 5½- to 3½-inch disks and vice versa.

One remedy is to put several floppy disk drives in the same machine. The problem with this is that while most disk drive controllers will handle all the different formats, some won’t talk to more than two drives in the same machine. As a result, Chaos Manor has several machines with various types of 5½- and 3½-inch drives, but no single machine has every type of floppy disk drive.

Thus, we can manage, but it’s awkward. However, help is at hand: I just received the Northgate Universal Floppy Drive Controller (NUFDC). This board takes a separate slot from your hard disk drive controller; but once it has done that, it will run as many as four different floppy disk drives, and each one can be different; thus, we could have a machine with one of each of the four kinds of drives if we wanted to, and I may just do that. Connect that machine to the others with a network, and it won’t matter what format I’ve got to read or write to.

The NUFDC is also capable of handling 8-inch floppy disk drives formatted as 1.2 megabytes; that takes a special cable, and I have not set that up yet, but I’ve no reason to assume it won’t work. The manual doesn’t say whether this will read or write to a 360K-byte disk, the results are unreliable.

I guess I don’t care: when I really need an 8-inch disk read, or for that matter need files off an old CP/M machine with various types of 5½- and 3½-inch drives, but no single machine has every type of floppy disk drive.

Thus, we can manage, but it’s awkward. However, help is at hand: I just received the Northgate Universal Floppy Drive Controller (NUFDC). This board takes a separate slot from your hard disk drive controller; but once it has done that, it will run as many as four different floppy disk drives, and each one can be different; thus, we could have a machine with one of each of the four kinds of drives if we wanted to, and I may just do that. Connect that machine to the others with a network, and it won’t matter what format I’ve got to read or write to.

The NUFDC is also capable of handling 8-inch floppy disk drives formatted as 1.2 megabytes; that takes a special cable, and I have not set that up yet, but I’ve no reason to assume it won’t work. The manual doesn’t say whether this will read the old “standard” single-sided single-density 128K-byte 8-inch disks some of us started with. I guess I don’t care: when I really need an 8-inch disk read, or for that matter need files off an old CP/M machine with various types of 5½- and 3½-inch drives, but no single machine has every type of floppy disk drive.

Computers That Grow With You.

Until now, advances in PC technology have left you with a single, all important decision. Move up and benefit from increased performance. Or, stay put and try to capitalize on the investments you've already made.

AST is announcing the end to this difficult decision. Our Cupid-32™ architecture allows you to upgrade your computer as your needs grow. All the way to i486™ technology.

That's right. Our Premium 386SX/16 and Premium 386 (33 and 25 MHz) computers incorporate a natural upgrade path. A path that doesn't force you to sacrifice your investment in already-owned systems and peripherals.

With Cupid-32, you can add the performance you need to add more users to a multi-user system. Add more nodes to a network file server. Or, add more power to a standalone situation, like CAD/CAM. All it takes is a simple, single board swap with one of our FASTboards®, when you are ready for more power.

So, in place of the difficult decision, we have a simple one for you. Why buy a computer from anyone else, when you can own an AST Premium Computer? After all, they're the only computers that grow with you.

For more information call 1-800-876-4AST. Or, use our Bulletin Board Service Number (714) 852-1872.

The Power Of Choice.
DESQview 2.2 and DESQview 386. The multitasking, windowing environments that work with your favorite software.

DESQview is the operating environment that brings OS/2 power to DOS. And it lets you, with your trusty 8088, 8086, 80286, or 80386 PC, leap into the next generation in PC productivity. For not much money. And without throwing away your favorite software.

Introducing DESQview 2.2
And now, DESQview 2.2 adds capabilities, performance, and compatibility enhancements you've been asking for:
Like being able to fine tune DESQview performance "on the fly," Run Lotus Express and Metro, and the Intel Connection CoProcessor. Even use the DOS 4.0 shell with DESQview. Have DESQview automatically install Quattro, Sprint, Aldus PageMaker, Microsoft Excel, Word Perfect, Database and as many as 80 other programs. And using the DESQview API, be able to dynamically link them.

More bang: less bytes
While other programs get bigger, we've worked to make DESQview smaller. And we've succeeded in a big way on PCs and PS/2's with extended, EMS 3.2 (AboveBoard), EEMS and EMS 4.0 memory—as well as on 386 PCs and PS/2s. For example, DESQview overhead on EMS 4.0 and 386 PCs can be as low as 10K on EGA/VGA PCs. And DESQview actually increases memory 30K on CGA PCs, 20K on monochrome and Hercules PCs. That's good news for users of big desktop publishing, CAD and database programs.

Introducing DESQview 386
For users of 80386 PCs and PS/2's (or PCs with 80386 add-in boards, such as the Intel Inboard 386), there's DESQview 386 (a combination of DESQview 2.2 and the new QEMM-386 Quarterdeck Expanded Memory Manager, version 4.2).

DESQview 386 gives you extraordinary power. Run text, CGA, EGA, VGA, and Hercules programs in windows and in the background. Run 32-bit 386 programs, like Paradox 386, and IBM Interleaf simultaneously with your favorite DOS programs. All with the speed and performance you expect out of your 386. And with protection against "misbehaved" programs.

Promise and performance
And, of course, both DESQviews have all the features that made prior versions the popular choice in operating environments. The ability to multitask in full screen. Transfer data. Access DOS via menus. Dial your phone. And create keystroke macros within and between programs.

Our story gets better and better
If there's any doubt about our commitment to your PC and PS/2 productivity, just look at our accomplishments over the years. We think you will understand why GE, Ford, Aetna, Monsanto, and so many other major corporations use DESQview.

And why PC Magazine twice gave DESQview its Editor's Choice Award for "The Best Alternative to OS/2," why readers of InfoWorld voted DESQview "Product of the Year" three times. Why, by popular vote at Comdex Fall for two years in a row, DESQview was chosen "Best PC Environment" in PC Tech Journal's Systems Builder Contest, and just won their "Professional Solutions" Award.

DESQview lets you have it all now.
Your 80386 PC, IBM Personal System/2 Model 80, PC or AT with 80386 add-in board, as well as your IBM Personal System/2 Models 50 or 60 can all break through the DOS 640K barrier. Now you can have maximum use of your memory—whether you have one megabyte or 32—with the Quarterdeck Expanded Memory Manager. All without having to purchase special expanded memory boards.

QEMM uses hidden features within your existing memory to make it compatible with the Lotus-Intel-Microsoft Expanded Memory Specification (EMS) version 4.0.

Now you can run colossal spreadsheets, databases, and CAD models designed for expanded memory, using Lotus 1-2-3, Symphony, Framework, Paradox, AutoCAD, Excel and more.

And if you'd like to use these programs all together—multitasking beyond 640K—QEMM works with our popular DESQview multitasking environment.

If you are one of the 12 million or so 8088, 8086 or 80286 PC users who feel left out, don't despair. We have options that let you keep your computer and favorite programs and give you today what the newest PCs and operating systems are promising for the future.

Visit your dealer for more information on barrier-breaking Quarterdeck products.

API Reference Manual
The key to the power of the DESQview API, our Reference Manual contains all you need to know to write Assembly Language programs that take full advantage of DESQview's capabilities. And there's an 'include' file with symbols and macros to aid you in development.

API C Library
Here are C language interfaces for the entire set of API functions. It supports the Lattice™ C, Metaware™ C, Microsoft® C, and Turbo C compilers for all memory models. Included with the C Library package is the API Reference Manual and source code for the library.

API Pascal Library
The Pascal library provides interfaces for the entire set of API functions. It supports Turbo Pascal V4.0 and V5.0 compilers. Included are the API Reference Manual, source code for the library, and example programs.

API Debugger
The DESQview API Debugger is an interactive tool enabling the API programmer to trace and single step through API calls from several concurrently running DESQview-specific programs. Trace information is reported symbolically along with the program counter, registers, and stack at the time of the call. Trace conditions can be specified so that only calls of interest are reported.

API Panel Designer
This interactive tool helps you design windows, menus, help screens, error messages, and forms. It includes an editor that lets you construct an image of your panel using simple commands to enter, edit, copy, and move text, as well as draw lines and boxes. You can then define the characteristics of the window that will contain the panel, such as its position, size, and title. Finally, you can specify the locations and types of fields in the panel.

The Panel Designer automatically generates all the DESQview API data streams necessary to display and take input from your panel. These data streams may be grouped into panel libraries and stored on disk or as part of your program.

More Tools are Coming
Quarterdeck is committed to adding tools as needed by our users. To that end we have been working with Ashton Tate and Buzzwords International on dBASE III and dBASEIV translators. And in the works, we have BASIC and DOS Extender libraries.
problems, Northgate has the answer.

Keyboards
The latest shipment from Northgate also included a big box of keyboards.

I have said for years that the best key layout ever invented was on the old IBM Selectric typewriter. Unfortunately, no one made a proper PC keyboard with that layout. First, IBM had their peculiarly dumb design, with extra keys between the Z and Shift keys, but with the function keys grouped on the left side. Then they changed to a keyboard with a reasonably standard layout, but the function keys were across the top, where you couldn’t get at them easily. Then they changed to something else.

Somewhere along the line it got frozen into concrete that the Backspace key is way up in the upper right, where you cannot reach it from the home keys; while the bracket and brace keys were put just above the Return key, where they are in the way if you go after Backspace. There were various other tomfool “innovations,” all caused by the fact that IBM engineers are not touch-typists. And IBM being the kind of company it is, no one ever bothered to ask the customers what they wanted. Meanwhile, other companies followed IBM’s lead.

The result is a series of miserable keyboards all designed to make extra work. Every one of them, for example, has the less-than and greater-than keys as Shift-comma and Shift-period, which has the effect that when you’re writing, you end up with “>S>A<” instead of U.S.A., and stuff like that; and when you go to...
THE NEW STANDARD FOR HIGH PERFORMANCE STATISTICAL SOFTWARE

CSS

COMPLETE STATISTICAL SYSTEM
WITH DATA BASE MANAGEMENT
AND GRAPHICS

A powerful, comprehensive, elegant, and super-fast statistical package for IBM (PC, AT, PS/2) and compatible computers. The CSS optimized user interface with fast hierarchical menus incorporates elements of artificial intelligence; even complex analyses require only a few keystrokes (batch processing is also supported). CSS features comprehensive, state-of-the-art implementations of:

- Basic statistics
- Multi-way frequency tables
- Nonparametric statistics
- Exploratory data analysis with analytic graphs
- Multiple regression methods
- Time series analysis with modeling and forecasting (incl. full ARIMA)
- General ANOVA/AICOWA/MANOVA
- Contrast analysis
- Discriminant function analysis
- Factor analysis
- Principal components
- Multidimensional scaling
- Item analysis/Reliability
- Log-linear analysis
- Cluster analysis
- Multidimensional scaling
- Item analysis/Reliability
- Log-linear analysis
- Canonical analysis
- Survival and Failure Time analysis (Censored data)
- Quality Control analysis
- and much more.

All statistical procedures are integrated with fast database management and instant, presentation quality graphics (over 100 types); full support for all mono and color graphics boards (incl. VGA) and over 100 plotters and printers (incl. the HP and Postscript standards). All CSS screen output is displayed via customized Scrollsheets™ (i.e., dynamic, user-controlled, multi-layered tables with cells expandable into pop-up windows); all numbers in a Scrollsheet™ can be instantly converted into a variety of presentation quality graphs; contents of different Scrollsheets™ can be instantly aggregated, combined, compared, plotted, printed, or saved. The flexibility of the CSS input/output is practically unlimited: CSS offers an intelligent interface (read/write) to all common file formats (Lotus, Symphony, dBII, dBIII+, DIF, SYLK, ...) and special utilities to easily access data from incompatible programs; graphics can be saved in files compatible with desktop publishing programs (Aldus, Ventura). CSS data files can be as large as your operating system (DOS) allows; OS/2 version coming soon. CSS precision exceeds the standards of all common precision benchmarks.

Technical note: The CSS user interface and all I/O were written in Assembler and Unix, graphics and data management were written in Assembler and C; the computational algorithms were written in Assembler and optimized Fortran. $495 (plus $5 sh/h); 14-day money back guarantee.

backspace, you get ]]]) and once again have to go back and fix that. This breaks one's train of thought and makes small computers a bit less useful for creative writers than they otherwise would be.

Various companies have worked on this problem. DataDesk International makes very good after-market keyboards that many users like a lot, and which I used to swear by; but the keys didn't have the positive feel that the old Selectric did, nor was the layout the Selectric's.

Finally, Art Lazere of Northgate Systems designed a keyboard just for me. The function keys are grouped on the left side. The Control key is to the left of the A key, where God intended it to be. The Escape key is in the upper left, where it was on the old terminals we all started with. The keys have a wonderful positive click to them. There's a separate arrow-key cluster and a numeric keypad.

Best of all, the Backspace key is oversized and just above Return, so I reach it handily with my fingers on the home keys; and the bracket and brace keys are in the upper right, where I can get at them if I want them, but aren't in the way. There's an asterisk key next to the reverse backslash and vertical rule key; and while less than and greater than remain shifted comma and period, Lazere commissioned a 20-byte TSR program called POURVOUS.COM that fixes that (I do Alt-Shift-comma and -period to get less than and greater than). The result is the perfect keyboard—for me.

Apparently I am the only one who thinks so; Northgate hasn't sold many of the "Pournelle" layout keyboards. They sell a lot of their standard ones, which I have to say, would be my favorites if I didn't have the "Pournelle" layout. Anyway, it works out well for me: because almost no one bought the keyboards configured the way I like them, there were a number of them in the Northgate warehouse; and I now have five of them, which you can pry away from my cold dead fingers.

The Gadget War
In The Mote in God's Eye (Larry Niven and Jerry Pournelle, Pocket Books, 1974; now in the thirty-sixth printing, he said preening), the characters all carry pocket computers that have a great deal of on-board capability and also link by radio to the rest of the world. These gadgets keep track of schedules, record conversations, and generally do the kind of management that makes life simpler.

Our book takes place in the far future; the fictional supercomputers have few limits on their performance. Back in reality, we ought to have about half that capability before the end of the century. Today, reasonably useful pocket computers are available, with more coming all the time; and thanks to Traveling Software, you can link them to your PC, meaning to the rest of the world.

The two leading pocket computers at the moment are Sharp's Wizard Electronic Organizer and Casio's BOSS (Business Organizer Scheduling System). Both are intriguing, although neither is what I'd like it to be; indeed, what I really wish is that I could combine features of the two.

Sharp's Wizard has the neat capability of accepting program cards, which lets third-party developers add features to the Wizard. It's slightly larger than the BOSS, and it makes good use of the extra space: there's a numeric keypad, and the function keys are very well labeled. On the other hand, the Wizard has a serious flaw: the alphabetic keys are laid out in ABCDEF fashion, so that people used to a typewriter find it difficult to make entries on it.

Casio's BOSS, by contrast, has a QWERTY keyboard; but alas, there is no separate numeric keypad, and I find it extremely difficult to use as a simple calculator. The Wizard is very easy to use as a calculator. The BOSS's screen is a bit larger than the Wizard's, but despite the BOSS's contrast control, I find that its screen is not as easy to see as the Wizard's, no matter what the lighting. Neither has a backlit screen, of course.

Some of the calendar and schedule software seems subjectively easier to use on the BOSS than on the Wizard; and when you're on the road, it's a lot easier to get data into the BOSS than the Wizard. At home you use Traveling Software's link system to connect it to your PC and put data in that way.

My—purposely subjective—conclusion is that unless you're quite devoted to gadgets, you may not use either the Wizard or the BOSS; but if you are, you'll probably like either one. I'm mildly used to the Wizard and will probably go on carrying it; but I'm not sure, and besides, Roberta will probably inherit the BOSS, so we'll have that with us anyway.

One thing is certain: if you get either of these gadgets, get the Traveling Software link system for it.

Electric Chemistry
One of the most impressive educational programs I've seen was also on display at the National Education and Computers Conference. The Electric Chemistry building package from Snowbird Software calls itself "a large-scale micro-world simulation of a group of chemistry
I haven't seen Snowbird's physical chemistry program. An organic chemistry program will be available in May 1990. I have been very impressed with the inorganic chemistry simulator.

Humit

Dr. Petr Beckmann is professor emeritus of electrical engineering at the University of Colorado, and he publishes one of the most interesting newsletters in the country: *Access to Energy* ($25 for 12 monthly issues). Fair warning: Beckmann is committed to both science and free enterprise. He is relentlessly logical and writes in a polemic style that spares no one. When he states a fact, it's a fact; when he catches an enemy in a falsehood or misunderstanding, he nails him.

A recent sample: "Like a rain dance that does not bring any rain, Bush's clean air proposals do have one characteristic that, in the dearth of positive features, deserves to be mentioned: they are not going to degrade the environment significantly." On ethanol as fuel: "If only 10 percent of U.S. fuel needed to be ethanol, the necessary corn would have to be grown on 500 million acres..." Beckmann is a former resident of Czechoslovakia, the home of the original legend of the golem, which is likely why he calls his publishing venture The Golden Press. It has produced such works as *A History of Pi* and *The Health Hazards of Not Going Nuclear*.

Now Beckmann has turned to software. The blurb for Humit asks, "Can you hum the Minuet of Mozart's 40th symphony? You will recognize it when you hear it, of course..." Beckmann is committed to both science and free enterprise. He is relentlessly logical and writes in a polemic style that spares no one. When he states a fact, it's a fact; when he catches an enemy in a falsehood or misunderstanding, he nails him.

On the same disk are the Play and Whatsis programs. Play converts your PC into a keyboard instrument, sort of, with the middle row of keys corresponding to white keys, and the row above it to black. Whatsis does the same thing, except that if you can manage to play the first 10 notes of one of the classical themes in Humit, the program will tell you which tune you just played. At least it's not much because the PC isn't capable of much, but the tunes are definitely recognizable.

CHAOS MANOR

The chemistry stocks are fairly complete compared to the top-of-the-line chemistry set I was given for Christmas. Anyway, you get your chemicals and go mix them. If you're a bit puzzled about some of the chemicals, you can look them up in the library. Once you start mixing, the program takes over and shows the result.

Sometimes there isn't a result, as when I put hydrochloric and nitric acids in with some mercury. However, you can also light the Bunsen burner under your reaction flask. I did, and sure enough, as the stuff got hotter, I got mercuric chloride.

The Electric Chemistry Building isn't as much fun as a real chemistry lab, because you can't do anything with what you make. I recall that we poured a couple of quarts of nitrogen tri-iodide into the manicured grass in front of Central High, so that we smelled out words; when the stuff dried, it gave off clouds of purple smoke and considerable heat, so that not only did "Go CBC" appear briefly in the smoke (for my high school alma mater, Christian Brothers College), but a week later the words were spelled in dead grass. Of course, that was a foolishly dangerous stunt, and I don't advise anyone to try it.

Like nearly all educational software, this one is copy-protected: they use the key-disk method, which is considerably more acceptable than one of the miserable schemes that partially reformat your hard disk. Educational software publishers tell me they have no choice: there are just too many teachers out there who persuade themselves their students "need" programs the school can't afford to buy. If the programs weren't copy-protected, they'd be distributed everywhere within a week of publication. Snowbird features a scheme whereby many students can use the program one at a time, each student having a disk to record results.
for it, especially since similar programs (though with far less of a library) are available on BBSes as shareware. On the other hand, it can sure startle someone to hear "The Ride of the Valkyries" burst out of Big Cheetah.

Beckmann's policy is consistent with his philosophy: to buy the program, you undertake not to make copies for use by others (there is no copy protection), and when you bring up Humit, there's a ten in Turbo Pascal. That asks the same questions about your knowledge tell you how well IDS NYCode simulates a building inspector. I can't understand; that is, the program works fine in that it lets you browse around the code and find anything you're likely to want, but I can't testify as to how complete it is, just as I can't of my knowledge tell you how well IDS NYCode simulates a building inspector. I like what I see, though, and if you're in the building business, you ought to be aware of this stuff.

Winding Down

I'm out of space, and there's still a huge stack on my desk. I didn't get to Bolland's Reflex 2, but if you have Reflex, you know how good that was; the upgrade is even better. There's Dream Maker Software's Mac Gallery, some 400 Macintosh clip-art images ranging from dinosaurs to Santa Claus, including a neat haunted house. It sure dresses up party invitations.

I have some new medical-simulation software from Learning Tools; their Cardiovascular Systems and Dynamics program is in use in about 200 medical schools, and by me it ought to be in all of them: students will learn more from experimenting with this than by cutting up animals, and it's cheaper to boot.

There are two books of the month: Deception by Edward J. Epstein (Simon & Schuster, 1989), perhaps the most important book I've read about international conflict since Survival Is Not Enough by Richard Pipes (Simon & Schuster, 1984); and The Control of Nature by John McPhee (Farar, Straus & Giroux, 1989). McPhee writes about efforts to save New Orleans now that the Mississippi wants to wander elsewhere; cooling lava with fire hoses in Iceland; and flood control in the Los Angeles mountains. It's good classic McPhee, and as soon as I get this column on the wire, I'll finish it. While I'm at it, I'll open my split of champagne and munch on pâté with pumpernickel.

TopSpeed C. Compiler and library conform 100% with proposed ANSI standard. Source compatible with MS C and Turbo C (where ANSI compatible). Library is a superset of both MS and Turbo C's libraries. Extensions include: Time-sliced scheduler for concurrent functions. Powerful text window management. Borland text windows supported. MS's graphics, plus: Bar chart & polygon plotting, standard formatted text IO to graphics windows. Interface to Borland's Graphics Interface (BGI). Mouse support. All BIOS and DOS calls supported. Common UNIX calls. 6 memory models plus user-definable memory models. Smart linker includes only functions and data used in the final program. Optional run-time checks include overflow, stack, array bounds, and pointer checks. Run-time and compilation errors automatically pinpointed in source code.

Automatic make. Fully automatic make with version control recompiles and rebuilds EXE, LIB and DLL files as necessary without the need of a make script. Make dependencies are described by project files, which simply list the objects to be included, as well as the names of other dependent projects. One single make can result in multiple compilations using different compilers and/or assemblers, linking and building of libraries, DLL's and an EXE file.

Seamlessly integrated environment. Up to 10 active editor windows, each with a capacity of 1/2 MB source code. Compiler errors and warnings pinpointed in source code; automatic file-switch when stepping between errors or warnings. All menus and hot-keys redefinable. By default, editor commands compatible with Turbo and SideKick. Keyboard macros a la Super Key. Cut and paste between editors, help system, and directly from screen memory. Multi-file search commands, programmer's calculator, built-in ASCII, key scan code, and color tables. HyperText help system with library reference.

When we started selling MKS products in 1986, the Tax Collectors were among the first to notice. They assessed our promise to bring the power and flexibility of a UNIX environment to the DOS desktop.

And then they came to call.

We're happy to report that the Tax People® quickly decided that MKS products were the perfect way to train users on UNIX operating systems using the PCs everyone was already familiar with, and the perfect way to speed development of new programs and procedures.

Get the new - but don't give up the old

The MKS Programming Platform gives programmers the best of both worlds - virtually unrestricted access to the power and flexibility of UNIX operating systems, and full DOS or OS/2 capabilities. With MKS your PC becomes a powerful and productive UNIX workstation, whenever you need it.

The Platform includes four proven members of the MKS family of software: MKS Toolkit, LEX & YACC, RCS, and Make.

The heart of the Platform is the MKS Toolkit. It provides a complete set of utility programs and over 150 commands compatible with UNIX System V.3. It also includes the MKS Korn Shell, a command interpreter, MKS Vi editor, and the MKS AWK programming language.

Next is MKS LEX & YACC, which work together as a highly efficient program generator, simplifying the creation of languages and compilers for DOS and OS/2. The set is completed with MKS RCS (Revision Control System), which gives total control of text file revisions, and MKS Make, which provides an efficient way to automate the production and maintenance of any size project.

All together they are the most efficient, most productive, and friendliest way to cross the bridge between DOS or OS/2, and UNIX.

Beyond multiple platform support

The Programming Platform performs on standard PC networks like Novell NetWare and PC NFS, with the illusion of a complete UNIX timesharing system. This means you can host your PC to PC NFS, allowing it to be used as a UNIX workstation.

MKS is an active participant on the POSIX standards committee, and we track the shell and utilities standard to the fullest extent. We take care to build the underlying POSIX kernel functionality on DOS and OS/2 into MKS software before moving utilities. That's why the Platform gives you 100% UNIX and POSIX compatibility, with no surprises.

Ideal training tools

Fast, painless training is another benefit of the Programming Platform. Developers can use their familiar PC keyboards while moving effortlessly to UNIX on the desktop, and exposure to new commands and functionality becomes part of the novice's working day.

The Taxman adds it up

When you stack up all the advantages of the Programming Platform - access to powerful development tools, time-saving management functions, full portability, easy training, and our unswerving dedication to the POSIX standard - it's no wonder that the people with the toughest jobs to do, like the Taxman, turn to MKS.

To learn more about The Programming Platform and other MKS productivity and development tools, call us today. Maybe we can make your job a little less taxing.
CUSTOMIZING FOR COMFORT

A series of environment variables lets you tailor Unix to your liking.

Whether you're running Unix on a personal computer, an engineering workstation, or a mainframe, you'll get the most from your Unix user account if you customize it. Most people like their desk chair and car seat set up a certain way; it's the same with your computer environment. The Unix shell environment is one of the first things you can start customizing.

Begin by finding out what you already have. Execute the command env (it may be printenv on some systems; set should also work, though slightly differently). This command displays a list of environment variables (which might be startling in its length) that you can set at any time. Application programs, including the shell itself, can read these variables and modify the way they operate as a result of the environment that you specify.

Often, the information about the environment variables is hidden somewhere deep in the Unix documentation. For example, if you read the manual page for the lp command carefully, you'll find a reference to the LPDEST environment variable. You can set this to designate your printer as the default printer, as opposed to the system default (which is set by the system administrator or print spooler administrator). You set it once when you log in and forget it.

Listing 1 is the result of running env on my system. It shows some of the environment variables that have proved useful for the programs that I run. Naturally, some of these reflect my personal taste (such as the contents of the EXINIT variable, which consist of the start-up commands for the vi editor).

More commands and programs than you might think check for the presence of such variables as EDITOR, MAILER, PAGE, SHELL, TERM, and TERMCAP. The first four of these inform applications of your favored programs for use as an editor, a mailer, a screen pager, and a Unix shell. Some people might prefer EMACS over vi as an editor, or move over pg as a paging program. While I generally use csh rather than the standard Bourne shell, the SHELL variable is generally used when "escaping" out of a program, and at such times I don't want the extra overhead time of starting up csh, so I specify the Bourne shell instead.

Why They Call It Curses
If you're new to Unix, you might have a bit of a problem running screen-oriented programs. Unlike a personal computer with its own dedicated screen software, a Unix system can have almost anything plugged in as a terminal. To answer the problems of running screen-oriented programs in a world of variable and unknown screen controls, a standard set of terminal-independent driver routines, known as the curses library, exists. The idea is to define a specific terminal's capabilities and to control the codes to a curses-compatible program. The terminals are described in the /etc/termcap file. Many Unix and most Xenix systems use the name ans1 to refer to the console on an IBM compatible; this can generally be used by IBM PC users dialing into a Unix machine.

The TERM variable should contain the proper name for your terminal; the TERMCAP variable generally should contain the name of the termcap file. While (as noted above) this is generally the system file /etc/termcap, you can also make it point to the name of your own file. This is useful if you are testing...

Setting Environment Variables

Let's say you're ready to actually do
some of this. If you're just sitting at the
regular Bourne shell prompt ($), then
you can simply type

TERM=fooobar

and the contents of the TERM variable
will be set to the string fooobar. You can
verify this by typing set.

But wait! The value will not be auto-
matically inherited by other commands
spawned from this shell. To prove this,
type env, which prints the values of the
variables actually set in the environment.

You can explicitly export it:

export TERM

Now when you type env, fooobar will
show up as your TERM type. This little
exercise is meant to show how important
it is to remember to export all the
changes that are made to the Bourne shell
environment.

Setting the variables is usually relegat-
ed to your session initialization when you
log in. If your default shell is the Bourne
shell, then you put the desired commands
in your .profile file in your home direc-
tory, like this:

PATH=$PATH:/u/david/bin
TERM=ansi
NAME="David Fiedler"
PAGER="more \-c"
LPDEST=lasr
export PATH TERM NAME PAGER\
LPDEST

If your default shell is the Berkeley/C
shell ($), then you put this in your .cshrc
file:

setenv PATH "$PATH": 
/u/david/bin
setenv TERM ansi
setenv NAME "David Fiedler"
setenv PAGER "more \-c"
setenv LPDEST laser

(C shell users also have the option of
creating both .login and .logout files,
which are executed when you log in and
out, respectively.)

Notice that strings with spaces in them
have to be surrounded with the double-
quote character. Also notice the syntax
of the first line, which takes the current
default value of PATH (the system's idea
of the order of directories to search for
executable files) and tacks on a reference

WE REFUSE TO RAISE PRICES!

"We have dealers—even from foreign countries—call and tell us they could sell a lot more DesignCAD 3-D at higher prices because some of their customers can't conceive a true 3-D solid modeling program costing only $399. They ask us to raise our prices because they know it's worth more, much more. But look at the history of our company: We just don't believe in inflated prices! An excellent CAD system shouldn't cost any more than a good word processor. So we still say, "Aw... What the heck! We refuse to raise our prices! Let's see the other guys beat this deal!"

WHY BUY THIS ONE?

There is a very important reason to buy DesignCAD 3-D other than price: PERFORMANCE. DesignCAD 3-D provides complete 3-Dimensional drawing capabilities. It's not a "warmed-over" 2D program. DesignCAD 3-D allows you to draw any entity in 3-D space. This means, for example, that you can draw a curve in the shape of a spring. You can draw a circle or arc at any angle on any plane.

DesignCAD 3-D gives your Personal Computer the power of a mainframe CAD system! With DesignCAD 3-D, you can produce complete 3-Dimensional models and drawings that were once considered impossible on a microcomputer!

Complete 3-Dimensional design features make it easy for you to construct realistic 3-D models. With full solid-object modeling capabilities you can analyze your drawing to determine the volume, surface area, or even center of gravity! DesignCAD 3-D even permits you to check for interference between objects! Aeronautical Engineers can now find the center of gravity for a new airplane design with a couple of keystrokes. The Architect can determine the surface area of a roof for decking in a matter of minutes. The Civil Engineer can calculate the volume of a lake or dam in seconds. The Mechanical Engineer will know for sure if certain parts fit together without interference. The uses for DesignCAD 3-D are only limited by YOUR imagination!

DesignCAD 3-D supports more than 400 different peripheral devices, including more than 250 printers (dot-matrix, laser printers, color printers, etc.), 80 plotters, most mice and digitizing tablets, and a wide variety of graphics cards and displays.

Once again, American Small Business Computers has proved that you don't have to spend a lot of money to get quality software. DesignCAD 3-D provides features such as Shading, Solid Object Modeling, Hidden Line Removal, and Cross Sectioning capability. All for only $399. No other 3-Dimensional CAD system can come close to providing the price/performance of DesignCAD 3-D.

HOW DO I GET ONE?

DesignCAD 3-D and DesignCAD 2D are available from most retail computer stores, or you may order directly from us. If you have questions about which program to purchase please give us a call. All you need to run DesignCAD 3-D is an IBM PC or compatible computer with 640 K RAM memory and a hard disk. Both products support most graphics cards, printers, plotters and digitizers. Free Information and a demo disk are available.

VERY EASY TO USE!

DesignCAD 3-D has consistently proven itself to be faster and easier to use than most competing CAD systems. In a national competition DesignCAD 3-D was matched in drawing speed by only one other CAD system. It cost $5,000. DesignCAD 3-D was able to perform a given drawing in nearly half the time as packages costing up to $5,000.

Customers frequently remark at how quickly they are able to learn DesignCAD. Many also comment about the power of DesignCAD.

Dr. Stephens of NASA states: "One of the things I like best about DesignCAD 3-D is that I can pick it up and go with it." Dr. Stephens, who evaluates and recommends software for purchase by NASA, says software must meet certain criteria. "One, it must work. Two, it must be user friendly and easy to use. I put it [DesignCAD 3-D] as far as I can push it. We're not using it as a toy down here, and I present the fact that some people believe that a product's ability is substandard because of its price."

Jon Hellett, an engineer at Allied Chemical states: "We use it extensively here and are really sold on it. Plant layouts, pipe runs, fabrications, along with a lot of other things are drawn and designed. I've got AutoCAD, but very seldom if ever use it anymore."

VERY POWERFUL!

DesignCAD 3-D version 2.1 is as powerful as most CAD systems costing $5000-$10,000! Features like: Complex Extrusions, a true 3-D color-coded cursor, full shading or rendering capability, Bending of Surfaces, Complex Sweeps and Translations, and Boolean Operations make DesignCAD 3-D one of the most powerful 3-D CAD systems available...at any price! Engineers, Architects, and Consultants constantly tell us that they use CAD systems costing thousands of dollars which are not as powerful as DesignCAD 3-D.

BYTE MAGAZINE SAYS...

"At $399, DesignCAD 3-D was the least expensive package we saw, yet it was one of the more powerful. Don't be fooled by the remarkable low price, this program can really perform!"

PC MAGAZINE SAYS...

DesignCAD 3-D, the latest feature-packed, low-cost CADD package from American Small Business Computers, delivers more bang for your buck than any of its low-cost competitors and threatens programs costing ten times as much. For a low-cost, self-contained 3D package... DesignCAD's range of features steals the show."

**THE UNIX /bin**

...to the /u/david/bin directory at the end.

In this way, I can add commands to my own private directory at any time, and they will be executed just like system commands. A colon is used to separate directory names, and two colons (or a colon as the first character after the equals sign) means "search the current directory now."

**System Administrators and the Environment**

You can use many of these same ideas as a system administrator. For instance, if you wanted to add another directory or two to the default search path, you would just do this in the one place where users will execute it when their shell starts up: in the /etc/profile file, which is examined before the user's own .profile. I suggest that you name the full directory path to be searched, just to avoid any confusion:

```bash
PATH=/bin:/usr/bin:/usr/local::
PAGER=more
TZ=PST8PDT
export PATH PAGER TZ
```

A similar entry must be made in /etc/ cshrc for the C shell users. All systems should have at least one directory for "home-grown" commands (/usr /local in the example above). This makes it easy to keep them separate for backup and maintenance purposes. And this directory should appear in the search path after the system directories, to prevent confusion in case someone names a local command the same as a system command.

Why did I set PAGER and TZ above? The PAGER variable will allow certain programs to use the more command when it's necessary — something that unsophisticated users will thank you for. And explicitly setting the TZ variable (to whatever your local value should be) will prevent certain time-related bugs from appearing. Setting other variables can also save you a great amount of user support time; think of how you can set EXPORT to some reasonable defaults, for instance.

The "search current directory now" feature mentioned above should be turned off when you are logged in as root, since it makes the "Trojan Horse" security hole possible. You just explicitly change this in the /profile file (root's initialization file), and while you're at it, you should add the /etc directory to root's PATH to make your life easier. Some versions of the C shell take care of both of these security measures automatically.

**Me and My RC**

Just as each user has a file that is executed when he or she logs in, so the system has a way of changing its default behavior when it's booted up. The system executes the /etc/ rc file when it first comes up into multiuser mode. For years, this has been the place to put system-specific code (e.g., loading special device drivers at start-up). If you're running into strange problems with a new system, it doesn't hurt to make sure that this file is setting important environment variables properly. Things like TZ, PATH, HZ (do not set this to your powerline frequency!), and even SHELL can be set here for the system.

In the most recent releases of Unix, /etc/rc.d does little more than go into a set of numbered subdirectories under /etc/rc.d and execute all the files it finds. Each of these directories has a designated function. But you find that the file /etc/rc.d/8/userdef has been executed once per hour or so, your E-mail may never get sent.

The only thing left to do to customize the system is to set up the cron facility using the /usr/lib/crontab file (on newer systems, this is now a set of files in the directory /usr/spool/cron/crontabs) for events that should repeat at specific times. If you're running UUCP (Unix-to-Unix copy), make sure that at least one of the daemon programs found in the /usr/lib/uucp directory is being executed once per hour or so, or your E-mail may never get sent.

ONE COMMUNICATIONS PROGRAM THAT MAKES ALL OF OUR INCOMPATIBLE COMPUTER SYSTEMS COMPATIBLE?
I CALL THAT UNLIKELY.

They call it TERM.

TERM runs identically under DOS, UNIX, XENIX, VMS, BTOS and MAC?
TERM is keystroke-for-keystroke compatible across all of our different computer systems and offers features like automatically restartable file transfers, data compression and CRC error detection.

But, can it be customized?
TERM's built-in script language is so sophisticated that it allows exact solutions to be tailored to our specific needs. In fact, there are over 25 pre-built scripts provided for solving problems like unattended file transfers, remote system polling, and error logging. TERM script allows building customized menus, data entry screens and pop-up windows designed for your unique applications.

And it talks to non-TERM systems?
Fluently. TERM comes with nine protocols and thirteen terminal emulations... that's enough to communicate with a wide variety of different systems.

DEC Terminal Emulation?
Wait till you see it. TERM's VT220 emulator meets the needs of all of our divisions by providing exact VT220 and VT102 emulation on all terminals. We've got full graphics character support even under Unix...not to mention Televideo, SCO color console and the other emulations.

Think of it as a bold, “seat-of-the-pants” solution that cuts to the heart of the OS/2 Presentation Manager complexity challenge. Thus unlocking the potential of this powerful operating system.

With the introduction of Smalltalk/V PM, object-oriented programming moves out of the realm of mystery and into a new era of breakthrough applications that promises to be of legendary proportions.

OS/2 PM is designed to push "user friendly" to a whole new level of sophistication. If you compare it to an orchestra, OS/2 has capabilities no ordinary assemblage of instruments has ever dreamed of possessing. Yet to tap its potential, OS/2 PM demands a conductor capable of true genius. That conductor is Smalltalk/V PM.

You'll find Smalltalk/V PM a perfect language for representing and manipulating high-level information. Because you go from designing to prototyping to delivering a completed application in one seamless step, you cleanly avoid the old costly “crash and burn” delays so common with languages born in the age of mainframes.

Networks let dedicated database servers bring SQL power to personal computers

In last month's column, I discussed the role that IBM's OfficeVision and Systems Application Architecture (SAA) will have in the corporate world. As you will recall, IBM's plans for your future are based on a mainframe acting as a Structured Query Language server. (SQL is a "truly" relational database system tracing back to circa 1970 IBM.)

This solution works, of course, only if you have such a mainframe. Although IBM will be pleased to sell you one, for many small businesses this just doesn't make sense.

What does make sense is to use the guts of SAA—that is, the user interface and the SQL server—without using SAA itself. This way, you can still have the communications, the data handling, and the centralized data storage, while using equipment that may otherwise meet your needs a lot better.

Serving You Right
In essence, the corporate database is simply a collection of information. Many companies place this information on a mainframe. This decision is often made more for reasons of capacity and security than for performance. Company data is much of what makes the company, and it must be protected.

With the maturing of LANs, these same benefits can now extend beyond the mainframe world into the realm of the personal computer. This is made possible by the introduction last year of SQL database engines that reside on dedicated database server machines attached to the networks. No longer is database work on microcomputers restricted to a single machine. The database software waits for the workstation software to ask it for a task.

As a user, you may never know that there is a SQL (pronounced "sequel") server out there. The workstation software presents the screens, performs initial edits, and validates entries. Once the user of the workstation software completes a screen, that screen is changed into a SQL query, which is then sent down the LAN to the database server. The server, in turn, finds the requested information and returns the results to the user.

This method of working has two advantages. First, it reduces the workload on the workstation, allowing that computer to be less powerful and, therefore, less expensive. Second, it also reduces traffic on the LAN significantly over software such as dBASE, which requires data, not just commands, to flow both ways.

The SQL Approach
The past year has seen the development of several SQL database server products. All offer the same flexibility IBM offers in the SAA world. The difference is that they don't require IBM hardware. Each product approaches the task of being a SQL server in a slightly different way.

Gupta Technologies' SQLBase server, for example, will work with nearly any network. Gupta also makes other software that provides connectivity to mainframe SQL databases and other external database products. Gupta gives you a complete solution.

Microsoft, on the other hand, offers only the database engine—that is, the part of the SQL server that actually receives queries and provides answers. Other companies, including Ashton-Tate, provide the front end that allows the database engine to be used.

Novell even manages to do without the dedicated database server. Its database continued

Gupta was likewise perceptive to server product runs as an additional process in the file server and supports the data files there. This has the advantage of not requiring you to buy a separate machine for the database server, but it does add an additional load to the file server, which can be a problem in the case of a busy LAN where there is a lot of disk activity. In that instance, you might find yourself waiting for your database query while someone else plays Novell's NIPES game.

Competing with SAA

Each of the three approaches will work to support a LAN with workstations that must share information for their applications. In the case of Novell's NetWare SQL, we rate it a very good value. "B lackship's 386/25 is low price leader."

Microsoft's Contribution

Microsoft has taken a different tack in the effort to bring a SQL server to market. Instead of designing the user interface itself, the company has arranged with Ashton-Tate and Borland to create versions of their DBMS products that will work with SQL Server. These products are expected around the end of this year.

In the meantime, SQL Server suffers...
Seagate's ST157 Family

As the storage and retrieval device for valuable information, a disc drive plays a critical role in a personal computer's overall operation. Building hard disc drives that deliver both high performance and high reliability requires the same degree of precision employed by skilled artists.

This precision is reflected in every Seagate ST157 family drive. Using our own stepper motor processes, each drive is auto-tuned for optimum performance every time the drive is powered up.

This 21-49 megabyte 3.5" drive family is a skillful blend of performance and reliability. With access times of 28 msec, these drives feature an MTBF of 70,000 hours, and are available in SCSI, ST412 and AT" interfaces.

Like the artist who spends years perfecting his craft, Seagate has spent the past decade mastering the fine art of disc drives. For more information on our palette of high quality storage solutions, contact your authorized Seagate distributor, or call Seagate directly at 800-468-DISC, or 408-438-6550.

from some significant limitations. Because of Microsoft's approach, few development tools are available now. If you plan to do work with SQL Server, you'd better plan to be a C programmer. While this might be acceptable for new project development, conversion of mainframe systems to work with a SQL server usually involves the use of COBOL, and that's not something that is well supported by Microsoft.

Perhaps more critical, Microsoft's SQL Server works only with Microsoft's LAN Manager. Considering that network operating system's minor position in the LAN marketplace, the limitation can be crippling. The majority of LAN installations (approximately 60 percent, according to a BYTE survey) are running Novell NetWare. Most of the rest are running 3Com.

In its current incarnation, Microsoft's LAN Manager is a poor choice, both because of its limited use and because of its significant security problems. While this may change someday, it's unlikely that moving this way now would be a wise business decision.

**Novell's Dual-Purpose Server**

If you already have a Novell LAN and it's not heavily taxed, Novell's NetWare SQL will save you the cost of another machine. This is because it runs as a value-added process in the file server itself.

That means, of course, that you can't use any other network operating system besides NetWare. It also means the file server will have to split its time between serving files and serving the database.

To make matters even less attractive, you have very little choice of how you will use the database server. Wordtech Systems has a version of its DBMS software that will work as a front end, but you'll have to program it yourself.

**Wordtech's Role**

Wordtech Systems doesn't sell a SQL server product, but it has found a way to provide workstation software that will use the dBASE programming language and still work with SQL databases. Because Wordtech's products allow the creation of some very acceptable user interfaces, and because dBASE programmers are easier to find than C programmers, this makes system implementation easy to accomplish. In addition, conversion from applications written for dBASE is simplified.

At this writing, Wordtech's products are in the final testing stages. They should be released by the end of the year.

**A Replacement for SAA?**

As you can see, none of these solutions is as well integrated as IBM's SAA is supposed to be. On the other hand, at least some of it is available now, and none of it requires you to buy an IBM mainframe or minicomputer. If your business is based on personal computers or on a non-IBM minicomputer, at least you have the option to gain most of the benefits that IBM promises. You will have to do more work, of course, but you won't have to run a mainframe, and that's a considerable savings in hardware and personnel.

At this point, the only realistic solution to the needs of a business that is moving to SQL is Gupta's SQLBase. For one thing, it's a complete solution. You don't have to wonder when your user interface is going to be available. For another, it allows great flexibility in the operating environment, supporting an AT-based database server on the low end and IBM's DB2 on the other. In other words, you can use the low-cost solution even if you do eventually end up in the IBM mainframe world.

How an upside down idea made the mouse obsolete.

Frankly, we thought any input device that operated by dragging it across an already cluttered desk was great technology misapplied. We took a different approach.

Now RollerMouse makes the conventional mouse obsolete.

Control Without Bending Your Elbow

All the pointing accuracy and speed you only hoped for from your old mouse is right at your fingertips. Moving from point to point with our oversized trackball is fluid, effortless and fast at 200 CPI resolution.

Using our exclusive four-button control, you have maximum click and click lock versatility. With programmable pop-up menus, RollerMouse works with software written with or without a mouse in mind. And RollerMouse technology means you never need to disassemble it for cleaning.

More Application Productivity

If you work with the latest graphics-based applications, such as desktop publishing, CAD/CAM/CAE or any object-oriented PS/2, PC or Mac operating system, don't be held back by old mouse technology.

Buy from the leader in precision pointing devices. CH Products perfected computer control technology more than 25 years ago. And the latest technology is at a dealer near you.

Apple aims at the scientific research market and announces two new Macs

Apple has always had an affinity for the higher education and scientific research community. The Apple University Consortium, a group of prestigious U.S. universities, has been an important Apple partner, even before the introduction of the Macintosh. If it weren't for the AUC's early adoption of the Mac, Apple would have pulled the plug on the machine by 1985. Sales of Macs to AUC members and the AUC's work in developing new software and hardware for the Mac have fostered much of the Mac's acceptance in business environments.

A current reminder of just how closely Apple works with the AUC members is the Apple Science CD, volume 1. This CD-ROM disk was previewed at the annual AUC meeting in July and is available at no cost through Apple's higher education sales representatives to any researchers and teachers interested.

The CD contains over 500 megabytes of scientific data covering hundreds of different scientific phenomena, including atmospheric and weather information, astrophysical data, biomedical data, scientific images, animations, and dozens of simulations.

It also has the complete suite of data-visualization and data-analysis tools developed by the National Center for Supercomputer Applications (NCSA) at the University of Illinois. Analysis software from the National Institutes of Health completes the disk. These tools let you take apart the data on the CD and demonstrate techniques to your colleagues. Also, you can use data-visualization methods that make it easy to "see" trends in the data that numerical methods alone often miss.

The value of the Apple Science CD lies in the "reality" of the data, making it an amazing teaching resource. You can now see what happens when a hurricane comes ashore, or what happens when two large air masses collide over land, or what happens when a star burns out. The Apple Science CD includes data for these events and many more, plus a series of simulations and animations that have been constructed based on direct measurements. It even has three-dimensional renderings that almost come alive when you view them with a standard pair of red/blue three-dimensional glasses.

The data on the disk was collected over a four-month period from research scientists across the country. The Apple Science CD owes its existence to several people, including Kurt Schmucker and Rob Wolf, research scientists at Apple; Brand Fortner, manager of applications software at NCSA; and Katie Povejsil, manager of academic solutions at Apple.

The Apple Science CD is Apple's third major CD-ROM disk. The first two, the Apple Education CD sampler and Phil and Dave's Excellent CD, are good examples of how important CD-ROMs can be to the Mac market. They remind us that desktop media and multimedia authoring need a source of high-quality images and sound, and CD-ROM disks are an inexpensive way to fill that need.

Apple covers a lot of ground with the Apple Science CD and deserves major-league kudos for distributing this resource for free. We should thank those involved in its production for having the foresight and guts to pull this off, especially in such a short period of time. I can't wait until volume 2!

The Soul of the New Machines

I can now talk about the two new machines that Apple announced in September, both of which I've used extensively continued
in prerelease versions.

The first machine is the Mac Portable. The Portable is a new "design center" for Apple; that is, it uses new components configured in new ways and manufactured on new factory lines. Unless you've been in a cave for the last year, you've probably got the basic specifications for the Portable memorized: a 16-MHz 68000-based machine of the familiar laptop/clamshell configuration made famous by Zenith and Toshiba. The Portable includes a fancy active-matrix LCD (where each pixel is controlled by a separate "transistor") that's not backlit, a keyboard, and a trackball (you can also use a mouse). The keyboard and trackball can be repositioned in the case to accommodate right- or left-handed users.

The Portable sports several memory and disk configurations, including a basic unit with 1 megabyte of RAM and one FDHD floppy disk drive. You'll also see units with two floppy disk drives; another configuration has one floppy disk drive and a 40-megabyte hard disk drive (with an 80-megabyte hard disk drive on the horizon). RAM will ultimately top out at 9 megabytes. For now, however, there's only a 1-megabyte RAM expansion board available, boosting total memory to 2 megabytes.

The Portable contains a single processor expansion slot that is incompatible with NuBus or the current Mac SE and Mac SE/30 slots. Apple seems to love mangling its own bus standards. The Portable includes the usual ports: one Apple Desktop Bus port (e.g., for external keyboards, mice, and x,y digitizers), two serial ports, a SCSI port, and a sound port. A 2400-bps internal modem will be an option.

Apple built the Mac Portable with the smartest power-management circuitry I've ever seen. The lead-acid gel battery in the unit I used could run the Portable for over 8 hours, unless you're doing constant disk updates. The power pack continuously monitors the state of the Portable, turning off unused components. It also acts as a power filter/surge protector. Unfortunately, the power pack is also an integral unit; you can't separate the battery from it to save weight. This means that the Portable must have the power pack installed even when the machine is using wall current.

With a 40-megabyte hard disk drive and 2 megabytes of RAM, the Portable checks in at over 15 pounds, a lot to lug around an airport. Still, it's not as heavy as some of the Zenith behemoths I've carried, like the Z-183 and the TurboPort 386. Compared to the NEC Ultra-Lite, the Zenith MinisPort, or the Toshiba T1000, though, the Portable seems enormous.

Its physical dimensions heighten the feeling of largeness, because it's actually wide enough to fit on your lap without the need to wire your knees together. This is an advantage when you're sitting on one of those uncomfortable airport chairs, but it's a distinct disadvantage when working on an airplane. The Portable simply won't fit on a coach-class tray table, and it just barely fits in first class.

Pricing speculation for the Portable has been rampant, since such decisions aren't usually made until just before the official announcement. A loaded machine (i.e., with 2 megabytes of RAM, a 40-megabyte hard disk drive, and a 2400-bps modem) will likely sell for over $6000, street price. Even at such a high price, Apple will sell every Portable it makes. In fact, I'd be surprised if the machine isn't such a hit that orders get backlogged right away.

The Mac IICi

The other new Mac is the 25-MHz IICx, called the IICI. This machine is the second small modular-design-center unit. The IICx includes built-in 1-bit and color video on the motherboard, so you don't have to buy a NuBus video card to drive a monitor. New ROMs and custom application-specific ICs complete the revamped motherboard, which uses considerably more surfaced-mounted components than the Mac IIXc, making it a reliable design.

Otherwise, the 25-MHz IICx should be similar to the 16-MHz machine. It incorporates the usual ports and an FDHD floppy disk drive, along with room for an 80-megabyte internal hard disk drive (larger hard disk drives are on the way). Three NuBus slots complete the system.

Pricing for this fastest Mac is completely up in the air, since it's likely to poach sales from the existing Mac IIX and IICx configurations, not to mention the Mac II. The figures being tossed about as I write this in July are 15 percent higher than the IICx. If those prices hold, most Mac II buyers will opt to buy the IICI, since it is noticeably faster at almost every computing task you throw at it. Spreadsheets update faster. Word processing documents open, close, and scroll faster. Multiple applications can be serviced faster under MultiFinder. You'll find the performance improvement of the IICI over the IIXc and IIX to be much more noticeable than you'd think.

The Mac Product Line

With the release of the 25-MHz IICx, the older Mac II becomes a product-line luxury. Since it costs more to manufacture than the IIX or IICx while coming in last in the performance derby of Mac IIs, the Mac II is expendable. Apple is likely to cease manufacturing the Mac II this year, if it hasn't already.

What about the compact Macs? The SE/30 is a big hit. It packs a lot of computing punch and RAM capacity into a small box for a good price. Apple will surely keep it around for some time. The company might considergoosing its product. If the 25-MHz 68030, but I doubt that will happen for a while.

The Mac Plus is a different story. The Plus is a tired design that's a pain to manufacture and service. With System 7.0 on the horizon and requiring 2 megabytes of RAM just to boot, the basic 1-megabyte Mac Plus seems like an antique. I had considered the Mac SE to be in the same boat as the Plus, but in August Apple reduced the SE's list price by $300, while adding the FDHD floppy disk drive as standard equipment. It's the first time I've seen Apple both lower a price and add a feature to the same Mac, so it seems the Mac SE will stay around.

As happened with the Apple II, though, I can see Apple continuing to manufacture the Mac Plus well into 1991, unless it builds the Mac Classic. As long as this machine is a cash cow that isn't stealing sales from the higher-end Macs, Apple would do well to keep cranking it out, especially for the student market. This is a market where word-processing and programming needs don't argue for virtual memory, blinding speed, and giant hard disk drives.

KMW brings Apple and Big Blue together. KMW makes your Macintosh more versatile — more productive — by linking it to your IBM midrange. Our line of TwinAxcess® protocol converters connects any Macintosh to your System/3X or AS/400.

New board connection for the Mac II. For a simple, cost-effective board solution, choose our TwinAxcess for the Mac II. This easy-to-install card plugs into any member of the Mac II family, with connection to your host through twinax cable.

Field-proven multiport products. Our TwinAxcess Series II and Series III protocol converters are ideal when you need remote attachment capabilities, or when you need support for up to seven devices. TwinAxcess system-level protocol converters provide midrange connections for any Macintosh, as well as IBM PCs and compatibles, laptops, ASCII terminals, and most popular printers. We can also help you connect to a mux, a data PBX, AppleTalk, or DECnet.

Powerful features on every level. TwinAxcess protocol converters benefit your Macs, your other peripherals, and your host, with these features:
- file transfer to and from your host
- terminal emulation
- manipulation of IBM midrange data within software programs such as Excel, Lotus 1-2-3, and MacWrite
- access to your host's mass storage capabilities
- printer pass-through to ImageWriter and LaserWriter

Presto! The page comes to life, almost as easily as if you'd scanned the images in with an HP ScanJet Plus scanner. Which you can do for just $2,190. (In fact, all those images came fresh from our scanner.)

This is a small, but tasty, example of how much you can spice up your communications. With photos, illustrations, and, thanks to OCR, text. Its 8-bit power provides 256 levels of gray and lets you scale images from 4 to 200% in 1% increments.
We need to do something to liven up Cheese Louise Pizza sales. People love our pizzas, once they sink their teeth into them. But we're having trouble getting more customers into the parlors.

What's the problem here? We have fresh, natural ingredients. Friendly people. Authentic Sicilian decor, with flyers, the best deal in town. But so far, only Frankie's grandmother has come in to get ten for the price of five. Maybe the flyers are too dull.

Maybe the ingredients should jump right off the page and say: Hey, take a bite! But how do we do that? Any ideas?

Joe Louise wants your knockout ideas.

Have we got some winners here?
Mount Etna erupting every hour on the hour. Our salads
The best salami. No baloney! Have Frankie's great-grandmother's secret dressing, and people keep telling us they've never tasted anything like it.

Now, for the past two months, we've been handing out 2-for-1

This month's special: CLP TLC

Joe Louise wants your knockout ideas.

Our scanner also raises the quality of OCR. (And the optional sheet feeder raises the quantity.) And it's equally at home in DOS or Macintosh environments.

C_talk/Views is a development tool for C programmers that not only reduces the complexity of Microsoft Windows but also slashes development time by up to 75%. 

Delivers on the promise of Object Oriented Programming.
Encapsulates more MS Windows functionality than any other tool on the market today. Get MS Windows applications off to a fast start with a framework of over 50 tested and ready-to-go object classes.

Provides support for the entire project.
Comes with Browsers, Intelligent Make, Application Streamliner, and an Interface Generator.

Gives you complete control.
Programming is still in C - use existing C libraries or call Microsoft Windows functions directly.

Offers real Object Oriented Programming.
Supports inheritance, encapsulation, and dynamic message binding. It is fully polymorphic - write less code than with other Microsoft Windows tools.

Pays for itself on even the smallest project.
Only $450.00 with no royalties.
Comes complete with source code.

Watch for: C_talk/Views for OS/2 PM, the Apple Macintosh and X Windows. Develop one program for all platforms.

How does OS/2 manage to do several things at the same time? Of course, no single CPU can truly do multiple things simultaneously; it just fools you into thinking that it can by quickly switching from task to task. And therein lie some subtleties I've recently been exploring.

Trickery
There are actually two parts to the trickery: peripheral scheduling and time slicing. Peripheral scheduling works for the most part by exploiting the tremendous differences in speed between a CPU and its peripherals.

Time slicing is concerned with how the operating system doles out CPU time among computer tasks, and this will be the focus of my column this month. I'll take up peripheral scheduling in another column.

Here, I'm concerned with CPU-bound programs. Programs are generally constrained by a single item in the computing system. The print-formatter programs found in word processors are held up by printer speed. Thus, these programs are print-bound—no matter how fast the computer is that they're running on, they'll run only at the speed of their printer.

Database managers like dBASE spend most of their time waiting for the disk drive. Run dBASE from floppy disks, and it's not much faster on an 80386 than on an IBM PC XT, which makes it disk-bound.

A Lotus 1-2-3 recalculation, on the other hand, isn't waiting for the disk or the printer. It's merely directing the CPU to pick up numbers, perform mathematical operations on them, and put them back. In other words, it's CPU-bound.

Consider a simple case of two such CPU-intensive programs. You want two spreadsheets to appear to recalculate simultaneously on a computer. All you need to do is give a little time to spreadsheet program 1, a little time to spreadsheet program 2, a little more time to program 1, and so on.

In "OS/2's Multitasking Dashboard" (November 1988), I discussed how the length of "a small amount of CPU time" affected OS/2's performance. That span of time is called a time slice, and its duration can be set with a CONFIG.SYS command called timeslice=nnn, where nnn is a value in milliseconds (32 ms minimum).

A little experimentation that I did in that column suggested that a time slice of about 512 ms—about one half of a second—seemed about right for maximum throughput.

Priorities
Once you've set the time slice to one half of a second, spreadsheet program 1 gets one half of a second, spreadsheet program 2 ditto, back to spreadsheet program 1, and so on. Is this necessarily the way you want it? Not in most situations. Some jobs are more important than others, and they should get a greater proportion of the CPU's time. That's why OS/2 includes the notion of priorities.

Each OS/2 task has a two-part priority value: the priority class and the priority delta.

There are three priority classes, numbered from 1 (lowest) to 3 (highest). Most OS/2 applications run at number 2 because it's the default class. Number 3 is the time-critical priority.

Number 1 is for jobs that should run only when nothing else wants the system.

---

For example, imagine a program that keeps track of what files you use and how often you use them. This could unfragment your files in the background, like the popular Disk Optimizer and Norton Utilities' Speed Disk programs. By keeping track of what files you do and don't use, it could also rearrange the files' directory entries so that the most-used files would have their directory entries toward the front of the directory for faster access.

Less-used files could be recommended for roll-off to floppy disks or could be automatically squeezed, as the ARC-type programs do. These files would automatically be unsqueezed if ever needed. Such a program would actually give you more room on your hard disk as time went on and the lesser-used files were squeezed.

You wouldn't want CPU time wasted on housekeeping tasks while you were busy doing some heavy spreadsheet work, but you wouldn't mind the system doing this while you were on the phone or scratching your head. That's the value of priority 1. Such a background task would be assigned the low priority, and the system wouldn't even consider the task for execution unless there were nothing else to do.

More specifically, you could say that a class 3 beats a class 2, which beats a class 1. If there is a single job of class 3, none of the class 2s or 1s get any time at all, except when the class 3 job is waiting for I/O. If there are no class 3s in the system, the class 2s take all the CPU time. Only when there are no class 3s or 2s, or when the class 3s and 2s are all waiting for I/O, do the class 1 jobs get any time.

Within classes are deltas. A delta is an integer from -31 to +31. If a program doesn't request a delta, it gets the middle-of-the-road value of 0. A program's default class and delta are, then, 2 and 0, respectively. Deltas matter only in the case of ties. If there are no class 3 jobs in the system, but several class 2 jobs, the class 2 job with the highest delta gets the lion's share of the time. Otherwise, they share time equally, unless you specify priority=dynami c, in which case the foreground program gets a bit more time. (Refer to my November 1988 column for more information.)

Deltas don't affect job performance across classes. A class 3, delta = 31 program still gets more time than a class 2, delta = -1 program.

Programs get priority class 2 unless they ask for a different class. That's all it takes—they just ask. I keep fearing that a software vendor will program its package to set its own priority to class 3, mainly to ensure that it will look good in magazine benchmarks or the like. Such an action would make the rest of the system stop dead, except when the package was waiting for I/O; the entire system would be enslaved to a single application. Pretty scary, in my opinion.

**Changing Priorities**

How does a job change its priority? Simple: with an application programmer interface called **DOSSETPRTY**. For the details, see the text box “Setting Task Priorities with DOSSETPRTY” above. Basically, you just specify the process ID of the program whose priority you want to change, specify the new class and delta, and call DOSSETPRTY.

Not just anyone can change a priority. A program can change the priority of only itself or one of its child processes, a continued

Who could have imagined, a decade ago, the power you now have at your fingertips?

Tiny chips that compute at clock speeds approaching 50 MHz. Memory in millions of bytes that you can hold in your hand. Enormous jobs done in minutes on your desk instead of days down the hall. All at a fraction of the cost.

Emerson Electric is making that same kind of revolution happen in the UPS equipment that protects these computers from erratic electric power.

Technology innovations are enabling us to bring costs down so low you simply can’t afford not to have UPS protection.

And not just for your larger computers and PC network applications, but for every computer you own down to the smallest PC.

Emerson is growing the broadest computer power protection product line in the world. It now ranges from internal board-level UPS' to massive systems for supercomputers.

You buy UPS systems for reliability — to keep your data secure, your people working and your computer networks healthy. Emerson UPS systems won’t let you down even when the power does.

And we’re backing these new products with new direct customer support and service nationwide, new distribution channels, and most of all, our energetic people.

That’s Emerson UPS today. Protecting the computers you depend on. It’s our only business. Watch us fly.

An Update

I see that I'm almost out of space. Before I conclude, however, here's a BIOS update. I mentioned months ago that the AMI BIOS won't run OS/2. Since then (as several readers have let me know—I'd already heard, but thank you to all who wrote), AMI has remedied the problem. The latest AMI BIOS runs OS/2 with no troubles. And if you have a clone that just won't run IBM's OS/2, you might try AST Research's OS/2 1.1. It seems more forgiving than other vendors' OS/2s. I run it on an old Micronics motherboard that seems unable to run any other version of OS/2.

Coming up: a program to exercise OS/2's priority-adjustment features, the High Performance File System stuff, and more on applications.
Our Printer Sharing Unit Does Networking!

An Integrated Solution
Take our Master Switch™, a sophisticated sharing device, combine it with MasterNet™ networking software for PCs, and you've got an integrated solution for printer and plotter sharing, file transfer, electronic mail, and a lot more. Of course you can also share modems, minis, and mainframes or access the network remotely. Installation and operation is very simple.

Versatile
Or you can use the Master Switch to link any computer or peripheral with a serial or parallel interface. The switch accepts over 20 commands for controlling the flow of data. It may be operated automatically, by command, or with interactive menus. Its buffer is expandable to one megabyte and holds up to 64 simultaneous jobs. The

MasterLink™ utility diskette for PCs comes with every unit and unleashes the power of the switch with its memory-resident access to the commands and menus.

Other Products
We have a full line of connectivity solutions. If you just want printer sharing, we've got it. We also have automatic switches, code-activated switches, buffers, converters, cables, protocol converters, multiplexers, line drivers, and other products.

Commitment to Excellence
At Rose Electronics, we're not satisfied until you're satisfied. That's why we have thousands of customers around the world including large, medium, and small businesses, factories, stores, educational institutions, and Federal, state, and local governments. We back our products with full technical support, a one-year warranty, and a thirty-day money-back guarantee.

"When Fosberry said a PS/2 with Micro Channel would let him juggle ten things at once and still have time to break for lunch, he meant it."

How’re you going to do it?

These days, no matter what size your company, you’ve got to be able to keep a lot of balls in the air to stay competitive.

The Genius Of Micro Channel. Which is why IBM developed the Personal System/2® with Micro Channel. Micro Channel can support multiple operating microprocessors. So you can, for example, separately manage peripherals, while freeing up the main processor to crunch numbers. A bus master can even be sending a fax while another manages traffic on a network, all with greater reliability.

Naturally, every PS/2® with Micro Channel runs DOS and OS/2®. So with OS/2 Presentation Manager, you can do multiple tasks concur-
rently, all with an easy-to-use graphical interface. What's more, with Micro Channel, there are no DIP switches to set, for simpler, more reliable installation. You can find and reset cards anywhere in the network—right from your desk!

The Solution Is IBM. So, to manage lots of information, jobs, hardware and software, invest in the PS/2 with Micro Channel. Contact your IBM Authorized Dealer or IBM marketing representative. For a dealer near you, call 1-800-IBM-2468, ext. 142. You'll learn there's almost nothing you can't do if you PS/2 it!
Nature's character recognition system can be trained to read any language. Flagstaff Engineering's SPOT OCR Text Reader is also trainable. It has read text printed in thousands of typefaces in over 130 different languages!

The SPOT OCR Text Reader works just like a typist who reads a page, then uses a keyboard to transfer the information on the page into a computer file—except SPOT uses a scanner for eyes and outputs the text directly into standard text files. SPOT is also faster. It can read up to 35 characters per second on a 16MHz AT, and up to 65 characters per second on a 25MHz machine (that's 780 words per minute). SPOT supports most major makes of scanners.

Using sophisticated statistical techniques, SPOT recognizes characters like the brain does: by examining their shape and context. Like nature's original, SPOT is very flexible. It can glance over an entire page or zoom in on a few lines of text. SPOT can read newspapers, magazines, books, manuals, invoices, contracts, government documents, columns, tables... just about any printed text. And SPOT keeps getting better. The new Version 3.0 is faster, more accurate, easier to use, and better documented than its predecessors.

Since 1982, Flagstaff Engineering has provided visionary data conversion solutions for thousands of companies worldwide. SPOT is already increasing productivity and making life easier for many publishers and researchers, accountants and telemarketers, medical and legal offices, archival and transcription services.

Wouldn't your business benefit from fast, accurate, and low-cost OCR software? Give us a call and let our application specialists explain how you can save time and money with SPOT, the OCR text-entry solution.
EVERYONE INTO THE POOL

Making sense out of asynchronous gateways

LAN gateways come in many different varieties, but the most common are asynchronous gateways, or "modem pooling" devices used over dial-up lines.

In most asynchronous gateways, one or more computers act as the communications server, or gateway device. They contain the shareable communications hardware, along with special communications software that acts as a two-way link between the other LAN workstations and the communications hardware. Most often, this link uses NetBIOS to route workstation communications data to and from the actual communications hardware. On the workstation side, something other than the usual stand-alone communications software is required—the technique of talking directly to a communications interface adapter won't work in a gateway environment, since the workstations don't have any communications hardware of their own.

Dedicating Resources

The gateway computer is often dedicated to the task of managing communications links and may service multiple ports and modems. Some gateway implementations, however, are nondedicated, so you can use the gateway computer as a regular workstation.

Dedicated gateways typically display a "control panel" on the screen that shows current call status and session usage information. A menu or command-line interface provides the ability to perform functions like forcing disconnection of an orphaned session or, if multiple lines exist, taking a modem out of service by disabling one of the serial ports. The software may also be able to keep a log of communications activity that you can use for departmental accounting and troubleshooting.

A nondedicated gateway computer usually uses a TSR program that operates in the background. The gateway software can't take up much memory, because the computer will also be used as a normal workstation.

The gateway software also has to be well-behaved; unfortunately, most TSR programs fare badly on a LAN. The software must also be bug-free, because a system crash not only will kill the communications session but will affect the workstation user as well. Finally, the gateway software has to be time-critical: It can't soak up too much of the CPU, it can't lose characters, it has to prevent interrupt latency (i.e., failing to handle a subsequent interrupt because the servicing of the current interrupt takes place with interrupts masked), and it must handle the possibility of reentrancy (this happens, for example, when the same gateway software services multiple communications ports, and portions of the software are common to both ports; if the common code is executing when a new interrupt occurs and the new interrupt also needs to execute that common code, the code must be written to be reentrantable). These are formidable issues for a personal computer.

Inside the Gateway

In a nutshell, here's how gateway software works. On start-up, the software initializes the COM ports and resets the modems. It establishes a unique name for itself on the LAN by performing a NetBIOS Add Name call. If the gateway serves multiple ports, it may take the approach of establishing a unique name for each port. The application then makes itself available by issuing a Listen command to NetBIOS for each unique name.

In a dedicated gateway, the gateway computer is idle while Listen commands are outstanding. Only when a...
workstation issues a NetBIOS Call command to a gateway’s unique name does it go to work.

In a nondedicated (background) gateway, the DOS prompt reappears once you’ve loaded the gateway software, and you can run other applications. The gateway software uses the NetBIOS “no wait” option on its Listen command, along with the Post address of a routine to handle a Call from a workstation, and thus it can relinquish control of the computer until activated by another computer’s Call. This means that each Call will interrupt applications running in the foreground on the gateway computer. The routine at the Post address takes control, saves the caller’s name and the NetBIOS-assigned Local Session Number, and sets up a Receive Network Control Block containing the Post address of a routine to handle messages sent from the workstation. The gateway software then performs a Return-From-Interrupt instruction to allow the application in the foreground to continue. If the program is written properly, the person using the gateway computer as a workstation never notices that the computer’s serial ports are being shared.

Similar processing takes place in a dedicated gateway, and it may even use the no-wait option on the Listen command. If so, the software monitors the Final-Return-Code field of the Network Control Block to determine when the command is complete. The difference is that the dedicated gateway software doesn’t have to worry about coexisting with other applications. However, both the nondedicated and the more sophisticated dedicated gateways have characteristics that make them multithreaded.

In dedicated and nondedicated gateways, once you’ve created a NetBIOS session, the dialogue consists of the workstation asking the gateway, “Do you have characters you’ve received from the modem?”, “Is the carrier still active?”, or “Can you send these characters through the modem?” The gateway processes each of these messages by honoring the request and sending back received characters and a result code.

Stand-alone communications programs typically poll the keyboard and serial port in a tight loop: “Is there a keyboard character I should send to the modem? If not, is there an incoming serial port character I should show on the screen? OK, go back and check the keyboard again.” As you can imagine, the polling of the serial port (or, more accurately, the buffer of received characters) happens many times per second.

If, in a gateway environment, each workstation sent its polling request to the gateway as a NetBIOS message, the LAN would begin to creak and groan under the strain. A better approach is to have the workstation and gateway be a little smarter than the average stand-alone communications package. The workstation sends a message containing the entire dialing command and phone number. It also issues a single “Any incoming characters?” request and assumes that there aren’t any until the gateway replies with a message packet containing one or more received characters. If you’re sending multiple characters across the line, as in the case of an X-MODEM file transfer, the workstation sends each data block of characters as a single NetBIOS message. Reporting a lost carrier is the responsibility of the continued

gateway software; it’s not a polling function within the workstation.

LAN communications software on both the workstation and gateway have to deal with NetBIOS return codes and a stand-alone environment. For example, what should a gateway do if it has an active, carrier-present communications session with a remote computer and it suddenly finds that the workstation that it’s serving is no longer talking back? The programmer must decide whether the gateway software should hang up or wait for the workstation to resume the dialogue.

Troubleshooting

Some problems with gateway computers are easy to pinpoint. If usage increases, you may have to add more capacity in the form of additional modems or gateway machines. Other problems are more subtle. A gateway may be capable of managing multiple NetBIOS sessions with multiple workstations, but you may need to increase the default NetBIOS session limit (commonly six sessions) on the gateway computer. Fortunately, most NetBIOS emulators allow command-line parameters.

If you’re in the midst of a communications session through a gateway and someone accidentally reboots the gateway or kicks its power cord, you’ll get an error message and lose the connection. Since the gateway is out of sight somewhere, error messages usually mean that it’s time to get up and take a walk to see what’s happening. Unless it’s only for occasional dial-out use, a gateway should receive some of the same security precautions you give to file servers. These include physical isolation from the normal work area, a sign near the machine warning people to avoid rebooting the gateway, and a written, posted procedure for starting the LAN that also contains directions for activating the gateway computer.

Selecting A Product

If you decide to add a gateway to your LAN, you almost certainly won’t be able to go down to the local computer store to see demonstrations of each of the types of gateways. Although LANs are proliferating rapidly, LAN products like gateways aren’t yet considered off-the-shelf items.

A good place to start your research is with the manufacturer of your particular LAN hardware and software. The vendor will have its own gateway product or will recommend a third-party package.

The next step is to know what questions to ask. For instance, can you configure the software for dedicated or non-dedicated operation? Can you use your existing communications software with the gateway, or will you need to buy new software? How many users does the software license allow? Does the software support terminal emulation, file transfers, scripts, and macros? Does the communications server support NetBIOS? XNS? IPX?

Only when you have fully defined your requirements can you select a product that’s right for you.

Coprocessor-based display controllers bring new speed and flexibility to PC graphics

Steve Apiki, Howard Eglowstein, and Rick Grehan

In the days when the C> prompt was common, handling the video display was not a big deal. You worked with a grid of 80 by 25 characters most of the time, switching to 640-by-350-pixel graphics mode to draw the odd introduction screen—nothing an 8088 or 80286 couldn’t handle along with the rest of its chores.

Alas, those days are gone. Today’s graphical user interfaces, windowing environments, CAD, and desktop publishing applications can put quite a strain on the CPU, even if it’s an 80386. The dumb frame-buffer approach taken by VGA and previous graphics adapters can no longer support the higher resolution and higher speed that exacting applications demand.

The future of microcomputer graphics lies with intelligent display controllers. Manipulating the display space of even a medium-resolution (1024-by-768-pixel), noninterlaced display can mean modifying 768K bytes of memory—a lot to ask of the already harried CPU. Move up to 1280 by 1024 pixels, and the requirement goes up to 1.25 megabytes. As resolutions and color depths grow, the time the CPU spends updating the display grows along with them. The most effective solution is to relieve the CPU of this burden and to put control of display memory in the hands of a dedicated processor. Boards built around graphics-oriented chips also benefit from the processor’s hard-wired graphics functions.

This month, the BYTE Lab examines 11 intelligent graphics controllers with an eye toward their performance in CAD and desktop publishing applications. We’ll also get a glimpse at how some of these boards perform under the TIGA (for Texas Instruments Graphics Architecture) interface standard (see the text box “Benchmarking the TIGA” on page 188).

All these cards support at least 256 simultaneous colors (8-bit pixel depth) and either 1024-by-768-pixel or 1280-by-1024-pixel resolution. Two of them are designed for the Micro Channel architecture (MCA); the rest are AT-compatible. They fall into a broad price range, from around $1000 to close to $4700, with a corresponding range in capability and support software (see table 1).

Each of the 11 cards shares the same basic design: at the heart of the board, a TMS34010 GSP (for Graphics System Processor) from Texas Instruments (TI); some video memory to hold the display map; and circuitry to drive the monitor.

On-Board Intelligence

TI’s TMS34010 is probably the most popular graphics processor in the current PC market. Its powerful graphics capabilities have earned it a place in everything from frame grabbers to printer controllers, including, of course, display controllers.

What makes the 34010 so well-suited to graphics is not immediately obvious. A quick glance at the instruction set reveals a typical repertoire: arithmetic operations, logical operations, comparisons, jumps—nothing surprising. There are the usual addressing modes: register-to-register; immediate-value-to-register, and absolute-or indirect-address-to-register.

Look a little more closely, however, and you’ll find some instructions with unfamiliar mnemonics. These are the dedicated graphics instructions. They are hardware implementations of essential graphics functions, such as filling a pixel array, drawing a line, pixel block transfers, and comparing a point to a window.

There’s also a graphics-oriented register indirect in x,y addressing mode. In this mode, a register holds a pixel’s address in x,y form—the pixel’s Cartesian coordinates on the screen. The mode relieves the software of the time-consuming job of working out the mapping of each pixel’s memory address to its screen location.

Delve even deeper into the 34010’s architecture, and you’ll find that the device is built for graphics from the ground up. It has 30 32-bit registers divided into an A bank and a B bank. The A bank registers are general-purpose; software can use them for temporary storage during computation. B bank registers are specialized; they hold information like the location and dimensions of the current clipping window or the current foreground and background colors.

While the 34010 would make a credible stand-alone processor, the designers built in special provisions for working in a coprocessing environment. Twenty-eight I/O registers map to high memory locations in the 34010’s address range. Some of these registers are directly accessible by the host processor via external pins. Hardware designers were relieved to see this; it made it easier for them to design a microcomputer-to-34010 interface. The programmer’s job was also made easier; through these I/O registers, the host microcomputer can read from and write to the coprocessor board’s memory, halt the 34010, and restart it at a known address.

The Brains Behind the Graphics

Coprocessor-based display controllers bring new speed and flexibility to PC graphics.
These boards also require video memory, a color lookup table, and video D/A converters (DACs). Most also include DRAMs for local code and data storage, and instruction ROMs.

The size of the video memory usually determines the resolution/color-depth combinations that a board can achieve. Each pixel requires at least 1 bit; in 256-color mode (2^8), each pixel requires 8 bits. For example, a 1280- by 1024-pixel card operating in 256-color mode requires 1280 x 1024 x 8 bits, or 1.25 megabytes. Cards that have more video memory than a single display page requires can use it to retain off-screen images that it may need for smooth scrolling or other quick recall.

The value of each pixel, stored in video memory, is indexed to a video DAC through a color lookup table. Video DACs typically have far greater color resolution than video memory can support—a typical value is 8 bits each for red, green, and blue, or 24 bits. A 24-bit lookup table allows the board to select, in 256-color mode, 256 of the possible 16.7 million colors that 24 bits allows. The lookup table/DAC combination, therefore, determines the size of the complete color palette.

On the other side of the DAC lies the analog monitor connection. The board's output scan frequency and bandwidth, which vary with resolution, determine whether or not a monitor is compatible. Typically, a high-frequency or multi-scanning monitor is required.

With the exception of the Enertronics Aurora 1024, each of these devices includes some local DRAM. DRAM can hold downloaded 34010 instructions or screen-related data. When running some CAD programs, including AutoCAD, on-board DRAM might contain a display list. A display list records vector positions in a drawing, dramatically speeding redraw and similar operations by relieving the CPU of repeated vector calculations. Display lists can also be maintained in system memory or even on disk.

One of the more interesting features offered by several manufacturers is VGA pass-through capability, which allows you to hook to VGA hardware via the VGA extension on the MCA bus, or a special cable between the coprocessor card and the VGA card's top connector.

GRAPHICS COPERPROCESSOR BOARDS

You then run the output of the intelligent card to a multiscanning monitor that can handle both high-resolution and VGA frequencies. Whenever the board is not active, it allows the VGA card to drive the monitor; when the board becomes the active display controller, it takes over the connection.

Other common components include controller ROMs, which may include IBM standard-mode (e.g., CGA or MDA) emulation firmware. Without emulation, add-on VGA modules, or VGA pass-through, you'll require a dual-monitor configuration. Some manufacturers put proprietary operating systems or software interfaces, such as DGIS (for Direct Graphics Interface Standard), onboard as well.

Application Tests

Currently, CAD and desktop publishing applications represent the most likely uses of these graphics boards. We ran several tests under the two most popular of these packages, Autodesk's AutoCAD release 10 and Aldus PageMaker 3.0; the results are graphed in Figure 1. PageMaker runs under Microsoft Windows, so results of the PageMaker test also give a good feel for the effectiveness of the Windows driver.

All our tests on AT-compatible cards were carried out on a Compaq 20-MHz 80386, and we tested the MCA boards on a 16-MHz IBM PS/2 Model 80. We completed the test system with one of three monitors: either NEC's MultiSync XL, which covered the lower-resolution (hence lower-frequency) controllers; or a Hitachi HM-4319 or Mitsubishi HL-6905, which both span the 30- to 65-kHz frequency range and worked with all these graphics boards.

Our AutoCAD tests were designed to test both display list and non-display list performance. Since many of these cards require expanded memory for display-list storage, we portioned out 512K bytes from extended memory using the Compaq Expanded Memory Manager (CEMM) on the Compaq or the Quarterdeck Expanded Memory Manager on the Model 80.

We used two files for the AutoCAD tests, one medium-size (300K bytes on disk and requiring a display list between 256K bytes and 512K bytes) and one large (453K bytes on disk with a display list larger than 512K bytes). The large

continued
Figure 1: Graphs of our benchmark results: Each graph shows actual time in seconds, so smaller bars mean better performance. Times for Compaq’s VGA card are included for comparison. (a) The small AutoCAD drawing, designed to require a display list of less than 512K bytes, tracks the effectiveness of each display-list processor. (b) Most boards couldn’t hold the display list of the large AutoCAD drawing in memory, but boards with disk-overflow capability (Compaq 1024 and Pro1280) handled redrags gracefully. (c) PageMaker Zoom and Scroll tests reflect the effectiveness of a card’s Windows driver.

file was sized so that it would force display-list overflow on boards that relied on expanded memory or had less than 512K bytes free on-board.

For each file, we timed redraw, pan, and zoom operations. The display-list drivers of some boards provide enhancements to the standard AutoCAD command set, with special commands to activate display-list functions. Where these enhancements were used, we timed the three operations using the dedicated display-list commands; if these were not available, we used standard AutoCAD functions. Photo 1 shows the large AutoCAD display.

We also timed two simple, graphics-bound functions in PageMaker. Our sample file included two facing magazine pages (see photo 2), which incorporated large and small bit maps, as well as text. The Zoom test is merely a Control-W key sequence in PageMaker, which sizes the facing pages to fit in the display window. It reflects the time required to display both pages.

Our second PageMaker test, Scroll, measures the time it takes to scroll from one side of the set of pages to the other. We scrolled across the window by holding down the arrow at one end of the scroll bar, forcing the display to update rapidly. To eliminate time wasted on disk access, we set up a large EMS disk cache and primed it by selecting the test pages several times.

A closer look at each board reveals qualities that a glance at the graphs and tables can’t show. A description of each board follows; products are grouped alphabetically within resolution categories.
If these images didn't catch your eye, then why are you reading this ad?

Images that leap out at you, especially in a magazine like this, have to be powerful. And whether you need to present your business information more effectively or you want to expand into multi-media, you need strong visuals. Together with Truevision, you can develop that power for presentations, CAD, training, video production and more. And it's easier than you think. You can bring photo-realism and multi-media to your presentations by using a TARGA board with compatible software and peripherals from over 200 companies.

With a TARGA videographics board and your PC*, XT* or AT*-class machine, you can capture images in real-time from a video source, merge them with other images or add text and graphs, even create stunning broadcast-quality animations, and then output the result to video, tape, slides or paper prints. That's how to maximize your presentation efforts into multi-media.

Truevision videographics cards are ready for you today. Contact us at 800/858-TRUE for more information, or visit your local Authorized Truevision Reseller for a demonstration. We'll show you how to visualize your data in a way that no one else can.
Imagine your present printer turning out crisp, high resolution plots while you continue to work, without interruption, at your PC.

The E0graph Plus add-on board lets you do that, and more.

You have total control over eight different line widths, and as many colors as your printer offers.

You can produce drawings 15 feet long, and longer, in any carriage width.

How about multiple plots, or automatic queuing of text and plots?

Yes, the E0graph Plus lets you do that, too—with ease.

Think of it! Using virtually any CAD or graphics program, you can work at your PC while your printer generates plotter-quality drawings with nearly incredible detail.

Best of all, you get all of this without the headaches, or expense, of baby sitting a plotter.

Thousands of users agree:

No other PC add-on can increase your productivity, or pay for itself so quickly, as the E0graph Plus.

It may sound too good to be true, until you call for the facts, toll-free, at 1-800-548-5780.

Although the Artist TI12 demonstrated good performance, it could not live up to expectations set by its high price. At $4695, the Artist TI12 was the most expensive board we reviewed, and it is less well equipped than a few less costly cards. Upgrades don't come cheaply, either: It costs $895 for a 1-megabyte DRAM upgrade and $1695 for 2 megabytes. $795 for a VGA Module, and $249 for a VGA pass-through kit.

The Artist package includes diagnostic software, PGL (for Professional Graphics Language) drivers, and the TIGA driver package. Control Systems does not provide any separate application drivers, so we tested the board exclusively under TIGA. If you choose to communicate with AutoCAD through PGL, you'll have to forgo display-list processing.

TIGA's AutoCAD driver supports a display list in expanded memory, but it does not have some of the slicker display-list features demonstrated by the other packages. More important, the driver is written for AutoCAD release 9 and does not support display-list-based pan and zoom functions.

The driver intercepts standard AutoCAD commands; if the display list overruns the allotted expanded memory, all display-list processing is disabled. This is hardly a weakness of Control Systems' product, but it causes the Artist TI12 to suffer in comparison with boards like the Matrox PG-1281 and Pepper Pro1280.

The display list was enabled for the small drawing and disabled for the large drawing. While the board was very responsive when doing redrags with the display list, pan and zoom functions suffered from using the TIGA driver. Non-display-list drawing times were excellent, so if you lack the memory to use the display list, the penalty won't be that great.

All installation and testing went without a hitch. We did notice a bug in the TIGA Windows driver that keeps it from properly displaying dragged bit maps, but the problem can be corrected by forcing a redraw. Performance under Windows and PageMaker was generally very good.

The Artist TI12’s only glaring weakness is in the critical category of price versus performance. While the hardware seems to be in excellent shape, software support is limited, and the current early versions of TIGA drivers do not manage to squeeze out all the performance that they could.

The IMAgraph board is the optional ACAD ADI display-list driver. The standard driver gives you full resolution and color but no display-list capability. The $195 IMAzoom package buys you display lists and real-time display of pans and zooms. Clicking on the IMAzoom Shutter brings up a smaller window and a submenu. An overview of the screen is shown within the window, and you use the digitizer to control the interactive zoom and pan functions.

In spite of the display-list support, the IMAgraph board consistently turned in some of the slowest times in our AutoCAD tests. The TI-1210-8 keeps all display lists in local memory. Unfortunately, the on-board memory was too small for either the small- or large-file display lists—IMAzoom with our files required more than 512K bytes, so we lost display-list capability. If you do a lot of work with AutoCAD, you may find that IMAzoom is such a useful addition that a RAM upgrade may be a worthwhile investment.

The optional Microsoft Windows driver handles the IMAgraph board nicely. The text and menus are clear and easy to read. The display driver handles bit maps rather slowly, a handicap if you need to move a lot of high-resolution images. One of the two pages on our PageMaker...
Are you asking yourself what a bear has to do with super speed, remarkable resolution and fabulous colors? We did, too. How can anyone bear to work with less than incredible speed, we asked ourselves. How can anyone bear to work without extraordinary resolution? Bear to work with less than 256 spectacular colors? We got so beared out, we decided to share one with you. Along with the bear facts about ATI's award-winning board.

Such as:
• high resolution 800x600 and 1024x768 graphics
• fast 16-bit bus support
• 100% register-level compatible in VGA®, EGA®, CGA®, MDA®, and Hercules® modes
• analog and digital monitor support
• easy, switchless installation
• high resolution and 132 column drivers
• Microsoft® compatible bus mouse and mouse port included

TAKE CHARGE!
Does What All These Utilities Do Plus Task Switching...

IN ONLY 20K OF RAM!

This power packed integrated program has received one great review after another. It is the utility of choice and most used by the industry's top PC review editors when it comes to serving their own personal computing needs. The reasons are simple. Take Charge! packs just about every utility you're likely to need in just 20K of RAM. The built in Task Switching feature will allow you to suspend one program and pop up another from within the current running program and return you to the exact location you left. Go from lotus to dbase and back. Take Charge! even Task Switches other well behaved TSR's and utility programs like PC Tools Deluxe 5.1, Advanced Norton, Xtree Pro and more in only 20K of RAM by making them part of Take Charge!.

Take Charge! is intuitive. It's easy to use and easy to learn, and best of all it requires no knowledge of DOS commands. Simply point, shoot and press function Keys.

Take Charge! includes: Menu program, Task Switching, Disk Services, File Management, Communications, DOS Shell, Disk Optimizer, Data recovery, RPN Calculators, appointment calendar, Rolobase/autodialer, screen blanker, Virtual memory text editor and more.

test document is a full-screen bit map, digitized at 300 dots per inch. When this page is redrawn, the display bogs down considerably handling the bit map. Objects belonging to Windows, such as lines, rectangles, and text, are displayed much faster. Pull-down menus suffer the same fate as large bit maps. When you select a menu from the menu bar, it appears very slowly. We found this rather annoying.

At $4195, the TI-1210-8 costs much more than the Number Nine Pepper Pro1280, but it's competitive with the other 1280- by 1024-pixel boards. We wouldn't choose this board for Windows, but the AutoCAD/IMAzoom combination makes the IMAgaph board (with sufficient memory) worth a look.

Matrox PG-1281 C/8/1.5M

The Matrox PG-1281 provides CGA emulation in addition to full PGA compatibility. We tested the version for the AT, but the board is also available for the PS/2s, Multibus, and VMEbus computers. We tested the optional drivers for AutoCAD release 10 and Windows.

The installation manual is very detailed. It's a good thing, too, as the evaluation unit came without a video cable. After several minutes of poking through the manual, we found the description of the video connector and located a suitable cable. Matrox sells video cables and monitors as options.

AutoCAD really likes this board. Our tests placed the Matrox as one of the fastest 1280- by 1024-pixel boards. Memory may have something to do with it. The unit we tested was equipped with the standard 3.5 megabytes of memory. There are 2 megabytes provided for video, and 1.5 megabytes handle the downloading of 34010 programming and display-list support. It takes a lot of horsepower to handle that much memory, and Matrox gave this card three custom gate arrays to boost the performance of the 50-MHz 34010 processor. The AutoCAD drivers are easy to install and provide support for the basic AutoCAD set—no fancy extras.
Bringing people and information together is what a Microcom LAN Bridge is all about. And, with our unique MNP® Data Compression feature, remote LANs can be connected at unprecedented performance levels. MNP squeezes twice the performance out of your wide-area link compared to other bridges at a fraction of the price.

In fact, the Microcom LAN Bridge is the only remote bridge on earth that uses data compression to move oceans of data between LANs. And, it's the first to support Token Ring networks, in addition to the Ethernet LAN standard.

Think about it. A fully integrated transparent MAC-level bridge built around the IBM PC/AT bus. In four fully upgradeable, multi-line models with speeds from 9600 bps to 1.544 Mbps (T-1). And with prices beginning at $6,198, the only thing a Microcom LAN Bridge can't squeeze is your budget.

The Microcom LAN Bridge. It brings information and people closer together, no matter where in the world they are.

In addition to the obvious price barrier, the major obstacle keeping coprocessor-based graphics systems from every user is a lack of suitable standards. A separate driver for each board/application combination is fine when you dedicate a board to a single CAD package, currently a likely scenario. But when your intelligent graphics board becomes your primary adapter, such an arrangement becomes intolerable.

The migration from the high end to every desktop has just begun, but already the battle for standards has been joined. Texas Instruments and 8514 supporters Western Digital and Headland Technologies are currently wrangling over the next great mainstream graphics standard (see "Clash of the Graphics Titans," IBM Special Edition, Fall 1989). TI touts its own 340x0 family and TIGA-340, while its rivals champion their versions of IBM's 8514 processor and the 8514 Application Interface (8514 AD).

Texas Instruments' Graphics Architecture, or TIGA, is a new software interface—the first released version (1.1) began shipping in early June. Still, its list of announced supporters from both the software and hardware development communities is impressive, and its emergence as a standard seems likely. To get a feel for the relative performance of the reviewed boards under TIGA, we developed a suite of benchmark tests, described below.

TIGA's Role

From the user's perspective, TIGA-340 is a library of graphics routines that allow application programs to communicate with boards built around chips in TI's 340x0 family. Furthermore, TI has rigorously defined the behavior of each routine in the TIGA library, so that a programmer developing an application on one TIGA board can rest easily in the certainty that his or her application will also run on any other TIGA-compatible system.

From the developer's perspective, TIGA is really two pieces of software: the communications driver, which runs on the host PC, and the graphics manager, which runs on the 34010 coprocessor board. The communications driver is actually a TSR process that usually installs itself in interrupt 7f hexadecimal. Application-generated TIGA calls pass down to the TSR process, which puts them into a kind of graphics message packet and sends them to the coprocessor board. The graphics manager then picks up the messages, determines which operation is to be performed, and executes that operation.

Any TIGA-compatible board is expected to support a minimal set of graphics operations (primitives). These are the routines that a programmer can expect to find available on all TIGA boards. The primitives are divided into two groups—core and extended. Core primitives are always available; they are loaded onto the coprocessor board when TIGA is installed (typically at boot-up). Extended primitives are optional; an application program may opt to load them only as required.

One of TIGA's strengths is that it doesn't bury that hardware under an inflexible application programming interface. Applications developers can define their own primitives, referred to as user-extended. So, if you determine that your graphics algorithms execute more efficiently when running on the 34010, you can write the routines in 34010 code (TI sells developer's kits for doing this) and build your own library of primitives. Then, at run time, your application can request that TIGA download your customized primitives to the coprocessor board. Applications can even switch libraries on the fly, deleting one set of user-extended primitives and loading another in its place.

The Benchmarks

Our TIGA benchmarks measure combined board-and-driver performance in executing common graphics tasks. They make extensive use of the TIGA 1.1 library, and they don't attempt to wring out every drop of performance through the use of user-extended primitives. Benchmarks work with objects sized in pixels, so they are independent of screen resolution.

Bit-block transfer (BitBlt) is more or less a test of memory-move operations. The BitBlt benchmark is in three parts. The first part moves a rectangular region of pixels from one region of the screen to another. The location of the source and destination regions were purposely chosen to overlap, so that the on-board transfer routine would have to set the direction pointers correctly. The second test copies a rectangular region from on-screen memory to off-screen memory and then repeatedly copies the block from off-screen memory back to

on-screen memory. The times for these two benchmarks were always identical, so we combined the results under the "BitBlt" heading in table A. The final test gauges the TIGA driver's zoom capabilities. By means of a BitBlt, the program first transfers a region from off-screen memory to successively larger regions on the screen. It then copies the bit block from the off-screen source into successively smaller on-screen regions. The effect is a box that first grows to fill most of the screen and then shrinks back to its original size.

Clipped lines and clipped ellipses test the clipping capabilities of the TIGA hardware. The program first defines a clipping rectangle on the display and then repeatedly draws lines whose endpoints are chosen at random. Many of the lines have endpoints that lie outside the clipping rectangle; the board is therefore forced to perform clipping on such lines. The software rotates through the color palette as it draws the lines. Next, the program clears the screen, reestablishes the clipping rectangle, and repeatedly draws ellipses whose bounding rectangles are chosen at random. (The bounding rectangle of an ellipse defines that ellipse's center location and major and minor axis lengths.) Again, portions of the ellipses lie outside the clipping rectangle. The program rotates through the color palette as it draws the ellipses.

Filled polygons tests the speed with which the board can draw pattern-filled and solid-color-filled polygons. We defined four polygons of various shapes—one with holes in it—to give the filling algorithms something to think about. We also defined four fill patterns. The benchmark repeatedly draws each polygon, randomly selecting its size and location. On each iteration, the program alternates between drawing the polygon filled with a solid color or with one of the defined patterns.

Text tests each board's capabilities at drawing clipped text. The program reads a string of 5000 characters from a data file and then formats that string so that it will fit into a block defined to be a set number of pixels wide and high. The formatted text is kept in main memory. Next, the program establishes a clipping rectangle and then repeatedly writes the text out to the screen at random locations; hence, portions of the text block fall outside the clipping region. The program executes the test twice. In the first part, it displays the text in a single color with an opaque background; in the second, it cycles through the entire palette while displaying text with a transparent background.

Gauging Performance

The results of these tests on the boards in this review that support TIGA 1.1 are shown in table A. Where a board had more than one pixel depth configurable through TIGA, we ran it in both 4- and 8-bit modes. We tested AT boards on a Compaq 386/20, and the MCA boards on a 16-MHz IBM PS/2 Model 80.

Each board showed consistent performance from test to test. Results were surprisingly unlike those generated by our PageMaker application tests, despite these boards' use of the same TIGA Windows driver. The PageMaker tests seem more dependent on the ability of the Windows driver to properly utilize the 34010.

The MCA-based Pepper Pro1280/ MC demonstrated outstanding speed. Its bus and 60-MHz processor contributed to excellent performance on all but the text benchmarks. The results are even more impressive when you consider that the board was run on a machine with a slower main processor than any of the others and that the text benchmarks are relatively main processor-dependent.

Number Nine's Pepper Pro1280 and the Control Systems Artist TI12 ran at nearly a dead heat. Although the two boards turned in virtually identical times on most benchmarks, the Control Systems board had a slight edge. The Pepper Pro1280 did not have enough DRAM to store the polygon definitions in 8-bit mode, and so it could not execute the polygon benchmark. PC Tech's Color 34010 Board ran noticeably slower than the others, as its lower processor clock rate (40 MHz versus 50 MHz) might lead you to predict.

Differences between 4- and 8-bit modes were only apparent on benchmarks that had a high ratio of pixel manipulation to calculation. The calculation-intensive clipped lines and clipped ellipses tests, notably, did not seem pixel-depth-dependent at all.

Windows is not the Matrox board's strong suit. It's rather slow in redrawing bit maps and appears to have coarse control over its color selection. As for speed, it ranked near the bottom, along with the IMAGraph board.

Overall, we liked the Matrox PG-1281. It would be a good choice for serious AutoCAD users due to its speed and exceptionally clear display. The list price of $4595 includes more memory than any other board we tested. OEMs and value-added resellers will like the complete documentation, which makes it easier to install in complex CAD systems.

Number Nine Pepper Pro1280

The Pepper Pro1280 is a veteran among 34010-based graphics cards. Introduced in December 1986, the Pro1280 is still a top performer despite its limited DRAM capability. The board as we tested it sells for $2995; a unit with a larger lookup table and a 16-million-color palette costs $3495. The board ships with TIGA and proprietary NNIOS drivers; current versions also bundle in TIGA drivers for Windows and AutoCAD. One drawback of this older unit is its inability to work with VGA cards. Not only does it not support pass-through, it can't even coexist with a VGA in the same system.

Prices are fairly low because the board includes only 128K bytes of instruction memory; the next lowest in the 1280- by 1024-pixel class is the IMAGraph board's 512K bytes. While other models provide for RAM expansion, the Pro1280's DRAM capacity is fixed. This kept us from running our Polygon benchmark under TIGA and may restrict other programs that require an on-board (but off-screen) memory workspace.

Number Nine's Power9 display-list driver does not even attempt to use on-board memory for display-list storage. It keeps the display list either in expanded memory or on disk. One sharp feature that we found surprisingly rare among these boards was the ability to use the disk as necessary if the expanded-memory display list overflows. Most drivers simply disable display-list processing continued

Somewhere Over The VGA Clutter Lies a Clear Choice

Finding the right VGA card can be a long and confusing journey, so follow the name you can trust. Hercules, the company that defined PC graphics, brings you the Hercules VGA Card. At just $299, it’s everything you need to enter the kingdom of color.

**Compatible.** The Hercules VGA Card delivers all 17 IBM standard video modes so your EGA and CGA software will be at home. And it will work with any color or monochrome analog video VGA monitor.

**Simple.** The Hercules VGA Card is easy to install and use with no switches, jumpers or custom software drivers. And since the Hercules VGA Card is faithful to the VGA standard, you’ll use future software without needing extra drivers.

**Beautiful.** Over 256,000 colors will brighten your workday routine. And the Hercules VGA Card’s 1/1 aspect ratio makes a square look like a square and a circle look like a circle.

**Adaptable.** VGA has set the course for operating systems of the future. Windows, OS/2 Presentation Manager and DESQview depend on the Hercules VGA Card’s readable registers for multi-tasking ease.

NEC MultiSync Graphics Engine

NEC's relatively new MultiSync Graphics Engine is, at $1999, likely to be one of the boards that leads medium- to high-resolution graphics into the mainstream. The card has built-in VGA and supports DGIS and CGI software interfaces. NEC has also announced TIGA support, and although drivers are not available at this writing, they should ship before you read this.

One of the likely tasks for a mainstream intelligent graphics card is managing graphical user interfaces like Windows and Presentation Manager (PM). The NEC board has a good start there, with a strong performance on our Windows test—only Compaq's AG 1024 was faster among 1024- by 768-pixel adapters. The driver also worked without a hitch. NEC also claims to have a driver almost ready for release that accelerates
High Resolution and Wide Screen for PCs and Apple Mac

**FLEXSCAN**

**MODEL 9400**

Increasing sophistication in the use of personal computers for general business applications, CAD and DTP has led to a growing demand for better resolution and larger display devices. Combining wide compatibility and functionality with the latest ergonomic design, the FLEXSCAN 9400, with a maximum resolution of 1280 dots X 1024 lines, will not only meet these requirements but those of the next generation of advanced business PCs.

**Wide compatibility**

With a wide Horizontal scan frequency range (30-65kHz), the FLEXSCAN 9400 is compatible with most signal sources, including standard VGA, extended VGA, 8514/A, Ultra Hi-Res Graphics controllers for PCs, as well as the Macintosh II and its Hi-Res Graphics Adapters. With the FLEXSCAN 9400, future compatibility is assured.

**Latest Technology**

By adopting a DBF (Dynamic Beam Forming) Electron Gun CRT, resolution, convergence and brightness in the screen corners have been improved over a standard CRT. By combining this with Dynamic Focusing Circuitry, the FLEXSCAN 9400 will give a sharp and bright display image over the entire screen. The 9400 also has 2 input terminals (BNC X 5 and D-sub 9 pin) which can be easily selected from a front mounted switch. This convenient feature enables the professional user to have a one-monitor solution even if he runs both Ultra Hi-Res and general business applications.

**Ergonomics and Utility**

The CRT of the 9400 has a special coating which not only reduces reflection but also the static electricity generated on the surface of the screen.

PM performance.

Under AutoCAD, benchmark results were mixed. As a caveat to all these results, we were using the only NEC driver available, which only supported release 9 functions. A release 10 driver is on the list of planned enhancements. NEC's display-list driver adds additional commands to AutoCAD and uses expanded memory exclusively. On the small file, where the display list fit within our 512K-byte limit, performance was outstanding. Redraw, pan, and zoom operations all executed in around 1 second.

Where the display-list commands could not be used, however (on the large file test), pan and zoom performance was abysmal. This is because the driver forces AutoCAD to regenerate the drawing when zooming on a three-dimensional display.

Another glitch that may or may not be related to differences between release 9 and release 10 came in mixing AutoCAD and NEC extended commands. If you mix NEC pan and zoom commands with standard AutoCAD pan and zoom commands, AutoCAD will lose track of the proper image position.

Overall, the NEC board seems to offer great potential at a good price. Although the driver will limit you if you're using AutoCAD release 10, the underlying hardware performs solidly. If NEC puts all the planned software support in place, the MultiSync Graphics Engine should be an outstanding product.

Number Nine Pepper Pro1024/MC

This is one of two MCA boards that we looked at. We don't have any way of comparing it to most of the other boards in this review, nor can we compare it to its AT-bus cousin, the Pepper Pro1280. The only fair comparison is to the other MCA board we reviewed, the Vermont Microsystems Cobra/2 HS. In our AutoCAD tests, the Pro1024/MC blew the doors off the Cobra/2 HS. The drivers are very similar, if not identical, to those provided with the Pepper Pro1280. We definitely recommend using the optional ($250) Power9 display-list driver.

Installing the Pro1024/MC is simply a matter of plugging the board into the MCA slot with the VGA pass-through. Once that's done, you boot the computer with the reference disk and set the slot configuration, and you're set. Batch files handle installing the required driver software.

PageMaker ran well, and the display was clear and comfortable to look at. Windows installed easily and ran with no surprises.

Our low-level TIGA tests also ran without a hitch. It's interesting to note that even though the Model 80 is slightly slower than the Compaq 386/20, the Pepper Pro1024/MC completed the TIGA benchmarks faster than any other board in the test.

The list price of $2495 includes 512K bytes of memory and standard drivers for AutoCAD and Windows. Those who use

AutoCAD will want to add the optional Power9 software, bringing the total to about $2750. Still, it’s cheaper than the Vermont Microsystems Cobra/2 HS and runs markedly faster.

PC Tech Color 34010 Board

PC Tech is a relatively low-volume manufacturer that caters to the OEM market. The company offers end-user products as well, including the TIGA-compatible Color 34010 Board. The board has a list price of $1600; an additional 256K bytes of video RAM is available for $250, and 4 megabytes of add-on DRAM will set you back $1200. If you need CGA emulation, PC Tech will add the appropriate ROM at no additional charge, but the company makes no guarantees about complete software compatibility.

The board is bundled with both TIGA and DGIS software interface drivers. We ran AutoCAD and PageMaker tests through the TIGA interface. Because the Color 34010 Board used the same TIGA ADI driver as the Artist T112 did, pan and zoom functions were handicapped. Still, the board is clearly not as fast as most of its competition. The same trend showed on our low-level TIGA benchmarks—in both cases, we attribute the slow runs to the relatively slow 40-MHz TMS34010.

If you’re looking for an off-the-shelf speed demon, you’re probably looking at the wrong board. In addition to its slow performance, the Color 34010 Board is poorly documented by end-user standards.

On the other hand, the board seems ideally suited for the user who doesn’t require a lot of hand-holding. The no-frills price is very attractive, and the fact that it runs glitch-free is appealing. PC Tech custom-configures boards on an order-by-order basis.

Vermont Microsystems, Inc. is no newcomer to the world of high-resolution graphics. In fact, the company wrote the book on PGA compatibility. VMI designed the PGL language that drives the PGA and designed IBM’s original PGA. Our tests included two major applications, but dozens more support PGA and compatible cards. Add to that number the countless other vertical-market and custom applications developed for the PGA, and it’s enough to make your head swim. The Cobra Plus isn’t the only PGA-compatible card we tested, but, because it comes from VMI, we would be willing to believe that it’s the most compatible.

*Readers Poll, Data Based Advisor, February 1989

CATEGORY: BEST DATABASE MANAGEMENT GRAPHICS PACKAGE.

dGE the most powerful database graphics package on the market, has just been voted the best graphics tool for a database manager,* according to the readers of Data Based Advisor. You think that’s impressive, consider this: the vote was based on dGE 2.0. Now dGE 3.0 is here.

**dGE 3.0 is better than ever.**

The Graphics Design Center, included in the new 3.0 version, supports the creation of graphic charts and pictures in a free-form menu driven environment.

So instead of requiring you to program in dBASE source code, the graphics Design Center writes the code for you. It’s designed the image using pull-down menus and WYSIWYG editing screens.

Here’s more good news. Version 3 also adds a font editor, expanded printer support, 3-D bar graphs and more.

Impress your boss, your clients, and yourself. Easily.

dGE does what you want. And it does it with the dialect of your choice. Consider the possibilities:

Unfortunately, our tests showed disappointing performance. AutoCAD release 10 runs flawlessly on the Cobra Plus, although it turns in the slowest times of any board with full release-10 drivers. We had hoped for better performance from a 60-MHz 34010. The board is easy to install, and VMI’s installation program takes care of the device and application drivers.

Windows is something else altogether. The Cobra Plus and Cobra/2 are the only two boards that displayed any serious problems running our PageMaker tests. Windows does its scrolling by copying large blocks of display memory from place to place. Several times, we noticed that the Cobra Plus had difficulty scrolling a window that was overlapped by another window. Parts of the lower (moving) windows would sporadically appear within the white spaces of the stationary upper window.

In the scheme of things, that’s far from disastrous. But several PageMaker utility windows rely on tiny icons of arrows and triangles to control different aspects of operation. VMI’s Windows/286 driver was unable to render many of these little objects, replacing them with much larger black rectangles. Setting tabs was the worst case. It’s hard enough to grab a 1-pixel-wide arrow with the mouse when you can see it. [Editor’s note: Since this was written, VMI has announced a new Windows driver that it claims fixes the pixel-wide arrow problem. The driver should be available by the time you read this.]

The Cobra Plus could be faster. At $3395, it’s not inexpensive. On the other hand, the display quality was excellent, and we feel confident that if anyone can build a 100 percent VGA-compatible board, VMI can.

Vermont Microsystems Cobra/2 HS

This is the MCA version of the Cobra Plus board. It is based on the same 60-MHz 34010 as the Cobra Plus, and, with nearly the same drivers as on the Cobra Plus, it performs identically.

The Cobra/2 costs $3395. For less money, the Number Nine Pepper Pro1024/MC runs much better. If you need absolute PGA compatibility, this card is a safe bet, but otherwise, the Number Nine board is a better deal.

A Perspective

In terms of performance, all these boards exceed VGA. Not so surprisingly, prices are also in a different league. But before you buy, get the latest information from each vendor—these boards are still fairly young, and capabilities and software support change rapidly.

The Number Nine Pepper Pro1280 seems to be the best overall choice for an off-the-shelf, high-resolution board. While it’s an older design and lacks some on-board DRAM, its capable display-list driver makes good use of other system resources, so AutoCAD performance is excellent. The Pepper Pro1280 is also comparatively inexpensive.

If you need a top-of-the-line platform for development, you may want to consider Matrox’s PG-1281. While significantly more expensive than the Pepper Pro1280, this board has powerful hardware enhancements and comes with a vast 1.5 megabytes of DRAM on-board.

For medium to high (1024- by 768-pixel) resolution, Compaq’s Advanced Graphics 1024 is a fine choice. Its combination of speed, price, and ease of use is hard to beat. Unfortunately, Compaq cannot guarantee compatibility if you don’t have a Compaq 80286 or 80386.

Of the two MCA cards we looked at, The Number Nine Pepper Pro1024/MC gets the nod. It performed well under standard applications and showed great promise for use under TIGA.

Two of the stumbling blocks in achieving such high-resolution displays have been the cost of memory and the processing power that’s needed to manipulate it. 34010 boards are one way to get superior graphics without crippling your CPU. Large display memories move you more than a bit beyond VGA.

When something becomes a standard, using it becomes second nature. That's true about LapLink. It's so effective that it has become the most popular laptop-to-desktop and desktop-to-desktop file transfer program ever.

And now Release III improves on the original with added power—while preserving the simple design that has made LapLink the choice of more major corporations.

LapLink III offers both serial and parallel file transfer, and you can take advantage of parallel transfer speeds of 500,000 baud or higher. It comes with a “six headed” universal cable that provides you with everything you need to use both serial and parallel modes.

And LapLink III will even install itself automatically on a remote computer.

That's in addition to ease-of-use and productivity features like our popular split screen design, flexible transfer options, and disk and printer sharing.

For the same fast, error-free file transfers between PCs and Macintoshes, get LapLink Mac. And for more information about any Traveling Software product, call us at (800) 662-2652.

The DECstation brings RISC power to Unix workstations at PC prices

Ben Smith and Rob Mitchell

The DECstation, Digital Equipment Corp.'s lowest-priced high-performance Unix workstation yet, represents a radical approach to development and marketing for the world's second largest computer manufacturer. It also represents a new era in personal computing and a new competitive challenge for low-end workstation vendors.

The DECstation is the first machine from DEC designed to run only Unix. It's also the first DEC workstation to use a CPU from an outside vendor (the MIPS R2000 RISC CPU). These facts alone make the DECstation noteworthy, but it is a groundbreaking machine in other ways as well.

With a starting price of $7950, the DECstation is one of the first RISC-based workstations that are in the price range of personal computers; its introduction has hit the workstation community like a bombshell. Dubbed the "Sun Killer," the DECstation has an excellent price/performance ratio, and its functionality is equivalent to Sun's SPARCStation 1 (see "Two Powerful Systems from Sun," May BYTE).

Heavy Metal
DEC sells two versions of the DECstation: the 2100 and the 3100. With the exception of CPU and memory speed, these machines are identical. The entry-level 2100 is a diskless workstation. It includes an R2010 FPU, 8 megabytes of memory, a 15-inch monochrome monitor, a SCSI connector, switch-selectable "thick-wire" and "thin-wire" Ethernet interfaces, two serial ports, a mouse, a keyboard, and Ultrix Workstation Software for $7950 ($11,900 for the 3100).

The price tag for our test machine, a fully configured DECstation 3100, was $39,300—more than three times the 3100's base price.

At the heart of the DECstation lies a MIPS R2000 RISC CPU, an R2010 math coprocessor, and an R2020 write buffer (see photo 1). The CPU runs at 12.5 MHz on the DECstation 2100 and at 16.67 MHz on the 3100; DEC rates the machines at 10 and 14 million instructions per second, respectively. The FPU puts in a double-precision LINPACK performance of 1.2 million floating-point operations per second on the 2100 and 1.6 MFLOPS on the 3100.

continued

The DECstation's RISC-based performance and low starting price of $7950 are turning heads in the workstation world. Its keyboard, however, is disappointing. It has no Escape key, and many keys are in nonstandard positions or have no function.
Unlike Sun's SPARCStation 1, the DECstation's 32-bit memory bus doesn't support direct memory access, and it doesn't have any expansion slots.

System memory consists of 120-nanosecond parity DRAMs mounted on double-sided, single in-line memory modules; you can upgrade in 4-megabyte increments up to the 24-megabyte maximum. Our DECstation 3100 review machine came fully populated. Also standard are a 64K-byte data cache and a 64K-byte instruction cache. DEC uses 35-nsec static RAM (SRAM) chips in the 2100 and 23-nsec chips in the 3100.

In addition to the SCSI connector, a video port, mouse and keyboard interface that looks like a modified RS-232, you must press the Control and left bracket keys. Many other commonly used keys are located in unusual positions, and many keys are specific to DEC's VMS operating system and have no function at all under Ultrix.

The DECstation's Ultrix Workstation Software includes Ultrix-32, Ultrix/DECwindows, a C compiler, X Window System 11, X User Interface (XUI), and implementations of TCP/IP and NFS. Ultrix-32, the DECstation's operating system, is a robust implementation of BSD Unix that also includes library routines and commands from System V.3. Ultrix has its own versions of /bin/sh and /bin/csh. DEC also provides the standard Unix shells, but having both means that you must pay careful attention to which shell you're running. The obvious advantage to having two versions is the enhancements that DEC provides. The disadvantage is that it's difficult to move between Ultrix machines and other Unix machines. Enhancements are barbed hooks for new users who don't realize what they're getting into. The adoption of the AT&T Korn shell would offer far more to everyone.

Ultrix for DEC's RISC machines contains special commands for optimizing program execution. Two examples are pixie, a program for analyzing program block use, and cored, a program that takes information that pixie generates and rearranges the basic blocks to facilitate better cache mapping. Also included are many utilities for E-mail, network mail, and message handling (the Ultrix

Seven ways to boost your BASIC

ProBas™ Basic Programming Library

So who cares that BYTE magazine calls ProBas a "Supercharger for QuickBASIC" or that PC Tech Journal says that ProBas is a "high-quality, high-quantity package"? Who buys a product just because Jerry Pournelle said "Anyone doing serious QuickBASIC programming would do well to get [ProBas]"? And who cares that Wayne Hemmery calls ProBas "The greatest thing since sliced bread"?

Who?—Only those who want to write better, faster, slicker programs and save hundreds of programming hours in the process. With all of the hoopla out of the way, we are formally announcing the momentous release of ProBas Version 3.1, now with over 400 assembly routines to make BASIC programs faster and more powerful than you ever dreamed with features like:

- A 1,000-page two-volume manual
- Full mouse support
- Extended and EMS memory support
- Full-featured windowing
- Moveable, resizable windows
- Screen snapshots (text & graphics)
- Virtual screens in memory
- Lighting-fast file I/O
- Critical error handling
- String, array, and pointer sorts
- Search directories and archives

Create dazzling screens in text, CGA, EGA, VGA, and Hercules graphics modes with windows that can overlay one another and be moved and resized on the fly. Store megaloads of string, data, or screen snapshots in extended or EMS memory. Draw complex text or graphic screens to memory and snap them on in an eyeblink. The ProBas file I/O routines allow you to read or write huge chunks of data at a clip, far faster than with BASIC.

ProBas also has over 300 other essential services, including handy string, date, time, directory, and array manipulation routines; string, screen, and data compression routines; valuable equipment and input routines; and faster replacements for many BASIC commands.

Whether you are a professional or a novice, ProBas will boost your BASIC in ways you never thought possible. ProBas allows the professional to write faster, tighter code in much less time and allows novices to quickly and easily write professional-quality programs that would be impossible with BASIC alone. The bottom line is ProBas adds power and saves time. After all, how much is a few hundred hours of your time really worth?

For all DOS versions of QuickBASIC and BASCOM. Just $149.00!

ProRef™ On-Line Help For ProBas

ProRef provides on-line help for the routines in the ProBas library. This hypertext manual links directly to the OBJ Advisor in QuickBASIC 4.5 so that the ProBas reference becomes an integral part of your QuickBASIC on-line manual. Includes information and examples on ProBas routines and helpful hints on programming in BASIC. Just $50.00!

Screen Management

ProScreen™ Screen

ProScreen is a full-featured screen generator/editor that will save you more design and coding time than you ever thought possible. ProScreen treats screens like a word processor treats text; provides complete control over characters, colors, and placement. Design input screens with up to 130 fields, 19 predefined and 2 user-defined masks. Save screens to screen files or OBJ files and use the tight BASIC/Assembly code that comes with ProScreen to access the screens. There's no kludgy code generator here! Access hundreds of input screens with less than 25K of total code. Just $95.00!

ProMath™ Mathematics Library

ProMath is a collection of over 150 high-level routines that provide mathematical functions and operations for programmers who often work in mathematics, science, or engineering. Complex variables, real and complex matrices, real and complex trigonometric and hyperbolic functions and their inverses, solution of linear equations, integration, differential equations, Fast Fourier transform, graphics support, and many other useful routines are provided.

For years Fortran has been the language of choice for scientific and engineering applications, but it lacks many of the useful features of QuickBASIC. ProMath contains most of the Fortran mathematical and numeric functions and allows you to easily translate Fortran code to BASIC or write new programs in BASIC, while retaining Fortran's numerical prowess.

The ProMath manual is over 200 pages and provides a complete description of each routine, including any algorithm and the mathematical formula the routine uses, shown in standard notation. For QuickBASIC 4 and BASCOM 6 only. Just $199.00!

ToolKit

The ToolKit is a collection of high-level BASIC and assembly modules that use the routines in the ProBas library to save you even more hours of grunt work. Why spend hundreds of hours re-inventing the wheel when you can just plug in ToolKit modules like:

- Super-fast B-Tree indexing
- Ring, Bar, Pop-Up, Pull-Down menus
- Scroll-bar tag windows
- Dialog boxes with radio buttons
- Two mini-editors with word wrap
- BCD math routines
- Julian date & calendar routines
- Patch EXE files
- Protected memory storage area

The ToolKit now supports EGA and VGA graphics modes for menus, windows, editors, calendars, and more. Complete with BASIC source code and complete documentation. The ToolKit requires the ProBas library and helps conserve your greatest asset of all—time! Just $99.00!

ProBas™ TELECOMM ToolKit

The ProBas TELECOMM ToolKit is a collection of high-level communications modules that you plug into your code to provide popular file transfer protocols, terminal emulations, login scripts and baud rates up to 115,200 baud. You get:

- Xmodem/Modem7/Xmodem-1k
- Ymodem (single and batch)
- CRC-16 and Checksum
- VT52, VT100, ANSI, BBS etc.
- Auto Dialer & data base
- Documented BASIC source

Why use clumsy SHELLS to complex terminal programs when you can plug just the communications routines you need into your code? Implement just the features and commands you want. Requires ProBas. Just $75.00!

DEC'S RISC POWERHOUSE

We found that the Everex actually outperformed the DECstation on low-level, integer-type operations (register, short, int, and long). But the DECstation was nearly five times faster on low-level floating-point operations (float and double). In random and block (sequential) memory operations, the DECstation outperformed the Everex by 10 percent to 20 percent. File operations showed similar performance. Note, however, that RISC processors do not show their true advantage over complex-instruction-set computer (CISC) processors until the compiler optimizes for RISC. The BYTE benchmarks don't reflect performance with normal RISC optimization.

Surprisingly, the margin of performance that the DECstation exhibited on the low-level operations wasn't as significant when we tested more all-inclusive operations. Our shell script test loads the system with various Unix commands and uses intermediate files for reading and writing. In these tests, the DECstation's performance was only fractionally better than the Everex's. And when it came down to our C compiler test, the Everex actually outperformed the DECstation.

Multiple Help Subsystems

The hypertext engine is just a part of the HyperHelp Toolkit. There's a wide selection of help subsystems with various displays, user interfaces, and memory requirements to suit almost any need. Want a small, window-oriented, keyword help system? It's in there! Need a Terminete & Slay Resident help system? It's in there! How about a lightbar indexing system that then pop-ups the selected items? It's in there!

The HyperHelp Toolkit gets it's blazing speed by using the low-level routine in our PRoBas Professional Basic Programming Library. HyperHelp requires the PRoBas Library. See our ad on the opposite page for information on PRoBas, shipping rates, and our thirty-day money-back guarantee.

Special Introductory Price—for a short time this powerful hypertext engine and collection of help subsystems is available for just $99.00!
What this means is that the DECstation is exceptional at crunching numbers. However, when it comes to the more mundane operations of office and software development applications, its performance is good, but not what we would have expected.

**Big- and Little-Endian**

DEC stirred up a controversy when it decided to use "little-endian" memory-mapping byte order in the DECstation, as it does in the VAX. Most other workstations, such as Sun's SPARCstation 1, use "big-endian" order, the reverse byte order. Most minicomputers, mainframes, and microcomputers based on the Motorola microprocessors (such as the Macintosh) use big-endian ordering. IBM PCs, Xenix machines, and other microcomputers that use Intel processors use the little-endian method. MIPS processors can run either way.

Byte order isn't significant for executable binary files (compiled programs), because very few executables run on a different architecture than the one for which they were compiled. But many data files are binary. If you move them to another machine that uses the reverse byte order, the data is scrambled. In a heterogeneous computing environment, byte order is a major factor in ensuring data portability.

It would seem to be a trivial task for the data transfer program to reorder the bytes, but since the algorithm needs the size of the data structure in order to figure where to begin and end the reordering, this isn't a problem that a general-purpose data transfer program can solve. The only solution is to limit the data in a heterogeneous network to a maximum data element of a single byte. In other words, you convert all data to ASCII before moving it out to the network.

This is how file transfers are traditionally done in the Unix environment. But this approach slows down the data operations of applications running on different kinds of machines. Still, the little-endian approach makes sense for DEC, since it's more likely that its users will network the DECstation with other DEC machines than with non-DEC computers.

**The Good and the Bad**

The DECstation is an excellent high-performance, single-user workstation, but it's not a good choice as a compute server or file server because it doesn't handle heavy disk I/O or user loads well. DEC markets the DECstation for office or engineering use, but the documentation is oriented toward the engineer, and the machine is best suited for this type of user. You don't need a DECstation for most office applications; inexpensive terminals running off general-purpose machines can perform those tasks perfectly well.

The DECstation is ready to network using either type of Ethernet. But it can't handle more than two serial I/O devices, its lack of a parallel port prevents its use with a wide variety of printers, and its unusual keyboard is a significant limitation.

However, if outstanding performance is what you're after, the DECstation won't disappoint you. It offers more horsepower than 80386-based systems can muster, at a very competitive price. And it provides strong competition for Sun and other workstation vendors.

After you ooh-ed and aah-ed over the letter quality output, 3-way paper feed, ease-of-use, 2-year limited warranty, and 9 pin price on our KX-P1124 printer, somebody said, “Great. Now do it with a wide-carriage.”

Introducing the Panasonic KX-P1624. Our newest 24 pin wide carriage printer.

It’s fast. Flexible. And fully-featured. Everything most offices are looking for in a dot matrix printer. At a price within most office budgets.

The features you’ll use most often are available at a touch. Seven resident fonts to vary the look of your documents. Formatting for different document sizes.

20 features, including 4 macros, right at your fingertips. What could be simpler?

Even macros that recall all the settings for a particular document at the touch of a single key.

True letter quality, high-resolution graphics, and seven resident fonts, so it’s ideal for all your office applications. You’ll find the 1624’s letter-quality mode as fast, or faster, than most popular 9 pins. Up to 63 LQ characters per second. With its 360 x 360 dpi bit-mapped graphics, you can incorporate special printed effects into your documents. Like company logos and line art.
Multiple paper paths mean you can put this printer exactly where you want it. There aren't many places in an office to conveniently put a printer.

So the 1624 gives you a choice of 4 different paper paths: single sheets from the top, bottom or rear. A special 'Paper Park' feature even lets you feed single sheets from the top, without removing rear-fed fanfold.

A 2-year limited warranty in this day and age? That's investment protection, Panasonic-style. You'll find 2-year warranties rather rare in the printer industry. But standard with the Panasonic 1624.

See your dealer for details.

So if you've been waiting for the ideal multi-purpose office printer, it has arrived. For the name of your nearest Panasonic printer dealer, call toll-free 1-800-742-8086.

Two diskless 80286-based PCs offer different options for LAN users

Bill Catchings and Mark L. Van Name

Diskless PCs make a certain amount of sense on a LAN. Rather than using local storage, a diskless PC boots from a LAN server and stores all its data on a server. With all the data in a central place, backups are easier, and, so diskless PC vendors claim, the network is more secure because workstations have no local disk drives. Diskless PCs also should cost less than standard PCs because they don’t have disk drives and can use smaller power supplies.

To test these claims, we looked at two 80286-based diskless PCs: the TeleVideo TS2 TeleStation and the Wyse WY-212. Both units house a monitor and motherboard in one compact case and use ROMs to boot from a Novell NetWare file server. Both also include 1 megabyte of 120-nanosecond DRAM on the motherboard. From there, however, the configurations diverge.

The TS2 is a 10-MHz 80286 machine that includes an 8-bit Ethernet adapter and Novell boot ROM for $1695 ($1429 without the Ethernet adapter and boot ROM). The unit comes with a socket for an Intel 80287 math coprocessor; a built-in green-phosphor, 14-inch, Hercules-compatible monitor; two RS-232C serial ports; one parallel port; and a 101-key Enhanced AT-style keyboard. The network interface card occupies the unit’s single 8-bit expansion slot.

The TS2’s memory configuration is expandable. Two of its four banks of 256K-byte, parity-checked memory come in single in-line memory modules. You can replace those SIMMs with 1-megabyte SIMMs to bring the memory to its maximum of 2.5 megabytes.

Our test unit also included MS-DOS and GWBASIC 3.3 ($85) and a 10-MHz 80287. TeleVideo doesn’t sell an 80287, so we assumed the common list price of $250 to calculate a total system cost of $2030.

The WY-212 has a 12.5-MHz 80286 CPU and 1 megabyte of RAM for $1799. The Wyse system delivers a little more performance than the TS2 and has monochrome VGA rather than Hercules graphics. It includes a socket for either a 6- or 10-MHz Intel 80287 math coprocessor (we tested the machine with a 10-MHz 80287); a built-in, 14-inch, white-phosphor VGA monitor; a Wyse 8-bit VGA card; one parallel port; two RS-232C serial ports; and an Enhanced AT-style keyboard. The VGA card and the network interface card fill the system’s two 16-bit AT-bus expansion slots.

Wyse sells the WY-212 through distributors; you can also buy the identical machine through retail channels as the Amdek System/286N from Wyse’s Amdek subsidiary.

The WY-212 includes two VGA utility disks, but it doesn’t come with a LAN adapter or DOS. You’ll have to buy the adapter from a third party. Wyse does, however, sell Novell NetWare and 3Com...
Rack & Desk PC/AT Chassis

Integrand's new Chassis/System is not another IBM mechanical and electrical clone. An entirely fresh packaging design approach has been taken using modular construction. At present, over 40 optional stock modules allow you to customize our standard chassis to nearly any requirement. Integrand offers high quality, advanced design hardware along with applications and technical support all at prices competitive with imports. Why settle for less?

3+Share boot ROM chips for $40 each. These chips fit into a socket in the Western Digital EtherCard Plus 8-bit Ethernet board (WD8003EB); a spokesperson from Wyse said that the chips will often work in other network adapters as well. Our evaluation unit included the $438 WD8003EBT card with a Wyse NetWare boot ROM. Wyse doesn't sell an 80287, so we added $250 to get a total system price of $2487.

The WY-212's memory is fixed; it limits you to 1 megabyte with no parity checking. That's not much memory these days, but Wyse at least lets you configure the 384K bytes of it above 640K bytes as extended memory.

Neither system compares well on price with many low-cost AT clones. Furthermore, in this day of 20-MHz 80286s, neither system is especially fast: Both units run with one wait state.

### A Look Inside

The first thing you notice about these systems is how small they are. Both monitors attach directly to bases on necks that tilt and swivel. Those bases have a small footprint—13 inches square for the WY-212, and 12 3/4 by 12 3/4 inches for the TS2.

The TS2 is no harder to open than a standard PC, although the monitor makes the task a bit awkward. Fortunately, once you remove the six screws from the bottom and the two from the back.

You can put the monitor portion of the case aside.

Inside, however, the TS2 is very different from most PCs. There are no drive bays, no fan, and only one horizontally mounted expansion slot. That slot holds the LAN adapter. It's easy to see why these units are among the quietest PCs you'll find.

The TS2's TeleVideo Ethernet adapter includes a NetWare boot ROM. The adapter is compatible with Novell's NE-1000, so installing the TS2 on a NetWare LAN is a snap.

The WY-212 opens much like the TS2, but it has nine screws on the bottom of the base. The main difference between the two systems is the two 16-bit expansion slots present in the WY-212. They're mounted above the motherboard, one to the left and one to the right. The LAN adapter is in the left slot, and the VGA board is in the right slot. The standard 8-bit Wyse VGA card uses chips from Tseng Labs. The CPU has a compatibility speed of 8 MHz, which you can set with SETUP. Jumpers let you run the 80287 at 6 or 10 MHz.

The motherboard is a tiny 10 1/4 inches wide by 9 1/4 inches deep. Ours had no visible trace cuts or jumpers. On it were a total of 78 chips, 32 of which were for memory. Four application-specific ICs (ASICs) from VLSI do most of the job of emulating an IBM AT. With so few chips and no mechanical components, the WY-212 should be reliable.

The TS2's motherboard is even smaller (8 inches wide by 7 inches deep, with a 1 1/2- by 4 1/4-inch notch in the back left corner) and has mostly surface-mounted chips. Like the WY-212 board, its design is mature—there was only one jumper wire. Of its 70 chips, 36 of them are for memory. One NCR ASIC and six VLSI ASICs provide the Hercules and AT emulation—an AT and video adapter in only 34 chips. The TS2's 80286 has a compatibility speed of 8 MHz that you can set with an external DIP switch.

Neither machine gives you many options; these units are basically smart terminals with no free expansion slots. You couldn't add a disk drive even if there were room in the cases, because the power supplies run at only around 50 watts. Other than the TS2's few memory choices, the only real option is MS-DOS 3.3. Currently, you also cannot run OS/2 on either machine; that will have to wait until vendors offer OS/2 remote-boot software.

**Performance**

We tested both diskless PCs on a thinwire Ethernet LAN with a 16-MHz 80386-based Samsung file server running Novell's NetWare 2.15 SFT (for System Fault Tolerant). The server included a 150-megabyte hard disk drive, a Novell NE-1000 Ethernet adapter, and 4 megabytes of RAM. The server's hard disk drive delivers excellent performance by combining a SCSI disk drive with an intelligent controller that has an on-board 8K-byte cache. NetWare further speeds disk accesses by prefetching sectors on most reads and by caching recently read sectors.

Because neither of these systems has a hard disk drive, their disk performance depends largely on the speed of the network and the file server. We chose, therefore, not to run any of the application benchmarks, which depend heavily on disk access and so could be misleading. We discarded the low-level disk I/O benchmarks for the same reason.

The network interface cards in each machine also affect overall performance. We tested both machines with 8-bit Ethernet adapters. Unlike the TS2, however, the WY-212 could use potentially faster, 16-bit LAN adapters.

We ran all the tests on an unloaded network. They showed just how hard it is to benchmark disk-oriented tests on a LAN: Both systems received a disk index over 10 times that of a standard AT, courtesy of the unloaded network and the speedy file server. While the disk test continued...
Price remains a big question: These two systems cost as much as, or more than, many AT clones that include hard disk drives.

Results are meaningless in absolute terms; it’s clear from our tests that network-based systems aren’t intrinsically slower than disk-based ones.

Surprisingly, despite its faster CPU clock speed, the WY-212 didn’t score significantly higher than the TS2 on the CPU tests. The similarity in scores probably stems in part from the fact that both machines run with one wait state.

In the FPU tests, however, the WY-212 beat the TS2 by about 15 percent. The TS2 lost here because it runs its 10-MHz 80287 at only 6.7 MHz. (A TeleVideo spokesperson said that the TS2’s coprocessor speed is limited to a maximum of 6.7 MHz, one-third the speed of the unit’s 20-MHz oscillator.)

The TS2 won the video tests by about 20 percent. That difference is potentially misleading, however, because the results come from two different sets of tests—the WY-212’s for VGA, and the TS2’s for a Hercules-compatible display.

Compatibility
Both systems fared well in compatibility testing. With no expansion slots, we couldn’t test much hardware. Two external serial devices, a USRobotics Courier 2400 modem and a Microsoft Serial Mouse, worked with both systems.

There were also no major software problems. Both flawlessly ran a wide range of applications, including Borland’s Quattro 1.0, Reflex 1.14, Turbo C 2.0, and Turbo Pascal 4.0; Digittal’s Smalltalk/V 1.2; Kermit 2.32/A, MicroPro’s WordStar 3.3 and 4.0; Lotus’s Symphony 2; Microsoft’s PC Paintbrush 2.0 and Word 4.0; Novell’s NetWare 2.15; and Symantec’s Q&A 1.1.

The TS2 did have a problem with Microsoft Windows 1.01. That software ran fine on the WY-212, but on the TS2 it got caught in an endless loop before it could completely come up on the screen.

To Disk or Not To Disk?
Both systems are well built and attractive and score high marks for their ease of installation and compatibility. With the right network adapter installed, you can take them out of the box and hook them to a network, and you’re ready to go. Depending on your LAN, you might need to build a boot disk on the server for your first diskless PC; after that, however, you can connect as many additional workstations as you like.

Price remains a big question: These two systems cost as much as, or more than, many AT clones that include hard disk drives. Furthermore, the absence of local hard disk drives hardly makes these two machines secure—it’s easy to get at server data via their serial and parallel ports.

If you want a diskless PC, either system is a reasonable choice. The TeleVideo TS2 TeleStation is cheaper and has more memory capacity, while the Wyse WY-212 offers a VGA display and supports higher-performance, 16-bit network interface cards.

Systemizing has become the connectivity standard at many of the world's largest corporations and throughout the federal government. Ten's of thousands are already in use. The new Systemizer Plus is the latest model in Applied Creative Technology's line of Systemizing products, and it delivers what 95% of corporate computer users want from a Local Area Network— at far less cost and complexity, and yet with much more versatility.

Corporate computing managers prefer Systemizing over other connectivity methods because it offers:
- Up to 6210 ports, each parallel and serial capable.
- Compatibility. Mix PC's, LAN's, mainframes, laptops.
- Easy owner installation. Low cost cabling.
- 5 min. user training with no support needed after.
- Flexibility; readily accommodates growth and changes.
- Powerful distributed buffering (up to 31 Megabytes)
- Distributed processing for high speed and reliability.

What does it mean when we say Mountain tape backup systems have an unrecoverable error rate of 1 in $10^{14}$ bits? Well, think of it this way. Statistically, you're more likely to hit the jackpot in the Massachusetts, Rhode Island, Oregon, California and Colorado lotteries. All of them. Before you would lose a single bit of data while backing up your computer with Mountain.

That's just one reason people think of Mountain more often than any other for error-free tape backup solutions. Mountain reliability. From 40 megabytes to 2.2 gigabytes.

DaynaTALK and FlashBox connection modules provide fast pickup for sluggish LocalTalk networks

Tom Thompson

Can you improve the performance of your sprawling Macintosh network without scrapping the whole thing and starting from scratch? Dayna Communications and Sun Microsystems' TOPS Division say yes. Both offer products with modified network drivers and enhanced connection modules that will boost the data transfer rate of existing LocalTalk networks. Dayna claims that DaynaTALK can increase transfer rates to a maximum of 850 kilobits per second, while TOPS says that its FlashBox kit will provide a maximum transfer rate of 768 kbps.

By themselves, DaynaTALK and FlashBox don't give a Mac any extra networking capabilities, such as transferring files. Each Mac and file server must be equipped with either the Dayna or TOPS product to be able to operate at the higher transfer rate. But both products work with Apple's networking software, AppleTalk, that lets you link Macs together with transfer rates of 230.4 kbps. Add networking software (e.g., AppleShare), and you can establish a dedicated Mac as a file server.

Common Roots
These two products are similar solutions for the same problem. To Apple's credit, each Macintosh system includes basic AppleTalk networking protocols and drivers. LocalTalk, Apple's low-cost connector module and cabling option, lets you link Macs together with transfer rates of 230.4 kbps. Add networking software (e.g., AppleShare), and you can establish a dedicated Mac as a file server.

Because LocalTalk lets Mac users into the networking game cheaply and easily, chaos often results. Soon, the network becomes a maze of cables string from cubicle to cubicle, and perhaps through the ceiling. Some users begin launching applications stored on the file server. Others regularly transfer huge files back and forth. One department attaches a color PostScript printer to the network. Soon all that activity slows down the network, and 230 kbps doesn't seem like such a fast transfer rate after all. If you're delegated to beef up that rate, you'll face a big headache: new and costly upgrade hardware, and worse, the prospect of ripping out the existing network wiring to add new cables.

Enter the Dayna and TOPS enhanced connection modules. To install either one, you turn off the Mac and attach the existing network connection module to the enhanced module, which in turn attaches to the Mac. Next, you restart the Mac, run the installation software to install the new network driver, and make any adjustments (e.g., you can set the DaynaTALK driver for transfer rates from 600 kbps to 850 kbps). You then reboot.

Both of these kits contain test applications that "exercise" the network connection by sending and receiving test packets between two nodes. The standard

DaynaTALK or FlashBox software replaces AppleTalk’s Link Access Protocol (ALAP). Network operations, such as calling a file from the server, don’t change; they just proceed at the higher transfer rate.

**Talking DaynaTALK**

Roughly the size of a cigarette package, the DaynaTALK connection module has a mini-DIN-8 cable at one end that attaches to the Mac’s printer port. A female mini-DIN-8 socket at the other end accepts the cable from a network connection module.

The software disk contains the ubiquitous read-me-first file, the DaynaTALK driver, and a network diagnostic application. Several Apple files also reside on the disk: the Network cdev (used to select the network driver via the Control Panel desk accessory), the Responder INIT (which responds to packets sent by the diagnostic network software), the Installer application, and Apple System software version 6.0.3.

Installation is a breeze because you simply boot the Mac with the disk and run the Installer. Once the Installer is launched, you just click on a mouse button to add or remove the DaynaTALK software.

To alter the Mac’s network transfer rate, you just click on the DaynaTALK “sneaker” icon inside the Network cdev’s display. A dialog box with several buttons appears. When you click on a Configure button, a new dialog box offers you a range of transfer rates: 850, 768, 740, and 600 kbps. The rate you select depends on the system you’re using. The entire Mac II family, the Mac SE/30, and some Mac SEs can operate at 850 kbps. Mac SEs made prior to mid-1988 can manage only 740 kbps. The 600-kbps setting accommodates marginal networks where low-quality cabling or widespread nodes degrade the signals.

The user’s manual thoroughly explains DaynaTALK, the test application, troubleshooting, and how to avoid network collisions (see the text box “DaynaTALK Option: Collision Control” on page 223). The manual’s step-by-step procedure might be overdone for experts, but it serves novices well.

**FlashBox Speed**
The TOPS FlashBox connector module is slightly larger than the DaynaTALK unit. FlashBox requires external power to operate its electronics, so, unlike with DaynaTALK, every FlashBox user needs to have an extra power outlet. But FlashBox offers something that DaynaTALK doesn’t: an LED indicator that shows when it’s transmitting. This is a welcome feature when you find yourself puzzling over whether the Mac is talking to the network or not.

A female DIN-8 port for the network connection sits at one end of the module; at the other end is a six-pin female socket that accepts an adapter cable for the Mac’s printer port. Adapter cables have the male DIN-8 connector; cables with a male DB-9 connector for use with the Mac 512KE are planned. While this adds a measure of flexibility to the design, it can also cause trouble. If you’re not careful, you might plug the network’s connection-module cable into this six-pin socket, damaging the FlashBox.

The software disk contains several versions of the network driver, an installer application, a network diagnostic application, an INIT, and a file with various installation resources. It also includes Apple’s Network cdev and an AppleTalk file that provides a new version of the AppleTalk driver for a Mac Plus.

The disk is not bootable, but the custom installer application manages nicely as is. I recommend that you make a boot floppy instead (there’s room on the disk for a stripped-down system) to minimize the risks of modifying a live System file. A click on the appropriate mouse button installs or removes FlashBox software.

The package doesn’t offer configuration options for network speeds, and it only allows transfer rates of 676 kbps or 230 kbps. Also, no collision filters are available. However, the DaynaTALK’s optional Collision Filter is compatible with the FlashBox.

The FlashBox manual, like DaynaTALK’s, offers detailed installation instructions for novices and a quick start-up guide for experts, and it has a section on diagnostic testing and topology mistakes. The manual is terse in some areas, but it doesn’t scrump on troubleshooting hints—a plus for any network manager.

**Acid Test**

We measured relative data transfer rates of the modules in real-world tests with BYTE’s LAN. We also copied files between two Macs in isolation (to eliminate network traffic) and over an “ideal conduit” (a network link consisting of a short length of phone wire between two PhoneNet connection modules).

To minimize the effects of machine performance on the transfers, we used a Mac IIcx equipped with an 80-megabyte internal hard disk drive and a Mac II with a 40-megabyte internal hard disk drive. Both disks were empty except for the system and benchmark files necessary to conduct the tests. We used 6.0.3 System continued
Our MAJOR ADVANTAGE-Supplying you with the Broadest Range of Software Ammunition.
Figure 1: Note that in the file transfer tests, subsequent file copies took less time to complete than the initial one. Subsequent copies benefited because the file structure was already built. FlashBox is, at worst, only 12 percent slower than DaynaTALK in these tests.

Figure 2: In searches for a file among lots of files, FlashTalk was slower than even standard LocalTalk.

Figure 3: In database tests, FlashTalk operating at 768 kilobits per second performed nearly as well as, or equal to, DaynaTALK operating at its maximum rate of 850 kbps.
DaynaTALK Option: Collision Control

DaynaTALK’s first line of collision defense in high-speed networks is SpeedGuard timing, a standard feature in DaynaTALK software. Collisions occur in LocalTalk networks because only one node can transmit at a time. Slower nodes (operating at 230 kilobits per second) sometimes don’t recognize high-speed transmissions in progress. A slower node may inadvertently broadcast on the network, “stomping” on a high-speed transmission and causing a collision. If slower nodes cause frequent collisions, network throughput degrades because high-speed nodes spend too much time resending information.

SpeedGuard timing simply places an irregular clock signal on the network (this signal is created by stopping the clock signal’s transmission for 10-microsecond intervals). The irregular clock generates an error condition in the Mac’s network communications hardware, the serial communications chip. Certain implementations of AppleTalk read this error as a sign that the network is busy. In this way, DaynaTALK’s timing scheme tricks slower devices into thinking that the network is in use and thus prevents collisions.

However, Mac IIs, Mac SE/30s, the LaserWriter Plus, and LaserWriter IINT and IINTX printers use a new version of AppleTalk that doesn’t treat this error as a busy condition. Dayna’s response to this is the SpeedGuard Collision Filter. This $69.95 option acts like a standard LocalTalk connection module with additional electronics to detect the high-speed signals. It resembles the DaynaTALK connection module, but instead has a DB-9 cable connector (a DB-9-to-DIN-8 adapter cable is included) and uses a small external power supply that’s similar to a calculator-battery charger. When the SpeedGuard Collision Filter detects a high-speed transmission, it generates signals that the Macs and the printers see as a network busy condition.

DaynaTALK and FlashBox are compatible. This will become a design issue for you if your network is strapped for power outlets.

Neither kit provides networking software to handle file transfers. DaynaTALK requires a file server and additional software to accomplish this. TOPS offers its TOPS/Macintosh software, which provides this capability without the need for a server. While TOPS/Macintosh isn’t cheap, for small networks it’s far less than the price of a PC server.

If I had my choice, I would combine Dayna’s multispeed network driver and collision filters with the TOPS network diagnostic software and TOPS/Macintosh software to manage file transfers.

DaynaTALK and FlashBox are designed to boost an existing network’s performance, but they won't solve all your networking problems. They both deliver higher network throughput, although the boost is relatively small for the price. Nevertheless, each is worth considering if data transmission on your LocalTalk network is becoming a waiting game.

Whose ad is this, anyway?

That's a very good question.

Because, instead of being an ad for the 20 very different companies you see here, it's actually an ad for the one industry standard that makes them very much alike.

The PostScript language from Adobe Systems.

Choose a printer or typesetter from one of these companies and you can make the choice for PostScript. Because each of these manufacturers have licensed Adobe’s page description language.

Why did they do it?

For one thing, PostScript delivers the ultimate in output quality and capability. Whether you're printing simple text for everyday correspondence or complex graphics for electronic publishing, PostScript makes it easy.

PostScript also gives you absolute freedom to select the best hardware and more than 4,000 software programs for your needs and budget. That's called compatibility and Adobe PostScript guarantees it.

So even though different PostScript printers and typesetters offer different resolutions, paper handling options and output speeds, you can be sure they all speak the same language.

The language of PostScript.

If you still have questions, call 1-800-952-6300 (Dept. #111) for all the answers, along with a free copy of the PostScript Product Catalog. You'll be glad you asked.

This ad is presented by Adobe Systems Incorporated, which encourages you to look for the PostScript symbol on computers, printers and other products that include PostScript software from Adobe Systems; it's your guarantee of quality and compatibility. The pioneering Gigapack-Mac lets moneyed Mac users effortlessly store gigabytes of data

Don Crabb

I've had nothing but problems with every DC-2000 tape I've ever made, and I'm tired of it. My headaches range from hard-read errors and unintentional overwrites, to tapes being just too small to back up an entire disk. If this sounds familiar, then the Gigapack-Mac DATA/DAT drive may be a welcome, if expensive, solution for your nasty backup problems.

The Gigapack-Mac stores data as bit streams on digital audio tape (DAT), an interesting technology that so far has not set the world on fire (see the text box "Defining DAT: Formats and Standards Lack Consensus" on page 230). First developed for high-quality audio recordings, DAT's role in computer data storage is still evolving.

DAT drives approximate a read/write tape equivalent of CD-ROMs. One of DAT's biggest advantages is the tremendous amount of information (roughly 1.2 gigabytes) that can reside in a single 2-by-3-inch cassette.

The Gigapack-Mac, by GigaTrend, is one of the first commercial DAT drives to ship, although a host of others is expected to be released this fall. The Gigapack-Mac serves Macintosh II, Plus, and SE users. GigaTrend imports DAT drive mechanisms from its West German parent, GigaTape GmbH.

The Gigapack-Mac consists of the drive, custom electronics, and two SCSI ports. Four touch-sensitive front-panel switches help users load and unload tapes, test the unit, and set up the SCSI ID (the drive comes preset to SCSI 4). A four-digit LCD status panel and two LEDs monitor on-line status and errors. A separate LED indicates power-on and is placed next to the tape-loading slot. Tape loading and unloading are power-assisted, much like a front-loading VCR.

My review unit arrived with a DB-25-to-DB-50 SCSI cable, a SCSI terminator, a power cord, a software disk, and two BASF DAT 120 cassettes that were certified by GigaTrend for data service. Completing the expensive ($5950) package was a thin and completely inadequate manual. It does only the weakest job of explaining how to use the hardware and software. A $6000 hunk of hardware deserves better.

A Drive Test Drive

I connected the drive to three different systems: an 8-megabyte color Mac II with an internal Apple HD40SC hard disk drive, a 1-megabyte Mac SE with an internal Apple HD20SC hard disk drive, and an 8-megabyte color Mac II with an internal Apple HD40SC hard disk drive and an external Jasmine DirectDrive 140 hard disk drive. In all three cases, the Gigapack-Mac was the only additional SCSI device connected. Besides everyday use, I tested the Gigapack-Mac using timed backup and restore tasks.

GigaTrend claims backup speeds of 10 megabytes per minute. At no time during any of my testing did my results come close to that (see table 1). Nevertheless, the Gigapack-Mac proved to be a reasonably fast tape drive, averaging a transfer rate of better than 1 megabyte per minute in most situations. Many DC-2000 and continued

Storing 1.2 gigabytes costs $6000 with the Gigapack-Mac and a 120-minute cassette.

**Inquiry 853.**

DC-600 tape backup units that I've used fall considerably below this rate.

For example, the Jasmine DirectTape DC-2000 tape drive holds 38.5 megabytes on a single DC-2000 tape. Its average transfer rate runs slightly under 1 megabyte per minute on both file-by-file and image backups. (The Gigapack-Mac doesn’t provide for image backups.)

The Jasmine’s burst transfer rate is about 1.5 megabytes per minute. My tests placed the DAT drive’s burst transfer at about 4 megabytes per minute. Overall, the Gigapack-Mac performed at least as fast as the DC-2000 drive, and sometimes twice as fast or more. (DAT has the added advantage of holding, in one cassette, enough data to fill 31 DC-2000 tapes.)

I've also had some recent experience with the Canon read/write optical disk drive in the NeXT cube. Canon claims an average access of 85 milliseconds, but I've found it to be much slower. On average, my transfer rates ranged from 5 to 9 megabytes per minute for large-scale file-by-file copies from the NeXT’s built-in 660-megabyte hard disk drive to the optical disk drive, which makes it faster than the Gigapack-Mac.

**Snappy Tape Shuttles**

Overall, the Gigapack-Mac performed solidly. Even though the DAT cassette is small, it quickly shuttles tape back and forth during a backup or restore operation, making the unit suitable for quick restores of single files.

During my testing, the time to access and restore a single file in a data set was about 30 seconds; it never took longer than 55 seconds or less than 15 seconds. The exact times depended on the position of the file in the data set.

The supplied backup-and-restore software admirably handled file-by-file operations. A filtering scheme for selecting a specific file, an updated file, or all files meant that I could easily back up only what I needed.

File restoration performed equally well. I could restore the entire data set or parts of it at will. I could even set the dialogue to automatically overwrite my restored files, never overwrite them, or let the software prompt me each time. In all continued

The New 25 MHz Executive 325ET combines all the latest technologies in the most advanced 386 computer available. And it's transportable.

$10 PER MEGABYTE OF DRAM

The 325ET has a hard drive access speed almost undetectably different from that of dynamic memory. For the first time, the large capacity of a hard drive is accessible at an access time of one millisecond (1 ms). Why limit yourself to 2, 8 or 16 megabytes of fast memory and pay $500 per megabyte, when you can have up to 160 megabytes at a cost as low as $10 per megabyte?

50 TIMES FASTER

Instead of waiting for the 65 millisecond (ms) access time of an MFM drive, or even the 17 ms of an ESDI drive, you can have instantaneous access to your data. The 325ET is blindingly fast with an average disk access time of 1 ms. In addition, the system architecture allows data transfer speeds that match drive capabilities. (That's really fast!). In fact, the overall read/write performance of the 325ET is 50 times faster (5,000%) than the Compaq* 386/25.

53,000 PORTABLE PAGES

The 325ET, when located along side of a monitor, takes little desk space. The compact design of the 325ET lets you carry it onto an airplane and easily stow it under your seat. Imagine bringing the equivalent of seven four-drawer filing cabinets worth of valuable information to your next meeting – accessible in just 1 ms.

Note: Tests ran with System 6.0.2, Finder 6.1, and the other system software from the 6.0.2 System Tools package. Only the disk accessories, fonts, INITs, and colons supplied with the Apple system were kept. MultiFinder didn’t run. LocalTalk/AppleTalk was disconnected. During all testing, the CPU’s data cache was disabled. I installed Gigapack-Mac’s version 1.06 software on the start-up disk for file backup and restore testing. cases, file restoration was a snap.

Unfortunately, version 1.06 lacks a mirror-image capability (although it is present in the menus as a dimmed item), so I couldn’t do volume image backups. This is an important omission. Any medium that stores 1.2 gigabytes as quickly as the Gigapack-Mac needs an image backup mode. (GigaTrend says it intends to offer this capability in the future.)

Another drawback was my review unit’s SuperLock copy-protected software. This annoying copy-protection scheme has since been removed from all copies of the Gigapack-Mac software.

Torture Tests

GigaTrend claims that the cassettes provide stable, long-term storage of large files, such as graphics images or font files. To test short-term stability, I carried a full cassette (containing 1.2 gigabytes of Mac files) in my soft-sided briefcase for about three weeks. The cassette received significant magnetic and environmental abuse (e.g., from airport metal detectors) and never failed.

I also shipped this same cassette from my office to my home and back again via overnight mail. I used the standard next-day-letter cardboard envelope, and I didn’t pad the cassette in any special way. The cassette still worked fine after making the round trip from Chicago to the carrier’s Memphis headquarters and back.

Finally, I placed the same full cassette

Defining DAT: Formats and Standards Lack Consensus

Digital audio tape (DAT) technology uses helical-scan recording to store information as a digital bit stream. That bit stream can be digitally sampled music with a signal-to-noise ratio rivaling that of compact disks, or it can be plain old computer data bits.

GigaTrend's Gigapack-Mac uses a logical tape format known as DATA/DAT. Also championing this format are 11 other companies, including Apple, Fujitsu-Ten, Hitachi, JVC, Kenwood, Panasonic, Sony, TEAC, and Toshiba. DATA/DAT distinguishes itself by its ability to do both random reads and writes to a tape. In other words, DATA/DAT can update the tape in place.

This format competes directly with digital data storage, which permits random tape reads, but not writes, so it cannot update a tape in place. DDS is sponsored by a committee of 10 companies, including industry giants Hewlett-Packard and Sony. So far, IBM has not come down on either side of the DAT format debate.

DATA/DAT has not yet made its way through the ANSI standardization process. The only part of DATA/DAT that its supporters have agreed on is the process for updating a tape in place. DDS, on the other hand, is a more mature technology that offers slightly higher storage capacities.

Partly because formats and standards are still evolving, immediate DAT sales may be modest. According to Hinda Chalew, an industry analyst with the market researcher Dataquest, 3800 DAT drives should ship this year, generating $5.6 million in revenues. Of these, only about 1000 drives will be full-price commercial units. But by 1993, shipments are expected to jump to 125,500 units, with revenues exceeding $74.1 million, according to Dataquest.

The Gigapack-Mac sells for $5950, and 120-minute cassettes cost $26 each in their data-certified format. That puts the total cost of storing 1.2 gigabytes at about $5976—the highest cost of these three options.

Is there a Gigapack-Mac in your future? That depends on your needs. For individual Mac users, the answer is probably no. You'd be better off with a cheaper backup technology, like DC-2000 tape or shadow directories recorded to another hard disk drive.

But if you have many small Mac hard disk drives, you might consider the Gigapack-Mac as a shared device used to back up all of them. And where large Macintosh disk drives and file servers hold many megabytes, the Gigapack-Mac also makes sense because it's easy to set up and use, and because the media is easy to store. Now, if only the price could come down a bit!
Don't Let the Desktop Programming Revolution Start Without You.

Presenting Matrix Layout 2.0

The Desktop Programming revolution has begun. More and more people are maximizing the productivity of their desktop computers without learning to write a line of code. It began with Matrix Layout. And continues with Layout 2.0.

More Power to the People

Matrix invented Desktop Programming to let you create your own programs right on your own PC. Now, Layout 2.0 makes it even easier to create your own powerful, professional-quality applications.

Start with Layout's tools window. Everything you'll need to build your program can be accessed by mouse or keystroke.

Next, use Layout's graphics and text tools to build a flowchart model of your program. Create your own windows, icons, and buttons. Cut and paste functions from other Layout programs. Or use the BlackBox Manager to add a BlackBox—a pre-built capability such as telecommunications or dBase support—to your Layout program. All, without writing a line of code.

Layout 2.0 is also a hypertext tool, allowing you to build Hypercard-like cards, with text and graphics, and link them to related cards in any file. Use it to create hypertext applications that will run on any IBM-compatible PC.

Power to the Professional

Once your program is complete, Layout 2.0 can automatically create a ready-to-run .EXE file for use by any IBM PC. Or have Layout 2.0 write it in Turbo C, Lattice C, Microsoft C, Turbo Pascal or QuickBASIC. The result: you've got a professional, stand-alone program that does exactly what you want it to. Use it, share it, modify it. You've got the power.

And a Powerful Bargain

For just $199.95 you get the entire Layout 2.0 package, including free technical support, and more programming power than you've ever had on your desktop. For more information, the location of your nearest Matrix dealer, or a copy of the Matrix Layout 2.0 VHS demonstration video (just $9.95 for shipping & handling), call today.

Although tricky to install, Hayes’s V-series modems with X.25 PADs boost data accuracy and throughput speed.

Stephen Satchell

If you need to communicate with the outside world through Tymnet or Telenet and you value your time and money, Hayes Microcomputer Products’ X.25 modems and modem enhancers offer you messages of hope. The company is now shipping X.25 PADs (which stands for packet assembler/disassembler) firmware with its V-series Smartmodem 2400, V-series Smartmodem 9600, and V-series Modem Enhancers. (X.25 is the CCITT-recommended standard for synchronous packet-switching networks.)

With X.25 firmware, the Hayes modems provide access to as many as four “virtual” connections. This means that, for example, you could simultaneously read three BBSes and an electronic conferencing system, if all these systems are connected to the same X.25 network.

The X.25 firmware also promises error control from source PADs to target PADs or host systems. Packets are built once in the source, and the information stays inside the packet until it reaches its ultimate destination. Data that is transmitted through synchronous methods, like MNP and V.42 (see the text box “Origin of the Protocol: X.25’s Evolution” on page 234), can sometimes be lost as packets flow between the two environments.

Because X.25 links the network and the source PAD using synchronous connections and high-level data-link control (HDLC), data pops through about 10 percent faster than if you used a standard asynchronous connection. Even without multiple-session support, your on-line time should drop significantly.

To see just what the Hayes X.25 PAD can do, I tested the V-series Smartmodem 2400 with a variety of public data networks. [Editor’s note: This review will concentrate on the X.25 PAD enhancement. For a complete review of the V-series Smartmodem 2400, see “4800 Bits, No Errors,” June BYTE.]

Manual Omissions

The weakest part of the Hayes product is the X.25 manual. It is disorganized, and it’s missing a section covering Macintosh and other computer systems without flow control. The manual also lacks a translation dictionary to help set up the CALL command and understand X.25 jargon.

If digging out details about how to dial into the services that you use is not your forte, save yourself the headache and hire someone to do the dirty work. Once you have the information, perhaps safely stored in calling scripts, you are in business.

Properly setting up the X.25 modem presents other installation battles. The V-series Smartmodem 2400 comes preset for flow control using the request-to-send and clear-to-send leads on an RS-232C port. Macintosh users must change flow control to use XON/XOFF before trying to issue PAD commands or make an X.25 connection; otherwise, the continued...
Origin of the Protocol: 
X.25's Evolution

In the beginning, modems simply converted digital data into telephone-line signals at one end and reconverted those signals back to digital data at the other end. Any error control took place outside the modem. Then desires for error control gave birth to a number of mutually incompatible software- and hardware-based protocols, including HDLC/SDLC, BISYNC, Kermit, and XMODEM. But under duress, most of these protocols proved ineffective.

In 1983, Microcom introduced the Era 2 internal modem with MNP (for Microcom Networking Protocol). MNP was supposed to eliminate errors outside of application programs, making the programs easier to create. A year later, Microcom moved the link-layer protocol into the modem itself and licensed the technology. Other modem makers latched onto MNP as a standard solution for data error control between two modems, so application programs wouldn't have to be designed to handle data disruption. Since then, MNP has been extended to reduce the overhead of sending data, incorporate data compression to further increase end-to-end throughput, and control the switching of modulation methods to adapt to line conditions in 9600-bps modems.

Users of packet-switching networks, such as Tymnet and Telenet, know that garbled bits are only one of a variety of transmission problems. Many asynchronous network interfaces assume that you're using dumb (non-error-control) modems or that you're directly connected to terminals. Because of these assumptions, the interfaces offer no way to control data flow.

Even if you upgrade the interface hardware to recognize flow control (using the request-to-send and clear-to-send RS-232C leads), you'll still endure many packet conversions. The host builds network packets and then sends them through the network to the packet assembler/disassembler. The PAD disassembles the packets and transmits them to the modem, which rebuilds them into packets again.

Wouldn't it be more sensible—and safer—to build the packets just once? This is the X.25 philosophy. In this approach, the PAD at the host computer builds the packets (no modems in the middle) and sends the packets the way the network wants to see them. When you need to access the network, you call in, making the PAD part of the network only as long as you need it to be. This approach saves the cost of a leased line and allows one access port on the network to serve multiple sites.

Modern in-dial services allow you to make one call into the network and as many "virtual calls" as you want without redialing. The number of concurrent virtual connections is limited only by the capabilities of your PAD. And if you add Smartcom III 1.1 or use software that supports Hayes AutoStream, you can simultaneously transfer data on all four virtual connections. Even with these multiple connections, your communications software will continue to perform as if you were using a standard dial-in line.

To set up multiple virtual connections, I established two links to CompuServe, one to BIX, and one to MCI using Smartcom III 1.1 on an 80386SX-based computer. I was able to transfer files in the "background" while working interactively, but Smartcom III was clumsy to use. I would have been far happier with a communications program running on a Macintosh (with a 19-inch screen, of course) with each session in its own window.

Affordable PAD

Hayes has managed to bring X.25 PDAs to market at a relatively affordable price. The V-series Smartmodem 2400 with X.25 support lists for $899, while the V-series Smartmodem 9600 with X.25 is $1299.

If your modem isn't a V-series, you can achieve compatibility with a Hayes Modem Enhancer for $349; this is handy if you are using V.32-based (9600-bps full-duplex) X.25 access ports. Hayes offers the option of choosing V.42 for error control at the same prices. (X.25 and V.42 are standard features, not options.)

So who needs X.25 in-dial? Not every-

one, that's for sure. Since it's new, X.25 in-dial won't be fully incorporated by service providers like Delphi, Dialog, CompuServe Information Service, and BIX for some time.

In addition, many potential users may flinch at today's public-network access prices. Tymnet imposes a prime-time surcharge of $2 per hour ($1 per hour non-prime-time) for X.25 access. Telenet doesn't add surcharges, but its per-hour access charges range from $6 to $9 per hour, depending on your location. Both Tymnet and Telenet bill each virtual connection at the same rate as an individual connection using the same line speed.

On the other hand, for businesses and others who are willing to pay for higher accuracy and shorter transmission times, the Hayes X.25 products deserve a close look.

1. It's sharp. Our new graphics card dramatically improves the performance of all your applications. You can choose up to 800 x 600 or 1024 x 768 resolution with 16 on-screen colors, or 256 colors at 640 x 480. Plus, 132-column text support helps you get the most from your spreadsheet applications.

2. It's fast. 50% faster than standard VGA. True 16-bit technology increases the speed of all your graphics and text applications on an IBM PC/AT/XT, PS/2 Model 80 or compatible.

3. It's versatile. It works in an 8-bit or 16-bit slot. You can easily upgrade it from 256K to 512K DRAM. And it lets you get the most out of today's popular MultiSync, Multiscan and 8514 monitors, including the MultiSync 3D and Seiko CM-1430.

4. It's 100% compatible. Guaranteed to run all your VGA, EGA, CGA, MDA and Hercules software applications. It's even easy to install. 3 easy steps is all it takes.

5. It supports more software. No graphics card gives you more high-resolution drivers, including Windows/286, Windows/386, Presentation Manager, AutoCAD, AutoShade, P-CAD, VersaCAD, GEM/3, Ventura Publisher, Lotus 1-2-3, Symphony, WordPerfect, and WordStar.

6. It comes with a full 7-year warranty. We can do that because we build all our products using our own Headland Technology chip and card design capabilities to ensure they will live up to our reputation for quality and performance.

7. And it's affordable. The new Video Seven VGA 1024i, a very sharp, very fast high-resolution Super VGA graphics card for only $397 with 256K DRAM. $497 with 512K.

So before you settle for just any VGA card, ask to see the big news in high-resolution graphics: the new VGA 1024i from Video Seven.

Ease into Mac Programming

Prototyper 2.1 gives Mac programmers a jump start

Ray Valdés

Prototyper is an interactive tool for creating prototypes of Macintosh programs. It's aimed at two audiences: It helps nonprogrammers design prototype applications in an interactive, nontechnical manner to help visualize product ideas, and it enables programmers who are not familiar with the Macintosh Toolbox to create skeleton applications that can be fleshed out over time. Prototyper's code generator produces the drudge code needed to support a complex Mac interface with nested menus and intricate dialog boxes.

The program's centerpiece is a Prototype window. In this window, you manage the interface objects that constitute an application. The window contains three icons that represent the major categories of interface objects available, and a scrolling portion that lists those that you have created for your prototype. The interface objects are menus, windows (including dialog and alert boxes), and a demo window that's the basis of Prototyper's simulation capability.

Clicking on the icons invokes the appropriate editor for that class of interface object. For example, clicking on the menu icon invokes a menu editor, while clicking on the window icon lets you create and modify windows, dialog boxes, and alert boxes. Each interface object owns a window on the desktop; you can leave the windows open and switch back and forth between them.

This is a very Mac-like approach to prototype creation. You work interactively and iteratively—creating and editing the application's menu bar, and switching over to tinkering with the details of a dialog box. You then return to the menu for further adjustments.

You can run your prototype at any time with Command-R. The simulated application's menu bar appears at the top of the screen, replacing that of Prototyper. You can select menu choices, open application windows that have been linked to those choices, click on buttons, and view dialog boxes. The application's Quit item brings you back to Prototyper.

Prototyper includes a short tutorial in one of the folders on the distribution disk, but it's almost unnecessary—this product is extremely accessible. A friend of mine—a software developer who'd spent months writing the core of an application—used Prototyper to design and build his application's interface in just a few days, without ever consulting the manual or the tutorial.

The Menu Editor
Your application's menu bar is the logical place to begin the prototyping process. Prototyper's menu editor is a window that contains three scrolling lists. The first scrolling list holds menu headings for your application—Apple, File, Edit, and so on. The next contains items for each heading (e.g., Edit might contain these items: Cut, Copy, Paste, Clear, and Undo). The last helps you build hierarchical menus.

It is very easy to define the menus for continued
your application. You just type a list of the menu headings into the first scrolling list. By clicking on any one of these headings, you can type the respective menu items in the second list box. This process takes longer to describe than it does to do. While you are working on a particular menu heading, the heading is temporarily added to Prototyper’s main menu bar. This lets you pull down a list of items from the menu bar and check on spacing, spelling, and visual appearance as you enter the items. To check the entire menu bar, you would choose Run or Quick Look from Prototyper’s menu. For a particular menu item, you can also define a sublist of choices in the hierarchical style that Apple introduced not long ago. In Prototyper, you get only one subordinate list of menu items; you can’t nest to arbitrary depth.

In the realm of Mac programming, writing menu-handling code is one of the more straightforward tasks. You can also use Apple’s ResEdit to modify menu resources. In this area, Prototyper’s quick and easy interactive tool, although enjoyable, does not save you that much time. It does, however, exemplify Prototyper’s approach to creating a simulated application: Everything is accomplished interactively and visually, with as much immediate feedback to the designer as possible. But it’s in the realm of creating and managing windows and dialog boxes that Prototyper earns its keep.

Windows, Dialog Boxes, and Zones
If you click on the window icon in the main Prototyper window, you invoke a dialog box with which you can specify the kind of window object you want to create. You can create six types of windows, two types of dialog boxes, and three types of alert boxes. These window types are all standard Macintosh window types. As such, they can differ in the style of their borders, in the use of close boxes and title bars, and in whether or not a dialog box is modal.

Once you specify the kind of window you want to create, Prototyper presents what it calls a worksheet—a window similar to that found in many drawing programs. The window features a palette of interface objects called zones. These zones are icons, scroll bars, editable text areas, noneditable text (static text), pictures (graphics imported from other Macintosh drawing programs), round-cornered buttons, radio buttons, check boxes, scrolling lists, pop-up menus, rectangles, and lines. Some of these are objects with which you can interact (e.g., pop-up menus, radio buttons, and editable (text zones). Others, such as static text, rectangles, and lines, serve informational or cosmetic purposes.

At any time, you can choose Quick Look, which simulates the window or dialog box that you are currently working on, or Run, which simulates your entire application.

To create a zone, you choose the one you want from the palette and click on the worksheet. Working with zones is similar to working with objects in a drawing program. You can select, resize, and drag them singly or in temporary groups. Double-clicking on any object brings up a dialog box that lets you change that object’s characteristics. This dialog box includes a brief, helpful description of the object, obviating the need for a context-sensitive Help function. Objects can snap to a grid.

Prototyper also provides some basic alignment commands (e.g., Align Top, Bottom, Center, Left, Right). These are useful, but I wish there were more of them—for example, an Align Middle function or a Distribute function, as found in MacDraw II or MacDraft.

You can specify a text zone’s font and size. Presently, you cannot specify the text style (i.e., bold, italic, or underline). The choices are tantalizingly present on one of Prototyper’s menus, but for some reason, they are not supported in this version. As with most Mac programs, there is an undo function. Although it’s workable and helpful in its present form, this function could be expanded further.

In the course of creating a prototype, I encountered situations that I thought should be undoable but were not. However, none of these was of major import.

One nice feature is the ability to export a window definition into a separate Prototyper file. You can then incorporate this file into some other prototype application. You can also import resources, such as menu definitions or dialog box specifications, from any Mac application that has these in its resource fork.

Simulating an Application
Real applications, of course, have dynamic behavior. It isn’t enough to view a dialog box; you need to be able to choose items or enter the parameters that the dialog box requests. Prototyper provides a simple mechanism for simulating this dynamic behavior.

For any interface object in your application (i.e., a menu item or zone), you can specify an action that will occur when you click on the object. Prototyper calls this feature linking. For example, you can link a button to the action of closing one of the windows in the simulation, or you can link a menu item to a sequence of different actions, such as closing one window, opening another, and disabling (graying out) other menu items. It is this linking feature that makes Prototyper a tool for simulating applications, as opposed to merely being a friendlier version of ResEdit.

Links in Prototyper are vaguely similar to links in HyperCard. HyperCard goes much further in allowing you to associate a HyperTalk script with an object and thus describe a much wider range of behaviors for that object. But this then becomes more like programming, which Prototyper seeks to avoid.

Prototyper can also simulate a real application through the use of demo windows. These are standard Mac document windows (with a title bar, a drag region, a close box, and scroll bars) that are linked to either a text file or a Macintosh graphics file (i.e., a PICT resource). When a demo window gets displayed (either automatically at program start-up or through a link to a button on another object), you see the corresponding text or graphic in the window. You can scroll, resize, move, or close the window. Of course, that’s all you can do. But with the appropriate choice of content, this feature can go a long way toward simulating a variety of applications—from a spreadsheet to a three-dimensional graphics program.

Code Generation
Prototyper can generate C and Pascal source code. You save your file from continued
Mass Storage Is No Longer A Peripheral Issue.

And it should be. Today's top end computer platforms have created dazzling new dimensions in CAD/CAE, data bases, networking and specialized DOS applications. More than ever, storage performance and capacity are central concerns.

And more than ever, Storage Dimensions is the logical solution.

With our SpeedStor™ hard disk subsystems, you get the best possible performance specs. But you get more than 14 ms access times and 15 Mbit transfer rates. You get our expertise in translating those specs into maximum system throughput — delivering to your application all of the performance it can handle. And all of the capacity it will ever demand. within Prototyper, launch the appropriate code generator for your target language (C or Pascal), and then tell that program to generate code for a particular language processor. For C, the choices are Think C 3.0 (formerly Lightspeed C), MPW C 2.0, and MPW C 3.0. For Pascal, they are Think Pascal 2.0, Turbo Pascal 1.10, MPW Pascal 3.0, and TML Pascal II.

SmethersBarnes rightfully assumes that it is your responsibility, if you are going to be working with source code, to get a copy of one of these language processors and learn how to use it. The manual includes a section with brief summaries on how to operate the particular compiler you have chosen. The descriptions are concise but sufficient to build an executable file.

The code generated consists of one file for each of the windows or dialog boxes in your application, a main file containing the event loop, and two files for initializing and handling menus. There are also appropriate header files. For C, these header files contain function prototypes per the ANSI standard.

Examining the code that this program produced, I found it well-written, well-commented, and logically structured—more so than many programs that people write. The names are long and descriptive. You can specify two levels of commenting (minimal comments or more extensive ones). For both C and Pascal, you have choices in how to format the code—how much to indent (if at all) the various language elements, such as IF statements, switch and case statements, function argument declarations, variable declarations, beginning and ending brackets, and even comments.

At each of the points in the generated code where you might want to add functionality, there is a comment to that effect. One disappointment is that many of the features present in the interactive simulation disappear when you move to compiled code—e.g., demo windows, hierarchical menus, buttons in windows (as opposed to buttons in dialog boxes), and certain kinds of linked actions. Another problem is that once you edit the generated files and add your code, it is difficult to go back to the interactive tool and add features there. When you generate code a second time, Prototyper isn’t smart enough to preserve your handwritten application code. You’ll have to wait for future versions of Prototyper to fix these limitations.

Legend has it that the first version of Lotus 1-2-3 was prototyped over a weekend and then completed over the next year. Now the most recent version of 1-2-3 has consumed over 100 person-years of programmer effort. To cope with this changed world, software developers need to expand their repertoire of tools and techniques. One valuable technique is interactive, dynamic simulation of applications.

Prototyper is a well-conceived, accessible, and worthwhile tool that supports this technique. It would benefit from a few improvements: more drawing operations (i.e., better alignment functions, more graphics objects, and more text styles), an extension language like HyperCard’s, and a smarter code generator. Nevertheless, it’s a valuable tool.

IT EATS IBM’S LUNCH...
AND SERVES DELL FOR DINNER!

Introducing Wells American’s CompuStar II. It’s one hungry machine. Feed it the toughest applications you can dish out and it’s ready for “seconds” before IBM, Dell and all the others even get started.

IT FEEDS ON THE COMPETITION.
CompuStar II’s enormous appetite for devouring the competition comes from its unique, modular design. Interchangeable, plug-in CPU “modules” are available in 80286, 80386SX, 80386 and soon — 80486 configurations. The modules are remarkably inexpensive — as little as $695 for a ‘286 module, and incredibly powerful. The 33MHz ‘386 module achieves a stunning MIPS rating! Best of all, for up to one full year after purchase, you can trade in the module you originally select toward the purchase of any of the other more powerful modules.

IT DEVOURS OTHER COMPACTS.
Unlike other small footprint micros, CompuStar II won’t put your computer expansion needs on a diet. Each system features an amazing six bus slots — four of them available in a fully configured VGA system. That’s 25% more than IBM or Dell gives you. Better yet, you can have up to 11 slots with CompuStar II’s exclusive bus expansion chassis. No other compact system available offers this much room for growth. And no other comparably sized system can accommodate that growth better than CompuStar II.

Its whopping 200 watt power supply gives you more than twice as much reserve power as IBM or Dell.

And CompuStar II has more room for disk/tape drives — four compartments in all; three accessible from the front panel. IBM and Dell give you just three compartments and only two are accessible from the front. CompuStar II also accommodates 5½" and 3½" disk drives. IBM and Dell restrict you to 3½" drives only.

IT’S ALSO WELL-MANNELED.
Worried about quality and reliability? Don’t! Wells American has been making PCs longer than IBM or Dell! Each CompuStar II is money back guaranteed for 31 days, factory warranted for a full year and can be field serviced from hundreds of locations worldwide.

When you think about it, buying an IBM or Dell system instead of our new CompuStar II is sort of like eating hamburger when you could have had steak — and paid less for it. CompuStar II...from Wells American. It makes “mincemeat” of everything else.

To receive a CompuStar II product information kit, call 1-803-796-7800. VAR inquiries welcome.

New application. New network.
You know the drill.

You made it. You built a distributed application that takes full advantage of the power of your network. You faced incredible obstacles. And you swore if you survived, you'd never do it again. Guess what? They want you to do it again.

This time, take a short cut. With Netwise® Our RPC TOOL™ lets you sidestep the obstacles by providing access to a common platform for the development of distributed applications. You write the application, then specify the network. Netwise automatically generates your distributed processing code. All of it. Every time. That means your application can easily migrate to any environment in the future. Banyan, Novell, Sun, 3Com and major software suppliers have endorsed this technology as a standard for building distributed applications. Now it's your turn.

Lisp primitives and system functions—such as device handling, garbage collection, and memory management—are implemented in microcode that’s loaded into a control store every time the microExplorer starts up. The writable control store makes for an elegant way to upgrade the system without having to swap hardware.

The distinguishing feature of the Explorer processor—which to me makes the microExplorer a Lisp machine—is its tagged architecture for typed data. Since Lisp is by nature a dynamic and heuristic language (as opposed to static and algorithmic), it’s often not feasible to type-check arguments to functions in advance, so typing occurs at run time. Lisp machines, including the microExplorer, implement this type checking in hardware.

The microExplorer arrived complete with a TI representative who did the installation. Apparently, that’s standard procedure—and given the system’s $15,000 price tag, probably not a bad idea. The standard microExplorer board comes with 4 megabytes of RAM, but mine came with an additional 8 megabytes of RAM on a piggyback board. The software comes on an external 80-megabyte hard disk drive.

The physical installation of these two components—TI calls them “the board and brick”—was straightforward. The external drive contained a folder called microExp with more than 60 megabytes of material, including the microExplorer application, a start-up file, paging files, and the start-up Lisp environment. After ensuring that my Mac was running a post-6.0 OS and that MultiFinder was installed on the external drive, the TI representative spent a couple of hours setting up the software (which included setting up Action!) and giving me the tour.

In addition to the “board and brick,” the minimum hardware requirements for a microExplorer system are a Macintosh II chassis, a 640- by 480-pixel monitor, an Apple extended keyboard and a single-button mouse, 2 megabytes of RAM, a tape drive or a floppy disk drive, and an 80-megabyte hard disk drive with 70 megabytes of free space (needed for swapping). But that doesn’t leave much headroom on the Macintosh side of the machine. Launching the microExplorer in that configuration left just 128K bytes of memory free. After I boosted the Mac II to 4 megabytes of RAM, memory worries evaporated—as well they should have, in a machine with a total of 14 megabytes of RAM.

Exploring the microExplorer

The microExplorer launches like any Macintosh application. But from then on, it’s almost all microExplorer and very little Mac. What comes up is a Lisp Listener window (i.e., the agent that reads Lisp expressions, evaluates them, and prints the results). The Listener also displays the amount of memory available to the microExplorer, and the names and versions of software tools it can access.

At the bottom of the screen is a graphical display of current CPU, disk, and garbage-collection activity.

Garbage collection is a technique for reclaiming memory occupied by objects that are no longer accessible. In some Lisp systems, garbage collection is performed on a batch basis, which means that periodically the system appears to lock up while it scavenges for free space in memory. On advanced Lisp systems (including the microExplorer), garbage collection is nearly invisible so that the user never feels it happening. I had to look hard at the garbage collection tell-tale (at the bottom of the microExplorer screen) to catch the microExplorer in the act. The microExplorer system offers two options for garbage collection: temporal (sometimes called generational scavenging) and batch (which is useful, for example, when preparing clean disk images).

Next to the status display, the system shows the current user and the current package. (A Lisp package is a collection of symbol names; it’s analogous to a C library.) The display feature I liked best was the mouse documentation window. It

shows what mouse-selectable functions are available in different regions of the screen, and it describes those functions. Symbolics and Xerox Lisp machines work like this. It's an effective way to make users productive quickly.

The microExplorer's interface closely follows that of the TI Explorer. On the Macintosh, the Option key plays the role of the microExplorer's Meta key, and F5 serves as the System key. To simulate the microExplorer's three-button mouse, you use the Option and Apple keys in conjunction with a mouse-click to access functions attached to the second and third buttons.

Major software components in addition to the Listener include a Lisp compiler, an interactive debugger, several Inspectors, the ZMACS text editor, and a Macintosh Toolbox interface. The compiler converts Lisp functions into macro-code. The debugger helps you examine the environment in which an error occurs. The Listener uses a text-based debugger; there's also a window-based debugger that performs substantially the same functions, but graphically. Inspectors view data structures. There's one Inspector for examining standard Lisp structures, and another for examining flavors.

Flavors are part of an object-oriented facility featured in all Explorer systems. A flavor defines a data type and a set of operations (methods) that operate on that data type. You can combine flavors to yield a new flavor that inherits the properties of its constituents; object-oriented programmers call this "multiple inheritance." Both Inspectors support the examination of several flavors concurrently in separate panes, and they maintain an inspection history so that previously inspected objects can be easily reexamined.

The ZMACS editor is a clone of Richard Stallman's EMACS—the traditional text-editing tool for Lisp environments. As such, it provides hundreds of useful functions. One function I liked was the ability to select and compile parts of a ZMACS buffer. This came in handy when working with a body of Lisp code I'd acquired by means of a hand scanner. I was able to compile the buffer in manageable chunks, and by applying the debugger to the resulting errors, I sorted things out with remarkable speed.

The Macintosh Toolbox interface gives Lisp code the ability to access the Toolbox routines. Prior to the advent of Action!, that was how microExplorer developers gave their applications the look and feel that Macintosh users expect. The tb package is organized along the lines of Inside Macintosh; the Mac's ROM calls and arguments have been Lispified in a way that will be transparent to experienced Macintosh programmers. Of course, you wouldn't use a microExplorer for serious Mac-specific development; rather, the point is to deliver a powerful Lisp application that presents a Mac-like face to the world. That's where Action! comes in.

Ready for Action

Although Action! doesn't openly proclaim itself to be a CASE tool, that's what it is. It has five components: the User Interface Objects, the Smart Editor, the User Interaction Manager, the Menu and Keyboard Management System, and the Development Tool. Users spend most of their time with the first two of these.

The User Interface Objects are a group of Lisp flavors that represent the elements of the Macintosh interface—menus, dialog boxes, scroll bars, icons, and fields. These flavors all derive from the root flavor Rect (for rectangle); they're subdivided into the flavors DisplayObject (for pictures and text) and ControlObject (for buttons and scroll bars). The Smart Editor instantiates these flavors and, by way of dialog boxes and menus, helps you position, size, and align the interface objects and specify the actions associated with them. An Action field is usually associated with an interface object; the field is where you put the name of the Lisp form that should fire up when a user clicks on the object.

The User Interaction Manager and the Menu and Keyboard Management System work behind the scenes, trapping system events and dispatching messages to appropriate objects. The Development Tool builds a text file that documents the components of the interface under development. You launch Action! by double-clicking on its icon or by invoking it from the Listener. Once it's launched, you're operating in a dual mode. That is, the Mac's menu bar includes items that belong to Action! and—as you begin to construct an application—items that belong to the application you're building. To keep the categories distinct, Action!'s items appear in red, prefixed by a bullet. If you press Command-Space, you switch modes; Action!'s menu items disappear, and you're no longer editing your application—you're running it.

When you choose the New item from Action!'s File menu, a window appears in which you can begin assembling User Interface Objects. You place these objects in the window with the aid of the Action! keypad. The keypad is a calculator-like device whose buttons represent interface objects. To select an object, you drag the mouse to the object's icon and release the button; an instance then appears in the window. You can move, resize, and align objects in the window—in short, you can arrange them any way you want.

One example in the Action! manual constructs a slide show with buttons labeled "start," "advance," and "reverse," and a PlotObject that represents the slide. The PlotObject is named :proj, and the code linked to the start button is this Lisp form:

\[
\begin{align*}
\text{th: set-value :proj} \\
(setq \text{*cnt* 6000})
\end{align*}
\]

In English, this expression sets the value of the \text{*cnt*} (associated with \text{proj}, the PlotObject) to 6000—the resource ID of the first picture in the slide show. Expressions linked to the advance and reverse buttons increment (or decrement) that resource ID, wrapping around

MicroExplorer in Action!

Another, more complicated example creates an address book. Here, several FieldEditObjects are used to represent name and address fields, and ButtonObjects handle New, Save, and Find actions. Find's action searches the address list for an entry that matches the fields specified in the main window. If that fails, an alert appears. Interestingly, the alert runs as a separate Action! application. This confused me at first, but it turns out that because an Action! application owns just one window, you must build multiwindow programs out of separate components that you store together in a folder.

Once you've got things working properly, you'll want to create a stand-alone, double-clickable application. The Lisp function define-mac-application does that. Of course, real applications aren't quite so simple. Action! can only help you build an interface. You're on your own when it comes to writing the microExplorer Lisp application to which that interface grants access. But Action!'s graphical, object-oriented approach makes the Mac-specific part of the project a breeze. You don't need a lot of Mac-specific knowledge—Action! successfully shields you from that. The documentation takes you through the development of several sample interfaces, and it does a good job of describing the User Interface Objects included with the package.

I tested the microExplorer at work, in the midst of a crowd that's done quite a bit of development work in Lisp on a variety of platforms. The souped-up Macintosh received a uniformly positive reception. Veteran Lisp hackers found that the microExplorer offers many of the capabilities they'd grown familiar with on Symbolics and Xerox Lisp workstations. Those who had worked with the Explorer saw the microExplorer as a less-expensive, code-compatible version of its big brother. Of course, less expensive is by no means inexpensive, but the microExplorer does offer the option of a scaled-down delivery system. You can develop on a 12-megabyte microExplorer, but you can deliver on a 4-megabyte microExplorer. That should put the benefits of hybrid Macintosh/Lisp technology within the reach of more users.

When you pick a printer for the office, the only thing you have to fear is being wrong.

An office printer can cost a few hundred dollars, or it can cost as much as a small car. And depending on how well it does (or doesn't do) what everybody in the office wants it to do, it can cost you a lot of sleep.

That's why when AEG Olympia talks about printers, the feature we talk about most is good technology. Which may explain why we're one of the leading business machine companies in our native Germany, where technology is a leading passion.

So before an AEG Olympia dealer tells you about all our dot matrix and daisywheel and laser printers, he'll probably show you how beautifully they all work. We live and breathe solid engineering, sensible design and dependable mechanics for printers, just as we do for our typewriters, facsimiles, copiers and shredders.

For the name of our nearest dealer, call 1-800-999-6872. Or write AEG Olympia, Box 22, Somerville, NJ 08876-0022. You can't go wrong with good technology. Where technology counts, business counts on us.
We develop products on the premise that...
People have their own quirky ways of doing things. Some think fast. Some slow. Some are deliberate. Some intuitive. Some work from 9 to 5. Others never stop. That's precisely why we offer so many different products. Including the widest range of truly portable PCs anywhere. And a line of printers that includes everything from a high volume laser to a four-pound, letter-quality, battery-operated portable. All of which can be easily networked. But all of which are designed to meet the specific needs of each of our individual users. Because the fact is, at Toshiba, we have an incredibly diverse and sophisticated customer base. And from what we've been able to determine they have only one thing in common. They're all different.

ANOTHER TECHNOLOGICAL BREAKTHROUGH

BROTHER 1800 AND 1900 SERIES PRINTERS

This is the printer series that's so good, it truly can please all of the people all of the time.

Choose the 24-pin M-1824L or M-1924L dot matrix printers and you get a top printing speed of 337 cps, 360 x 360 dpi for high resolution graphics, a 24k buffer and 64k RAM and emulations that include IBM's ProPrinter™ X24, Epson's LQ850 and Diablo's 630.

For the budget-minded, see our 9-pin M-1809 and M-1909 printers. They feature speeds up to 360 cps, graphic resolution of 216 x 240 dpi, a 9k buffer and 32k RAM plus Epson EX and IBM 9-pin printer emulations.

Whether you choose our 80-column 1800 models or 136-column 1900 models, you'll get the friendliest control panel in the business. With a 6,000 hour MTBF, you won't break down mid-job, either. And Brother's Paper Parking™ feature will let you switch from sheet to form paper and back in mere seconds.

If you need even more speed and higher resolution, don't miss the Brother HL-8e with its many emulations and 44 internal fonts or the HL-8PS PostScript®-compatible laser printer.

Brother...fast, friendly, flexible, affordable printers for everyone. What could be better?

The power and flaws of Lotus 1-2-3 release 3.0 make it a program for the few of us

Edward Reno

At the risk of giving a false impression of my high regard for Lotus 1-2-3 release 3.0, I want to tell you about its major drawbacks. It has three: namely, slowness, hidden expense, and incomplete presentation graphics enhancements.

The biggest problem with 3.0 is that it is slow. However, the standard BYTE benchmark tests (see table 1) show that 3.0 was only marginally slower than releases 2.01 and 2.2 in basic calculation speed. In the Scroll Right test, 3.0's screen refresh capability blew 2.01 and 2.2 away. (That advantage will bring consolation only to those who still don't use the End key to navigate around the spreadsheet.)

When I used 3.0 on my real-world spreadsheets, I got a different view. I ran the Calc, File Retrieve, and File Save tests on 3.0 using a 927K-byte spreadsheet, which is what I commonly work with. Here, the real difference between 3.0 and 2.01 became obvious.

I used both an 80386- and an 80286-based system. On the 80386 machine (a PS/2 Model 80-111), 3.0 took over 40 percent longer to calculate my spreadsheet than did 2.01 or 2.2. That difference was amplified on the 80286 machine (an AT), where 3.0 took nearly four times longer than 2.01 and over 10 times longer than 2.2.

However, in saving and retrieving a file from disk, the results were mixed. On the PS/2, 3.0 and 2.01 took about the same time to retrieve the file, and 2.2 was the hands-down winner. Times for saving the file under DOS were also about the same, but 3.0 saved the file notably faster under OS/2. Release 3.0 didn't fare well at all on the AT, taking six times longer to retrieve a file.

I suppose I could run a theoretical calculation that would show that, during the course of my life expectancy, I would end up sacrificing several weeks because I used 3.0 rather than 2.01 on an 80386 machine. But I can live with that—as long as my spreadsheets don't get too big.

What I cannot live with, however, is 3.0 running on an 80286 machine—at least not on an 8-MHz machine configured similarly to mine. The 185-second Calc test that takes 39 seconds using the old version of 1-2-3 is a bit much. And a File Retrieve discrepancy of 386 seconds under 3.0 to just 56 seconds under 2.01 is intolerable. Those few weeks running 3.0 rather than 2.01 on an 80386 machine could easily become several years on an 80286 machine.

Part of the problem is that—unlike 2.0—Lotus wrote 3.0 in C rather than in assembly language. Release 3.0's speed is further compromised by its use of overlays in DOS and virtual memory in OS/2. In both cases, this means that disk swapping of code occurs in many operations, even in the Calc test.

Minimal Recalc and Background Calculation

Two features in 3.0 try to mask some of 3.0's loss of calculation speed. One feature, Minimal Recalc, was available as a Lotus-supplied add-in for 2.01. It causes continued
There are many pauses in all but the most preempted by keyboard input. Since the spreadsheet to recalculate only those cells affected by a particular change.

In addition, 3.0 also has background calculation, which lets the program continue to calculate as long as it is not being preempted by keyboard input. Since there are many pauses in all but the most intensive keyboard input, the theory is that your spreadsheet will be continuously updated.

The theory works fine on small or otherwise simple spreadsheets. But any

one with large and complex spreadsheets will find these features practically useless. On my 927K-byte spreadsheet, for example, when editing a formula that contained only a single-cell reference, I pressed Return to move the cursor out of that cell and on to another operation. I had to wait 8 seconds for 3.0 to write the new value of the cell to the screen. On the AT it was much worse; it took 133 seconds to write the data to the screen. I promptly turned off background calculation.

**Requirement for Extended Memory**

There are also some memory management issues for 80286-based systems. When Lotus says you need at least 1 megabyte of available RAM to run 3.0 under DOS, the word available hides a dual requirement.

First, the additional 384K bytes over a base 640K bytes must be extended, not expanded, memory. Depending on your system, this could mean reconfiguring 384K bytes of your expanded memory (assuming you already run large spreadsheets) for use as extended memory.

I also found that a 927K-byte 3.0 .WK3 file took only 884K bytes in .WK1 format. If you are playing at the ragged edge of expanded memory with some of your files, you may have to add more memory.

An 80386 machine can easily escape these problems. It just has to run a memory manager that conforms to the Virtual Control Program Interface (VCPI) specification. Some examples are Qualitas's 386Max, Compaq's Extended Memory Manager (CEMM), and Quarterdeck's Extended Memory Manager (QEMM).

These problems have a conceptually simple solution: Buy an 80386 system with lots of memory. Lotus is offering an upgrade to 3.0 for $150 until the end of the year. But the real expense of upgrading to 3.0 will be for new hardware.

None of the release 2.01 add-ins will run with the add-in manager that Lotus has built into 3.0. The problem is that the power user who really needs 3.0 is also the one who is most likely to have add-ins in the first place. In my case, unless Symantec comes out with a 3.0-compatible version of SQZ!, pretty soon, I may be forced to upgrade my hard disk drive.

**Incomplete Presentation**

**Graphics Enhancements**

The good news about 3.0's graphics is that you can display graphs on the same screen with cell entries and print graphs directly without going through the Print-Graph program.

A new automatic graphing feature allows 3.0 to guess what data it thinks you are looking to graph. There are also new types of graphs, some of which are wholly new, such as the High-Low-Close-Open graph, for those who cheat a little on their corporate CompuServe or Dow Jones subscriptions and load in the stock prices for their own portfolios. In addition, a new mixed graph lets you

Terminal emulation doesn’t have to be this way.

We’ve all been there. Trying to remember whether the “Do” key is really <Ctrl-F1>. Or was it <Alt-F1>? And the editing keypad. Can you be absolutely sure you’re about to press the “Select” key and not the “Remove” key? The results can be disastrous.

That’s why KEA developed the PowerStation. The PowerStation, an exact VT200 layout keyboard bundled with VT240 or VT220 terminal emulation software, turns your IBM PC or compatible into a key-by-key replica of a DEC terminal — without messy labels!

But what does that get you?

**Peace of mind.** The PowerStation keyboard takes the frustration out of switching between a DEC terminal and a PC because each key is right where you’d expect it to be. And our “Gold Key” version makes ALL-IN-1 and WPS a breeze.

**Savings.** If you think you can’t afford both emulation software and a keyboard, think again! The PowerStation can actually save you money by eliminating the time you waste every day translating between VT and PC keystrokes. And with the PowerStation, startup training costs are virtually eliminated.

**Consistency.** The PowerStation keyboard provides a consistent interface for both VT emulation and regular PC applications. In emulation mode you get the 105-key functionality of a real DEC keyboard and in PC mode you get a super enhanced keyboard. And you can use the PowerStation on virtually any PC! Move between an XT, AT, PS/2, AT&T PC and a DEC terminal without missing a keystroke.

The best in terminal emulation software. With the PowerStation keyboard you get the fastest, most precise, DEC terminal emulation software available: ZSTEM. You have the choice between two popular software packages: ZSTEM 240, our VT241/VT540 graphics emulator and ZSTEM 220, our VT220 text emulator. Both packages will impress you with their speed and feature-by-feature accuracy.

To top it off, the PowerStation gives you all this at a surprisingly low price. But find out for yourself why Digital Review Labs says “the PowerStation 240 is a godsend.” Call us at 800-663-8702.

Phar Lap Virtual Memory Manager.

It will let you write applications up to 5, 10, 15 megabytes or more for any 386 PC running MS-DOS®. Forget about RAM limitations. Your application can run on a machine with as little as 1 or 2 megabytes of memory.

Only Phar Lap 386lVMM® gives you demand-paged virtual memory capability so you can write mainframe-sized applications for the PC. Applications your customers can run on their 386 PCs now with no additional memory. No kidding. All you need is 386lVMM and our family of 386 development tools. Existing programs developed with our 386lDOS-Extender can be easily expanded with 386lVMM too.

Our tools let you take full advantage of the 386 protected mode architecture. Break the DOS 640K limit in the language of your choice; C, Fortran, Pascal, or Assembler.

For fast compact code, use 386lASM, our 80386 assembler that's upwardly compatible with the MASM® 8086 assembler. Existing DOS and mainframe applications written in a high level language are easily ported by recompiling. And 386lLINK, our 32-bit native mode linker, puts it all together.

Debugging is made easy too. With our 386 symbolic debugger you can debug applications written in assembler or any high level language. Best of all, with Phar Lap's 386lDOS-Extender® you can run your native mode program on any 386-based PC running MS-DOS. And you have full access to DOS system services through INT 21.

NO COMPATIBILITY PROBLEMS

Phar Lap's tools are compatible with the industry's leading systems: DESKPRO 386®, IBM Model 70/80®, 386 clones and accelerator boards. Not only will your new applications be compatible with the leading systems, they'll run alongside all other DOS applications.

NO ROYALTY PAYMENTS

Once your 386 application is complete, all you pay is a low one-time fee to license 386lDOS-Extender for redistribution. 386lVMM is also developer friendly. Call to find out about our flexible runtime pricing. You can unlock the entire DOS market now. Don't wait for OS/3.

Combine a line and clustered bar graph. Other features include the ability to create horizontal graphs, stacked graphs that convert into surface charts, and double y-axes graphs.

Added to these goodies are enhanced color, hatching, and gray-scale capabilities. Text is a bit easier to work with; you can add up to two footnotes per graph, and, similar to Lotus's Symphony, you can do logarithmic scaling on any axis.

The bad news for this three-dimensional spreadsheet is that, strangely, a 3-D graphing capability is missing. Also missing is the ability to have directly interactive and nameable settings sheets, as in Symphony. The irritation is compounded by all these capabilities having been built into 2.2.

The one significant exception involves print settings, which you can save and retrieve by name in 3.0, although you cannot view these settings in tableau format on the screen. Curiously enough, however, you can print them out.

Finally, although 3.0 has some print enhancements, it has no full-featured presentation printing features like those in Funk Software's Allways. The rub is that those features are included in 2.2.

The Glass Is Really Half-Full

Release 3.0 contains new features that will delight named-range addicts. One of the most satisfying is the ability to use as-yet-undefined range names in a formula you are composing. You can place a range name where you think it belongs; C, Fortran, Pascal, or Assembler.

Formulas can be up to 512 characters long. You can also attach a note of up to 512 characters to any range name. This will ease the pain of your not being able to use Note-It or similar cell annotation add-ins in 3.0.

Finally, you can name macros directly, not just in branching statements, with any name of up to 15 letters. This allows you to exceed the previous limit of 27 master macros.

New @ Functions

Release 3.0 has 14 new @ functions. The maximize-the-cash-flow crowd will revel in @DB, which lets you simultaneously compute double-declining-balance method and straight-line method depreciation and then automatically select whichever

How Soft-ICE Works

Soft-ICE uses the power of the 80386 to surround your program in a virtual machine. This gives you complete control of the DOS environment, while Soft-ICE runs safely in protected mode. Soft-ICE uses the 80386 to provide real-time break points on memory locations, memory ranges, execution, I/O ports, hardware & software interrupts. With Soft-ICE you get all the speed and power of a hardware-assisted debugger at a software price.

Don't want to switch debuggers?

You don't have to!

Soft-ICE can run stand-alone or it can add its powerful break points to the debugger you already use. Use your favorite debugger until you require Soft-ICE. Simply pop up the Soft-ICE window to set powerful real-time break points. When a break point is reached, your debugger will be activated automatically.

MagicCV with Soft-ICE

Using Soft-ICE with CodeView gives you the features necessary for professional level systems debugging. MagicCV and Soft-ICE can work in concert with CodeView to provide the most powerful debugging platform you will find anywhere.

NEW—Version 2.0 includes EMS 4.0 driver.
Attention Windows Developers!
Version available for CVW.
I found two relatively minor bugs with 3.0 that Lotus is addressing. Statistical gurus will appreciate the addition of @STDS and @VARS and their related database statistical functions, @DSTDS and @DVARS. These features let you calculate the sample standard deviation and variance, in addition to the population standard deviation (@STD and @DSTD) and variance (@VAR and @DVAR), which 1-2-3 has always allowed users to calculate.

I think everyone will be grateful for the reappearance of the simple, old-fashioned @TODAY, which succumbed between 1985 and 1989 to the roundabout @INT(@NOW). Release 3.0 also has some worksheet auditing functions—particularly useful with 3-D spreadsheets.

A new database function, @EXIST, lets you go into a database and pluck out a specific detail in a record. Finally, the @DQUERY function will, if more fully implemented through optional DataLens drivers, have the ability to take an entire database query language (e.g., Structured Query Language, or SQL) as its arguments—that’s a powerful feature.

**Printing Features**
A new range of printer layout options is controlled from the Print menu. You can now point to and select print styles and fonts from the Print menu. If you don’t like the preset options, you can use the setup string in the Print menu.

Release 3.0 also handles background printing. You can specify more than one print range in a single-range statement, the cell reference for the contents of headers and footers, and a particular number for starting pages. You can even print the number and letter coordinates in the worksheet frame along with your data.

Perhaps the most significant print enhancement in 3.0 is the ability to directly print graphs from the Print menu and on the same page as worksheet data. You can print the graph from the Print menu, but you cannot make any changes in its settings at this point. Instead, you must exit the Print menu and go back into the Graph menu, where you can fiddle with the settings until you have them the way you want them, and then go back to the Print menu.

To get graphs on the same screen as cell data, 3.0 goes to bit-mapped screen presentation in EGA and VGA mode. The somewhat jagged-looking font that results is not as pleasing to look at as the older-style full-character font. At installation, you can also specify two displays.

**Gotcha!**
I found two relatively minor bugs with 3.0 that Lotus says it is addressing. First, if you run a reverse @SUM function over a range of just two rows, top to bottom, or two columns, left to right, you are asking for trouble. When 3.0 gets down to the limit of two rows or columns, it hiccups when you delete the upper or left boundary in a reverse @SUM, or any other @ range function. For example, instead of...

The Future

The ProHance™ PowerMouse is a mouse and a whole lot more. So before buying any mouse, you owe it to yourself to try it out.

The built-in keypad puts not only mouse keys but number keys, function keys, and up to 240 commands at your fingertips, greatly reducing going back-and-forth to the keyboard, or up-and-back to the command line. And since the commands are macros, lengthy keystrokes are reduced to the press of a button, letting you work faster and with far less hassle than you ever thought possible.

And these benefits are not limited to just your new mouse-driven programs. PowerMouse provides an entirely new level of speed and ease-of-use to your existing keyboard-driven programs. Without additional drivers. And without changing the look or feel of your programs. Programs like Lotus 1-2-3, Symphony, Quattro, word processing software, and more.

Intimidating? Not at all. The keyboard is clearly labeled and about as easy to use as a calculator. As one of our users put it, "It's just so intuitive."

PowerMouse will pay for itself in a few hours. And we back that with a money-back guarantee. PowerMouse sells for $225. Call our toll free number to place your order, and we'll rush one to you. You'll quickly see why PowerMouse is the choice for the future.

making the expected adjustment from $\text{SUM}(A3, A2)$ to $\text{SUM}(A2, A1)$, it returns the value for $\text{SUM}(A2, A1)$. To add to the confusion, the bug asserts itself in 3-D contexts as well. I don't consider this bug serious since, as a matter of prophyactic work habits, I avoid reverse & range functions. But other users may get into a pile of trouble over this.

Another problem occurs when you use the Data Fill command with dates. The command fails. Admittedly, the likelihood of this bug affecting any worksheets in the same file, with the command fails. Admittedly, the likelihood of this bug affecting any spreadsheet in a material way is probably beyond 3.0's new 18-decimal floating-point range.

Multiple Worksheets, Multiple Files
The most important enhancements in 3.0 revolve around its 3-D and new database management capabilities. Depending on your memory configuration, you can get up to 256 separate 1-2-3 worksheets into active memory. These worksheets can be all in one file or, through the new File Open command, in as many as 256 separate files, all active in the same session.

The integration between multiple worksheets, even when they run across files, is seamless. You have to get used to the 3-D coordinate references that are cluttered up by worksheet letter references (e.g., A:A1..C:B6, which cuts across three worksheets, A, B, and C). Where different files are being referenced, you have the extra baggage of file path and filename in double-angled brackets.

But 256 active worksheets is not the end of it. Release 3.0 can now link to files on the disk, and you can reference them in formulas that also include active files. (This is a technology that Multiplan had in 1982.)

My only complaints about 3.0's 3-D capability have to do with the window management and the translation utility. When working in 3-D mode, you are restricted to three rigidly formatted, overlapping windows. You can, however, zoom to full size in a single window and then divide that window in the conventional horizontal and vertical ways.

The problem with the translation utility, which converts 3.0 worksheet files for use with 2.0, is its speed. The translation utility does its job, appropriately flagging those 3.0-specific parts of a file that won't translate fully into a 2.0 environment. But the process is terribly slow.

Database Management: The Secret Revolution
Release 3.0 supports database structures that are effectively relational. Its database structure lets you retrieve records across multiple databases. The program organizes data in a row-column table, with each row corresponding to a record and each column to a field within the record. Thus, retrieving across multiple databases means retrieving from more than one such table with a single command or formula and criterion range. (Of course, the target records in the different database tables must share a common data element.)

Because of 3.0's 3-D architecture, those different tables can exist on different worksheets in the same file, with the criteria and output ranges themselves existing on still other worksheets in that same file. The databases can even be...

REVIEW
FOR POWER USERS ONLY

spread over different files. With file linking, you can also access 1-2-3 files that are not active, but only disk resident.

In addition, external databases are accessible, in principle, to 3.0 through what Lotus calls DataLens drivers. Lotus supplies a single DataLens driver for dBASE III database tables. It also supplies a sample table in dBASE format so that you can try out the driver.

The DataLens technology is currently incomplete, however. In particular, the new @DQUERY function, which supposedly will allow you to nest entire foreign database query languages under it, is not yet operational. If and when it is fully implemented, and if Lotus can persuade other DBMS software vendors to use DataLens drivers, 1-2-3 stands a chance of maintaining its commanding position in the power-user market.

Other major enhancements to 3.0’s database management facilities are fully complete, however. The most powerful is the Data Table 3 functionality. Its concept is simple enough; it’s a Data Table 2 with a z-axis. It is no more complicated than that in its simplest "what-if" form.

Moreover, you can draw input from databases and use database statistical functions such as @DSUM, @DMAX, and @DSTD for sifting the contents of databases into three dimensions. When combined with the ability of 3.0 to query multiple databases—on disk as well as in active memory—there is little limitation for what you can do with database management in 1-2-3. Other significant database management enhancements include a free-form version of data tables and sorts on up to 256 keys.

Does It All Add Up?
Release 3.0’s improvements—particularly the database management and 3-D worksheets—are worthwhile. But those improvements come with a sacrifice in speed, additional hardware costs, and disappointing graphics. Furthermore, program developers using the new Lotus Development Environment have yet to produce any add-ins.

An imperfect instrument, Lotus 1-2-3 release 3.0 is still in the process of formation. Despite its flaws, I like 3.0 and have decided to upgrade. In my opinion, 1-2-3 has always been the most important thing happening on the desktop—3.0 has only confirmed that opinion.

SOFTWARE SECURITY

WHETHER REPORT.

Whether you're a software developer writing new applications for the IBM or Mac, or a PC user securing proprietary data files, software and data protection has never had a brighter silver lining. For a number of very good reasons.

Beginning with the 'whether-expert' Rainbow Technologies. And ending with its Software Sentinel family of hardware keys. Starring five models that fit virtually any software program or data file you need to protect.

There's the best-selling SentinelPro for the IBM PC/XT/AT, PS/2 and compatibles, and even the Atari ST. Known worldwide for its virtually unbreakable security. And its ASIC technology. And its invisible operation. A close relation, the Sentinel-C stands at-the-ready for custom configurations and multiple software packages.

In the Apple market, security-minded Mac software developers turn to Eve. For completely transparent operation and world-class security of the protected software. Just by plugging Eve into the Mac ADB connector.

PC users wanting a low cost, user-friendly solution to the problem of securing sensitive data can call on the DataSentry. Using a proprietary Rainbow algorithm or DES, the DataSentry encrypts data files on individual PCs, protects modem transmissions and secures data on local area networks.

Rainbow's latest protection strategy is the SentinelShell—that lets users place a 'shell' around existing, off-the-shelf programs. Because access can be limited to those issued a key, libraries, universities and corporations can very simply guard their software investments.

Whatever your whether, Rainbow Technologies has the software and data protection products that make the difference. For more information, call 714-261-0228 in the U.S., or contact Rainbow Technologies Ltd. in the United Kingdom for the distributor nearest you. Whethercasters are standing by.

SOME THINGS IMPROVE WITH AGE

Unlike fine wine, few 4GL's improve with age. Especially when so many trendy software products have gone sour in so short a time.
Yet filePro has timeless qualities—staying power, and the kind of growth and adaptability that make it fittest to survive. filePro Plus is a complete Application Development Environment (4GL) whose pioneering efforts and refinements have stood the tests of time.

SIMPLICITY, POWER & PERFORMANCE

What's filePro's secret? filePro Plus makes Application Development easy. Mainly because filePro is easy to learn. (Ask any developer or end user who has experienced it.) A powerful editor, built-in debugger, and built-in capability to prototype screens and reports make the development cycle short. Applications are developed faster, outperforming products like Informix, Oracle, dBASE III & IV, Advanced Revelation and FoxBASE Plus.

FILEPRO'S 4 "P's"—POWER, PERFORMANCE, PORTABILITY, PRODUCTIVITY

Our customers were the first to benefit from portability. (Actually, filePro is portable between DOS, OS/2, Networks, Xenix, Unix, AIX, Ultrix, HP-UX, SUN OS and DEC VMS.) They realized that there is no need to redevelop or redesign applications. That files and applications are so easily transferred. And finally, that filePro saves on two of their most valuable resources—time and money.

filePro Plus. The Timeless Investment.

Alpha Four: No Programming Required

This relational DBMS features dBASE compatibility and ease of use, but at a performance cost.

Malcolm C. Rubel

Although dBASE is popular, it has never been easy to use. Alpha Four may solve this problem. It provides almost complete compatibility with dBASE III Plus files while also providing a full range of screen, report, label, mail merge, and other capabilities that are already set up.

With all that it does, Alpha Four takes a lot of hard disk space—2.4 megabytes, to be exact. I also found a little hitch in it while installing it. The program modifies the existing CONFIG.SYS file, or it creates a new one with Alpha Four's file and buffer requirements; however, when I installed the program on drive F, the installation program made a CONFIG.SYS file on drive F instead of on drive C.

Alpha Four comes with over 120 different printer configurations, covering the most popular printers. Special configurations are available for printing envelopes on a Hewlett-Packard LaserJet. The only important item missing is a generic PostScript printer driver.

Alpha Four includes an excellent tutorial that provides good examples of both simple and complex database management tasks. The documentation is also well written and complete.

The program is almost totally menu-driven, and moving from one menu to another is logical and intuitive. A person with little or no database management experience won't have any trouble figuring out what comes next. I wish that other programs were laid out as well. Good online help is also available.

dBASE Compatibility

Alpha Four can use dBASE III Plus data files directly. It works with database files (.DBF), memo files (.DBT) and index files (.NDX). However, Alpha Four cannot use dBASE IV files, because it does not support the master index file type (.MDX) or the memo file (.DBT) that dBASE IV uses.

I did find one incompatibility between Alpha Four and dBASE—it has to do with templates. With dBASE, you can choose not to store formatting characters, which are used as a part of a template, as data. The picture function @R handles this. With Alpha Four, the picture-formatting characters are automatically part of the field value when it is stored. In other words, in dBASE you can store the telephone number "(212) 555-1212" in a character field with a length of 10 (just the digits) using the picture function, while with Alpha Four, you must specify a length of 14. If you try to create a template for the field, you will run out of space before you run out of numbers. In this case, you will have to suffer the extra 4 bytes per record that this implies.

Although Alpha Four and dBASE share the same database file structure and the same indexing routine, little else about the two programs is similar. Alpha Four cannot run user programs. There is no "dot prompt" to contend with or use.

Instead, you define the necessary pieces
of an application from different specifica-
tion screens and work surfaces. Alpha
Four can use the individual pieces, or
you can integrate them into a complete
application. Database tables are related
to other database tables in sets, with the
links defined and established only when
the set is constructed. You define data-
entry screens, reports and labels, filters,
and mail merges from their own modu-
les, and you can call them independ-
ently or as part of a larger application.

As with dBASE, you can set ranges
and filters with Alpha Four. You can
change the active index, set a filter, and
save it all from within one screen. While
Alpha Four does not provide you with a
point-and-shoot filter builder, it does
provide you with access to all fields,
functions, and logical operators while
you are building your filter expression.
Alpha Software is also good enough to
recognize and tell you that filters slow
down processing and that you should,
where possible, try to index on the filter
expression, set that as the active index,
and then indicate the range for the de-
sired data.

Forms Design and Field Rules
The Alpha Four forms feature lets you
design screen-entry forms visually. The
forms designer is WYSIWYG, and it lets
you print directly from the forms design.

With this feature, you don’t have to
create the same design twice, once for
the screen and once for printing.

A major difference between the Alpha
Four forms designer and dBASE is that
with Alpha Four, you don’t use any edit-
ing rules in the screen form, the way you
do with dBASE. To handle this neces-
sary function, Alpha Four uses the
“field rules” option from the Database/
Set Design utility. With dBASE, you
must specify the acceptable values as a
part of the data-entry screen, and you
must also specify the format template for
output as a part of your report program.

While this gives you the flexibility to
handle the same piece of data differently
in different areas of the program, in most
instances, it simply means more work.
Alpha Four has gotten around this by
designating the formats and editing pa-
rameters as an integral part of the data-
base design process.

The field rules act more like a data dic-
tionary than anything else. You can
create calculated fields, enforce case for
alpha data, and supply the editing tem-
plate and the mask and print template for

User Jeff Garbers, Crosstalk Communications' Director of Software Development, has been debugging with Periscope® Model IV and says, "The hardware really makes Periscope shine, especially when you've got timing-related problems. I can now track down changing pointers and altered buffers on my 386. I've been using it to debug Crosstalk® Mk. 4 and there's just no better way to do it."

Periscope IV gives you the ability to debug time-sensitive programs, hardware-interrupt routines, and programs with intermittent errors. You can run your program at full speed while tracking down unwanted memory overwrites. You can use the information captured in Periscope IV's real-time trace buffer to see EXACTLY what the system is doing, and to improve its performance.

Compatible with virtually any 286 or 386 with an AT-style bus, Periscope IV works on machines running up to 25MHz with any number of wait states. Because it gets information directly from the CPU, instead of from the system bus, Model IV is not sensitive to bus compatibility issues.

Periscope IV collects CPU information in its hardware trace buffer while the CPU runs at full speed. Whether you tell Periscope IV to capture just selected information or to capture everything, you can use its powerful trace buffer commands to search for and display the execution history the way you need to see it. And you can use the CPU cycle count information to get the last bit of performance out of your code.

With Periscope IV you can set hardware breakpoints on memory accesses (within the first 16MB), I/O ports, and data. You can also set breakpoints on the occurrence of specific sequences of events, such as "watch for the routine FOO to begin executing, then while it is, watch for the variable BAR to be written." This capability, called sequential triggering, enables you to define complex conditions, then stop your program and examine what has happened when these conditions occur.

If you're developing a large application that needs all of the lower 640K, you can use the optional Plus board to keep Periscope totally out of normal DOS memory. The Plus board requires the use of a second slot.

The Periscope IV software is an extension of the software that comes with all models of Periscope. So, along with Periscope IV's powerful hardware, you get a full-function software debugger with source and symbol support for most popular PC compilers and linkers, Microsoft® Windows support, PLINK overlay support, dual monitor support, support for debugging device drivers and TSRs as well as regular programs, DOS independence, crash recovery, ease-of-use, and much more.

Prices on Periscope range from $145 for software-only Model II-X to $2,995 for a 25MHz 386 hardware-assisted Model IV. Call 800/722-7006 for pricing details, free information, to talk about your debugging needs, or to order your Periscope.

each field. You can also indicate whether the mask is to be strictly enforced or whether exceptions can be made to it. You can supply either a default value or a calculated default expression as a part of the field rules.

Field rules also let you elect whether or not a field requires an entry. You can even make the field rule dependent on a value in another field. You also have the option of using a valid expression that must evaluate to a logical true before the program accepts the entry.

You can specify a condition for which the field is skipped and no entry is required (e.g., if you have a male patient, you don’t ask if he’s pregnant). You can have the user enter critical data twice to make sure that it’s right, and you can supply a prompt for each field. The program lets you perform field lookups either from a table in memory or from a database on disk. You can set the size of the window that pops up and whether it pops up automatically or only on entry of illegal data. Bad data can be that which is already in the table or that which is not. All this is available without any programming.

Alpha Four has even tamed memo fields, which have long been the toughest part of the report portion of Alpha Four is that versatility. On the first pass you can generate sorting statistics. On the second pass, you can use these numbers (e.g., sales per region as a percent of total sales).

The label-printing program lets you determine the size of a label, how many labels you want across a sheet, how many spaces you need between labels (across or down), the number of copies you want to print, and the labels’ contents. You can specify what information goes where and what to do with blank information.

One of Alpha Four’s best features is its ability to define up to 26 different browse tables for each set of data. You can define fields to be included in the browse, and you can select the order in which they are to appear. You can also include calculated fields. Unlike dBASE IV, you can show the contents of memo fields in the browse table.

Macros and Other Good Stuff

Alpha Four provides a keyboard macro capability so you can record and edit any series of keystrokes. This comes in handy when developing applications and in circumstances like data entry, where repetitive keystrokes become a burden.

The product also includes a complete set of import and export file specifications, letting you get at data stored in other programs and also letting you write data to them. You can import data from Alpha Software’s Alpha Data Base Manager II (the company’s flagship product), from Lotus ,WKS and.WK1 worksheet files, and from Microsoft SYLK and VisiCalc DIF files, as well as from dBASE II, PFS: File, and ASCII tables and character-delimited format files. Alpha Four will export in these file formats as well as in MultiMate and WordPerfect merge file formats.

Along with all the basic features, Alpha Four lets you pause for operator entry during printing, using calculated fields in the middle of your letter and printing information conditionally. For example, you can automatically generate a different type of form letter that thanks contributors based on the amount they gave.

Last, but certainly not least, Alpha Four contains the ability to define custom menus that let you call submenus, run macros, call another application, or run another application. The generator also allows you to add a prompt line and a help file, if desired. While not terribly sophisticated in its design, the Alpha Four applications generator lets you develop good, solid, basic applications.

The Downside

Alpha Four does a better job than most of the competitive products I’ve seen. This doesn’t mean that I’m a complete fan of the product. Alpha Four is, by definition, limited in what it can do. With a database management product, such as dBASE IV, which includes a programming language, you will always be able to do things that a defined product like Alpha Four cannot.

Alpha Four does not have a programming language and is not designed to execute even a single line of user program code, so you cannot do anything that’s not built into the product. It would help if Alpha Software could put a RUN command in the product that allowed you to swap Alpha Four out of memory and run another program.

On the other hand, if you have heard anything about Alpha Four’s lack of indexing speed, you can discount most of it. Version 1.05 is five to 10 times faster than 1.0 and, as you can see from the benchmark times in table 1, close to the speed of dBASE IV for simple indexes but still slower for a compound index.

Overall, Alpha Four represents an excellent alternative approach to handling data management tasks. But at $959, it’s not that much of a bargain. I wish the program was a bit peppier than it is, but it’s still an excellent ad hoc query device for small databases. I would definitely consider the program for an environment where I had nonprogrammers and novice computer users who want to look at data for themselves.

DISK TRACER AUTOMATES DISKETTE COPYING.

Put time-consuming formatting and copying tasks behind you with the new Disk Tracer. Now you can format and copy diskettes easily and automatically. Just as the paper copier eliminated messy carbon paper, now Disk Tracer eliminates the slow, tedious task of copying diskettes manually.

Simply place your original diskette and blank diskettes in the top tray, select the quantity desired, press COPY and walk away. Don’t walk too far, Disk Tracer produces a perfect copy every 24 seconds...without your effort or attention! Disk Tracer does it all automatically, fast, freeing you and your computer. And by reducing your labor cost, it quickly pays for itself.

Disk Tracer is one of many state-of-the-art diskette copiers brought to you by Trace, with a product family that answers every need from high volume industrial diskette copying to our inexpensive desktop copiers. Interleaf’s Technical Publishing Software (TPS) blends two styles of computer-based publishing. The first, represented by troff and TEX, is stream-oriented and works with a global description of a document’s format. The second (and newer) style, best exemplified by PageMaker, works in a WYSIWYG mode with individual pages.

Both methods have advantages: troff and TEX powerfully automate the pagination of large documents, and PageMaker shines when you need to lay out custom pages that mix text and graphics. TPS’s union of the two styles is, for the most part, a happy one that has made it one of the most interesting desktop publishing packages around. The latest version, release 4.0, enhances both halves of TPS’s personality.

Release 4.0, ranging in price from $2500 for the core version to $15,000 for the full version, runs under Unix on Sun, Apollo, and DEC workstations. I used the full version on a Sun386i. That’s a heady combination of hardware and software, but there’s hope for PC and Mac users.

Interleaf has already ported release 3.0 to PCs and Macs. These versions, known respectively as IBM Interleaf Publisher and Interleaf Publisher, have recently dropped into the sub-$1000 price range.

The advent of DOS extenders with built-in virtual memory (on 80386 PCs) and System 7.0 with virtual memory (on 68030 Macs or on 68020 Macs equipped with paged-memory-management units) might tempt Interleaf to move its latest version over to these platforms. The company isn’t making any promises, however.

First Impressions
On the Sun workstation, TPS can run in a SunView window using your choice of Sun or Interleaf conventions for mouse-button behavior, or it can claim the workstation’s entire screen (again, with your choice of mouse conventions). I preferred the SunView approach, which let me iconify and de-iconify the TPS application and switch among windows containing other tasks, such as Unix and DOS terminals and SunView’s Organizer.

That flexibility, however, requires you to think in terms of two different windowing models and two different desktops. Moving or sizing the SunView window that contains TPS (or any other SunView application) works one way. Within the TPS window, moving or sizing the window that contains a TPS document works another way.

Although the mechanics of TPS’s desktop differ from those of Sun’s, the two share a common philosophy that I find less congenial than the Mac’s. Both turn what are simple click or click-and-drag operations on the Mac into menu-driven affairs. For example, to close a TPS document window, you click on the document’s name to pop up a menu that

Interleaf’s Technical Publishing Software lets you easily mix text and graphics in a document.
Style, Structure, and Content
You use the vertical, left-aligned component bar to view and edit the components of a document. In the default empty document, there is a single component name: para. When you click in the document’s main window and start typing in text, the text appears on the screen as 12-point Times Roman (similar to Times Roman) spaced 1.16 lines apart.

These properties flow from the default para component. To change them, you select the component’s name in the component bar, activate a pop-up menu, and open a set of linked property sheets associated with the component. Here you can specify a para’s margins, font family and size, indentation, horizontal justification, display attributes (underlining and strike-through), kerning (intercharacter spacing), leading (interline spacing), color (for spot color separation), and even hyphenation and spelling dictionaries.

The component bar is a more powerful version of what Microsoft Word calls a style sheet. But it also serves as a structure editor that complements the main window’s text editor. To delete a range of text from within a para, you’d use the text editor to highlight the range and then cut it. But to delete the entire para component, you’d highlight its name in the component bar and cut it.

The component editor also gives access to the component masters that lie behind the instances that appear in the component bar. The para component in the default document is one such instance. You can create a second para in the text editor by pressing the Line Feed key, or in the component editor with the Create->para command. Now select the new para in the component bar, access its property sheet, and change its font. The ensuing pop-up menu prompts you to apply the change locally or globally. The first choice affects only the para whose property sheet you’ve accessed. The second affects all existing paras and, because it updates the master that’s used to stamp out new instances, all future paras as well.

Working with masters takes some getting used to. They’re reclusive: You cannot edit them directly; you can only transfer properties to them by way of instances. However, the component bar’s Create->menu lists all the masters in a document. In addition to para, the default document provides masters that govern subheads, lists, bullets, and tables. To add a new master, you create an instance of one of the known masters, adjust its properties to fit your needs, rename it, and globally apply the change. This procedure simultaneously creates a new master and that master’s first instance.

Although masters normally transmit style to the instances that derive from them, they can also transmit content. Take a look at one of the pages in the What’s New section of this magazine. In the design of a template for that section, I used a shared-content master to define a firstpara component that includes the bold divider at the beginning of each article. Once that was done, the Create->firstpara command (TPS adds the new component to the Create menu on the fly) conjured up a new component that contained the divider. Because all the dividers in the document shared the master’s content, a change to any of them—for example, in color, width, thickness, or vertical offset—propagated through the master to all the others.

Text in Graphics in Text
That bold divider was a graphical, not a textual, element. TPS graphics live in frames that are, in turn, tied to components. You create frames in the document window, not in the component bar—they’re part of the content of components, not components themselves. As such, frames anchor to the text of your document. But, like components, frames have adjustable properties. For example, you can specify that a frame will appear at its anchor’s location, after the text in which the anchor occurs, or at the top or bottom of the anchor’s page. Frames can also fill the page, and they can overlay or underlay text and other frames on the page.

Other useful frame properties include width and height, which you can specify in terms of a column of text, a whole page, or absolutely, and offset, which fine-tunes the placement of the frame either horizontally or vertically, depending on the method of anchoring. Like components, frames are instances of masters. Once you adjust one to your liking, you have built a frame master that you can name and reuse.

When you select and open a frame, you enter the diagram editor—a highly sophisticated, object-oriented drawing program. The basics will be familiar to anyone who’s used MacDraw or Adobe Illustrator—lines, ovals, boxes, and fill patterns behave much as they do in these popular Macintosh applications. But the power of the TPS diagram editor is simply breathtaking. The arc and spline
Introducing PC-MOS™ 3.0

A multiluser system no longer means only a mainframe or minicomputer. Today's 386- and 286-based PCs are more powerful than the minicomputers of just a few years ago. And they often provide more desktop power than one person can use effectively.

That's why you need PC-MOS 3.0. It harnesses the power of your 386- or 286-based PC and turns it into a powerful multiluser, multitasking computer. PC-MOS is the multiluser operating system that lets you run popular DOS applications such as Windows™ Lotus 1-2-3™, dBase IV™, or WordPerfect™—without modification.

PC-MOS is the perfect solution for a small business or a department of a large company that needs to easily and affordably share programs, databases or peripherals. It takes full advantage of the power—and saves you money in the process! For example, instead of replicating PCs, each user can have an inexpensive terminal or monitor that acts like a PC.

DOS Compatibility Means Minimal Training

And Support

Since PC-MOS is DOS compatible—unlike UNIX™ or OS/2™—there's no need for users to learn a "new" operating system or be retrained on the application programs they already know. And unlike most LANS, PC-MOS is easy to install and even easier to maintain. No hassle, no expensive wiring, and no network management headaches.

There are now more than 100,000 users of PC-MOS worldwide, but if you haven't seen it lately, take another look. We've broadened our base of compatible applications and added multi-level security, faster disk performance and larger task sizes. Version 3.0 also interfaces with Novell LANs, 3270 mainframe communications products and "The Software Link's" LANLink™ local area network.

Call us today for more information about PC-MOS 3.0 and the location of your nearest multiluser dealer. We'll show you how to easily and affordably turn your PC into a powerful multiluser system.

THE POWER OF THE PRESS

effects are a joy to use. In addition to the
rectangular grid, an isometric grid helps
you create objects that look three-dimen-
sional. You can supply numeric input for
nearly all operations, and you can be as
precise as you want (that's true through-
out the TPS system). You can even spec-
ify a scaling factor for numeric input, so
that if you're drawing, say, a floor plan,
you can express distances in feet or in
inches.

I particularly liked the suite of tools
that align a set of selected objects to one
another's top, bottom, left, or right
dges, vertical or horizontal centers, or
the frame. For finer adjustments, you
can use grid alignment and gravity. Ob-
jects respond quite sensitively to one an-
other's gravity points, and you can even
adjust the gravity radius if congestion
makes that necessary.

Another handy feature is subediting,
which enables you to recursively edit a
group of objects. With subediting, you
don't have to undo a group to change
something in it. This feature makes
groups extremely useful.

Three kinds of text can appear in a
frame: raster text, outline text, and
microdocuments. Raster text objects use
the same fonts as the regular text-pro-
cessing system. You can rotate them in
90-degree increments, and they interact
intelligently with other kinds of objects.
For example, while adding labels to a
chart, I found it easy to lay down a series
of construction lines, snap the baselines
of the text labels to those lines, and then
center the text labels horizontally with
respect to the lines.

You can convert a raster text object to
its equivalent in a Bitstream-supplied
outline font. It's a one-way conversion—
if you've misspelled something, you'll
have to throw the conversion away and
start over. But once the text is in outline
form, you can size or rotate it arbitrarily,
change the weight of its edges, fill it with
a pattern, and twist it into unusual (and,
you hope, artistic) shapes.

Microdocuments are TPS documents
that live within bounding rectangles
inside graphical frames, which, in turn,
live inside components of regular TPS
documents. Confusing? Well, yes, there
are a lot of Chinese boxes here, but
microdocuments are an intriguing inven-
tion. The problem with raster and outline
text objects is that, while they're fine for
short phrases and one-liners, you often
need more text than that in a diagram,
and you'd like that text to behave as text,
not as graphical objects. Microdocu-
ments do that. Nearly all TPS's text-pro-
cessing power is available within the
microdocument editor. Microdocuments
can even participate in the main docu-
ment's table of contents and index pro-
cessing. That makes them a good choice
for captions and legends.

Layout Problems
With this formidable collection of tools,
I set out to produce templates for a few
pages of BYTE. To my surprise, I was
unable to solve a layout problem satisfac-
torily. Look again at the What's New
section. See how the columns run around
the photograph at the top of the page? In a
multicolumn format, TPS doesn't do
well with that sort of text/graphics inter-
action.

Frames work beautifully when they're
no wider than a single column; the frame
anchors to and flows with the text. When
the frame gets wider than a column,
there are a couple of possibilities: It can
straddle the page (the straddle acts as a

text-flow barrier), or it can overlay the page (but then the frame won’t obstruct text flow).

A text-shaping feature lets you manually push text around an overlay frame, but that’s a custom operation and can’t be made part of a reusable template. A final option, used in the newsletter example provided with the software, is to put each column’s text into a separate microdocument; then it’s easy to put the columns where you want them. But again, that’s a custom operation that doesn’t yield a reusable template. Text can’t flow between microdocuments, so in a production environment, you’d be stuck doing lots of electronic paste-up.

I was trying to get TPS to do something it wasn’t designed to do. It’s not really a layout system, and it’s not intended for newspaper and magazine work. The essence of layout is that each page gets special treatment. But TPS’s dominant mode is document-oriented rather than page-oriented. True, its diagram editor is so powerful that you can ignore the document mode and create highly customized mixtures of text and graphics within frames. Nevertheless, in document mode TPS’s strength is automatic pagination, not custom layout.

Who needs this capability? Technical documenters, business folk, scientists, engineers, commercial book publishers, database publishers—anyone who produces lots of pages, needs high quality and fast turnaround, wants to define and reuse design standards, and doesn’t want to fuss over each individual page.

Charts, Tables, and Equations

TPS supports its diverse users with several additional special-purpose tools. Three that I haven’t mentioned are the equation, chart, and table editors. The equation editor does mathematical type-setting. It parses expressions made of letters, digits, parentheses, brackets, and mathematical keywords, and it produces typeset equations.

The chart editor is the nicest that I’ve worked with. It’s data-driven—you cut tab- and new-line-delimited sets of numbers from an text file and paste them into a chart’s data sheet. The system supports the usual collection of chart styles but offers excellent control over variation within those styles. Using data on 66 machines that have been tested in the BYTE Lab, I developed a stacked-bar chart that displayed nearly 600 data points. The result was clear and precise on-screen and even better when printed on a LaserWriter IINT.

TPS’s attention to detail is such that you can set the width and length of the hash marks along a chart’s axes (among other chart properties) in terms of whimsically named rsus (for “ridiculously small units”). An rsu is equal to a millionth of an inch. The manual notes dryly that you have to add 3000 rsus to a chart parameter to see even a slight difference in 300-dot-per-inch printed output.

Charts inherit frames, so it’s easy to add further embellishments using the diagram editor. You can move and size charts and lay pictures or microdocuments on top of them. I even found a way to mimic the BYTE format for benchmarks. Sometimes application benchmarks are shown as left-to-right bars and system benchmarks as mirror-image right-to-left bars on the same page. The diagram editor couldn’t flip the system benchmarks to the other orientation, but TPS’s screen-capture tool turned the chart into a raster image, which I then flipped and aligned to achieve the desired result.

Tables are interesting hybrids. When you create a table in the component bar, you specify the number of rows and columns that it contains. The result isn’t a single component name, however, but rather a list of names—one for each row. From any row component, you can access property sheets that govern that row instance, the row master (and, by extension, all rows), or the whole table. When you click in a cell, you can access property sheets that govern that cell, and you can apply changes to only that cell or to its whole column. Text wraps within cells, and a row grows automatically when the contents of any of its cells require it to do so.

Document and Project Management

TPS recognizes that the kinds of documents it does well usually represent the work of a team rather than an individual author, and it works hard to support the team approach. The book is a meta-document implemented as a special directory that joins into a single entity a collection of documents that may have been produced by multiple authors on multiple workstations. The book’s documents retain their individuality, but they can also behave as an aggregate for purposes of pagination, indexing, and printing. A catalog is to a book what a component bar is to a document. Catalogs can export properties to the documents in a book; that’s a useful way to control the style of a collection of documents.

A set of what Interleaf calls “effectivity tools” aids in the control of versions, revisions, and annotations. The mechanism entails tagging components with attributes and then applying control expressions to select components that match one or more attributes. For example, if you have to maintain a software manual for a product that runs under multiple operating systems, you might use the attributes “Unix” or “VMS” to mark the variable parts of the book. Or, if several editors are reviewing a document, you might use the attributes “Frank” and “Sylvia” to selectively show or hide their comments.

Not everyone on a writing team needs a TPS workstation. The system happily imports ASCII files that intersperse component names (e.g., <$para>) with textual content. That’s an important point to bear in mind. For example, a single TPS workstation run by a competent artist/typesetter might be adequate to serve a team of PC-based technical writers.

Toward an Open Architecture

TPS 4.0 takes a small step in the direction of what the company calls an “open architecture”: A Lisp interpreter is embedded in the system, and a small set of Lisp programs comes with the installation. The names of these programs appear on the Custom pop-up menu; icons in the Custom cabinet contain the Lisp code.

These “Leafware” utilities can run Unix commands from within the TPS desktop or set TPS system parameters. It’s an embryonic capability, but one that holds much promise.

Building extensibility into TPS—as most CAD vendors have done with their products—invites third-party developers to customize the product for more specialized markets than Interleaf itself can address. It’s a great idea, although it’s not yet clear that Leafware will open up the TPS product to the extent that AutoLisp has opened up AutoCAD.

TPS 4.0 is a remarkable product. From a PC or Mac perspective, it’s like having TEx, PageMaker, Adobe Illustrator, and Microsoft Chart all rolled into a single package. There’s so much there, I’ll bet many users will tap only a fraction of its capacity. But for those who deal heavily in the kinds of documents that TPS does well—from display advertisements to textbooks—TPS 4.0 will get the job done with speed, style, and precision.

MICRO-CAP III.™
THIRD-GENERATION INTERACTIVE CIRCUIT ANALYSIS. MORE POWER. MORE SPEED. LESS WORK.

MICRO-CAP III™, the third generation of the top selling IBM® PC-based interactive CAE tool, adds even more accuracy, speed, and simplicity to circuit design and simulation.

The program's window-based operation and schematic editor make circuit creation a breeze. And super-fast SPICE-like routines mean quick AC, DC, Fourier and transient analysis — right from schematics. You can combine simulations of digital and analog circuits via integrated switch models and macros. And, using stepped component values, rapidly generate multiple plots to fine-tune your circuits.

We've added routines for noise, impedance and conductance — even Monte Carlo routines for statistical analysis of production yield. Plus algebraic formula parsers for plotting almost any desired function.

Modeling power leaps upward as well, to Gummel-Poon BJT and Level 3 MOS — supported, of course, by a built-in Parameter Estimation Program and extended standard parts library.

There's support for Hercules® CGA, MCGA, EGA and VGA displays. Output for laser plotters and printers. And a lot more.

The cost? Just $1495. Evaluation versions are only $150.

Naturally, you'll want to call or write for a free brochure and demo disk.

Your best reason yet to move up to a '386. Now you can own a complete ZEOS '386SX 16MHz hard drive system for less than comparable '286 systems. The ZEOS '386SX. ZEOS performance, quality and support. ZEOS value. The Choice is Clear.

If you plan to buy a 16- or 20MHz 286 machine, think again. A fundamental change in computing is about to take place. Systems based on the 80286 processor will be replaced by systems based on the 80386SX. As America's premier manufacturer of 80386 based systems, we've designed the new ZEOS 386SX to provide everyone with a window to the future. A future of '386 speed and performance at a fraction of what you would expect to pay.

And ZEOS knows '386 systems better than anyone. After all, PC Magazine chose ZEOS above 57 other companies for "For Overall Excellence" in their recent '386 Blockbuster issue.

The new ZEOS 386SX simply runs circles around '286 based machines. PC magazine noted that the ZEOS 16MHz 386SX compares "favorably with the 20MHz '286 machines reviewed in "The 80286: Unsafe at Higher Speeds?"" (PC Magazine, December 27, 1988).

So forget those 16- and 20MHz '286 machines forever. The ZEOS '386SX-16 "blows 'em right out of the water." As PC Magazine says, "386SX-based machines are the right choice..." and the new ZEOS 386SX is the right choice for you.

30 Day Absolute Satisfaction Guarantee. One Full Year Limited Warranty.

If a company believes in their product, they should stand Rock Solid behind it. That's why your new ZEOS 386SX hard drive system includes our famous 30 Day Absolute Satisfaction Money Back Guarantee, One Full Year Limited Warranty and Express Parts Replacement Policy.

24 Hour a Day Sales and Toll Free Technical Support!

And talk about service! ZEOS is the only computer company in America standing by ready to help you Toll Free, 24 hours a day, 365 days a year. Nobody supports their customers like ZEOS!

Order your new ZEOS 386SX now with confidence. Your choice of ZEOS quality and performance is Guaranteed. Order now by calling 800-423-5891.

CAUSE is a personal programming tool that allows you to create applications without a programming language. With CAUSE, applications can be created on the PC or Macintosh, transferred to the other platform, compiled and run. CAUSE employs object-oriented design utilizing icons, graphics, windows and the mouse. CAUSE has a built-in relational database and tools for creating reports and windows. Predefined functions, program trace, and the automatic generation of end-user documentation help decrease development time. The Professional version of CAUSE includes an unlimited runtime license. Applications can be submitted to Maxem for consideration as EFFECTs with royalties paid to the author through the Maxem Authorship Program. For more information call 1-800-336-6296 or write Maxem, 7855 South River Parkway, Tempe, AZ 85284.
Lab Report: Three Singular Systems

Of the slew of systems that the BYTE Lab benchmarked this past month, we found three worthy of note: the AST Premium/386C, the Swan 386SX, and the Wedge Turbo 286.

We've come to expect quality from AST, and the **Premium/386C** doesn't disappoint us. The system features a 20-MHz 80386, switchable to 8 or 4.77 MHz, plus an efficient memory architecture, an AST trademark. A proprietary interface board supports up to 16 megabytes of dedicated 32-bit memory. Four banks of sockets for single in-line memory modules on the board can support four 256K-byte or 1-megabyte SIMMs each. It also delivers the cache: 64K bytes of 25-nanosecond static RAM.

Our unit came with a 90-megabyte hard disk drive. The floppy disk drive controller supports up to three floppy disk drives. A 1.2-megabyte 5¼-inch floppy disk drive is standard. One parallel and two serial ports are built into the system board, saving an expansion slot.

The motherboard uses SIMM architecture for memory upgrades. Our unit came with 1 megabyte of 100-ns RAM that was shipped with the unit we received.

The AST expansion slots can take advantage of an extended bus architecture. The extra pins allow intelligent peripherals to share control of the system bus to relieve some of the processing load from the main CPU.

The system's benchmark results (see table 1) place it in the upper tier of 20-MHz machines. Although it falls behind the Dell System 310, the ALR Flex-Cache, and the Compaq Deskpro, it leads most of the 20-MHz pack with a CPU index of 3.26 and an overall application index of 16.14.

The quality of the **Premium/386C** shows in its sturdy construction and the system documentation. AST's comprehensive manual comes complete with glossary, index, and technical appendices. It even covers software utilities bundled with the system. These utilities include disk caching, memory management, print spooling, low-level disk formatting, and system setup.

But quality doesn't come cheap. The **Premium/386C**'s basic configuration (without a hard disk drive or monitor) costs $4395. Add $800 for a 40-megabyte drive and controller, or $1750 for a 90-megabyte ESDI drive and controller.

If you're searching for a 32-bit hybrid at 16-bit prices, the **Swan 386SX** is worth a look. At $1399, its price competes with that of most 80286s, while its performance matches that of many 16-MHz 80386 machines.

Like most SX vendors, Swan Technologies optimized space inside the Swan box. The 40-megabyte hard disk drive, mounted vertically, attaches to the standard drive bays. This leaves two half-height bays free beneath the 1.2-megabyte 5¼-inch floppy disk drive. A 16-bit Adaptec modified frequency modulation disk drive controller card with 1-to-1 interleave manages the drives.

The extra space means that the Swan is ready for future enhancements. In addition to the extra drive bays, the unit provides two 8-bit and six 16-bit expansion slots. Our unit had both 8-bit slots filled with an I/O controller and an 8-bit VGA card. The disk drive controller occupied one of the 16-bit slots. That still leaves plenty of room for expansion cards.

The motherboard uses SIMM architecture for memory upgrades. Our unit came with 1 megabyte of 100-ns RAM.

---

**Table 1: The AST Premium/386C's CPU and application indexes place it among the fastest of the 20-MHz 80386s. The Swan 386SX posted respectable benchmarks for a machine base-priced at $1399. The Wedge Turbo 286's CPU index was well below that of comparable 20-MHz machines.**

For a full description of all the benchmarks, see "Introducing the BYTE Benchmarks," June 1988 BYTE.
Tucked beneath the vertical drive bay, the SIMM modules are hard to get at even after you remove the hard disk drive. As with many 80386SX models, no memory caching is available. The Swan 386SX uses the Chips & Technologies NEAT (for New Enhanced AT) CHIPSet for bus, memory, and peripheral control.

Benchmark results (see table 1) place the Swan 386SX in the middle of the SX pack, behind the Compaq 386s and ahead of the IBM PS/2 Model 55 SX. But its price undercut that of any 80386SX machine we've seen yet. A Swan 386SX with VGA and a 32-megabyte hard disk drive sells for $2298. A 40-megabyte model goes for $2498. Utilities, including Disk Manager for formatting your disk, and a well-structured (though unindexed) manual come with the package.

Competing with the new 80386SX machines is a flock of souped-up 80286-based systems. The Wedge Turbo 286 employs a 20-MHz Harris 80C286 processor running at 24 MHz. Unfortunately, the Turbo 286 does not deliver a performance advantage.

It's hard to figure out why this machine is so lackluster (see table 1). We might blame the 10-MHz FPU for the poor cumulative application index (8.78) that places the system below every other 20-MHz machine we've tested; that hurt it in the scientific/engineering applications. And the generic disk drive controller limits disk-intensive applications.

But neither of these factors accounts for the CPU index of 1.58, well below that of other 20-MHz 80286s such as the Wells American 286/20 (2.74) and the Dell System 220 (2.72). We tried changing the CPU speed by the CMOS setup, by hot-key switching, and by software utilities. Nothing provided the extra boost. We could switch speeds between slow and fast, but the fast setting just wasn't fast enough.

The Wedge comes standard with 1 megabyte of memory (expandable to 8 megabytes), a 1.2-megabyte 5¼-inch floppy disk drive, a 40-megabyte hard disk drive, an NEC MultiSync GS monitor, a 101-key Enhanced keyboard, and DOS 4.01. The system also offers three expansion bays, memory, and peripheral control.

An 8-page-per-minute Canon engine drives the unit, which has both a Centronics parallel port and connector, and an RS-232C serial port using a DB-25 connector. The printer supports IBM Graphics Printer, Diablo 630, Hewlett-Packard LaserJet Series II, and HP 7475A plotter emulation modes. It comes with 15 ROM-resident outline fonts supplied by URW, a German typeface foundry.

The S4295 Model 6140 comes with 1 megabyte of RAM; the S4995 Model 6142, which I looked at, comes with 3 megabytes. A $699 plug-in card supplies 22 additional font outlines. The printer uses the ASCII Coded Escapement page description language working with an ACE driver on the computer. Like PostScript, ACE is device-independent, but it relies on concise operators (many are only two characters long) to describe the page. The company supplies drivers for Windows 1.04, 2.01, and 2.03; AutoCAD 2.62 releases 9 and 10; GEM 3.0; Ventura Publisher 1.0 and 1.1; and Microsoft Word 3.x and 4.0.

Using a 33-MHz PC Link 386 running Windows 26 version 2.1, I printed from many Windows applications. A threecolumn Aldus PageMaker 3.0 document using many fonts and a simple graphic printed in 40 seconds. A Micrografx Designer 2.0 drawing of a silhouetted image printed in a minute.

My version of AutoCAD (2.52) was incompatible with the Genicom driver, but I configured AutoCAD to use the ADI plotter driver, set the printer to HP 7475A plotter mode, and coaxed plots out of AutoCAD. I even got plots with fill patterns out of MacDraw 1.1 on a Mac II by configuring the MacPlot plotter driver for a Hewlett-Packard plotter.

I scanned in several images on an HP ScanJet scanner using Hewlett-Packard's Scanning Gallery software at 300 and 400 dpi. I saved these images as TIFF files and imported the images into PageMaker. The quality of the printed 400-dpi images looked worlds better than the 300-dpi images. However, because 400-dpi images contain more information, I couldn't print out either a full-page scan...
INTRODUCING HAUPPAUGE'S 33MHz SYSTEM BOARDS.

If your computer feels slow, we know where it hertz. For a fast cure, get our new 386 MotherBoard/33MHz. We've built in 4 Megabytes of high speed RAM, 64K of RAM cache, and both 387 Weitek math coprocessor sockets. This board makes your 386 computer the fastest PC available!

**Network Savvy.** With the 386 MotherBoard/33MHz, you can build a file server or workstation that makes Novell networks scream. Enjoy compatibility with Token Ring, Arcnet, Ethernet, and other network cards.

**The UNIX Engine.** Great for VARS, Systems Integrators and UNIX OEMs, the Hauppauge 386 MotherBoard/33MHz runs SCO Xenix, Interactive 386/ix and AT&T's UNIX System V. With its PC/AT compatible I/O system, our 33MHz board accommodates the latest in disk control, graphics, and network I/O cards.

**CAD Capability.** Do your AutoCAD and other CAD programs seem slow? The 386 MotherBoard/33MHz boosts your math and graphics applications, and supports the high speed 387-33 and 33MHz Weitek math coprocessors.

**Technical Features.** The 386 MotherBoard/33MHz includes:
- 4 Megabytes of high speed 32-bit memory, expandable to 64 Megabytes
- 64K of 20 nsec cache memory
- Six 16-bit expansion slots, one 8-bit and one 8-bit/32-bit slot
- PC/AT compatible I/O system for support of OS/2 and UNIX.

or a complex graphic with shading unless the printer had 3 megabytes of RAM.

Since this printer costs as much as a decent PostScript printer, you must first decide if the extra resolution is worthwhile. If you're printing newsletters that have only text, the answer is no—the additional detail is hardly noticeable. But if you're working with scanned images, it certainly will make a difference.

Budget yourself for the Model 6142 with the extra memory. As long as Genicom supplies printer drivers for popular applications (an OS/2 driver would be nice), lack of PostScript compatibility shouldn't be an issue. —Tom Thompson

Windows Made Clearer

Microsoft Windows, like all graphical user interfaces, is an acquired taste. GUI or no, it forces you to contend with plenty of pull-down text windows, and you still need to know what filenames start what applications.

Now several products are attempting to take the pain out of using Windows. I looked at two of them: ClearView from Wang Laboratories and PubTech File Organizer (PFO) from Publishing Technologies. Both replace Windows' MS-DOS Executive.

At $79, Wang's ClearView is the less expensive of the two. It marks the company's first move into mass-market software. The name "ClearView" pretty much says it all. When you start Windows, it gives you a very clear view of your applications. Instead of a long list of filenames, ClearView puts Macintosh-like icons on the screen—and little else.

You can, of course, add icons for your own applications, using a choice of standard icons. ClearView's Windows Organizer lets me set up custom menus using both icons and (optionally) text. You can also customize the placement and sizing of the windows that appear when you start applications. Since I almost always use my editor when I first start Windows, I set up a custom start-up file that immediately opens the editor in one window while displaying additional application configurations. I especially liked the ability to set up my common applications so that I could call them with a hot key. There's even an automatic screen blanker that actually works with Windows (unlike most commercial blankers).

I'm not an icon fan, but I admit that these two icon-based products make Windows easier to use. Deciding which one's for you will be tough. Besides a lower price, ClearView's simplicity makes it easier to learn, especially if you work with only a couple of applications.

PFO's sophistication recommends it for those working with large hard disks chock-full of applications and data files. If you like the Macintosh look and feel, PFO's definitely the choice. Either way, these products improve on the standard Windows interface, making Microsoft's GUI truly easier to use.

PowerMouse Courts 1-2-3 Users

The PowerMouse 100 from ProHance combines a mouse and a programmable keypad to make editing Lotus 1-2-3 spreadsheets a snap. Just don't throw away your conventional mouse if you also run graphics programs.

This slick-looking critter plugs directly into a serial port. Its 40 labeled keys can be programmed with one or more combinations of keystrokes and mouse movements. The mouse ships with a 9-to-25-pin adapter, a program disk, a user's manual, and instructions for 1-2-3 use.

At first, the mouse's size and array of buttons made it awkward to handle. But the more I used it, the faster my fingers found the right buttons.
"Is there something we missed?"

Is there anything missing in the ACCEL-500 24-pin dot matrix printer? Not performance. The ACCEL-500 can zoom through drafts at 480 cps. Print charts and graphs in dazzling color. And combine letter quality with high resolution color graphics.

Not versatility. The ACCEL-500 is compatible with most popular printers. So it's equally at home on Macintosh® and IBM® compatible PCs. There's a paper-handling option for every office application, too.

Not convenience. The ACCEL-500's innovative Select-Dial™ makes paper handling a snap. And plug-in Intelli-Cards™ add fonts and printer emulations instantly.

Not reliability. The ACCEL-500 is a round-the-clock workhorse that takes even the most demanding workload in stride.

And certainly not value. The ACCEL-500 is priced below leading printer brands that offer far less capability.

In fact, it seems that the only thing missing from the ACCEL-500 is you.

QuickC Smooths QuickAssembler Programming

Now that Microsoft is bundling QuickC with The QuickAssembler, programmers can write, debug, and execute assembly language programs within the comfort of a Windows-like interface. When more speed is needed in a C language program, developers can write assembly code in a separate module called from the C program. Also, QuickC's online help system, the Quick Advisor, has been enhanced to allow the inclusion of QuickAssembler instructions, directives, operators, and MS-DOS and IBM PC ROM BIOS services. C language programmers still have access to help on the C run-time library functions.

Microsoft also boosted the environment's debugging capabilities by adding support for viewing registers and the numeric processor's status. Unfortunately, you can't mix C language source code and assembly language displays. Users needing this feature will have to rely on Microsoft CodeView. Also, the debugger supports only C language syntax for expressions. This is inconvenient because users must enter all hexadecimal values in the debugger with a leading Ox.

The QuickAssembler supports the full syntax of the latest version of Microsoft Macro Assembler, as well as a few enhancements. The QuickAssembler STARTUP directive, for example, now automates the process of setting up the DS, SS, and SP registers during initialization of assembly language programs. Microsoft now includes a history-oriented debugger that creates a script of actions during program execution and a program "builder" utility. Both of these tools fit seamlessly into the environment.

A setup program typical to most Microsoft products installs the package. I ran into some snags, however. The README file in my copy claimed that the segmented-executable linker could be used with the QuickC environment. But this linker version spilled text onto the mouse up, down, left, or right, the software generates keyboard cursor keys. Although this works well with 1-2-3 and other nonmouse software, the product just isn't usable with graphics software. The absence of a Microsoft-compatible mouse driver is a conspicuous omission.

ProHance says that it is integrating Microsoft compatibility with programmable drivers and plans to provide free updates to registered users when the software becomes available later this year.

Overall, PowerMouse worked like a champ with 1-2-3 and my other text-based software. But $195 is a lot to spend for a mouse that can't do graphics. Lotus users, however, will probably think the price is right. —Michael Wiggins

Mitac is the first to give you a choice of architectures on the 386SX platform.

Whether you use the “industry standard” (AT) architecture or the up-and-coming Micro Channel of IBM’s new PS/2s, Mitac’s 386SX-based computers assure you the power of Intel’s future-compatible 80386SX microprocessor. The power you need to affordably run today’s (and tomorrow’s) most advanced 32-bit applications. Of course, you don’t need both the MPS2386 and the MPC2386, but whichever system you choose, you get a compact micro with 386 performance and a host of built-in features. On-board VGA-compatible graphics controller, space for both 5-1/4” and 3-1/2” diskette drives, room for four storage devices and a total of six expansion slots assure you maximum flexibility with room for growth.

And, as with all Mitac microcomputers, the MPS2386 and MPC2386 are backed by a one-year warranty and Mitac’s complete service and support programs. For more information on Mitac’s full range of AT- and Micro Channel-compatible computers and the name of your nearest authorized dealer, call today 800-648-2287 Extension 348.

Mitac's microcomputers are distributed in the U.S. by Microamerica and Schweber Electronics. Canadian distribution is handled through TLS.

Circle 122 on Reader Service Card
In the last 15 years, the microcomputer industry has moved from 8-bit machines to 16-bit machines to 32-bit machines, and a lot of us are wondering: Where do we go from here? Will this binary progression continue? Are 64-bit machines next? Then 128-bit? Or have we reached some sort of reasonable limit, a plateau, beyond which the return isn't worth the investment?

These questions and others are answered in this special In Depth section on 32 bits and above. In “Are 32 Bits Enough?” Steve Krueger looks at the overall question and then divides systems down into logical, functional areas, such as buses, memories, instructions, and addresses, and discusses the pros and cons of raising the width of each.

When it comes to memory interfaces, wouldn’t logic say that wider is always better? But it isn’t. In “Seeking a Wide Berth,” Ron Sartore tells you when and why it isn’t and discusses 32-bit memory architectures in detail.

It would be hard to discuss 32-bit hardware without exploring the latest offerings from Intel and Motorola. In “Revenge of the CISCs,” Michael Slater and John H. Wharton provide a definitive examination of Intel’s 80486. They also look at Motorola’s 68040 in as much detail as was available at press time.

One element that 32-bit systems seem to share is an increased capability for virtual memory. In a special series article, “A Virtual Crowd,” BYTE explores virtual memory on DOS, OS/2, Macintosh, and Unix systems. In “Virtual Memory: The Next Generation,” Robert Moote describes in detail the demand-paging virtual-memory capabilities of Intel’s 80386 and 80486 processors. In associated text boxes, Julie Anderson examines “VM Under OS/2” while Ben Smith looks at “VM in Unix.” And then Phil Goldman looks at the new capability for virtual memory on the Mac in “Mac VM Revealed.”

No discussion of 32-bit and above systems would be complete without mentioning the RISC arena. RISC machines have long been “off limits” to DOS users, but no more. In “DOS at RISC,” Colin Hunter and John Banning describe a binary compiler that lets you run DOS software on RISC machines and take advantage of their 32-bit capabilities as well.

Finally, in “Clearing the Air,” Bill Blagdan talks about the various issues to consider with 32-bit software. What does it buy you? How well does it use the capabilities of the 32-bit hardware? Should you consider DOS extenders? In other words, what do the words “32-bit software” mean to you?

The future may well look to 64 bits or beyond, but for many of us, the investment involved in a 32-bit system is as much as we can even think about. For now, getting the most out of 32 bits offers challenge enough.

Are 32 Bits Enough?

Microprocessors have grown from 8 bits to 16 bits to 32 bits. Do we need to keep them growing?

Steve Krueger

In the mid-1970s, it had become clear that the data width of microprocessors would grow from the 8 bits that were common then. At that time, there were many good reasons why microprocessor words would get bigger: We needed 16- and 32-bit data types, larger and more powerful instructions, and more addressing, and we've gotten them in the 32-bit microprocessors. Is a similar group of forces driving today's 32-bit microprocessors to larger word and instruction sizes? Maybe, but today's arguments are less persuasive and more ambiguous than those that have pushed us this far.

Since the 1970s, many changes have occurred in the way we use microprocessors. High-level languages have displaced assembly language for most applications. The RISC and CISC (complex-instruction-set computer) styles of computer architecture have become distinct. Processor speeds have increased much more rapidly than memory speeds. Memory sizes have increased a thousandfold. Microcomputer hard disk drives are available in the capacities and performances that were to be found in the minicomputers of the 1970s.

And system architectures have copied their larger predecessors with direct memory access, multimaster buses, multiple buses, and intelligent peripheral controllers.

I'll divide systems into different parts for ease of discussion: CPU data, instructions, and addresses, and other vital parts of the system—cache memory, main memory, buses, and I/O devices.

Different forces and engineering trade-offs govern each of these parts.

CPU Data

Today, CPUs need to support the same data types used in their operating systems and application programs. A compiler will produce most of the instructions that are run on a new microprocessor. Today's CPU architect needs to consider the data types supported by the most important programming languages: C, FORTRAN, COBOL, Ada, and Pascal.

These languages have similar requirements, even if the emphasis is different. In C and Pascal, the most important types are the integer, the character, and the pointer. In FORTRAN, most data is either integer or real. In COBOL, the main data types are string, integer, and fixed-point decimal. Ada combines the requirements of all these.

The sizes of the data used in C on 32-bit microprocessors vary significantly (see table 1). Since standards govern the character and floating-point types, they aren't subject to variations (although character representations for some other

languages, such as Japanese, use more bits). Binary integers are represented in 16 to 32 bits. A few implementations of C provide a long long type of 64 bits.
Since this structure of data typing is the most common, most CPU architectures will stick with a primary data size of 32 bits, but they will also support 8-bit data, at least for characters, and 64-bit data for double-precision floating-point numbers and, possibly, double-precision integers (long long).

CPU Instructions
CPU instruction-set architectures have split into a CISC camp that offers variable-length instructions with a short average length and a RISC camp that features fixed-length instructions that are easy to fetch and decode. The RISC instructions have only moderate pressure to expand beyond the nearly universal 32 bits, while CISC instructions already vary in size from 8 to 96 or more bits in increments of 8 or 16 bits (which can be thought of as the basic instruction size). The CISC scheme is under no pressure to change, either.

Only the very-long-instruction-word (VLIW) computers are currently pushing beyond 32-bit instructions (see "VLIW: Heir to RISC?" in the August BYTE). The Multiflow Trace computers (an example of VLIW) use instructions as large as 1 kilobit. However, it will be more than five years before this technology has an impact on the CPU market.
What will happen soon in microprocessors is superscalar execution. In superscalar execution, the microprocessor attempts to start two or more conventional instructions on each cycle. The decode logic must test for resource conflicts and data dependencies to schedule the few...
The Activator - Natural Selection For Software Protection

In any industry, just as in nature, the process of natural selection raises one solution above another. Natural selection is the most elegant of engineers.

In the area of software protection The Block has been selected by the marketplace as the solution that works. Over 500,000 packages are protected by our device.

For the past 4 years our philosophy has been: "You have the right and obligation to protect your intellectual property."

A New Ethic For Software Protection

In allowing end-users unlimited copies of a software package and uninhibited hard disk and LAN operation, The Block has created a new ethic for software protection.

By removing protection from the magnetic media we remove the constraints that have plagued legitimate users.

They simply attach our key to the parallel port and forget it. It is totally transparent, but the software will not run without it.

A New Technology For Software Protection

Our newest model, The Activator, builds on our current patented design, and establishes an unprecedented class of software protection.

We have migrated and enhanced the circuitry of The Block to an ASIC (Application-Specific Integrated Circuit) imbedded in The Activator.

This greatly improves speed and performance, while reducing overall size. Data protection can also be provided.

Programmable Option

The Activator allows the software developer the option to program serial numbers, versions, or other pertinent data known only to the developer, into the circuit, and access it from the program.

Once you program your part of the chip, even we have no way to access your information.

The ASIC makes emulation of the device virtually impossible. It also presents an astronomical number of access combinations.

Full 100% Disclosure

Since The Activator is protected by our patent we fully disclose how it works. Once you understand it, endless methods of protection become evident.

Just as no two snowflakes are the same, no two implementations of The Activator are identical. And like the snowflake the simplicity of The Activator is its greatest beauty.

We never cramp your programming style or ingenuity. Make it as simple or complicated as you desire.

Let us help safeguard what's rightfully yours. Please call today for additional information or a demo unit. It's only natural to protect your software.

instructions currently available without changing the result of the program. A superscalar processor will become starved for instructions unless several instructions are fetched in each cycle.

Basically, I see no pressure to increase instruction word size in microprocessors in the foreseeable future.

CPU Addresses
Address architecture is one area where there is real pressure to grow beyond 32 bits. Already, the operating system can set up most microprocessor memory management units to have a separate 32-bit address space for each process. The combined memory addressed by all the processes can be considerably larger than 32 bits. In fact, the physical memory addresses that most MMUs generate are larger than 32 bits.

But even the 32-bit address space of a single process is under some pressure to grow. This pressure comes from applications with large data spaces where it’s important to keep all the data within the virtual address space rather than split between virtual memory and files.

CAD/CAE is one such application area. With the growth of design complexity and of tool complexity and function, address-space crunches will be inevitable. Within five years, ICs that have more than 10 million transistors will be under development. If each transistor and wire is represented by just 20 bytes in virtual memory, such a design will take about a gigabyte of virtual memory. The sophisticated applications that make a design of this scale possible will themselves be tens of megabytes large; the temporary storage used in operating on the design as a whole will require hundreds of megabytes. So, by 1995 some large CAD applications will need 2 gigabytes of process address space, and 2 gigabytes is close enough to the 4 gigabytes per process limit of most 32-bit machines that some address-extension techniques will be needed.

However, for the majority of applications, 4 gigabytes of address space per process is more than enough. With that much space, a text editor could edit a 1-million-page document, and spreadsheets could be thousands of times larger than on a 640K-byte IBM PC. Thus, I don’t think address extension within a process will be a crucial issue in the early 1990s.

When longer addresses become an issue, engineers won’t choose to lengthen the machine word. Instead, they will use a variety of tricks to give larger addresses to those few processes that need them without increasing the size, complexity, or run time of the more common small processes. This is a continuation of the “small model” and “large model” used in compilers for Intel 80x86 architectures for the same reasons: size, complexity, and speed.

One of the tricks would be to provide long_ptr forms of memory-reference instructions that use a register pair to contain a 40-, 48-, or 64-bit address (see figure 1a). These could be loaded and

stored with long_ptr data if a 64-bit integer type is supported.

Another trick (especially appropriate for load/store architectures like RISC machines) uses an extra source register for the most significant part of the address (see figure 1b). This allows those applications that can statically allocate regions of the extended address space to certain classes of data (e.g., like types, or groups of data referenced together) to treat extended address space as segments, possibly saving many loads and stores of the high-order address word.

The compiler would generate ordinary memory references for small model programs and the majority of the references in gargantuan model programs. These would reference the first 4 gigabytes of the process's address space, the same part referenced if the high-order part of the address is zero.

**System Bandwidth**

The system bandwidth requirements govern the widths of the various data paths outside the processor. Table 2 shows the bandwidth requirements from the processor to cache memory and from cache memory to main memory points within the system.

The PMB column of table 2 shows the memory-access bandwidth created by several realistically hypothetical processors. The first two are similar to currently common CISC processors. The rest are similar to RISC processors, current and future. Notice that the volume of data that must be supported grows from about 17 megabytes per second with a processor similar to current ones to over 230 megabytes per second with a high-speed RISC processor such as may be expected in the future. Main memory will be able to supply only about 40 megabytes per second if you assume a 32-bit-wide main memory and a 100-nanosecond access time. Cache memories can fill the gap.

Cache memory is a fast memory that stores recently referenced data. If a subsequent reference needs the same data, the cache can supply it much more quickly than main memory. Today, cache memories for microprocessors range from 256 bytes to 64K bytes. With this range of sizes and when processing an average program, the cache can supply the needed data on over 90 percent of the memory references.

The percentage of references that the cache memory can satisfy is called the hit rate. Conversely, the miss rate is the percentage of references where the cache memory cannot supply the needed data. The hit rate and miss rate always total 100 percent, so a hit rate of 92 percent corresponds to a miss rate of 8 percent.

If a high-speed cache memory can satisfy 92 percent of the references, then main memory need only satisfy about 8 percent. Thus, from the 232.6 megabytes per second of traffic generated by the fastest processor in table 2, the main memory needs to supply only about 18.6 megabytes per second (see figure 2). Often, however, several requests that the cache memory can't satisfy arrive in quick succession, placing a much higher peak demand on memory performance. As a rule of thumb, the main memory should be able to supply two to three times the average bandwidth required.

**Cache Memory**

Three design trends are apparent in cache memories. First, almost every system will have caches. Second, the caches will be integrated onto the chip with the CPU. And third, in many of the highest-performance systems, the on-chip caches will be too small for the system performance desired, so a second level of cache will be connected directly to the CPU's pins.

The data width of on-chip instruction and data caches will be at least as wide as the CPU needs and may be wider to support the bandwidth required. If the CPU supports only 8-, 16-, and 32-bit data, continued
the data-cache width will be 32 bits. If the CPU also supports 64-bit data, the data-cache width will need to be 64 bits.

The data width of the cache memories may be wider to accommodate the higher bandwidth requirements of superscalar, vector, or other high-performance architectures. Extra data width costs little in on-chip cache memories where connections between the CPU and the cache are easily provided. Extra data width is more expensive in external caches, which are constrained by the cost of providing additional data pins on the CPU chip.

And yet, a large difference in speed exists between internal and external signals so that an external cache is slow compared to an on-chip cache. To reclaim the bandwidth lost over slow pins, engineers are likely to widen the path from the CPU to external first- or second-level cache memories to 64 bits and eventually to 128 bits, in spite of the higher cost of the resulting high-pin-count chips.

Main Memory
Main memory is slow compared to the CPU, and the disparity will get even worse in the future, even though memory itself will continue to get faster. Main memory will have difficulty supplying the bandwidth that high-speed processors need, even after the caches have reduced it. A 32-bit-wide memory system constructed out of 80-ns DRAM chips will have an access time of about 150 ns for a bandwidth of about 27 megabytes per second, just enough for the 22-million-instruction-per-second RISC processor in table 2. In practice, the system bus will add at least 100 ns to the access time and reduce the bandwidth to 16 megabytes per second, enough for the 10-MIPS processor but not enough for the higher-performance processors.

For systems with processors faster than 20 MIPS, memory will be 64 bits wide, doubling the bandwidth available from memory. Memory-systems designers will further increase memory bandwidth by providing fast block transfer of 4 to 16 words between main memory and cache memory. The combination of these will supply enough bandwidth for processors up to about 75 MIPS, where further increases, possibly 128-bit-wide memory, will be needed to keep the system performance high.

System Buses
System buses are another place where you can lose bandwidth. The amount of time that the system bus adds to a memory access will decrease the memory bandwidth available. The system bus adds time for arbitration, address propagation, and data propagation. The physical size and electrical properties of the bus limit the minimum propagation times, which won't get below 50 ns on expansion buses with several slots.

Engineers designing system buses can lessen the effect of propagation time by using wider buses and by including block transfers. Wider buses transfer more data on each bus cycle, effectively doubling the bandwidth available. Expansion buses have grown from 8 bits to 32 bits as memory and I/O performance needs have dictated. Block transfers send several words of data in a single bus transaction, saving the arbitration and address propagation delays after the first word. If the memory system can supply data that quickly, the average time per word decreases and the bandwidth increases.

The last design trend is already firmly entrenched in the industry and will cer-
certainly continue: separating the memory bus from the I/O or expansion bus. Because memory bandwidth is so crucial to high-performance computers, engineers will pay close attention to high-performance memory buses within the cost constraints of the final system. 64-bit memory buses will be common. On the other hand, I/O buses will be limited to 16 or 32 bits to control costs and match the width of I/O devices. In servers and other systems where I/O bandwidth is crucial to performance, multiple I/O buses, not wider data paths or higher speed, will supply the needed bandwidth.

I/O Devices
I/O devices don’t need wide buses (see figure 3). Even a SCSI-2 disk peripheral transfers at a maximum of only 2 megabytes per second, which is also the peak transfer rate for a 16-megabyte-per-second token ring. An FDDI (fiber distributed data interface) network, at 12 megabytes per second, will tax today’s slower I/O buses but is easily supported on the Micro Channel, the NuBus, or EISA.

Probably the only I/O device that taxes a high-performance I/O bus is a graphics frame buffer. Fast redraw of the video screen is important to the perception of high performance. One simple benchmark is to copy a full-screen image from memory to the screen buffer. For a system with adequate performance (and reasonable crispness), the copy should take less than \( \frac{1}{10} \) second; for a high-performance system, less than \( \frac{1}{20} \) second.

For a megapixel display with 8-bit pixels, this image consumes a megabyte. So for a \( \frac{1}{10} \) second copy time, the CPU must access the frame buffer with at least 10 megabytes per second of bandwidth. For a \( \frac{1}{20} \) second copy time, the CPU needs at least 60 megabytes per second of bandwidth to the frame buffer, far beyond the attainable bandwidth on the Micro Channel, the NuBus, or EISA.

An even tougher benchmark is a full-screen move from the frame buffer to itself, as when you move a window on the screen. With the same megapixel display, this would require over 20 megabytes per second of bandwidth to the frame buffer for the lowest acceptable performance. This is barely attainable with the Micro Channel, the NuBus, or EISA. As a result, engineers will have to choose either to attach frame buffers to the systems-memory bus, or to use a graphics processor directly attached to the frame buffer and communicate with the main processor over the I/O bus.

Strike Up the Bandwidth
Systems will grow in bit width in a number of places, but there is little reason for CPU designers to make major changes in CPU architecture in the next few years and probably the next decade. By 1995, however, almost every CPU will have some minor changes to support extended addressing beyond 32 bits per process.

Many CPUs will support double-precision floating-point processing with 64-bit data paths and arithmetic. Memory and memory buses will expand to accommodate the higher bandwidth demands of high-performance CPUs. Bandwidth issues will dominate systems design.

Monoputer/2™
The World's Most Popular
Transputer Development System

Since 1986, the MicroWay Monoputer has become the favorite transputer development system, with thousands in use worldwide. Monoputer/2 extends the original design from 2 to 16 megabytes and adds an enhanced DMA powered interface. The board can be used to develop code for transputer networks or can be linked with other Monoputers or Quadputers to build a transputer network. It can be powered by a 20 or 25 MHz T800 and is priced from $1295.

Parallel Languages
Fortran and C Make Porting a Snap!

MicroWay stocks parallel languages from 3L, Logical Systems and Inmos. These include one Fortran, two Cs, Occam, Pascal, and Ada. We also stock NAG libraries for the T800 and Parasoft's debugger, profiler, and Express Operating Environment. A single T800 node costs $2,000, yet has the power of a $10,000 386/1167 system. Isn't it time you considered porting your Fortran or C application to the transputer? It's easier than you think!

Quadputer™
Mainframe Power For Your PC

MicroWay's Quadputer is the most versatile multiple transputer board on the market today. Each processor can have 1, 4 or 8 megabytes of local memory. In addition, two or more Quadputers can be linked to build large systems. One MicroWay customer reduced an 8 hour mainframe analysis to 15 minutes with five Quadputers, giving him realtime control of his business. Quadputer is priced from $1995.

COSMOS™/M
Finite Element Analysis Running on the Quadputer

One of the most fruitful areas for parallel processing is finite element analysis. Problems which can be broken into small pieces run naturally on systems built up of many processors. COSMOS/M running on a Quadputer took just 300 seconds to solve a problem which ran in 12,000 seconds on an AT. Even very large mainframe problems run fast on the Quadputer; a system with 12,000 degrees of freedom took just 806 seconds while another that had 23,000 DOF ran in just 40 minutes. Contact MicroWay for information on COSMOS/M.

Wider memory isn't necessarily faster; application demands, memory design, and control logic all affect performance

Ron Sartore

Although 32 bits has now become synonymous with power and performance in today's microcomputers, the truth about wide memory is subtler and more complex than many people realize. It's true that when moving blocks of wide data from one part of the system to another, 32-bit memory architectures easily outrun 8- and 16-bit designs. But transporting data is only a part of what computers do. Many operations and data types don't require 32 bits: ASCII characters, for example, are only 8 bits wide, and some operands are only 1 or 2 bytes wide. In these cases, the extra memory width is wasted and can even introduce inefficiency into the system.

Designing wide memory is not conceptually difficult: Think of it as stacking the bytes side-by-side instead of one on top of the other. In principle, wider memories provide more data faster and more easily. Yet doubling or quadrupling memory width is riddled with trade-offs: When you're operating on small pieces of data, it can seem like doing surgery with a bulldozer. Applications that don't mate well with the memory architecture may find their performance crippled, even when running on the fastest processors. How can this be? Can the memory interface actually be too wide?

The answer requires an analysis of what you do with memory. Wider memory is good when the proper memory control is in place. The most fundamental issue is that no matter how wide the memory is, high performance for byte operations must still be maintained. Thus, the trick in memory-system design is to provide both quick byte manipulation and fast wide-data movement. It is counterproductive to focus on one and ignore the other.

Sizing Things Up
Memory-controller design is not greatly influenced by the total size of memory or the data-path width. In fact, the most important design factors are how many controllers are used and what section of memory they watch.

Controller sophistication can vary from a simple step-and-fetch-it approach to complex schemes involving more control logic than memory components. Different memory-control algorithms for the same memory board can affect the result of a benchmark program by more than 10 percent.

For example, it's possible to keep a DRAM chip accessed (i.e., keep the row address strobe [RAS] active on completion of an access) on the hunch that the next access will be within the same row. (To enable this scheme, the controller must contain address comparators.) If the hunch is right, you will have a zero-continued
Explaining DRAM

**Access time** After the initiation of row address strobe (RAS), this is the minimum time required for the DRAM to return data that is guaranteed to be valid.

CAS (column address strobe) This control signal performs several functions. First, it indicates that the address pins to the device contain a desired column address. Whether the address is latched or passes through directly determines clocked page mode and static column mode, respectively. Second, CAS is used to enable the data output driver for read cycles. To access a column, a row access (RAS is active) must be performed first and persist throughout one or more column accesses.

**Cycle time** The access time plus the RAS precharge equals the total cycle time for the DRAM. This means that a 100-nanosecond chip, for example, will take 100 ns to return valid data, but it can be accessed only once every 150 to 180 ns.

RAS (row address strobe) This control signal is the major activator to a DRAM component, initiating a complex series of events within the chip. On initiation, it latches the state of the address pins to be used for the row access. Once initiated, it must then be followed through, because an aborted cycle will corrupt the contents of an entire DRAM row.

**RAS precharge** After a completed access, RAS needs to take a “breathing spell” to ramp up for the next access. The duration of this delay is typically half the access time; thus, an 80-ns DRAM might require 40 to 60 ns for precharge.

**Refresh** The charge of each bit within a DRAM is held by a very small capacitor (on the order of 50 femtofarads). When the bit isn’t accessed, the charge slowly decays and will be lost if not refreshed. A refresh cycle is a type of read cycle that reenergizes a whole row of bits. About one in 100 cycles must be devoted to this task.

Row, column addresses Internal to the DRAM, the memory cells are organized as a two-dimensional array, rows and columns. Externally, to reduce the component package size, these address inputs share the same physical pins. Control signals RAS and CAS determine which address is selected at any time.

**Wait-state transfer**; but if it’s wrong, there will be a penalty of at least two wait states while a new row is accessed. In short, this approach will improve some benchmarks while hurting others.

One reason this scheme doesn’t produce more benefits is that the memory used by the code most likely lies in a different region, or DRAM page, than the program data. This means that your hunch is only correct when accessing memory cells within the same DRAM row, and it’s always wrong if the cells are in a different row or region. If DRAM chips permitted you to access two (or four) rows simultaneously, you could then treat DRAM as both main storage and cache and eliminate wait states when changing from one memory area to another.

**DRAM vs. SRAM** Since much of the discussion on large memories involves DRAM, it’s necessary to understand the terms and concepts of the device itself (see the text box “Explaining DRAM” at left). What makes DRAM chips attractive is their high ratio of storage density to price: Because DRAM uses one transistor per bit, whereas static RAM uses four to six transistors per bit, DRAM will provide four times the storage of SRAM for an equivalent price, at any given technology level. DRAM chips also offer better board-packing density because they double up address pins (row and column), while SRAM chips receive all addresses at once, which requires more physical pins but is faster.

In fact, the major disadvantage of DRAM is speed, especially compared to SRAM. The access time for DRAM is two to three times longer than it is for SRAM of the same technology, and DRAM performance is further hampered by the time consumed for RAS precharge and refresh cycles.

Many memory-system architectures revolve around optimizing DRAM usage through techniques such as interleaving and burst transfers. Interleaving hides the RAS precharge delay by alternating memory addresses in different DRAM devices, so that one DRAM device is accessed while the other is precharging. The result of interleaving is that the system-memory cycle time equals the DRAM access time, just as it would for...
Networks are wonderful—but they can also be a lot of work. An increasingly popular and economical alternative is a multiuser system, where a number of people share one 386 computer.

VM/386 MultiUser makes it simple. Add a multiport or graphics card to your 386, and up to 32 users can continue to work with their familiar DOS graphics and text programs. Each user has their own copy of DOS and 640K of RAM. Best of all, every user is totally independent of all the others.

VM/386 MultiUser is based on VM/386 Multitasker, the bulletproof multitasking program which has won both the Technical Excellence award and the Editor's Choice award from PC Magazine.

Get the benefits of a network—without the work! Call toll-free, 800-458-9108, or 408-986-8373.

SRAM. Burst transfers boost performance by moving blocks of data from DRAM to a high-speed SRAM cache or to the processor.

Choosing Configurations
Assuming that DRAM chips are a desirable component in the construction of a system's main storage, how should they be arranged? Within a given system, the designer can specify any number of bits as the memory-access width. So how is an optimal memory word defined?

If a computational problem involved operating on a single bit, a designer might wish the processor permitted a memory-word interface that was only 1 bit wide! As absurd as that sounds, the rationale would be that to set or clear a single bit, the system wouldn't waste time or energy doing a read-modify-write cycle for a memory area wider than the desired bit.

In the past, many different memory-addressing schemes were tried. For example, Sperry-Univac's successful 1100 series mainframe was based on a 36-bit word: Characters were 6 bits wide—enough to handle the uppercase and lowercase alphabet plus numbers and symbols—and certain addressing modes permitted retrieving 3-bit half-characters. And that wasn't very long ago!

Today, memory addressing has standardized on the 8-bit byte. Characters use 8 bits, not 6, and half-characters, or nibbles (4 bits), must be transferred to and from storage by the processor in 8-bit bytes. This is great news for text-editing programs, but not for number-crunching scientific calculations.

Along with the definition of a byte has come de facto standardization on the 16-bit word, the 32-bit doubleword, and the 64-bit quad word. But the 16-bit “word” is a misnomer, because a memory word is simply the bit width of memory access, which can be 32 bits as easily as 16 bits. The confusion would be alleviated if 16

bites of data were called a double byte.

At the same time that the industry was resolving text-character representation between EBCDIC and ASCII (guess which won), a similar turmoil was brewing over number representation. Here, the IEEE stepped in to coordinate matters. Currently, IEEE standard 754 (version 10) specifies a 32-bit representation for single-precision floating-point num-

bers (a 23-bit significand with an 8-bit exponent plus 1 sign bit). Double-precision floating-point numbers use 64 bits of memory, and extended double-precision floating-point numbers use 80 bits.

Another driving force behind larger memory widths has been in the representation of the program itself. Both program control (such as jumps or calls) and data access require address content within the code: If a program is to access large amounts of memory, it also needs to be able to retrieve and operate on large addresses. This holds true for direct addressing, indirect access (where memory contains the next address), and indirect access with a code offset.

The Dilemma
Many of today's personal computer benchmarks (including BYTE's) use the term word to denote 16 bits. In doing so, a benchmark that measures 16-bit-word moves to an even- or odd-word boundary encounters memory-transfer inefficiency when it communicates with non-word-width memories. If you want to compare 8086s with 80286 and 80386/80486 machines, you must have rules and consistent tests: but choosing a stock word width doesn't really seem fair when comparing machines that use different widths. The examples that follow demonstrate the implications of this.

To really understand the trade-offs inherent in the choice of memory width, you can construct a series of imaginary memory architectures and test them in different situations to compare their performance. The simulated memory can be accessed in two "ticks" of the clock and has a three-tick cycle time.

The simplified example uses eight different memory architectures. Block diagrams representing the eight imaginary memory organizations are shown in figure 1. Case 8 doesn't exist in any personal computer and is a perfect example of control-logic chips rivaling the number of memory chips.

For the first scenario, imagine handling a byte string move in an address transition of 1 byte. To keep it fair, start all systems "ready to access," and for brevity, transfer only 8 bytes. You can also assume that the starting address is a common word boundary for all systems and that data is moved to an adjacent (lower) byte. A symbolic representation for each case will use the following notation:

- \( C = \) cycle (interim between accesses to the same memory element)
- \( r_n = \) first half of read cycle, byte \( n \)

Figure 1b: (Case 6) A 32-bit (doubleword) two-way interleaved memory, or "pseudo 64." (Case 7) A 64-bit (quad-word) noninterleaved memory.
In the first test, the 8-bit interleaved memory (case 2) would be the fastest among the existing architectures, quicker even than wider memory organizations (see table 1). But if you move each byte by an offset of 2 bytes (as shown in table 2), the 16-bit interleaved structure (case 4) is fastest, with 8- and 32-bit interleaved organizations (cases 2 and 6) tied for second place. Memory width and interleaving control yield benefits that are dependent on two things: the operand data width (8, 16, or 32 bits) and the offset and alignment that data traverses.

Although wider memories are slower, they produce benefits. Processors such as the 80386 and 80486 can use 32-bit operands; when they do, they outstrip systems with narrower memories. To demonstrate this, move two 32-bit words by an offset of one 32-bit word.

The scenario depicted in table 3 shows a fivefold improvement for the 32-bit interleaved memory over the 8-bit non-interleaved memory. This strongly suggests that if your processing requires 32-bit floating-point calculations, you should choose a machine that excels in 32-bit performance. Ignore the benchmarks that compare machines on byte operations; they may be misleading.

But if wider memories aren't necessarily better for handling small chunks of data, such as characters or byte operands, why use them? The answer points to a drawback in the simulation: The tests it runs are just a subset of what typically goes on within a system. If, in a real computer, every other CPU operation were a write to memory, then caching wouldn't do much good.

In reality, the ratio of memory-write operations to memory reads rarely exceeds 1-to-4, because the code portion of memory isn't written to except when...
Computers For The Blind

Talking computers give blind and visually impaired people access to electronic information. The question is how and how much?

The answers can be found in “The Second Beginner’s Guide to Personal Computers for the Blind and Visually Impaired” published by the National Braille Press. This comprehensive book contains a Buyer’s Guide to talking microcomputers and large print display processors. More importantly it includes reviews, written by blind users, of software that works with speech.

This invaluable resource book offers details on training programs in computer applications for the blind, and other useful information on how to buy and use special equipment.

loading, and even then it’s treated as data. The model also assumed that you could move a known portion of data without regard to computational considerations, such as source/destination address generation or length of transfer.

Burst Mode: Feature of the Future?
Often, main memory isn’t the direct interface to the processor. It has become customary for high-performance systems to incorporate an SRAM cache. The basic principle behind a main-memory cache is that when a given address for data or code is requested, it’s very likely that the same or nearby addresses will be requested again. Since the cache controller maps precious SRAM in blocks or sets of words, main-memory operations become either block transfers to fill the

cache (read main memory—write to cache) or single-cycle write operations to update main storage. This is how Intel’s 80486, with its built-in 8K-byte cache, interfaces to external memory. A line in the 80486’s cache is 4 doublewords wide (128 bits); when the 80486 needs to fill that line, it can use burst-mode transfer. The memory dialogue for this operation using the simulated memory architecture would look like this. First, you have to alter the conditions slightly. You fill the 80486’s on-chip cache using DRAM page mode in 16-byte bursts. With the 80486’s 25-MHz clock rate, and assuming that the memories are now implemented with 100-nanosecond...

Harold W. McGraw, Jr., Chairman, McGraw-Hill, Inc.
I'm a volunteer supporter of the International Executive Service Corps, a not-for-profit organization with a vital mission:
We send retired U.S. managers overseas to help businesses in developing countries, which often respond by increasing their imports of U.S. goods. In fact, developing countries consume about 40 percent of U.S. exports.
As an IESC volunteer, you would not get a salary. But you would get expenses for you and your spouse, plus a world of personal satisfaction.
IEC leads the field in this kind of work. We've done over 9,000 projects in 81 countries. We could have a project that's just right for you. To find out, send this coupon to: Harold W. McGraw, Jr., Chairman, McGraw-Hill, Inc., P.O. Box 10005, Stamford, CT 06904-2005.

How to Improve Performance

The examples above clearly illustrate that memory performance is too much a DRAM chips, you'll need two ticks to read the next DRAM page for non-interleaved organizations, and one tick for interleaved. (The interleaved cases burst in one tick because they can initiate the access for subsequent data concurrently with an ongoing data transfer.)

The memory dialogues for the 80486 burst transfer in each of the cases are shown in table 4. The results show that the most efficient and practical memory architectures for supporting burst transfer are the 64-bit or 32-bit interleaved (pseudo 64) organizations.

Parallel Port Interface (PPI)

Key Tag

The parallel port interface (PPI) connects between the printer port on a PC and the printer cable. The PPI holds two Key Tags, one on each side. Each Key Tag contains a secure custom chip which is pre-programmed by Glenco to only work with the assigned software package. A second Key Tag can be employed to protect another package, or may be used to turn other software packages “on”, remotely or on-site.

- STANDARD KEY TAG - Software is protected for an unlimited number of executions. They are pre-programmed to include a sequentially assigned S/N.
- COUPON KEY TAG - Software is valid for a preset number of executions. The Coupon count can be reset remotely or on the customer’s site by using a second update Key Tag.
- READ/WRITE KEY TAG - With programmable memory. Perfect for companies which have multiple products or a product with several optional modules. By having several packages protected using one Key Tag, your costs are lowered.
- DURATION KEY TAG - Has a clock on board. (Available late '89)

inside memory chips is even greater in wide memory organizations. A 32-bit memory system reads 32,768 bits, or 4096 bytes, at a time! If an SRAM were integrated at this stage, the interconnection between main memory and the cache would be extremely wide. A single cache line would be thousands of bytes long and could be loaded or swapped out in one DRAM cycle. Cache management for write operations, including avoiding stale data when multiple copies of an address exist within the system, would be easier and faster to perform.

The raw ingredients are now present within DRAMs to integrate a cache; all that would have to be added is 4K bits (4 rows) of high-speed SRAM and a few pins. This scheme is not impossible: One large DRAM supplier is considering it for a 4-megabit chip. In fact, the obstacles to achieving the caching DRAM are more political than technical. If each DRAM supplier should implement a different solution to the component, large manufacturers would shun the devices. Prices would be high, and each implementation would be a critical, sole-source component. Manufacturers avoid single-source components at all costs.

Fortunately, there is an industry committee that defines memory standards—JEDEC, or the Joint Electrical Device Engineering Council. Ten years ago, JEDEC successfully adopted and propagated the x4 DRAM standard; now it should work on coordinating suppliers in the standardization of a caching DRAM design.

What the Future Holds
The pace of development in the computer industry makes predictions approximate, at best. After all, just a little more than 20 years ago, mainframes such as the IBM System/360 Model 30 (a medium-to-large-scale member of the 360 product line) had a basic storage of 64K bytes (with a maximum of 312K bytes), a memory cycle time of 2000 ns, and a memory width of 32 bits (the same as the 80386 or 80486).

Processor speed improvements have placed greater and greater demands on main storage and will continue to do so in the future. Within the next 10 years, you’re likely to see personal computers that are equipped with 64 megabytes of 64-bit-wide memory cycling at 20 ns. Data-path width will continue to grow, perhaps more so in silicon than on printed-circuit-board copper. To achieve these fabulous specifications, the industry will need continually improved control logic and memory organization, caching DRAM and multiple row accessing, and, most of all, coordination and standardization among suppliers.

OS/2 can do!

Until now, working on several jobs at the same time was next to impossible. But with OS/2®, you don't have to wait for your computer to complete one job before starting another. So working on several jobs at once is easy.

While you're recalculating a spreadsheet or printing a document under OS/2, you can also start one or more communications sessions with another office. Your computer can continue to work on those jobs in the background while you do something else, like write a report or check your on-line calendar.

You can take OS/2's multitasking ability even further with IBM's Micro Channel®. Its multiple lanes can handle the heavier flow of information and make your computer one of the most reliable and versatile business tools you can get your hands on.

Want to juggle several things at once? With OS/2, the solution is IBM.

Will the 80486 and the 68040, heirs to the dynasties built by Intel and Motorola, slow the RISC bandwagon?

Michael Slater and John H. Wharton

The first commercial microprocessors contained thousands of transistors; the 8086 and the 68000, tens of thousands; and the 80386 and the 68030, hundreds of thousands. The logical next step is millions, and indeed the 80486 and the 68040 weigh in with over a million transistors each.

The increased complexity of each generation has allowed word widths to expand from 4 bits to 32 bits, and addressing ranges to jump from a few kilobytes to 4 gigabytes. Memory management units, included in more recent generations of microprocessors, have eased the implementation of multiuser, multitasking operating systems and virtual memory. For the most part, however, until the most recent generation of microprocessors, you needed external chips for cache memory and floating-point processing.

Now, for the first time, it's possible to build a complete, high-performance CPU with floating-point and memory management functions on a single chip. The Intel 80486 is Intel's first true RISC processor, and while it has an intriguing architecture, it's too new to have much of a software (or hardware) base.

This article will focus on the 80486 and 68040, the heirs to the dynasties built by Intel and Motorola. These chips are very similar in terms of general features (e.g., cache, memory management, pipelining, and burst-mode bus), although they execute different instruction sets and thus have different application software bases.

As of this writing, Intel had shipped some samples of the 80486, but Motorola was still awaiting the first 68040. Intel had released full details on the 80486, while Motorola had issued only general information about the 68040. Thus, this article covers the 80486 in much more detail simply because little information about the 68040 was available.

The Intel 80486

Contained in the 80486 are a highly optimized integer unit compatible with the 80386, an FPU compatible with the 80387, a complete virtual memory management and protection system, 8K bytes of unified program and data cache, bus snooping and other multiprocessing support hooks, and several minor additions to the family architecture and instruction set (see figure 1). The die measures 619 by 414 mils using 1-micron high-speed CMOS technology, and it contains 1.18 million transistors, edging out the short-lived record of 1 million in the 80860.

continued
Intel claims that performance of the 80486 at 25 MHz will be about 37,000 Dhrystones, 6.1 million Whetstones (double-precision), or performance relative to the VAX 11/780 of about 15 to 20 VAX MIPS. This places the microprocessor squarely in competition with many RISC chips. Samples of 25-MHz chips have already been distributed, and Intel promises 33-MHz and 40-MHz versions to follow in 1990.

The 80486 implements essentially the same instruction set, memory organization, programming model, process-management facilities, and so forth as the original 80386, although the 80486 significantly outperforms its predecessors. Intel made no significant changes to the 80386 architecture except for six new instructions required for cache support and multiprocessing functions.

The 80486 appears to have been designed with four key objectives:

- Remain 100 percent software-compatible with existing 80x86 processors;
- Improve the performance of existing programs by 2 to 4 times;
- Add hardware and software facilities to support multiprocessing applications; and
- Increase the level of integration for PC-class systems.

Why didn't Intel reopen the architecture to add a slew of new instructions or to revise the programming model? Because the plan for the 80486 is to cement the 80386 family's domination of the personal computer industry. By retaining the same programming model for the 80386 and 80486 CPUs, Intel can promise third-party software developers a consistent programming environment on computation engines spanning a wide price/performance range. Intel hopes that the new product announcements will ensure that all future high-end PC software will be targeted to the 80386/80486 family, relegate the 80286 and its predecessors to lower status, and shut out the various "upstart" RISC builders.

Meeting Performance Goals

The 80486's claimed performance enhancement of 2 to 4 times that of the 80386 results from several factors. The fully redesigned integer unit (IU) and on-chip cache reduce the average number of clock cycles per instruction by a factor of about 2.5. The on-chip FPU executes floating-point instructions about three times faster than the 80386/80387 combination, largely because data transfers between the IU and FPU are more efficient. And while the initial device clock speed is 25 MHz, the 80486 is designed to scale to clock rates higher than those that the 80386 can achieve.

The instruction execution unit is designed to process loads, stores, and simple integer operations (i.e., those present in most RISC architectures) in as few clock cycles as practical. Less commonly encountered operations, such as multiplication, division, and process-context switches, received less design attention and require essentially the same number of clock cycles as—and occasionally more than—they do on an 80386.

If cache alignment and system timing conditions are propitious, data loads, stores, and simple register-to-register arithmetic operations do indeed complete in a single clock cycle (see table 1). There are no load-delay slots; the instruction immediately following a load can use the newly loaded data with no pipeline stall. No RISC machine has yet achieved this feat.

Arithmetic operations that implicitly reference memory-based variables need an extra clock cycle to retrieve data from the cache; operations that store computed results back in memory generally take three clock cycles total, as would a simple RISC load/operate/store instruction implementation.

Figure 1: The 80486 chip uses 1-micron high-speed CMOS technology and contains 1.18 million transistors. Its performance relative to a VAX 11/780 will lie between 15 and 20 VAX MIPS.
Hayes fever.

Get fast relief from high prices with ATI's high-performance, error-free modem for a fraction of the price.

Allergic to high modem prices? Here's news that will clear your head, not your budget.

ATI Technologies' 2400etc/e® external modem* meets the competition feature for feature... and then some! Remarkably, it costs just a fraction of the price.

Relief is fast. With MNP® level 5 data compression, the 2400etc/e's throughput speed exceeds 4800bps, thereby lowering transmission costs.

The 2400etc/e complies with the CCITT V.42 error-control standard, including LAP-M and MNP, for 100% error-free data transfer. As well as offering synchronous operation, it's fully compatible with the standard and extended Hayes® 'AT' command sets. Plus, ATI's easy-set front panel controls provide convenient access to frequently used commands.

Don't suffer from high prices. The ATI 2400etc/e external modem cures Hayes fever for only $299.** And that's nothing to sneeze at.

You'll be relieved to know that ATI also offers a high-performance internal modem, the 2400etc/i, at an equally non-allergic price. Only $239.**

*Comforms to CCITT V.22, V.22bis, Bell 103 and Bell 212A standards. **MNP and 2400etc/e are registered trademarks of ATI Technologies Inc.

The 80486 also doesn't use branch delay slots or conditional-branch prediction clues. The existing 80x86 software base doesn't use these techniques either, since neither one had entered microprocessor-design methodology 12 years ago when the 8086 architecture was defined.

Cache Characteristics

The on-chip cache is fundamental to achieving the high performance level of the 80486. Although the cache is considerably smaller than the 32K-byte external caches built with the 82385 in many 80386-based PCs, it's considerably more sophisticated. Its line size is 16 bytes, rather than 4 bytes, and its organization is four-way set associative, not two-way. Wide buses from the cache let the instruction prefetcher grab blocks of code 16 bytes at a time. Cacheable memory reads always fill an entire cache line, using an optimized four-word burst transfer.

In contrast to most processors with on-chip caches, the 80486 cache is unified to hold both code and data. This generally provides more efficient cache utilization than would, for example, separate 4K-byte code and data caches. It also solves problems that might otherwise arise in executing application programs that include self-modifying code, a questionable programming technique that is used by some significant DOS software. Cache addresses are physically mapped.

The most-often cited disadvantage of a unified cache design is that code and data fetches can collide, stalling instruction execution. The 80486 prefetch system avoids this hazard in two ways. Prefetching instructions 16 bytes at a time reduces the frequency of collisions; and, when collisions do occur, the data request is serviced first. The execution unit can generally keep busy finishing instructions already in the prefetch queue. (For more details on the inner workings of the 80486's cache, see the text box "Caching In" on page 328.)

Cache Effects on Bus Operation

The 80486 is the first microprocessor to include an on-chip cache with complete bus-snooping logic. The inclusion of these functions causes a considerable change in the nature of the memory interface, and the 80486 bus structure is thus quite different from that of the 80386.

The inclusion of caches on any microprocessor leads to a curious reversal in the nature of the traffic on the external bus. In noncached systems, most of the activity on the external bus involves

C THE LIMIT!

MicroWay is your best source for the software and hardware you need to get true 32-bit performance from your 386. Our NDP C compiler takes the original C concept of writing lower level code with a higher level language to the limit by providing an inline assembly language editor. The programmer specifies which register is used to store a variable. This feature makes it possible to use port or perform interrupts or block moves inline, instead of through calls. The use of register-allocated variables to control hardware reduces the size of critical code sequences by a factor of 3 to 10 and keeps the 386's pipelines full by eliminating costly calls. If you are interfacing DOS or the ROM BIOS, or writing graphics routines, a device driver, operating system kernel, or an embedded application, you owe it to yourself to try NDP C-386.

Our Users Report:
Milt Capsimolis of Ithaca Software in Ithaca, NY, developer of HOOPS, the highly regarded 3D object-oriented graphics library, reports, "We ported a huge application — well over 100,000 lines — without a hitch, in less than a day! NDP C-386 was the fastest C compiler we used... we also liked the enormous advantage it offers through its support of the Weitek coprocessor."

Fred Ziegler of AspenTech in Cambridge, Mass., reports, "I ported 900,000 lines of FORTRAN source in two weeks without a single problem! AspenTech's Chemical Modeling System is in use on mainframes worldwide and is probably the largest application to ever run on an Intel processor."

NUMERICS HOTLINE
(508) 746-7341
Intel projects cache hit rates for the 80486 of 96 percent for DOS applications and 92 percent for Unix and OS/2 applications. These estimates are from trace-driven simulations, not measurements, but are presumably close to what typical real values will be. Thus, the number of read cycles that appear on the external bus is drastically reduced, and write cycles dominate bus activity.

When a cache miss occurs on a read cycle, the 80486 fills an entire four-word (16-byte) cache line. Thus, most memory-read cycles are four-word bursts. Single-word reads occur only for noncacheable areas and for input ports. (Accesses to the I/O address space are never cached.)

To support cache refills efficiently, the 80486 bus interface provides a special burst mode, but this is activated only when the system logic requests it. The processor indicates the start of the cache fill by asserting ADS# and providing the address of the first word. The system logic responds by asserting KEN# (cache enable) if the access is to a cachable location. KEN# is then checked by the processor in the first cycle to determine whether or not to perform a four-word transfer.

The 80486 also provides cachability control in the page table, but existing operating-system software doesn’t support these bits. Systems designed with the 80386 and 80385 cache controller decode noncacheable regions in external hardware, and the KEN# input lets the 80486 use this same mechanism.

Figure A shows the timing for a maximum-speed burst transfer. This four-word transfer requires only five clock cycles, as compared to eight cycles for the fastest possible nonburst cache-line fill. The system logic indicates that it can perform a burst transfer by asserting BRDY# (burst ready). The processor then performs successive transfers as fast as one per clock cycle. Just as in regular transfers, wait states can be added to transfers within the burst by delaying the assertion of BRDY#.

The 80486 asserts (sets low) the BLAST# (burst last) signal during the last cycle of the burst and during nonburst (single-word) accesses to indicate to external logic that the processor isn’t ready to begin a burst cycle. You can also think of BLAST# as “ready to burst.” It is high whenever the processor is ready to perform a burst transfer. Burst transfers aren’t limited only to cache-line fills, and they don’t have to consist of four transfers. The 80486 will offer to perform a burst transfer (by negating BLAST#) whenever it’s reading 64 bits or more of data (e.g., a 64-bit floating-point read). If the addressed device asserts BS8# or BS16#, the processor performs the required number of transfers in a single burst. For example, a cache-line fill from a 16-bit device produces a burst of eight 16-bit words.

Burst-mode transfers take advantage of the fact that both page-mode and static-column DRAMs are much faster on successive accesses within a page than on the first access. However, even successive transfers aren’t fast enough with common DRAMs to keep up with the 80486’s maximum rate of one transfer per clock cycle (40 ns at 25 MHz, or 30 ns at 33 MHz). The solution is to provide two interleaved memory banks. Thus, each bank needs to provide only one word every two clock cycles to maintain the maximum transfer rate. Normal data bus activity can continue while AHOLD is asserted. In figure B, RDY# is asserted and a word of data is read into the processor in the first cycle of the invalidate transaction. BREQ (bus request) is an output from the 80486 that’s asserted whenever the 80486 is ready to perform a burst transfer. BREQ can be used in multiprocessor systems to control access to the system bus.

Since cache-invalidate cycles require access to the cache tags, they can interfere with the processor’s access to the cache. The 80486 reads code from the cache 16 bytes at a time, and these 16 bytes are fed into a 32-byte prefetch queue, so code fetches from the cache are relatively infrequent. But if the 80486 must perform a data access to the cache (or must fetch code because the prefetch queue is empty) in the same clock cycle as the invalidate request, the CPU stalls for one or more clock cycles.

In a multiprocessor system, this stalling can cause a significant degradation in performance. To minimize the degradation, you can use external logic to identify shared-memory areas and inhibit snooping on all but these areas. Second-level caches also reduce the degradation from snooping.

Second-Level Cache Support

A cache-hit rate of 92 percent may seem very good. But if the time to process a miss is very long, the misses can significantly reduce performance. For a given-speed main memory, the miss penalty (in clock cycles) increases as the processor’s clock rate increases. Thus, the performance loss due to cache misses is lowest for 25-MHz systems.

Faster 80486 systems, operating at 33 MHz and eventually at 40 MHz and up, are likely to use external second-level caches, which are typically much larger than first-level (on-chip) caches. The majority of accesses in the first-level cache will hit in the second-level cache, keeping the penalty for such misses to a minimum. Only when a miss occurs in the second-level cache will the 80486 need to access main memory.

The 80486 provides two signals to support a second-level cache: FWT (page write-through) and PCD (page cache disable). These signals are copies of the corresponding bits in the page

Caching In
table and allow the operating system to control cachability on a page-by-page basis. If PCD is set, the internal cache is disabled, and a second-level cache must be disabled as well. The PWT bit has no effect on the internal cache because it's always write-through. It's provided to selectively force write-through operation on an external write-back cache.

Cache-Support Functions
Minor changes to the 80386 architecture were made to support the cache facilities. Two reserved bits of each memory-page-table entry were redefined to control cachability characteristics on a per-page basis. When the PCD bit for a page is cleared, internal caching of data from that page is allowed. If the bit is set, internal caching is disabled. On each external memory access, the states of the PCD and PWT bits for the referenced page are copied to external pins. Off-chip logic can monitor these pins to control the write-back policy of an external second-level cache. The internal cache ignores PWT since all writes are write-through.

Two new input pins control internal cache operation. When a cache miss occurs, the 80486 tries to fetch the required data from external memory. As the data is returned, the chip tests the KEN# pin. If KEN# is negated on the first transfer cycle, the value fetched bypasses the on-chip cache and is processed directly, regardless of the state of the PCD bit. If KEN# is asserted, the memory cycle is transformed into a four-word burst transfer to fill the cache line. Asserting the FLUSH# input pin invalidates all internal cache tags.

The cache controller implements streaming and wraparound burst transfers for instructions and data. The first memory word returned contains the value needed by the unit that initiated the transfer; this value is passed to and digested by the requesting unit as soon as it arrives. The 80486 retrieves ensuing words in an order that ensures optimum use of 64-bit-wide interleaved memory systems, and it stores them temporarily into a four-word staging register. If external logic indicates that all four words fetched are cacheable, the cache is updated. Otherwise, the holding register is abandoned without affecting the cache.

---

**Figure A:** The timing for a maximum-speed burst transfer. This four-word transfer requires only five clock cycles; the fastest possible nonburst cache-line fill requires eight cycles.

**Figure B:** System logic first asserts AHOILD (address hold); then the 80486 disables its address outputs on the next clock cycle. System logic then drives the address on the 80486's address pins and asserts EADS# (external address). If the supplied address matches the cache tags, the 80486 invalidates that cache line.

A = application-level software; S = system-level software; TLB = translation look-aside buffer

Program fetches, and most of the remaining data transfers are reads. A cached system satisfies most fetch and read cycles internally, so they don’t appear on the bus. All 80486 writes, on the other hand, pass through to the external bus, so the majority of the bus traffic is outbound.

To decouple write operations from the performance of external memory systems, the 80486 contains four internal write buffers. If the external bus is busy, data writes simply save their data and destination addresses in the write buffer and complete in a single clock cycle. If all four buffers are in use, the instruction stalls. (The MIPS Computer Systems R3000 family has a similar facility but requires external write-buffer chips.)

As a further performance enhancement, Intel recommends that memory systems latch the write data and address information externally and implement a delayed write-memory cycle to free up the address and data buses as quickly as possible.

New Instructions

The 80486 includes six new instructions that are not present in the 80386 (see table 2). Three new protected-mode instructions help maintain the cache state: INVLPG (invalidate the translation look-aside buffer [TLB] entry), INVD (invalidate data cache), and WBINVD (write back and invalidate data cache). The latter two are identical from the 80486’s perspective, since the on-chip cache never contains dirty data to be written back. The only difference between them is that the second form asserts an output signal to control optional external write-back caches.

Two previously reserved bits in control register 0 have been defined to globally enable the cache replacement and write-through facilities. Three new 32-bit test registers have also been added, to let the operating system test operation of the cache tag and data memory blocks.

Two new instructions support multiprocessing systems. The CMPXCHG (compare and exchange) and XADD (exchange and add) instructions perform atomic memory read/modify/write cycles and simplify the implementation of software semaphores in multiprocessing applications.

The sixth new instruction, BSWAP (byte swap), reverses the byte order of a 32-bit operand. This lets the 80486 share data structures and on-line databases more easily with big-endian processors, such as the 680x0 and IBM mainframes, in coprocessing systems and networked installations. It will also be a boon to the execution of programs written in COBOL, still the most widely used of all computer programming languages. COBOL uses big-endian data structures and binary coded decimal (BCD) strings throughout. (You can use the original 8086 XCHG instruction to reverse the order of 2-byte operands.)

is a simple load from memory and assumes a cache hit; the boxes below the D2 and EX pipeline stages show the actions of the EU and cache logic during each clock cycle. The second instruction performs a register-to-register add, using the just-loaded data, and the third stores the result back to the same memory location. Note that all three instructions are prefetched together, and that each spends a single clock cycle in each of the other pipeline stages.

The 80486 encoding scheme: When a prefetched instruction is ready to begin, D1 logic examines its op code and determines the instruction class into which it falls. For simple, single-cycle instructions, the D1 stage determines what operation the execution stage will perform later. D1 also determines the entry point within a microinstruction ROM that contains the control word for the first execution cycle. If the instruction requires a memory-address calculation, the D1 stage also retrieves the information needed to compute the address and passes it on to the segmentation unit.

The D2 stage expands each 80x86 macroinstruction into control signals for the ALU. For single-cycle macroinstructions, this is simply a function of the original op-code bits. The D2 stage also controls the computation of the more complex addressing modes.

During the EX stage of the 80486 pipeline, the ALU in the EU performs calculations appropriate to the instruction. Unlike a conventional RISC pipeline, the 80486 may take up to several dozen EX clock cycles to execute a complex macroinstruction or to manipulate complex data structures. In such cases, a conventional microcode engine controls the ALU. In other cases, such as memory loads and stores, the ALU remains idle.

Finally, the WB stage, if needed, discards the register data and status flags modified during the preceding EX stage. If the current instruction updates memory, the computed value is sent to the cache and to the bus interface as soon as it becomes available. Figure 2 shows the pipeline stages for a series of three single-cycle instructions: load, add, and store.

The 80486's nonreduced instruction set also supports a full range of opera-
sections that reference memory-based operands as their source or destination. Figure 3 shows a register-to-memory add instruction equivalent to the sequence shown in figure 2.

For optimum performance, 80486 programs should follow the same data alignment guidelines recommended for 80386 systems. Specifically, 32-bit (or smaller) data objects should reside within a single 32-bit word. If a data object isn't properly aligned, control logic immediately initiates two successive access cycles. This simplifies the cases in which the object is split between separate cache lines or when it combines cached and noncached data.

Unaligned references still work, but at the expense of three extra stall cycles as the second access is performed and mated with the first. (To optimize the execution of virtual-mode 8086 programs, unaligned 16-bit data objects that fit within a 4-byte address boundary don't incur this penalty.) If any part of a requested data object isn't present in the cache, control logic will initiate an external memory-read cycle and insert stall cycles as needed.

Refilling the Prefetch Buffers

As sequential instruction execution proceeds, each half of the prefetch queue periodically becomes empty. Prefetch logic attempts to refill empty buffers with the next sequential instruction block. If the required instructions are in the cache, the buffer will be refilled in one clock cycle.

If the cache misses, prefetch logic requests a burst of instruction fetch cycles from external memory. In the meantime, the EU can generally keep busy for a handful of clock cycles—Intel says about eight—processing instructions that remain in the alternate prefetch buffer. External prefetches are performed in ascending order, with each word copied both to the prefetch buffer and to the cache as it's received. Thus, performance is minimally impaired, even for external prefetches.

The instruction pipeline unit monitors its own copy of the code-segment limit register. Prefetch cycles that would exceed the limit are automatically suppressed, so as not to reference nonexistent memory. Attempted branches past the end of the code segment produce limit-check errors.

80486 Pin Functions

Figure 4 shows the 80486 pin functions. The 32-bit address bus is implemented as 30 address bits, plus four byte enables that encode the two least-significant address bits and the transfer width. Many of the control signals and inputs are similar to their 80386 counterparts.

The 32-bit address bus is implemented as 30 address bits, plus four byte enables. The 80486 implements a single-phase clock, so the internal and external clocks have the same frequency. This technique, first tested by Intel with the 80860, should simplify system design and may make it easier to meet FCC emissions standards.

PC Integration Improvements

A number of 80486 bus-interface facilities simplify the design of IBM-style PCs and workstations. An extra pin for each byte of the data bus produces and verifies bus parity. This eliminates the need for off-chip parity logic, saving money and, more important, reducing delays in the critical timing path of external memory.
systems. CPU operation is unaffected when parity errors are detected, but a bus-error output pin is asserted.

Despite the integration of the FPU on-chip, pains were taken to provide full software compatibility. Separate inputs reset the IU and FPU individually. Floating-point errors can be reported in several ways; the simplest option simply asserts the FERR# (floating-point error) output pin. This signal can be routed through an external 8259A interrupt controller, just as in prior PC designs, before returning to the 80486 interrupt-request pin.

The 8086 physical address bus is limited to 20 bits. Address calculations that exceed the 1-megabyte limit overflow gracefully to produce low-order addresses. This leads to subtle incompatibility problems with the larger address spaces of 80286- and 80386-based systems. AT-compatible systems in real mode must currently implement an external software-controlled mask to force address line A20 to zero. On the 80486, this address bit can be masked internally, removing a slight propagation delay from a critical address timing path and ensuring that the internal cache matches external memory. The A20M# (address bit 20 mask) invokes this function.

The 80486 enhances the 80386 dynamic bus-sizing facility. On any memory cycle, the addressed device can indicate whether it’s 1, 2, or 4 bytes wide. If it’s only 1 or 2 bytes wide, the processor immediately issues additional bus cycles as needed to retrieve any required higher-order bytes. This lets the 80486 boot itself from a single byte-wide EPROM, simplifies peripheral interfacing, and eliminates the external state machine required to perform byte-wide transfers on the XT, AT, and Micro Channel buses.

The four parity bits, DP0 through DP3, serve as inputs on read cycles and as outputs on write cycles. If parity is incorrect on a read cycle, PCHK# (parity check) is asserted. This doesn't affect the operation of the processor in any way; systems that use parity will normally connect PCHK# to NMI. PCHK# isn't valid until the clock cycle that follows the end of the read cycle. Because of the cache operation and instruction prefetching, bus activity is quite decoupled from

---

**Figure 5:** The instruction unit of the 68040 executes the same instruction set as the 68030, with perhaps a few additions to support new hardware features. The implementation is completely new, however, with a redesigned ALU and pipeline to decrease the average number of clock cycles required per instruction. The design increases the size of on-chip caches from 256 bytes to 4K bytes each and integrates the FPU onto the chip.
instruction execution, and it's difficult to correlate the parity error with the instruction that caused it. An external address latch can be added to capture the address for diagnostic purposes.

**The Motorola 68040**
The 68040 will contain over 1.2 million transistors, making it about the same size as the 80486. Motorola says that it will be 100 percent compatible with existing 68000-family processors. No specific performance figures have been released, but the chip is said to operate at roughly three times the rate of the 68030. Its floating-point performance is expected to be significantly faster than the 80486's.

Figure 5 shows the block diagram of the 68040. The IU must execute the same instruction set as the 68030, with perhaps a few minor additions to support new hardware features. The implementation, however, is entirely new, with a redesigned ALU and pipeline designed to significantly decrease the average number of clock cycles per instruction. Motorola's "Product Preview" states that the IU has been "optimized to significantly reduce the execution time of compiler-generated code." This presumably means that the simpler instructions, which most compilers tend to use, will be sped up the most.

The FPU is compatible with the 68882 coprocessor, but the trigonometric functions aren't directly supported. Instead, they are trapped and must be emulated in software. These functions were performed in microcode in the 68882, and since the 68040 will be able to execute simple macroinstructions in a single clock cycle, software emulation may be comparable in speed to a microcode implementation. The basic floating-point functions that the FPU implements in hardware will operate in fewer clock cycles than the 68882 required, providing very good floating-point performance.

The on-chip memory management unit is a superset of that found in the 68030. Separate address translation caches are provided for instructions and data, since there is a separate address path for each.

As in the 68030, the 68040 has separate instruction and data caches. Each cache contains 4K bytes, so the total cache size is the same as that of the 80486. Bus snooping provides cache coherence in multiprocessor systems. The 68030 doesn't provide snooping, and its data cache must be disabled in systems using shared data.

**RISC Meets CISC**
With the announcements of the 68040 and the 80486, CISC processors have taken a major step toward performance levels previously achieved only by RISC processors. This reopens the entire RISC/CISC debate and raises numerous questions about which processors are likely to be successful in various market segments.

Based on preliminary performance claims, it appears that the 68040 and the 80486 will both perform at roughly three times the rate of the 68030. 80486 will both perform at roughly 15 VAX MIPS at 25 MHz. Each is projected to be about three times as fast as its predecessor, providing a significant speed increase while also reducing the system chip count by eliminating the floating-point coprocessor and, in many systems, the external cache.

Some observers question the need for this level of performance in single-user PCs, but among so-called "power users" there exists an insatiable desire for speed. More sophisticated windowing systems and user interfaces will require more processor performance just to keep the system's perceived speed at a constant level.

RISC processors have made possible a new class of workstations, including the R2000-based DECstation 3100, the 88000-based systems from Data General, and the SPARCStation I from Sun. These workstations cost roughly $10,000 for a basic configuration, which isn't much more than a similarly equipped 80386-based AT or Mac II, yet they provide two to three times the performance. If you're considering switching to Unix, these RISC systems provide a much better price-to-performance ratio than existing 80386- and 68030-based computers.

The drawback has been that RISC-based workstations couldn't directly use the existing DOS software base. DOS emulators are available, but their inefficiency reduces performance significantly.

REVENGE OF THE CISCS

ly. [Editor's note: Some capability now exists to convert DOS software to run on RISC machines with the help of a "binary compiler." See "DOS at RISC" on page 361 for more on this subject.]

Unix Meets DOS

The 80486 provides the best of both worlds. As a Unix engine, its performance should match that of low-end RISC-based systems. Furthermore, the 80486 will run both DOS and OS/2 software—within a Unix window if desired—and run it fast. This ability will be very valuable in convincing DOS users to move to a Unix system. If you can have top-of-the-line DOS performance and good Unix performance at the same time, it's not nearly so hard to decide to buy a Unix box.

The 68040 will also compete for the workstation market. Although it can't run DOS applications directly, it has the benefit of having the largest existing base of workstation applications software. While 80386 Xenix systems outnumber 68000-family Unix systems, most Xenix applications are business-oriented and not comparable to the technical workstation applications that are the 68000's strength. Nevertheless, the 68000 family's workstation application base is now being rapidly ported to RISC architectures.

The 68000 family's other key software assets, the Macintosh system software and applications, are an asset only to Apple. The future of the 68040 (and the future of the Macintosh itself) would be far brighter if Apple would license the Macintosh Toolbox. The 68040 will inherit Apple's high-end Macintosh business and a 68000-family compatibility-oriented segment of the workstation business, but these markets will not approach the size of the 80386 and 80486 systems market.

Playing Catch-Up

Some RISC advocates have claimed that CISC is doomed, since (they say) complex instructions have irregularities and external memory dependencies that inherently limit their performance. Nevertheless, by combining a finely tuned mix of brute force (multiple wide internal data buses and a huge transistor budget) and finesse (regularized instruction pipelining and an optimized bus interface), the architects of the 80486 and the 68040 have achieved near-RISC performance levels.

It now seems clear that CISC can catch up to RISC performance. However, it's important to note that this is indeed a game of catch-up. The 68040 and the 80486 will begin volume shipments in 1990; both SPARC and MIPS chips have been shipping with comparable performance levels for nearly two years. By 1991, a new generation of RISC chips will be doubling the performance of current implementations, and CISC will have to play catch-up again (probably in 1992) with the 68050 and the 80586.

The Clipper language offers two compelling reasons to adopt it as your application development standard: open architecture and .EXE file generation. Clipper 5.0 boasts even more. We think you’ll be convinced before you reach number nine.

1. Open Architecture.
Clipper is both powerful and easy to use, with the most comprehensive command and function set available. Want more? Extend the Clipper language with user-defined functions written in Clipper, Assembler, C and other languages.

2. User-defined Commands.
Even more extensibility is available in Clipper 5.0. Support for user-defined commands allows you to tailor your command set to a specific business or industry.

3. .EXE File Generation and LAN Support.
Clipper’s compiler yields stand-alone .EXE files for unrestricted distribution, requiring no LANPACKs®, no run-time modules and no licenses of any kind!

4. Break the 640K DOS Limit!
Improved memory management in Clipper 5.0, made possible by an exclusive version of Pocket Soft’s .RTLink®, lets you run applications larger than 640K, without overlays!

5. It’s Faster.
Clipper dramatically reduces development time, but accelerates program execution and large network performance beyond any system you’re using now!

6. Use What You Already Know.
Integrate existing routines from C, Assembler, Fortran, Pascal or dBASE®. They’re all more powerful with Clipper!

Clipper 5.0 introduces new variable types, user-modifiable GETs and multi-dimensional arrays that can contain arrays!

New and expanded documentation will make you immediately productive in Clipper 5.0. And you can access it all on-line through the included Guide to Clipper® and Norton Guide® Engine.

9. You Can Get It First!

Virtual memory gives you the ability to run programs that are larger than the amount of physical memory installed on your computer. First used in the Atlas computer system at the University of Manchester, England, in 1960, VM today is almost universally available on mainframes, minicomputers, and workstations.

A distinguishing feature of VM is its low profile—you need not be concerned with the details of fitting your program into memory. Contrast this with, for example, program overlays. Overlays require you to indicate explicitly which parts of the program must be in memory simultaneously, and which parts are disjoint and need not coexist. Each time a new version of the application is released, these decisions must be revisited.

With a VM system, you simply build your multimegabyte application, oblivious to the amount of memory installed on the computer. If the computer has more memory, the application runs faster; less memory, and it runs slower—but it always runs, with no extra programming required.

How is this sleight of hand accomplished? At any given moment during the execution of a program, some portion of it is in physical memory, and the rest is swapped to disk. As the program executes, it continually references code and data in other parts of the program. If the referenced code or data is in memory, program execution continues uninterrupted. If the program references something that is not in memory, the operating system gets control. The referenced code or data is brought into physical memory (if necessary, causing some other part of the program to be swapped to disk); the application program continues executing, oblivious to all this activity.

To use VM, a program must be divided into pieces. Individual pieces of the program can be either in memory or swapped to disk at any given time, and the VM subsystem of the operating system must keep track of each piece. If the pieces are variable in size, they are called segments, and they usually relate in some way to the organization of the program (in the simplest case, the program has one code segment and one data segment). If the pieces are always the same size, they are called pages. In either case, hardware assistance is required to enable the VM system to bring referenced pieces into memory without the knowledge of the application program. It's generally accepted today that paging offers performance benefits over segmentation, and most commercially available VM systems offer some form of demand-paged VM. The term demand continued...
paging means pages are brought into memory as they are referenced, as opposed to anticipatory paging, in which the VM system attempts to predict the pages that a program will need next.

A VM system is a clearly delineated subsystem of an operating system. The VM system allocates and frees memory, maintains the data structures necessary to perform the virtual-to-physical-address translation, and brings program pieces into memory as they are referenced. VM can, of course, be implemented for both single-tasking and multitasking operating systems, and it is essentially the same in either environment. The only additional consideration required for multitasking is separate tracking of the virtual address space for each process, to implement working set management at the process level.

The following two articles discuss the details of VM implementations on 80386 and 80486 systems and on the Macintosh. The first discusses how Intel's hardware has evolved to make demand-paged VM possible. The second describes how Macintosh System 7.0 implements VM while maintaining compatibility with applications written before VM was even considered for the Mac. The arrival of VM on the two most popular computing architectures signals another important advance in the capabilities of personal computers.

Virtual Memory: The Next Generation

Intel's 80386 and 80486 microprocessors bring demand-paged virtual memory to your desktop

Robert Moote

Although noted primarily for their raw power, Intel's 32-bit processors also give you the ability to address more memory than your computer contains. This capability is a result of their built-in hardware support for VM.

Software support is also required to provide demand-paged VM on 80386 and 80486 machines. You can currently find VM implementations in 80386-specific versions of Unix and Xenix, and in Phar Lap Software's 386/DOS-Extender. Future versions of OS/2 will also support demand-paged VM.

Hardware Roots

IBM based its original PC on the Intel 8088, a variant of the 8086 microprocessor. When Intel introduced the 80286, it built in hardware support for segmented VM. Thus, the 80286 has two modes of operation: real mode, in which it looks like a fast 8086 to ensure backward compatibility with DOS, and protected mode, which provides (among other things) the hardware support necessary to build a segmented VM system. With the 80386, Intel added hardware paging support and 32-bit operation. Recently, Intel introduced the 80486, which, from a software point of view, is largely a fast 80386 (see "Revenge of the CISCs" on page 323). Anyone with an 80286-, 80386-, or 80486-based PC has the hardware capability to run VM programs.

Unfortunately, DOS remains an 8086 operating system and must run in real mode, where all the VM hardware support provided by the 80286/80386/80486 is disabled. When 80286 and then 80386-based PCs were introduced, developers quickly made versions of Xenix and Unix available, providing 80286 machines with segmented VM and 80386 machines with paged VM. OS/2 also implements VM (see the text box "VM Under OS/2" on page 344), but it is restricted to segment swapping because OS/2 is an 80286-specific operating system. 80286- and 80386-specific DOS extenders have also been available for years. In addition to being able to run large programs under DOS, these extenders usually support VM. (OS/2 and Unix also provide support for large programs, but they do not have the ability to run DOS programs larger than 640K bytes.) As with Unix, the 80286 DOS extenders provide segmented VM, and 80386 DOS extenders support paged VM. (For more on Unix VM systems, see the text box "VM in Unix" on page 348.)

80386/80486 Memory Architecture

The 80386 and 80486 microprocessors provide hardware support for both segmentation and paging when the processor is executing in protected mode. As the term implies, this mode also provides memory-protection benefits.

The design outlined here uses the hardware segmentation facilities for program protection, and the paging facilities for VM. This division of labor is a common choice in a combined paged/segmented architecture.

Segmentation

80386 and 80486 programs are divided into segments; at a minimum, a program has one code segment and one data segment. Code segments can't be modified, and data segments can't be executed.
This allows easy detection of a common class of programming errors. Each segment has a limit, and any attempt to access code or data beyond the segment limit is prohibited.

A program segment on the 80386 or 80486 has its own base address, segment limit (its length), and protection information (whether it is a code or data segment, whether it is read only or read/write, and so on). This information is contained in either a global descriptor table or a local descriptor table maintained by the operating system. Each entry, or segment descriptor, in the GDT or the LDT identifies one segment.

When a program references a memory location, it's always a location within a segment. Usually the segment is implied; that is, it's a location within the current code or data segment for that program. The 80386 and 80486 processors contain segment registers that are loaded with values—called segment selectors—that select a specific entry in the GDT or the LDT. The program can then reference memory as an offset within the selected segments and need only reload the segment registers when it's necessary to address a different program segment. (For programs written in a high-level language, the program segmentation and the loading of segment registers is handled entirely by the compiler, so you need not even be aware of it.)

A segment selector, plus an offset within the segment, is referred to by Intel as a logical address. (The logical address is called a virtual address on most systems because it's the address that the application program sees.) This logical address is converted by the processor's segment-translation unit into a linear address. The linear address is equal to the base address of the segment (obtained from the segment descriptor) added to the segment offset (see figure 1).

Because it would be expensive to read the segment descriptor in the GDT or the LDT for each memory reference, the processor caches the descriptor in an internal register whenever a segment register is loaded with a segment selector. This allows the translation operation depicted in figure 1 to be performed efficiently.

**Paging**

The 80386 and 80486 processors have 32-bit internal and external address buses. The maximum size of both virtual and physical memory is therefore 4 gigabytes. The physical memory on the system is divided up into 4K-byte pages, continued
VM under OS/2

Julie Anderson

Because OS/2 was originally designed for the 80286, its use of virtual memory is constrained by the capabilities of the 80286 hardware. Thus, you can run only highly restricted DOS applications in real mode, and multiple segmented 16-bit applications. The latter can address up to 16 megabytes of physical memory and 1 gigabyte of virtual memory. Two years after the release of OS/2 1.0, Microsoft is completing work on its OS/386 version, presently called OS/2 for the 386. Microsoft expects to release the Software Development Toolkit for this product at the end of this year, with the production release following in the first half of 1990.

OS/2 for the 386 is the OS/2 everyone's been waiting for. It will support applications written to the 32-bit flat address space of the 80386 and let multiple DOS applications execute concurrently with both 16- and 32-bit applications. OS/2 for the 386 will also use demand paging to simplify and expedite memory management and swapping.

The 80286 Blues

Microsoft originally chose to write to the 80286 environment because of the 80286's large installed base. Although a logical decision, it required Microsoft to face some serious hardware limitations in providing compatibility for DOS applications. The 80286 architecture supports 8086 (and 8088) DOS applications in real mode only, and it is designed to run either in real mode or protected mode, but not to multitask applications running in both modes. (To switch from real to protected mode, you set the protection enable bit in the machine status word, but to switch from protected to real mode, you must reset the system.)

Virtual 8086 Mode

Virtual 8086 mode on the 80386 solves all these problems. OS/2 for the 386 can create multiple, 1-megabyte virtual address spaces in which DOS applications can run in protected mode while supporting real-mode-style addressing (segment:offset pairs). OS/2 for the 386 will use this mode of addressing to run multiple DOS applications concurrently with 16-bit and 32-bit protected-mode applications. Each application has its own logical copy of the lowest 1 megabyte of memory. An application running in virtual 8086 mode that writes directly to video memory can continue to execute when switched to the background because it's writing to its logical copy of video memory. Changes made to an application's logical address space won't affect either the operating system or applications, which have their own versions of the same logical memory addresses.

In addition, the 80386 quickly switches in and out of virtual 8086 mode on a task-by-task basis, depending on the value of the TSS flag in the Task State Segment. On an interrupt, the 80386 switches out of virtual 8086 mode, meaning that device drivers can exist outside the application's address space. OS/2 for the 386 uses this feature to map out device drivers—including network software—thus leaving as much as 600K bytes for the DOS application. In contrast, OS/2 1.1 gives the DOS application only 500K bytes. Although DOS applications that reprogram the hardware (e.g., some backup utilities) are still forbidden, any program that runs under an 80386 control program like DESQview or Windows/386 should run successfully under OS/2 for the 386.

Demand Paging

OS/2 for the 386 maps the application's logical addresses to physical memory addresses using the 80386's paging hardware, which divides the machine's physical memory into a series of 4K-byte page frames. The operating system assigns a page of virtual memory to each 4K-byte area of the application's logical address space. Pages don't have to be contiguous in memory; OS/2 for the 386 keeps track of the location of an application's pages through entries in the page tables.

Demand paging, which the 80386 supports in protected mode as well as

with pages aligned on 4K-byte address boundaries. Thus, you can think of the physical memory on the computer as an array of pages starting at physical address 0. Pages are not related in any way to the organization of the application program; instead, they are used for memory management and implementation of VM. Actual memory pages in the computer are referred to as physical pages (often called page frames). For example, on a PC with 2 megabytes of memory, there are 512 physical pages. Pages allocated to a program are called virtual pages. The maximum number of both physical and virtual pages in the system is 1,048,576 pages, or 4 gigabytes of memory. (A multitasking system can support a larger system-wide virtual address space by maintaining separate page tables for each process in the system.) As a practical matter, the physical memory on a PC is much less than 4 gigabytes. While the virtual address space can be much larger than the available physical memory, it is limited—in this case by the available disk space—because virtual pages must be kept either on disk or in physical pages.

The segment-translation logic yields a 32-bit linear address. The page-translation logic translates this linear address into the physical address that the processor places on the external memory bus (see figure 2 for a simplified view of this process). The linear address contains a
virtual 8086 mode, makes memory management on the 80386 faster and simpler than on the 80286. On the 80286, OS/2 allocates memory in variable-size segments, and then must track both the physical location and the size of an application's segments. As applications are loaded, grown, shrunk, and terminated, many variable-size segments are allocated and freed. Physical memory becomes fragmented, and OS/2 may need to move segments to free up enough contiguous memory to satisfy an allocation request. When physical memory is exhausted, OS/2 chooses a segment to swap to disk. It may need to rearrange segments in the swap file to free up enough space to write the segment. Later, when an application references the swapped segment, OS/2 must again find an appropriately sized area of physical memory into which it can read the segment from the disk.

On the 80386, the 4K-byte page frame removes much of the complexity. With this fixed-size memory-allocation unit, neither physical memory nor the swap file becomes fragmented, and moving pages is never necessary. Like segments on the 80286, developers can designate memory blocks in OS/2 for the 386 as "discordable." In this case, the page is not swapped; its space is merely reused.

Working hand-in-hand with the operating system, the 80386 hardware is optimal for demand paging. The 80386 speeds page lookups by caching on-chip, in the translation lookaside buffer, which contains the page-table entries for the 32 most recently accessed pages. When an application reads or writes to a page, the 80386 sets the accessed bit in the page-table entry. This helps the operating system determine which of the pages have been accessed recently.

On the 80386, attribute bits in page-table entries (similar to segment management on the 80286) indicate whether or not the page is present in memory and the types of accesses that are valid. To deny write access to a page, the operating system can reset the read/write attribute bit; application code is customarily marked read-only.

One additional attribute bit in the 80386 is the dirty bit. The 80386 sets this bit whenever the application writes to the page. The operating system can test this bit to determine whether or not a page should be written to disk. If the page already exists in the swap file and it hasn't changed, it can be discarded. In addition, for a page that isn't present, the operating system can use the other 31 bits of the page-table entry (all bits except the present bit) to store the disk address of the swapped page. Although it's fairly safe to assume that OS/2 for the 386 will exploit the 80386 hardware, Microsoft has not announced what use, if any, OS/2 for the 386 makes of these attribute bits.

Flat Address Space
OS/2 for the 386 supports the flat, or linear, address mode of the 80386, which allows an application to specify a segment selector and a 32-bit offset. In this mode, the 80386 supports 4 gigabytes of physical memory and 64 terabytes of virtual memory. Both 16-bit and 32-bit applications will run concurrently. To accomplish this, OS/2 for the 386 will add a dynamic link library (DLL) with a new set of application-programmer-interface calls. Those OS/2 API calls that reference 16-bit segments: offset addressing will be replaced with a 32-bit version. Because both APIs are provided in DLLs, an application simply loads the appropriate library to run.

Although a 16-bit application asks the operating system for memory in terms of segments, OS/2 for the 386 translates the request into the corresponding number of pages. Although their addressing schemes may be different, concurrent 16-bit and 32-bit applications can communicate with each other using the usual interprocess communications mechanisms, including shared memory; each application will simply use different API calls to reference them.

OS/2 for the 386
Although it's been a long wait (and it isn't over yet), OS/2 for the 386 will, by exploiting the capabilities of the 80386, address the current complaints against OS/2. More than one DOS application will run with true concurrency.

An efficient memory-page-swapping technique will reduce the amount of physical memory you need to add to the system for acceptable performance. Most important, having access to the 80386's flat address space may entice developers to port applications from other unsegmented architectures, opening up the potential for a new class of OS/2 applications.

12-bit offset (2^12 equals 4096, the page size) and a 20-bit virtual-page number.

The processor looks up the virtual-page number in page tables maintained by the VM system. This process generates a 20-bit physical-page number. When concatenated with the offset, the result is the physical memory address. For example, if virtual page 8 (linear addresses from 32K to 36K) is mapped to physical page 1 (physical addresses from 4K to 8K) in the page tables, then the linear address 33K (00008400 hexadecimal) maps to physical address 5K (00001400 hexadecimal); the 20-bit virtual-page number 8 is mapped to the 20-bit physical-page number 1.

Figure 3 shows the page-translation process in more detail. The 20-bit virtual-page number is composed of two 10-bit fields: a page-directory index and a page-table index. The VM system maintains one page directory and multiple page tables. The page directory and page tables are 4K bytes in size, each containing 1024 32-bit entries. Each entry in a page directory contains the physical address of a page table. Each entry in a page table contains the address of a physical page. Thus, the page-translation logic uses the page-directory index to obtain the address of the appropriate page table, and it uses the page-table index to look up the address of the physical page.

The contents of a page-table entry for a continued
Figure 4: Twelve bits in the page-table entry provide information about the page to the processor and to the VM subsystem of the operating system. Four bits on the 80386 (2 on the 80486) are unused and reserved.

Figure 5: When combined, segmentation and paging result in a system that provides protection without causing memory fragmentation. Segments are used for program protection, and paging is used to map programs into physical memory in fixed-size chunks.

The page present in physical memory are shown in figure 4. The 20-bit physical page address leaves 12 bits available for additional information. Bit 0 is the present bit; it indicates whether the page is in memory or swapped to disk. For present pages, bits 1 and 2 are used for page protection; they mark a page either read only, read/write, or supervisor access only. Bit 5—the accessed bit—is set by the processor each time the page is accessed, and bit 6—the dirty bit—is set when the page is modified. The dirty bit and accessed bit are crucial for the implementation of VM. Bits 9 through 11 are available for use by the VM system, and the remaining 4 bits are reserved in the 80386 for use in future processors. Two of those 4 bits (bits 3 and 4) are used in the 80486 processor to control memory caching at the page level.

If a page is marked “not present” (the present bit is 0), the VM system can use all the other 31 bits in the page-table entry.

The page-translation process appears expensive, since it involves two memory accesses—one to the page directory and one to the appropriate page table—to obtain the address of the physical page. The 80386 or 80486 processor therefore keeps a four-way set-associative cache of recently referenced page-table entries. This cache is called the translation lookaside buffer. Since programs tend to exhibit localized referencing behavior, most page references result in a hit in the TLB. Thus, extra memory references are usually not required to obtain the needed page-table entry. Normally, software can ignore the operation of the TLB. However, VM system software must flush the TLB after making changes to the page tables to ensure no stale page-table entries remain.

The combined effects of segment translation and page translation are shown in figure 5, which demonstrates one possible mapping for a segment five pages (20K bytes) in size. In this example, the segment base address is aligned on a page boundary, and the segment spans exactly five virtual pages. Note that the segment is contiguous in the linear address space; this is mandatory. The five virtual pages are mapped by the page-translation logic to five noncontiguous physical pages.

**VM Management**

The job of a VM system is to allocate and free VM for use by programs, write virtual pages to a swap file on the disk if there are too many virtual pages to fit in physical memory, and bring pages back into memory as page faults occur, so the program can continue to execute. This is primarily a bookkeeping job. Part of this job requires the use of an algorithm that decides which page is to be replaced (swapped to disk) when a page fault occurs and a physical page is required to bring the referenced virtual page into memory. The choice of this algorithm can have considerable impact on the performance of an application program.

The VM system must maintain the data structures (the GDT, the LDT, and the page tables) so the processor can do address translation. It must also keep any additional information required to perform the rest of its tasks.

**VM Data Structures**

The VM system must keep track of free (unused) physical memory. Since pages are a fixed size and need not be contiguous (because contiguity is preserved in the linear address space, not the physical address space), this is a trivial task. A one-way linked list of free physical pages is all that is necessary.

When a segment is allocated or extended, it requires a contiguous region in the 4-gigabyte linear address space (see figure 5). The VM system must therefore
keep track of allocated and free regions in the linear address space. This is most efficiently done by means of a bit map, one bit for each page in the linear address space.

The VM system must also maintain certain information about pages in memory (see table 1) and pages not in memory (see table 2) in the page-table entry. When a virtual page is marked "not present," there are 31 bits available for use by the VM system in the page-table entry. However, if the page is present, only 3 bits are available. It's possible to maintain all the information listed in table 1 in one 32-bit page-table entry if (a) just the accessed bit and the dirty bit are used for the page-replacement algorithm, (b) in-memory pages don't need an address in the swap file, (c) no process ID is needed, and (d) statistics are not kept on a per-page basis.

If more information is required (for more sophisticated swap-file management, a better page-replacement algorithm, or keeping paging statistics), the VM system must maintain an additional data structure in parallel with the page tables. For example, the parallel data structure could allocate an additional 32 bits of information for each virtual page, so that a total of 64 bits is available.

A virtual page marked "present" could then use the 3 VM system bits in the page-table entry for a page-locked flag, a system-page flag, and a mapped-page flag. The parallel data structure might contain a page-on-disk flag, a swap-file address, page-aging information, and statistics information.

A virtual page marked "not present" would use a present bit and a page-replaced flag in the page-table entry. The remaining 30 bits would be available for other information (such as a time stamp for when the page was replaced). A page marked "not present" would contain the same information as a present page in the parallel data structure.

Handling Page Faults
A page fault occurs when a reference is made to a virtual page that is marked "not present" in the page tables. It is the page-fault handler's responsibility to allocate a physical memory page, bring the virtual page into memory, and then restart the instruction that caused the page fault.

Usually, when a page fault occurs, all physical pages are in use. The page-fault handler must select a virtual page that is in physical memory and swap it out to disk, thereby freeing a physical page for continued

---

**Table 1: Besides address information, the VM system needs to keep track of present-page characteristics and information for the page-replacement algorithm.**

**INFORMATION REQUIRED FOR PRESENT PAGES**

1. The address of the physical page to which it is mapped (bits 12-31 of the page-table entry).
2. Page-aging information, used to decide which virtual page to replace (swap to disk) when a page fault occurs. The not-recently used (NUR) strategy needs only the accessed and dirty bits in the page-table entry to make this choice; other replacement algorithms require more detailed aging information.
3. A flag marking the page as locked or unlocked. Locked pages cannot be paged to disk. This is required for operating-system pages, and sometimes for application program pages (e.g., for hardware interrupt handlers).
4. A flag identifying the page as owned by the operating system or by an application program. This is not always required (often it's sufficient merely to mark operating-system pages locked). On multitasking systems, a process ID may be needed.
5. A flag identifying the physical page as allocated (the usual case) or mapped. Programs sometimes need to map a region of the physical address space to access memory-mapped hardware devices. Mapped memory is not physical RAM memory, and the VM system must be able to make the distinction so it doesn't attempt to return mapped memory to the free physical-page list when it's deallocated.
6. A flag for whether the virtual page is also in the swap file, and if so, the address within the swap file where it is stored. This is used to enhance system performance when the page is replaced. If it is already in the swap file and has not been modified (the dirty bit is not set), then the expensive disk-write operation needed to put the page in the swap file can be avoided.
7. Optional paging-statistics information kept for performance analysis (and working set management, in a multitasking system). Typically kept information includes the number of times each page has been replaced, the paging rate (the number of page faults per second processed by the system), the page-reclaim rate (the number of page faults per second on previously replaced pages, as opposed to program pages being referenced for the first time), and a complete history of a program's paging activity.

**Table 2: Swapped pages keep track of their location on disk, indicate whether they are yet present on disk, and keep various statistics.**

**INFORMATION REQUIRED FOR SWAPPED PAGES**

1. The address of the virtual page in the swap file.
2. A flag indicating whether the virtual page is in the swap file. In a commonly used optimization, a virtual memory page newly allocated by a program is simply marked "not present" and "not in the swap file." It's not desirable to allocate a physical page immediately, because programs commonly allocate large amounts of virtual memory at a time. The first time the page is referenced, the VM system allocates a physical page and zeroes it. This avoids a disk write needed to put a zeroed page in the swap file when the virtual memory page is allocated, and it also avoids a disk read to bring the page in from the swap file the first time it's referenced. The page is only allocated and written to the swap file when (and if) it's finally swapped out to disk.
3. Additional statistics information. This typically includes a flag used to keep statistics on the page-reclaim rate that specifies whether the page is in the swap file because it's been replaced or because it hasn't yet been referenced by the program. More elaborate schemes might also time-stamp the page when it's replaced, so that the VM system can calculate the elapsed time between when the page is swapped out and the next time it's referenced.

VM in Unix
Ben Smith

Programmers at the University of California at Berkeley first introduced virtual memory to Unix in 1978. The impetus was the VMS operating system on Digital Equipment Corp.'s VAX computer, which had the ability to address and use 1 gigabyte of memory when it had as little as 1 megabyte of physical memory. Earlier DEC machines required that all users have separate memory (limited to 64K bytes), private to their individual processes. The result of the Berkeley programming effort was 3BSD (and 4BSD in 1980). The spread of BSD Unix can be attributed, more than anything else, to this one feature. Now, all modern versions of the Unix kernel have either swapping or paging, which are two versions of virtual memory.

Swapping
Although in some contexts the terms swapping and paging refer to the same thing, in the Unix environment, swapping refers to moving entire processes in and out of physical memory. It's obvious that if each user process is going to be allowed to use a major part of memory, the only way to support multiprocessing is to swap these processes out of active memory to allow space for the next process. Each process is brought back into active memory when it is time for it to continue processing. A separate area of the disk (or a separate disk) is reserved just for swapping. This area does not require management by the file system, but instead is managed by the kernel, which is more tuned to the needs of swapping.

The limitation on swapping is that a single process must always use less than the system's physical memory capacity. (Some memory must be held for the kernel.) However, swapping is simple to implement and therefore requires little operating-system overhead.

Paging under Unix
The incorporation of memory management units into most modern computers has provided virtual addressing, a necessary element of paged virtual memory. The virtual address space is divided up into units called pages. If the operating system takes advantage of these facilities, it will properly handle page faults by moving virtual memory in and out of active memory as required.

Since a page is smaller than the process or its data area, there is a finer control of memory. Only parts of a process need to be moved out to storage, not the whole process. There can be enough of it left in physical memory to continue the process while the data and nonactive sections of the program are moved back and forth between active memory and storage.

Because pages are a fixed size, the memory management at the page level doesn't relate to what the memory is being used for. The operating system can determine what a particular area of memory is being used for by looking at the structure of the executable file or process. Pages can be grouped into logical segments for each kind of use. Memory management at this level can relate to what the memory is being used for, as well as which memory is least-recently used. All processes and their data can be handled similarly, with the exception of the virtual page that is being brought into memory.

Page-replacement strategies have been the subject of considerable debate. Obviously, the best choice is the virtual page that the program will not reference for the longest time into the future. Since programs cannot predict the future, the page-replacement algorithm must be based on a heuristic about typical program behavior. Any such algorithm will occasionally make bad decisions; the objective is to select a strategy that makes reasonably good decisions most of the time and doesn't incur a lot of overhead.

Perhaps the most popular algorithm is least-recently used (LRU) replacement. This strategy selects for replacement the page that hasn't been referenced for the longest time. This is based on the heuristic that the recent past is a good indicator of the immediate future. Supporting this are common program constructs such as looping, subroutine calls, stacks, and repetitive array traversals.

Implementation of a full LRU algorithm requires time stamping a page each time it is referenced. This support is not provided by most hardware (including the 80386 and 80486). Thus, an approxi-
of the Unix kernel. The kernel serves all other processes and therefore must reside in physical memory at all times. So, even with virtual memory, the physical memory must exceed the size of the kernel. With some of today's kernels in excess of 2 megabytes, this is not a trivial requirement.

**Mach to the Rescue**
The Mach kernel (from Carnegie Mellon University) solves many of the memory problems that are inherent in standard Unix schemes. Mach doesn't require device drivers to be linked into the kernel, and therefore the kernel is much smaller.

Mach splits the concept of a process into two elements, *tasks* and *threads*. A task provides the physical environment to its threads. A thread can be created or destroyed, or started or stopped without adversely affecting its task. By having the operation of device drivers incorporated into threads of the kernel task, drivers are loaded into physical memory only when needed.

Mach's virtual memory implementation is significant. It’s object-oriented, it has hooks for the implementation of virtual memory concepts at the user level rather than just at the kernel level, and it uses copy-on-write algorithms for efficiency. A task can allocate and deallocate arbitrary regions of virtual memory and change the protections and inheritance of allocated regions. Mach's virtual memory runs on both paged and unpaged memory management hardware. From the start, Mach was designed for undefined parallel-processor machines; it is building memory management for the computers of the future.

This hardware independence makes Mach an attractive design for developers. However, it has only been fully implemented on the NeXT Computer. (There are other implementations under development.) Mach is most significant as the guiding light for future Unix kernel design. It is influencing the designs of the OSF and AT&T Unices (see “Mach: The Model for Future Unix” on page 411).

**NUR Page Replacement**

The not-used-recently (NUR) approximation to LRU is attractive because of its low overhead and its ability to make surprisingly good choices, considering the small amount of information on which its decisions are based. This algorithm uses the accessed and dirty bits maintained for each page to choose a page for replacement. When a program is first loaded, none of the pages has been accessed or modified. As program execution proceeds, code pages are accessed, and data pages are accessed or modified (marked dirty). Based on the values of the accessed and dirty bits, each page is placed in one of four categories, as shown in table 3.

The lower the category a page falls in, the more attractive the page is for replacement. The ordering of the categories is based on the heuristic that pages that haven't been accessed aren't likely to be needed in the near future. It is also based on the observation that unmodified pages are more attractive for replacement than dirty pages, because unmodified pages need not be written out to the swap file. Since there are typically many pages in each category, the algorithm performs a circular scan of the linear address space, starting with the page immediately following the last page swapped, and selects the earliest occurrence of the lowest category encountered.

As program execution proceeds, most pages tend to fall into categories 2 and 3, and the VM system loses the ability to make good choices. Therefore, the VM system periodically scans all the pages and clears the accessed bit for each page. This resetting of the accessed bits explains how pages fall into category 1 (modified but not accessed), which otherwise would describe an unrealistic situation. Immediately following the page-table scan, all pages are vulnerable to replacement; but not for long, as actively referenced pages quickly are marked as “accessed” again.

**The Page-Swap File**

Virtual pages that are not in physical memory are kept in a page-swap file on disk. Since pages are of fixed size, you can think of the swap file as an array of virtual pages. In the simplest case, the swap file is always as large as the virtual

As Macintosh applications grow larger and more complex, and as multitasking permits more than one application in memory at a time, RAM has become a scarce and precious commodity. One way to satisfy your Mac’s ever-growing appetite for memory is to buy more. This is an expensive solution, however, and one that is still limited by the physical design of your computer. A less expensive and more elegant solution is to use your disk drive as RAM.

Mac-Flavored VM
The Macintosh virtual memory manager (which I will hereafter call Mac VM) is included as part of version 7.0 of the Mac System software. It allows the Mac to access up to 14 megabytes of memory using today’s 24-bit ROMs. On newer 32-bit ROMs, it allows the Mac to address up to 1 gigabyte of memory. Practically speaking though, the VM size is constrained by how much disk space you have available; today, this is usually 300 megabytes or less, typically 40.

Mac VM runs on any Macintosh that contains a memory management unit (MMU). This unit is built into the Motorola 68030 CPU used in the Mac IIx, IIcx, and the Mac SE/30. It is an add-on...

Finding Fault

In a virtual memory system, memory is divided into pieces called pages. At any time, some of an application's virtual pages will be in memory; others will be stored on disk. To make logical memory appear larger than physical memory, each virtual page must be distinguished by whether or not it is in physical memory. If it is, the page-table entry for the page contains the address of the physical page frame.

However, if the page referred to in the table entry is not in physical memory, a page fault occurs, and the memory management unit yields control to the memory manager. This is where your hard disk comes in. If the page accessed is not in physical memory, then it is contained on disk—specifically, in a portion of the disk (often a file) known as the backing store.

When a page fault occurs, the memory manager first frees up physical memory space by selecting a physical page frame and writing the virtual page that it contains onto the backing store. It then reads the page data for the desired virtual page into the frame and changes the new page's table entry to show that the page is in physical memory and located in the page frame stolen from the displaced page. Likewise, the entry for the page written to disk is updated; it is marked "not in physical memory." Finally, the memory manager returns control to the CPU, which retries the access that caused the page fault. The entire process is known as page-fault handling.

You can think of the backing store as an image of virtual memory; a particular page's data is found at the same offset in the backing store as it is in virtual memory. Pages are brought into physical memory as needed, but reside on disk. (In fact, they need to be written back to disk only if they have been changed since last being read from the disk). Because of this, the amount of virtual memory is limited to the disk space available for the backing store.

Option for the Mac II, which uses the 68020 CPU.

Another requirement is a reasonable amount of disk space for the backing store—the disk file that stores pages not currently in memory. You must set aside an amount of backing store equal to the amount of memory desired. All this space must reside on the same disk volume, which must be a Hierarchical File System volume. You can't use an external file system, such as MS-DOS, nor a remote one, such as AppleShare, for the backing store.

This last restriction is necessary because Mac VM transfers to and from the disk mostly at the driver level. Thus, any driver that underlies a backing-store volume must support block-level reads and writes directly to the disk. The AppleTalk filing protocol driver used by AppleShare volumes doesn't do this direct mapping; neither do most external file systems. Eventually, Mac VM will provide an interface to allow it to use an external file system as the backing store.

Of course, compatibility is always a concern for any new piece of system software. Mac VM should be transparent to typical applications. However, there are certain types of applications that may run into problems. For instance, applications that access the SCSI manager directly are not guaranteed to work. This is not a large concern because only peripheral utility programs would do so, and those correctly written will access the SCSI manager through the SCSI driver or through their own driver if the peripheral is not a disk; both of these methods will work correctly.

Also, applications that alter the CPU interrupt vectors directly will crash under Mac VM. This, too, is a forbidden practice (as defined by Apple's guidelines for software developers), but it may be Mac VM that exposes the problem. Fortunately, this practice is ancient, and the applications that adopted it—mainly for copy-protection purposes—have long since ceased and desisted.

Note that both of these practices, while strictly "illegal," will still work for drivers. In general, the only type of code that could possibly break goes directly from the interrupt vectors to application memory (i.e., the application memory heap, the stack, or the A5 globals).

Pieces of the Puzzle

Up until the introduction of the Mac IIx last year, no Macintosh had the MMU built in as a standard. The MMU is necessary to implement VM efficiently and transparently. Transparency is crucial because of the huge existing base of software for the Mac.

Also, Mac VM's backing store can take up a considerable amount of disk space. For the first few years, the Mac had little or no extra disk space. The average amount of disk space has recently increased greatly and should continue to do so.

In contrast, the average amount of RAM per Mac has increased very slowly. When the Mac 512K first came out in 1985, it had such a surplus of memory relative to disk space that many users employed RAM disks—they didn't know what else to do with so much memory! With Mac VM, the Mac world has come full circle. Now, disk space is pressed into service as RAM. It's unfortunate, as the first situation is definitely preferable to the second.

Retrofitting the Mac OS

When the Mac OS was originally developed, VM was not a goal—not even a long-range one. Consequently, many shortcuts were taken in the architecture and implementation that have made the development of VM very difficult.

For instance, the Mac OS implicitly assumes that an application has complete control over the machine. The 68000 has an option that divides CPU processing between user mode (for applications) and supervisor mode (for the operating system). When disabled, all code is run in supervisor mode. The Mac OS never enables this option, and applications take advantage of this fact.

This causes many problems. For example, it makes robust page-fault handling extremely difficult (see the text box “Finding Fault” above). When a page fault occurs, an exception frame is dumped onto the supervisor stack. The memory manager uses this frame to determine exactly which page the CPU is accessing. If the user-mode option is disabled, the exception frame is dumped on the same stack that the application uses. The problem with this is that the memory for the stack might be paged out (i.e., not in physical memory). In this case, the MMU has no way to handle the situation—it has no place to dump the exception frame—and the machine locks up.

Mac VM solves this by enabling the user-mode option. Then the application automatically runs on its own user stack, and the supervisor stack is private to Mac continued

C/Database Toolchest

The C/Database Toolchest™ adds sophisticated file management functions to your Power C™, Turbo C®, QuickC®, or Microsoft® C compiler. With the C/Database Toolchest™, your data requires much less disk space than with programs like dBASE®, and you can access your data much faster. Of course the full power of C provides you with an unlimited amount of programming flexibility.

The C/Database Toolchest™ includes three major components:
1) An advanced B-tree library gives you instant access to your data.
2) A high-level ISAM library provides you with an easy-to-use C interface, and
3) A complete database manager (with C source code included) shows you how to create impressive applications.

You also receive a comprehensive 350 page manual and a utility for converting dBASE® files.

The C/Database Toolchest™ supports features that you'd expect to find only in products costing ten times as much. Advanced features include variable length records, variable length keys, multiple keys per index, and multiple indexes stored in a single file. Your data files can contain an unlimited number of records, and each record can be as large as 32K bytes in length.

About the only thing that the C/Database Toolchest™ doesn't do is cost you a lot of money. We've kept our price low so you can manage your budget as easily as your data.

VM and held in physical memory. Mac VM handles applications that wish to make use of supervisor-mode instructions by emulating the instructions in software.

Double Faults
The exception-frame dilemma is just one special case of a more general problem. Mac VM must ensure that in processing a page fault it doesn't generate a new one. This is the main reason that Mac VM doesn't use the file system to transfer pages between memory and the backing-store file.

The file system contains a large number of hooks—low-memory addresses that point to routines it calls. Sometimes, applications replace these hooks with ones that point to their own routines. The problem is that the memory occupied by these routines may be paged out to disk when Mac VM starts processing a page fault.

Thus, calling the file system in the midst of page-fault handling could conceivably cause additional, infinitely recursive page-faulting. Because of this, Mac VM uses the underlying driver and avoids the file system. Luckily, drivers don't have low-memory hooks, so Mac VM must only ensure that the memory it passes to the driver is kept in physical memory.

This last situation is trickier than it seems. Because current SCSI drivers are not reentrant (i.e., callable more than once concurrently), Mac VM must ensure that a backing driver (usually the SCSI driver) will never page-fault. If it does, you end up with the situation where Mac VM needs the driver during page-fault handling but can't get it because it is already being used. The solution is to trap all calls to the driver, made via the _Control, _Status, _Read, and _Write traps, and to hold a few things in physical memory—namely the parameter block, the application-supplied transfer buffer (for reads or writes), and the part of the stack that the driver might use (the few hundred bytes underneath the current stack pointer).

Deadly Interrupts
In addition to keeping the driver from page-faulting, Mac VM must ensure that no interrupt code page-faults while the backing driver is in use. This includes such code fragments as VBL (for vertical blank) tasks, time-manager tasks, I/O-completion routines, and raw interrupt code. All of these happen asynchronously with respect to the driver, so even careful monitoring of the driver won't catch them.

One simple solution is to turn off interrupts while using the driver. This isn't very satisfactory because it cripples the machine whenever the driver is used, which could be for many seconds at a time during file transfers. The cursor will be jerky (because the mouse won't be sampled often), AppleTalk will drop packets, and serial communications may fail. All in all, using the machine would be very frustrating.

A much nicer solution—the one that Mac VM adopts—is to be selective about which code will run at interrupt time when the driver is in use. Mac VM differentiates between user code and system code (which is somewhat ironic, as the distinction is being made 5 years after the fact instead of during the Mac OS's design).

System code is composed mostly of Apple system software, or third-party code that enhances or replaces it. System code usually exists in the system heap, which is always kept in physical memory. It keeps both its private data storage and all external data that it accesses within the system heap. System code that must touch application memory at interrupt time can make use of special Mac VM calls (see table 1) to temporarily hold such memory in physical memory. Examples of system code include the floppy disk driver, AppleTalk, the SCSI manager, the Apple desktop bus drivers (mouse and keyboard), and INITs.

User code typically comes from an application and resides mostly within an application's MultiFinder partition. It might run at interrupt time. User code includes application-spawned VBL and time-managing tasks, AppleTalk link access protocol handlers, and completion routines, as well as application code. User code is allowed to cause page faults.

With a well-defined division of user and system code, Mac VM can simulate turning off interrupts by suspending all user code while the backing driver is in use. This avoids reentrancy problems without disabling system interrupts. Because system code remains resident, it cannot page-fault at interrupt time. Thus, the system response will remain smooth; the cursor code will always run, as will AppleTalk. The only difficulty lies in the fact that Mac VM must treat each type of user code as a separate case. The method for suspending VBL tasks is very different from the one that delays completion routines.

Of course, the best solution to the reentrancy problem is to use a reentrant backing-store driver. With this in mind, the SCSI manager for System 7.0 facilitates reentrancy in the drivers that use it, and the new Apple SCSI driver, also available with the system, will take advantage of it. Mac VM will check the backing driver to see if it's reentrant. If it is, Mac VM will not suspend user code at

User code includes application-spawned VBL and time-managing tasks, AppleTalk link access protocol handlers, and completion routines, as well as application code. User code is allowed to cause page faults.

With a well-defined division of user and system code, Mac VM can simulate turning off interrupts by suspending all user code while the backing driver is in use. This avoids reentrancy problems without disabling system interrupts. Because system code remains resident, it cannot page-fault at interrupt time. Thus, the system response will remain smooth; the cursor code will always run, as will AppleTalk. The only difficulty lies in the fact that Mac VM must treat each type of user code as a separate case. The method for suspending VBL tasks is very different from the one that delays completion routines.

Of course, the best solution to the reentrancy problem is to use a reentrant backing-store driver. With this in mind, the SCSI manager for System 7.0 facilitates reentrancy in the drivers that use it, and the new Apple SCSI driver, also available with the system, will take advantage of it. Mac VM will check the backing driver to see if it's reentrant. If it is, Mac VM will not suspend user code at...
all. Other types of drivers might be reentrant already; to work with Mac VM, all they would have to do is set the flag that Mac VM checks.

**Design Decisions**

Mac VM has been performance-tuned using a variety of techniques. It has been tested with different values of the classical VM parameters. For instance, a number of page-replacement algorithms have been tried. Page replacement is the process by which the memory manager decides which page to send to the backing store when it needs to bring a new one into physical memory.

The page-replacement algorithm currently used is a modified version of the Clock algorithm (see reference 1), so called because it simulates the movement of a clock. It involves keeping a circular queue of physical page frames. Implicitly linked and made circular by the algorithm rather than by a data structure, the frames in the queue are accessed sequentially by page-frame number.

Each page frame in memory is automatically marked by the MMU indicating whether it has been accessed recently by the CPU. Mac VM keeps a pointer (known as the clock hand) to the last page frame that it replaced. At a page fault, the pointer sweeps around the frames looking for a page frame that hasn't been modified since it was read from disk and continued.

---

**Figure 1:** The clock hand starts from the last frame replaced (blue) and examines each frame to find the first that has not been accessed recently and has not been modified (green). If no such frames exist, the hand does successive sweeps searching for frames (yellow and red) that meet successively less restrictive replacement criteria.
hasn’t been accessed recently (see figure 1). As it tests each frame, it clears the marking in the corresponding page that signifies that the frame has been recently accessed.

If the page-replacement system finds an unmodified, not-recently accessed page, it returns this information to the memory manager. The physical frame for this page is then stolen. If no such page can be found, the clock hand sweeps through the page frames again, this time looking for a page that has been modified but not replaced recently. If none of these can be found, the hand sweeps around once more, looking for the first frame that does not contain a page held in physical memory, as one in the system heap might be. The held pages are exempt from previous passes as well.

The Clock algorithm is well suited to Mac VM’s needs. It is a global page-replacement algorithm; it doesn’t require knowledge about different applications and their relative virtual and physical requirements and histories. Also, it’s simple and efficient, yet still gives a good approximation to the more complex LRU algorithm. Finally, it is extremely space-efficient. The size of the circular queue is small and is proportional only to the amount of physical memory, not the virtual memory.

The generic Clock algorithm assumes that, on the first pass, modified pages contained in page frames swept by the clock hand will be written out to disk and have their entries marked as not modified and not accessed. However, this only works well on machines that contain disk drives with direct memory access (DMA). Such drives can read or write concurrently with the CPU, so the writing scheme makes sense: At no cost to the CPU, it can minimize the number of pages that are in physical memory and modified. This minimizes the risk that the CPU will be forced to replace such a page. Such a replacement would have to happen synchronously, at least in the current Mac OS, because processing cannot continue until the page fault has been handled.

Because of this, Mac VM’s general strategy is to put off writing modified frames until it absolutely must. This is coupled with a variety of techniques that are used to convert modified pages into clean ones. Eventually, Mac VM will have replaceable algorithms, and it will know how to pick one based on the characteristics of the backing driver (the driver transfer speed, latency, and whether it has DMA).

Another parameter that has been tuned is page size. Mac VM currently uses a 4096-byte page size. This size has yielded the best empirical results. Not coincidentally, it is the minimal optimal transfer size for the SCSI manager. Also, since it’s relatively large, it keeps the page table smaller; fewer entries are needed. A page size of 4096 bytes is one of the few sizes allowed on next-generation MMUs.

You have one simple choice to make about disk space: You need to choose between keeping the entire virtual memory image on disk, or only those pages that are not in physical memory. In the latter scheme, there would no longer be a mapping between a VM address and its location on disk. Instead, the page’s entry in the page table would contain the page’s frame in the backing store if it wasn’t in memory.

This would be very useful in terms of saving disk space. If you have 2 megabytes of RAM and want to use 5 megabytes of VM, you need only 3 megabytes of disk space. The problem with this is the loss in speed.

If a complete virtual image is not kept on disk, then every time a page is replaced, it must be written to the backing store, even if it hasn’t been modified. For example, consider a page of data in physical memory. This page must always exist somewhere, or the data will be lost. In the disk-saving scheme, the page can’t be both in physical memory and on disk simultaneously. Thus, when it’s replaced during a page fault, the page must be written to disk even if it hasn’t been modified. Because most of the time during page-fault handling is spent in transferring to and from the backing store, this doubles the average page-fault handling time. Mac VM keeps a complete image of virtual memory on disk: It sacrifices disk-space savings for the sake of speed.

**Inside Story**

Many of the optimizations in Mac VM involve topics related to the Mac OS. Mac VM runs beneath the Mac OS and takes advantage of as many peculiarities of the Mac OS as it can. Most of the advantage comes from being able to determine whether the Mac is dependent on the data in a given page. If not, Mac VM can treat such a page as if it had uninitialized data and mark it “uninitialized.” These pages don’t need to be written to disk when they are replaced, and they don’t need to be read from the backing store when access to them causes a page fault. Therefore, page-fault handling for these pages is extremely fast. And page replacement in general is very fast, too; the modified Clock algorithm actually looks for uninitialized pages first. A--

The Era of the Personal Workstation

When in 1981 the first personal computer from IBM was introduced to the market, no expert predicted its success. After only one year, this computer set a new standard, the PC standard. Of course, there were other computers, like the Apple II. Some of these computers were faster and more reliable than the IBM PC. But the standard was set by this machine. And it was set by the users, who bought this computer and demanded applications, programs, peripherals and services. A whole industry grew up with this one machine. The personal computers of today are the great-grandchildren of this little computer. One can find its roots in nearly every personal computer that works with MS-DOS.

When the IBM PC was introduced, it worked with MS-DOS, too. It was MS-DOS 1.1, the first release. And it became standard as an operating system, just like the PC became standard as THE personal computer.

The technology today is far more advanced than it used to be in 1981. This an effect of the tremendous market power, which was unleashed by the PC standard. But know, the great history of this standard has become a burden, it slows down any development in this industry, which is bound to be "compatible". Today's microprocessors have more processing power than the big mainframe computers in 1981. But they use only 5-10 percent of their real abilities for the users, because of the existing industry standards. We at Bauer Systems think it's time for a new standard, it's time for the PERSONAL WORKSTATION!

Stop! This is not a break with the reported history of computers. It's a break with compromises, which were made to have the highest grade of compatibility. We have found a way to have the best of both sides: Unforeseen processing power and user friendliness and compatibility with existing industry standards. We cannot promise that your most beloved word processor will run on our new machine, and we cannot promise either that your beloved screen will work with our machine. But we can promise you that if you ever try our new system, you will not try another existing computer again.

The TESS IV PERSONAL WORKSTATION is based on the Intel i486 microprocessor. This microprocessor combines the features of the 80386 microprocessor and the 80387 arithmetic coprocessor together with a sophisticated cache management unit on one chip. The i486 microprocessor has a raw processing power of 14-15 MIPS. In the TESS IV PERSONAL WORKSTATION, this microprocessor is combined with 8 Megabyte of 70 ns dynamic random access memory. The system has a clock rate of 25 MHz. Early benchmarks indicated a processing power of 12 MIPS for the whole system. We developed a configuration for this system, which represents the best combination of available options. The TESS IV PERSONAL WORKSTATION is equipped with our i486-computer. We chose a SCSI host adapter as storage interface. In the standard configuration, one 200 megabyte hard disk drive and one 3.5" Floptical disk drive are connected to the host adapter. It offers a sustained data transfer rate of 1 megabyte per second and it can handle up to seven SCSI devices. The hard disk drive has an access time of 16 ms. The Floptical disk drive is a newly developed 3.5" floppy disk drive that is able to store up to 20.8 megabyte of data on a 3.5" Floptical diskette. It can also format, write an read standard 3.5" diskettes in the PS/2 formats. The Floptical disk drive has an access time of 65 ms. The graphics subsystem of our TESS IV PERSONAL WORKSTATION contains its own Texas Instruments TI 34010 graphics processor, clocked at 40 MHz. At this clock rate, the TMS 34010 has a processing power of 6 MIPS. The processor is combined with 1 megabyte VRAM for a maximum screen resolution of 1024 x 768 pixels in 256 of 262.144 colors. Our display features a 21" flat-type screen offering the user an optimal viewing area. The etched, non-glare 0.31 mm dot pitch CRT allows for brilliant sharp images on-screen. The keyboard of our TESS IV PERSONAL WORKSTATION is connected to the screen and contains a standard 102 keys AT-layout. A 3-key mouse is connected to the keyboard as the standard pointing device.

The TESS IV PERSONAL WORKSTATION is equipped with four serial and two parallel external interfaces. It can be expanded by plug-in expansion cards compatible to the ISA-bus interface. The complete system except the desktop devices is mounted in a trim deskside tower case in a unique design. It is powered by a 300 W switching power supply with build-in battery backup and surge protection.

To unleash the full processing power of the i486 microprocessor, we chose the newly developed Open Desktop from SCO as operating system. Open Desktop features the full 32-bit, multiuser, multitasking capabilities of the UNIX System, a graphical user interface offering Presentation Manager-compatible "look and feel", the industry-standard X Window System, SQL database management, TCP/IP networking to dissimilar systems, full data sharing between DOS and UNIX Systems, and instant access to thousands of existing DOS and UNIX System applications. Open Desktop delivers the multitasking computing power, friendly graphical interface, and seamless connectivity required for today's demanding business and technical professionals who require dedicated personal productivity systems. And it's equally well-suited as a multiuser, multitasking platform for workgroups of 8, 16, 32 or even more users.

To meet the high standards we set ourselves by designing this computer, we developed a sophisticated distribution and service system. The TESS IV PERSONAL WORKSTATION will be distributed by the microtronics Trade Service through field consultants. Your computer will be set up at your site and configured to your demands. The microtronics Trade Service will provide worldwide on-site service for one year. If your system can't be repaired on-site, you will receive a equal replacement for the repair time.

To receive more information or to purchase your TESS IV PERSONAL WORKSTATION, please contact the microtronics Trade Service. We hope you will be with us in the era of the personal workstation!
Accordingly, Mac VM is very concerned with finding these "born-again" pages.

Mac VM finds uninitialized pages by sitting in various traps and then analyzing the data passed to the trap routines, as well as the goal of the routine itself. For instance, when an application is launched, it is allocated a large MultiFinder partition. The partition memory may have been used for other purposes, but now that the application is launched into it, Mac VM knows to mark all the pages in the partition as uninitialized. This can also be done when the application quits.

In general, Mac VM will watch whenever a large piece of memory is allocated (_NewHandle, _NewPtr), resized (_Set(HandleSize, _SetPtrSize), or deallocated (_DisposeHandle, _DisposePtr) using the heap manager. (Note that the heap manager is commonly called the "memory manager" in Macintosh literature. The former term is used to differentiate it from Mac VM, which is a virtual memory manager.)

Mac VM pays very close attention to memory deallocation. Many applications dispose of the memory in which they are currently executing. Typically, they make the _ReleaseResource call and then immediately return to code that hasn't been disposed of. This saves a few bytes in resident-code size, since the instructions to dispose of the code segment no longer need to be in memory. Therefore, Mac VM must check to see if the program counter register is within the heap block being disposed of.

Mac VM also watches the _BlockMove trap. When a large piece of memory is transferred, the previous contents of the destination are overwritten. Thus, the destination memory can be treated as if it were uninitialized, and Mac VM marks all pages completely contained in the destination range as such.

Finally, Mac VM takes advantage of the structure of the user stack. When the trap _StackSpace is called, Mac VM guesses that the application is about to use some portion of the rest of the stack (the space between the top of the heap and the bottom of the stack, which grows down). Therefore, it marks all the pages in this area as uninitialized. In addition, when Mac VM replaces a page, it checks to see if the page is completely in the nonman's-land between the heap and the stack. If so, Mac VM can mark the page uninitialized; it need not write the page to disk, even if it's modified.

One more optimization that Mac VM makes is to maximize the amount of VM available in Macs limited to a 24-bit address space (see figure 2). Although up to 16 megabytes is available (2^24 bytes), the ROM is mapped in, starting at 8 megabytes. Thus, the Mac OS does not allow access to more than 8 megabytes (the motherboard has only enough sockets for 8 megabytes of memory using today's 1-megabit RAMs). The memory above the ROM is mapped to NuBus cards (1 megabyte per card) and to memory-mapped I/O. To increase VM space, Mac VM works around the ROM, literally. It wraps the ROM and used NuBus slots in non relocatable blocks in the MultiFinder heap. Then it can use the leftover NuBus slots for VM.

**Start-up Action**

Before Mac VM starts up, the Mac sees the physical memory as is. After Mac VM is installed, the Mac sees the virtual memory. Because VM addresses don't

necessarily map directly to physical addresses (see figure 3), and because some system and INIT software resides in a memory area bounded by addresses referenced by the low-memory globals BuffPtr and MemTop, it’s important that Mac VM be installed before such software. The Mac OS uses BuffPtr as the upper bound on application memory.

The first piece of replaceable software that runs when the Mac starts up (not including the disk driver itself) is the debugger, if there is one installed. Developers frequently use the debugger MacsBug, but most users use none at all. When Mac VM is enabled (using the Mac VM interface in the Control Panel), it writes the name “Mac VM” to the debugger entry in the boot blocks of the system disk. It also writes the name of the debugger into the entry for the disassembler, which is the second piece of software executed. In this way, the debugger can still run, but only after Mac VM. This is very important, because MacsBug wants to install itself in the high memory above BuffPtr.

However early the Mac VM installs, a system heap will already exist, since the driver for the system disk, as well as other structures already created by the ROM, must be located there. Therefore, Mac VM must guarantee that all addresses within the system heap are the same in virtual memory as they are in physical. It must ensure that the page-table entries for these pages have identical page-frame virtual-page numbers. This is a bit tricky to maintain, because under MultiFinder the system heap is resized dynamically.

When Mac VM starts up, it must also create the MMU page tables on the fly, since it doesn’t know how much RAM is in the system or how large the system heap is.

Programmer Interface
Mac VM provides a limited number of routines available to applications programmers (see table 1). The first three calls are useful for system code that must access application code at interrupt time. The code can hold the memory, access it, and then release it. Since Mac VM keeps a reference count on each page, the unhole call will not undo the effect of previous holds on other ranges of memory; the same is true for locking. The DeferUserFn call is useful when a routine is called whose size (including the routines it calls) is indeterminate; you can use this instead of holding the memory.

The last four calls are especially useful for smart NuBus cards. These cards can access physical memory, but they don’t go through the MMU. Therefore, the card must get the page-table mapping so it can manually make the same translations that the MMU does. It uses the LockMemory call to ensure that the mapping doesn’t change. The Mac VM interface has purposefully been made as small as possible. Mac VM itself has been made as efficient and transparent as possible, negating the need for an extensive array of calls.

No Frills
The philosophy behind Mac VM is to keep it small in scope, extremely efficient, transparent, and, above all, compatible with existing software. It’s important to limit the scope precisely because of the complexities that compatibility requires. Achieving compatibility with existing applications requires a little empirically derived code and a lot of testing. Compatibility with the Mac OS forces Mac VM to plug up the holes wherever a VM environment has been ignored. Another good reason to limit scope is time.

Future versions of Mac VM will include many more complex features. One such feature is memory protection. Protection ensures that one application running amuck cannot modify the memory of another.

Two problems are inherent in any protection scheme. First, it is difficult to implement a great deal of software without altering it. Second, Mac VM can’t differentiate between applications. Therefore, MultiFinder would have to be changed to turn the protection to different applications on and off when switching between them, based on calls provided by Mac VM (ProtectMemory and UnprotectMemory, probably).

But this arrangement still has problems because system-wide linked lists exist that are threaded through multiple application heaps. For example, the port list keeps track of all open QuickDraw GrafPorts. The code that walks and maintains these lists will touch memory from multiple applications. Still, Mac VM might be able to allow for these types of lists since it catches the access violations and can recognize the offending piece of code. It can subsequently open up the desired protected area and restart the access. This will be very tricky, though, since third-party software unknown to Mac VM keeps such lists, too.

For all this trouble, the gain is not that great. The system heap is a huge area that is shared by all applications. Therefore, an illegal modification to the system heap can still crash the Mac. However, it might be possible to minimize the portion of the system heap that is shared and modifiable.

Another useful feature would be to have separate address spaces. In this scheme, each application has a separate page table and therefore separate mapping between virtual and physical memory. This automatically provides memory protection, but also carries with it all the problems associated with protection. In fact, these problems are now more severe than ever. The linked lists are now impossible to deal with, since some of the addresses (those not referring to objects in the current space) aren’t valid, although they might map to valid addresses in the current address space. The type of bug this aliasing causes is very difficult to track down.

The one especially nice characteristic of maintaining separate address spaces is that it would allow for a much larger total amount of VM. Instead of 14 megabytes of VM total, Mac VM could allow perhaps 13 megabytes of VM per application, plus about 1 megabyte of shared memory. For a system running 6 applications, this would amount to as much as 79 megabytes of VM.

However, in the time it would take to implement separate address spaces, 32-bit ROMs will be plentiful, most applications will (hopefully) run with the 32-bit ROMs, and there will be unlimited amounts of VM for all. If this is not the case in the future, then perhaps Mac VM will indeed implement separate address spaces.

Beyond 7.0
Future versions of Mac VM will implement many of the features I’ve mentioned. The most exciting feature, however, is a tighter integration of MultiFinder and Mac VM. Intrinsically, these two belong together; they represent the key components of a mature operating system: task handling, task communication, and memory management. Integration will allow for a more efficient, elegant, and robust interplay among these components.

The advent of 32-bit microprocessors—the 80386, the 68030, and RISC chips—has led to a performance revolution in computer design, affecting workstations, midrange systems, and large multiuser systems. But, ironically, the impact of that revolution has barely been felt on the desktop, where the 16-bit 8088 and 80286—continue to dominate.

RISC-based systems are the performance champs among desktop computers. But their acceptance has been slow—largely because of a lack of applications software. Millions of business users have grown accustomed to the wide range of DOS spreadsheets, word processors, department-level database management systems, and other personal productivity tools. With a multibillion-dollar training and data investment in these programs, DOS users aren’t about to switch to RISC if they can’t take their software with them. The solution is to let them run their DOS software on RISC machines.

Making DOS software run on RISC machines isn’t easy, and several traditional strategies have failed to overcome the portability problem. But a new technology called binary porting, which converts the binary 8086 instructions of a DOS program into high-performance RISC code, means hundreds of DOS programs—and millions of DOS users—could soon make the leap to RISC.

RISC Side Story

The first RISC CPUs were developed in the late 1970s and early 1980s by computer researchers at IBM, the University of California at Berkeley, and Stanford University. Instead of following traditional computer designs, which packed as much processing power as possible into each CPU instruction, these computer architects built machines with much simpler instructions that executed more quickly.

The resulting performance gain was so striking that RISC ideas quickly found their way into commercial CPU designs, including the Motorola 88000, the MIPS R2000 and R3000, and the Sun SPARC. These RISC processors use instructions that execute in as few clock cycles as possible, generally only one.

RISC processors also rely on optimizing compilers to generate the fewest possible instructions for each program and to organize the instructions to minimize pipeline delays. The marriage of optimizing compilers and RISC architectures means that a RISC program can often execute much faster than its conventional equivalent, even though the RISC program may be longer.

RISC has the speed—but it doesn’t continued

have the business software. And duplicating familiar DOS business software on RISC workstations is no simple task. This is not only because RISC processors are incompatible with old-fashioned CISC (complex-instruction-set computer) CPUs such as the 8086, but also because all RISC computers introduced to date are based on the Unix operating system, which is incompatible with DOS.

Meanwhile, millions of PC users have reached the performance limits of their DOS-based IBM PCs, XTs, and ATs, and need more power. RISC workstations would be a logical upgrade path but for the lack of compatibility. How can we bridge this compatibility gap?

Movable Software

For the last 25 years, two main strategies have allowed software written for one computer to run on a second, incompatible machine. Emulation means that a program running on the second computer mimics the first computer’s hardware and operating system. Porting requires rewriting or otherwise modifying the first computer’s software to run on the second machine.

The problems with these two approaches have remained the same for 25 years, too: Emulators are too slow, and porting takes too long.

An emulator is essentially an instruction set interpreter. It fetches, decodes, and executes the instructions of the DOS program, one instruction at a time. This process consumes a great many RISC instructions for each 8086 instruction performed, and a great many clock cycles. Thus, an emulator runs DOS software relatively slowly. Emulating DOS code on a RISC is more of a problem because of the mismatch between the 8086 CISC instructions and the RISC instructions. Since each 8086 instruction must be decoded on the fly, there is no opportunity to use the compiler optimization techniques that give RISC its performance advantages.

Emulators have other disadvantages for DOS programs running on RISC Unix systems. They produce a single-user environment on the target system and thus fail to take advantage of the multiuser features of Unix (a real problem for database programs). They also preserve the worst features of DOS programs on the Unix system—for example, keyboard polling loops, which are a real performance drain in multiprocess systems, since idle programs consume CPU cycles by polling the keyboard. And they tend to make very inefficient use of cache memory.

Porting, by contrast, has traditionally required the software vendor to rewrite the source-language version of the program. Porting is great for the user—if it happens. Unfortunately, it almost never does. A port of the program you’re interested in is almost never available for the RISC Unix computer you’re using. The reasons are partly technical and partly economic.

For performance reasons, most DOS programs contain relatively large sections written in assembly language. Porting a program requires that these sections be rewritten in another language. From that point on, the software vendor must support, maintain, upgrade, and keep in sync at least two versions of the program—or three versions if there’s a second port, four if there’s a third, and on and on. This rewriting takes a long continued

time—often several years—and maintaining multiple versions of a program is very costly.

And for what? The DOS market has 25 million users. The entire Unix market has 4 to 5 million. But the Unix market consists of dozens of incompatible machines, each requiring a separate port. And of the fewer than 5 million Unix users, only about 30,000 use RISC workstations. Given these market realities, it's no surprise that most DOS software vendors choose to invest their precious engineering resources on upgrading their current DOS products or introducing new ones rather than porting their source code to RISC Unix computers.

The Binary Porting Strategy
Hunter Systems has recently developed a new porting technology called binary porting, which does not require making any changes to the source code of a program. It uses advanced optimizing compiler technology to convert executable binary code directly into a program that will run on the target machine.

A binary port produces a program that has the same performance and functionality as a source port, but performing a binary port takes considerably less time. Moreover, once the binary port to Unix is complete, the program is available on all Unix machines—CISC as well as RISC. Successively porting the program to each type of computer is no longer necessary.

Binary porting is a two-step process. The first step is binary analysis. This step is time-consuming; it corresponds to conventional source porting. However, binary analysis takes only a few days or weeks, instead of the months or years that source porting usually requires. The binary analyzer reads the executable code of the DOS program and performs a sophisticated global data-flow analysis on the program. The analyzer then produces a key file containing the results of the data-flow analysis.

The key file can then be combined in a "shrink-wrapped" package with the original DOS program. This package can be distributed to any Unix user, with almost any type of computer: RISC or CISC, System V or Berkeley Unix. For all practical purposes, the package is a "universal binary" that all Unix machines can run (see figure 1).

The second step is called binary compilation. This is essentially an automatic installation process. The end user needs to do it only once, and it takes only a few minutes using a program called a binary

The Aurora 1024 brings the graphics user into the new age of graphics processing. By adding the Aurora 1024 high resolution graphics card to your XT or AT, you will have unparallel processing power with 100% IBM 8514/A compatibility. The Aurora 1024 is a full-featured TI 34010-based board that runs at resolutions up to 1024 x 768 x 256 colors.

The Aurora 1024 is fast! It runs 20-50 times faster than VGA and 10-50% faster than IBM's 8514/A. But that's not all! With the specially designed ADI driver, you will see AutoCAD redraw 20 times faster than IBM's 8514/A and other industry-leading boards (as shown below).

With the Aurora 1024, you also get industry-wide software compatibility. That's because IBM's new graphic standard, the Adapter Interface (AI) used for the 8514/A, is included with every board. And for AutoCAD users, we also include our specially designed ADI driver—as well as the hottest performing Windows and VENTURA driver available. These interfaces give ready access to a wide range of important non-CAD application programs, such as Lotus 1-2-3®, Wordperfect®, Quattro®, PS/RIO®, PS/TOPAS®, EXCEL®, EnerGraphics™ and Pagemaker® ... plus hundreds of other titles.

The Aurora 1024 sets a new standard of value and performance at about half the price of most comparable high-resolution graphic boards. You simply won't find a better price anywhere! $995

compiler. The binary compiler reads the DOS program and key file and converts them into a RISC Unix program, using the key file’s flow data for code optimization. The installed program is a real Unix program, with the performance and functionality of a source port (see figure 2).

All architectural and operating-system dependencies of a particular RISC Unix system are incorporated in its version of the binary compiler. The binary compiler can be ported to many different Unix platforms, and each new port inherits all the currently available DOS programs with key files.

Binary Analysis

The basic problem for the binary analyzer is finding all the executable code of the application that it’s analyzing and then creating a complete flow graph for the code. Once this is done, the analyzer uses a series of relatively mechanical steps (e.g., global flow analysis) to create the information for the key file.

To find the code and create a flow graph, the analyzer traces execution paths and decodes instructions, starting with the application’s entry point. This process will easily find all the executable code in the program, as long as the program doesn’t use either self-modifying code or computed jump or call destinations. Unfortunately, real programs use both of these techniques. The binary analyzer handles them by a combination of automatic procedures and human intervention (see figure 3).

When the analyzer encounters these constructs, it generates an anomaly report and proceeds until all execution paths are blocked by anomalies. Then a human analyst must figure out the construction that caused the anomaly and provide the answer to the analyzer. To aid the analyst, the analyzer has an interactive mode in which it prints out the instructions, propagated values, and flow graphs of partially analyzed programs and indicates the parts that cannot be analyzed.

Once the binary analyzer has constructed a complete flow graph for a program, it performs a number of analysis and optimization steps, including live/dead analysis of registers and condition codes. The analyzer uses this information in subsequent optimization steps. The binary compiler will also use it to help generate good code.

Once all this analysis is complete, the analyzer produces the key file. The key file consists mainly of directions to the binary compiler indicating where to decode instructions. The analyzer outputs this information in an order that will allow the binary compiler to process all the application-program files in a linear way. In general, a key file is about 20 percent the size of the corresponding executable application file.

Binary Compilation

The binary compiler uses the information in the key file to convert the code in the original binary image into the machine code of a target system. Each binary compiler is designed for a particular target architecture. The binary compiler contains a front end that reads the DOS program and key file, a back end that generates optimized code, and a run-time library that provides the interface to the Unix operating system (see figure 4).

The compiler starts by reading in the binary application program, using the transformation routines in the key file, if necessary, to put it into usable form. Under the direction of the key file, the compiler then converts the binary code into an intermediate representation, one block of instructions at a time. The compiler first decodes each block of code and then applies any modifications that are called for in the key file. The dead register and flag information from the key file is propagated from the end of the block back through to the beginning. Then the compiler performs a number of optimizations on the intermediate code.

Following optimization, the compiler generates target-system code for each intermediate instruction. The code generators use the dead register and flag information to eliminate unnecessary flag computations and improve the efficiency of computations involving overlapping registers. Code generators also assign target-machine registers at this point.

The binary compiler converts DOS and BIOS traps and direct hardware accesses into calls to the Unix run-time library. This library’s functions then

Why Experienced Computer Users Don’t Think Very Much About Modems

Our research shows that knowledgeable MIS managers, PC coordinators, and end users simply don’t want to think of modems at all.

Not exactly what modem makers relish hearing! But it’s hardly surprising that you want to save your thinking for bigger and more important things.

Modems are a lot like plumbing. As long as the data is flowing, they’re practically invisible. However, when something goes wrong, those little boxes are just lavished with attention.

By then, you’ve lost data, time, money, and perhaps an opportunity. Both senders and receivers are dismayed and disarrayed.

Fortunately, there are simple ways to limit this aggravation. Our research suggests a few points to keep in mind.

The cost of the modem is not the modem’s cost.

The fixed price of the modem is relatively insignificant. Ongoing costs matter far more.

In the long run, for example, a high-speed modem can save you a small fortune on phone bills. More data sent in less time means less money to the phone company.

You can also save with more reliable and robust modems that communicate over a wide range of telephone line conditions.

Resending data costs both time and money. The less time you spend transmitting data, the more time you have to spend on your business.

Downtime and adaptation time can also cost you dearly.

Be sure to ask if the modems are compatible with their earlier generations. You don’t want to start with suppliers who regularly obsolete their own products, or who don’t offer you an upgrade path.

Modem support can be a real hassle with the wrong vendor.

Setting up and installing your modem can affect both your budget and your sanity. Many manufacturers forget to make their modems easy to use!

This becomes expensive when you want to start up fast or need to support a large number of users.

Dip switches, on-line help screens, and easy-to-use manuals should be demanded. It also helps to have a quick-reference guide printed on the bottom of the case.

In sticky situations, it’s vital to have toll-free support and applications engineering.

Bottom line: The data must get through.

A bit of data traveling from your computer is converted by your modem and sent to your local telephone office.

From there, it is exposed to the vagaries of phone lines, various transmission media, and weather patterns.

They all conspire to corrupt your data and slow down your throughput.

All modems are not created equal; some are less sensitive to noise and have better error-correcting protocols.

Some are simply more robust and have better filters.

Modems are more than mere commodities — technology does count.

“When things go wrong, I want the supplier there.”

That’s when you need the right supplier on board. Look for one who gives fast turnaround time on repairs and adjustments, and who doesn’t vanish after the sale.

Look for a company with history and promise — one that’s here today and here tomorrow.

Not everyone needs the same modem.

The best way to keep modems from wasting your time and money is to buy them from a reliable supplier with a broad product line. Those with limited lines sometimes try to cram square pegs into round holes.

People with differing applications have differing requirements. Dealing with a broad-line supplier simplifies ordering, reduces training/support time and cost, and limits hassle and coordination.

In the end, if you give enough consideration to choosing the right supplier, you’ll hardly have to give modems any thought at all.

Optimized RISC Code Generation
RISC CPUs derive most of their performance advantage over CISC processors through code optimization. This is why emulated code cannot realize the same performance as compiled code. The binary compiler, however, is a true compiler; it uses the same optimization and code-generation techniques that other RISC compilers employ. As a result, binary-compiled programs compare favorably with compiled source ports.

Among the optimizations the binary compiler performs are simple peephole optimizations, such as eliminating instructions whose combined result is dead and combining multiple instructions into one. In addition, the compiler performs dynamic register allocation based on a virtual register model. The compiler assigns both 8086 registers and temporary registers (used, for example, in address calculations) to target-machine registers.

The binary compiler also performs code-motion optimizations. The most common of these involves eliminating common subexpression computations. For example, two 8086 instructions in a given block may have the same memory-addressing mode with the same parameters. This is too trivial to eliminate at the 8086 level, but it becomes significant when the addressing-mode computation must be done by several target-machine instructions.

Finally (and perhaps most critically for RISC CPUs), the binary compiler performs instruction scheduling to take advantage of pipeline delays. The compiler moves arithmetic and logical instructions immediately behind jumps and loads to fill the "delay slot" that is available right after a jump or load instruction is executed.

The Analyzer and XDOS
Binary porting may be a promising idea in theory, but how does it compare in practice to the conventional techniques of emulation and porting? We at Hunter Systems have developed not only the binary-porting idea, but also a real binary analyzer (called the Analyzer) and a series of real binary compilers (each called XDOS). We have also created key files for more than a dozen DOS software packages, all of which can now be used on multiuser Unix systems.

With the Analyzer, a human analyst can produce a key file from the binary code of a DOS program in a fraction of the time that a conventional port would require. Since the key file contains no dependencies on the target computer, the same key file can be distributed to any XDOS-equipped system.

XDOS uses the key file to convert the DOS program to its target format. Hunter Systems has ported XDOS to many different Unix platforms based on the 80800 and 80386 CPUs. XDOS for the 88000, MIPS R2000 and R3000, and Sun SPARC will become commercially available over the next few months. Each of these XDOS ports will be able to run all DOS programs with key files.

Listing 1 shows one example of how successful the RISC XDOS ports have been. The listing shows a basic block of 8086 code that has been binary-compiled into 88000 code and R3000 code using XDOS, with optimizations that include instruction scheduling and dynamic register allocation. The original block has five instructions and takes 23 cycles to execute on an 80386. The compiled version takes 9 cycles to run on the 88000 and 10 cycles on the R3000. At the same clock rate, the RISC versions run more than twice as fast.

Making Port
Key files are available for some of the most widely used DOS programs: Lotus 1-2-3, DataEase, dBASE III Plus, Microsoft Word, Multiuser Advantage II, Quattro, R:base, BRIEF, Sprint, WordPerfect 4.2 and 5.0, WordStar Professional, and XyWrite III Plus. Hunter Systems is also marketing the Analyzer as a porting tool for software vendors so that key files can be developed for the incredible variety of DOS programs.

In addition, Hunter Systems has submitted the Analyzer and XDOS to the Open Software Foundation as an Architecturally Neutral Distribution Format, or ANDF. The OSF is currently searching for a system by which software vendors can distribute their programs to users of many different kinds of Unix computers without sending source code. (Sending source code to users has two disadvantages: The user must recompile the source code before running it, and the source code may contain proprietary information or techniques that the software vendor wishes to keep secret.) An XDOS key file, along with the original executable version of the program, forms an ANDF package that any XDOS-equipped computer could use.

True 32-bit processors, including RISC CPUs, are just beginning to penetrate the desktop market. Recent announcements by Digital Equipment (DECstation 2100), Data General (Avion), and Sun Microsystems (SPARC Station 1) represent a milestone in the progress of RISC-based Unix computers into the low-end desktop market, in direct competition with high-end DOS systems.

The new RISC Unix computers will need the wide range of DOS applications software to succeed in the business market, and both users and software vendors will need a way to move their DOS applications to take advantage of RISC's spectacular price-to-performance features. Binary porting offers the performance and functionality that emulators lack, and—unlike a source port—one binary port reaches the entire Unix market.

Now you can eliminate 90% of your batch file problems for $99.95. The Builder™ is the first compiler that transforms sluggish batch files into blazingly fast .COM and .EXE files. Not only does it give you turbo language speed, it extends the DOS batch language with over 50 new commands and keywords.

For example, menu commands like DropDown, PopUp, and LookAndFeel are built into the language, so you can quickly produce an unlimited number of programs, and distribute as many copies as you wish.

The Builder also includes a powerful editor to provide an integrated development environment.

And it's the perfect tool for creating installation scripts. The Builder has DOS dexterity that BASIC and C can't match. And its small compiled code size won't hog memory or disk space.

What's more, by compiling a program with The Builder before you distribute it, you'll have bulletproof security.

What are the issues to consider with 32-bit software?
Will 32 bits solve all your problems?

Bill Blagdan

Choosing all your hardware by how well it can run the software you need is much easier said than done. Many 80386-based computers are currently being used as fast 80286-based machines because the vast majority of popular software applications on the market are compiled for 16-bit execution. 80386-based microcomputers don’t have a price/performance advantage over 80286-based PCs unless they are running 32-bit software.

It’s true that 32-bit software can move more data in fewer clock cycles and has access to more memory than 16-bit software. These are the factors that provide increased performance for 32-bit applications. However, there are not yet many 32-bit applications available that can take advantage of these capabilities. Understanding the issues as well as the technology surrounding 32-bit software will provide you with the insight you need to make educated microcomputer-buying decisions. Some of the issues include 80386-specific software versus 32-bit software, DOS extenders, various aspects of OS/2, and the 80386SX microprocessor.

80386-Specific vs. 32-bit Software
80386-specific software uses features of the 80386 CPU not available on the 8086, 8088, and 80286. But to be truly classified as 32-bit software, applications must execute 32-bit instructions. Thirty-two-bit instructions can manipulate data and memory in 32-bit chunks and provide 32-bit addressing of up to 4 gigabytes of memory.

The 80386’s real, protected, and virtual 86 operating modes also complicate things. When executing in real mode, the 80386 is operating as a fast 8086 processor executing 16-bit instructions. None of the advanced features of the 80386, including 32-bit instructions, are employed in real mode, and memory access is limited to 1 megabyte. On the other hand, virtual 86 mode enables simultaneous multiple 8086 sessions, each in its own protected memory partition, or virtual machine. However, this multitasking of 16-bit sessions occurs only with the proper operating environment to function as an arbitrator.

Windows/386 is specific to the 80386, but it is not a 32-bit application. It is a 16-bit application that enables semiprotected multitasking of other 16-bit applications through its windowing graphical interface. It offers only partial protection because it doesn’t provide true crash-isolation of its multitasking programs. When one of its multitasking applications crashes, Windows/386 lets you save the data in the other multitasking sessions before rebooting. It’s also important to note that Windows/386...
doesn't run concurrently with, or allow multitasking of, 32-bit DOS applications. This is because they run in the protected mode of the 80386, which conflicts with the Windows/386 memory management structure.

The 80386 microprocessor's protected mode provides the means to access the advanced features of the 80386, such as 32-bit instruction execution, 32-bit addressing, and multitasking of 32-bit applications. However, to take advantage of all the features of the 80386's protected mode, operating systems and software applications must be written for it. Currently, DOS is a real-mode operating system that doesn't permit protected-mode execution. So, how do you create 32-bit DOS software that runs in protected mode and takes advantage of the advanced features of the 80386?

DOS Extenders
DOS extenders are software tools used to create applications that run partially in protected mode under DOS. An extended application is only partially protected because it switches back and forth between real and protected modes during execution and can crash the whole system when it is in real mode. Applications created with DOS extenders look like ordinary DOS programs. However, hidden from the user is a kernel that starts under DOS, switches the processor to protected mode, and provides an interface between the application and DOS operating-system services, via a keyboard, for example.

To produce software with a DOS extender, you need a compatible 16-bit or 32-bit compiler. The compiler determines whether the application executes 16-bit or 32-bit instructions. To develop software that exploits the 32-bit instructions of the 80386, you need a 32-bit compiler that is compatible with a 32-bit DOS extender. Both 16-bit and 32-bit versions of DOS extenders are available to take advantage of protected-mode features of the 80286 and 80386 processors, respectively.

If you can compile familiar 16-bit DOS applications for 32-bit execution, why are there so few 32-bit versions of 16-bit software packages? First of all, DOS extenders have some very important limitations. When executing an extended DOS application, all DOS system services, including I/O, must run in real mode. Therefore, every time an extended application performs an I/O instruction, such as reading the keyboard, it switches to real mode, performs the I/O function, and returns to protected mode. This switching between modes costs valuable clock cycles and decreases application performance.

Second, you may have to significantly rewrite 16-bit source code to run in protected mode. You can port well-behaved software from the 16-bit DOS environment to a 32-bit, protected-mode, extended-DOS environment.

Third, the market for an 80386-only product is much smaller than for an 80286/80386 product due to the massive installed base of 80286 machines. Many of the 32-bit DOS applications available today are mainframe or minicomputer software ported to the 80386 and recompiled with a DOS extender. And many of them address small, vertical markets and don't offer any solutions to the broad base of IBM-compatible personal computer users.

The OS/2 Challenge
Another factor contributing to the small number of 32-bit DOS applications is the challenge to create OS/2 versions of popular programs. OS/2 is a 16-bit operating system that was designed to take advantage of all the protected-mode features of the 80286 microprocessor. Some of the advanced features include true protected-mode multitasking, access to 16 megabytes of memory, a graphical user interface, better harmony among programs, and compatibility with familiar DOS commands.

Perhaps the most important new features of OS/2 are its application programming interface (API) and graphical programming interface (GPI). OS/2’s API and GPI provide a comprehensive programming environment, including thousands of built-in function calls. You no longer have to set up interrupts via the interrupt 21 API of DOS to perform system calls. The enhanced programming environment provided by the API and GPI of OS/2 provide the tools needed to create more functional and easier-to-use applications.

16-bit OS/2 vs. 32-bit DOS
Currently, 16-bit OS/2 versions and 32-bit extended DOS versions of many popular software packages are under development. For those packages with both versions under way, you might expect the 32-bit version to be faster. Tests have shown, however, that 16-bit Paradox OS/2 outperforms 32-bit Paradox/386. Unlike DOS, which is a real-mode operating system, OS/2 runs exclusively in protected mode. Thus, OS/2 applications don't waste time switching between real and protected modes. So, if you compare different program incarnations, you must do it carefully.

A 16-bit OS/2 application also may outperform a 32-bit DOS version because of OS/2’s ability to use threads. A thread is the smallest unit of execution within an OS/2 application. Every OS/2 application has at least one thread, but several threads can run at the same time.

OS/2 programmers can use these threads to create applications that employ multitasking within themselves by overlapping program functions with user input. For example, an OS/2 spreadsheet program could perform recalculation as a separate thread when you hit the Recalculate key, freeing up the keyboard so you can go on working with the spreadsheet.

OS/2 vs. OS/2 for the 386
The production release of a new 80386-specific, 32-bit version of OS/2, tentatively called OS/2 for the 386, is scheduled for the first half of 1990. Two important issues must be addressed when comparing this version with the original: 32-bit instruction execution and segmentation.

Although 32-bit instruction execution will be available under OS/2 for the 386, any applications released for the current version of OS/2 will have to be rewritten and compiled with a new 32-bit OS/2-compatible compiler to gain this advantage. Given this complication, many software vendors may never release 32-bit versions of OS/2 applications. Instead, they may simply package them as 16-bit versions to run under both OS/2 and OS/2 for the 386.

The second important issue to consider regarding OS/2 and OS/2 for the 386 surrounds segmented versus linear memory addressing. The 80386 microprocessor’s memory architecture supports a linear, or “flat,” memory model that enables direct addressing of up to 4 gigabytes of memory. With a flat memory model, you can set up one huge 4-gigabyte code-and-data segment and avoid the extra work required by 8086 and 80286 segmented architectures.

However, memory segmentation is required with a protected-mode, multitasking operating system such as OS/2 or OS/2 for the 386. Multiple code and data segments are kept for each application running concurrently in a multitasking environment to enable hardware-assisted protection by the microprocessor. Therefore, while OS/2 for the 386 won’t do away with segmentation, it will enable you to use data and code segments that...
Finally! An affordable, state-of-the-art modem designed to maximize any workstation or desktop and take up minimal space. The new 2400 baud modem from Computer Peripherals, Inc. is a 100% Hayes compatible external modem which boasts more high-tech features than its competition at an unbelievable price tag.

The compact, distinctively sleek tower design simplifies placement, and it's easily accessible, front panel power switch eliminates fumbling around the back of the unit. The handsome weighted base holds the ViVa24 firmly in place, and sharp LED indicator lights are aligned for comfortable viewing, utilizing international graphic icons that make the ViVa24 simple to understand.

The small tower design creates a natural flow of air over the surface of the board, allowing the ViVa24 to run cooler and affording you 24-hour, worry-free operation. The ViVa24 modem provides the user compatibility with IBM PC, XT, AT, IBM PS/2, Apple Macintosh computers and any computer that supports RS-232C.

The ViVa24 modem represents innovation from its footprint up with features such as: use of the Hayes "AT" command set, asynchronous data format, auto-dialing, auto answer, adaptive equalization, non-volatile memory, automatic tone and pulse dialing, remote access while your computer is unattended, self-test and built-in diagnostics. Best of all, the ViVa24 is fully backed with a five-year limited warranty.

Before investing in an ordinary modem, be sure to investigate the ViVa24. For more details, call your Ingram Micro representative now at:

are larger than the 64K bytes that is permitted under OS/2.

The 80386SX Microprocessor
The 80386SX is a low-end version of the 80386 that can run 32-bit software but is hindered by a 16-bit data bus. In most cases, the 80386SX operates in the same 16-bit environment as the 80286. However, tests show that the 80386SX is slower than the 80286 when running 16-bit applications, and slower than the 80386 when running 32-bit applications. Compared to the 80286, the 80386SX is also slow at multitasking 16-bit applications under OS/2.

Easier Said Than Done
Software continues to be one of the most important factors to consider when purchasing personal computers. You have a wide range of choices of IBM PC-compatible hardware platforms, ranging in price from less than $1000 for 8088, 8086, or 80286 processors to more than $10,000 for the latest 80386 or 80486 processors.

Not all 80386-specific applications are 32-bit applications. DOS extenders are an important option to consider, as are the performance differences between 16-bit OS/2 applications and 32-bit extended DOS applications. And the new 32-bit version of OS/2 has its advantages as well.

Which IBM PC-compatible personal computer platform you choose should be determined by two primary factors: the software you need, and the hardware's ability to run that software effectively. Just because a program claims to be "32-bit software" doesn't mean that it is the best program to run your particular application.

Discover the Shape of Computing to Come

1 Mathematical Methods in Computer Aided Geometric Design
Edited by Tom Lyche and Larry L. Schumaker
Nearly 50 papers from distinguished international researchers show you the latest mathematical techniques for designing and interpolating univariate and multivariate splines, algebraic curves, rational curves and surfaces, Bézier curves and surfaces, finite elements, and more. Topics treated include scattered data interpolation, geometry processing, convexity and shape preservation, subdivision, knot insertion and removal, knot selection for parametric curves, geometric continuity, and cardinal interpolation. 628 pp., $49.95

2 Introduction to Parallel Programming
By Steven Brawer
Complete with examples in simplified Fortran, this first-of-a-kind self-tutorial guides you step by step through the basics of parallel programming — from creating multiple processes and scheduling memory sharing to dealing with data dependencies. And it presents such useful applications as discrete-time, discrete-event simulation, numerical integration, and Gaussian elimination — plus parallel versions of the traveling salesman problem and maze exploration. 438 pp., $39.95

3 Elements of Differentiable Dynamics and Bifurcation Theory
By David Ruelle
A rigorous introduction to the mathematical theory underlying chaos and strange attractors — emphasizing infinite dimensional systems, non-invertible maps, attractors, and a general theory of bifurcations. Includes detailed problems. 187 pp., $27.50

The Professionals' Information Center—Since 1961
How to match the best front end with the best back end.

You've invested in the best hardware, operating system and database products. You have a staff of programmers ready to go. But to build great looking applications with the sophisticated features today's users demand, you need a powerful front end development tool—JAM™.

JAM, the most advanced user interface management system on the market, does it all—from prototyping to implementation. And, because it works with any database or file manager, you get the best front end and the best back end.

JAM is hardware independent, so it isn't limited to one computer, database or operating system. In fact, JAM runs on everything from PCs to super-minis, works under 7 operating systems and provides access to a host of database products. Using JAM you can create a consistent user interface across multiple systems and hardware platforms.

JAM makes it easier than ever to design and revise complex applications. Using features like context-sensitive help, procedural command language (JPL), shifting and scrolling fields, extensive data validations, on-line testing, and a variety of visual attributes, you'll be amazed how quickly your applications spring to life.

JAM is fast, as well as flexible. Development time is reduced significantly thanks to JAM's powerful screen drawing utilities and comprehensive library of subroutines. You can easily create and link together screens, windows, and menus to develop an application shell. Then simply attach the processing routines, and your application is complete.

Plus, if your back end is an SQL-compatible relational database like Oracle®, SQLbase®, Informix® or Britton Lee®, you'll really appreciate JAM/DBi, JAM's optional database interface. With JAM/DBi, you can develop entire applications using only industry-standard SQL statements and JAM's authoring tools.

So if you're programming in a 3GL like C or FORTRAN, follow the lead of the many Fortune 1000 companies who have already discovered JAM.

We Interrupt The War For This Im

Offering hundreds of presentation treatments from word charts to three-dimensional bar, pie, scatter, and polar graphs.

And with SuperCalc5, you select fonts, lines, boxes, grids and shading. All of which can be used to produce the highest quality customized reports.

Plus, SuperCalc5 actually makes productivity easier. An integrated Undo feature simply reverses unwanted commands. And a truly comprehensive system of debugging highlights costly errors and analyzes macro logic.

Perhaps even more impressive is the way SuperCalc5 can link spreadsheets. Up to 255

To all those unlucky enough to be stuck smack in the middle of the current spreadsheet confusion, take heart.

There is, at last, a viable alternative to war: revolution.

One that delivers even more performance than you have (ahem) been waiting for, but without demanding expensive new hardware or extensive retraining. And without abruptly cutting you off from any user in your company, even those on mainframes.

The name of the spreadsheet is SuperCalc5.

And what it can do for you is, frankly, quite revolutionary.

Let's begin at the end. Stand-alone quality graphic capabilities have been built in.
to be precise. Linking either in memory or on disk, either pages of the same spreadsheet or independent, either SuperCalc5's files or Lotus® 1-2-3®'s.

Which brings us to the "L" word. SuperCalc5 not only reads and writes Lotus® 1-2-3® files, it totally coexists with Lotus.

But not for Excel®

Which now brings us to the "E" word. Unlike Excel, SuperCalc5 runs on all IBM® and compatible computers but also takes full advantage of 286 and 386 machines when you decide to make that transition.

And if all that isn't enough to make you run out today and join the revolution, there's even more incentive.

Like our free demo disk offer through July 31, 1989. And our $100 upgrade offer for just about any spreadsheet you're using. Call 1-800-531-5236. In Canada call 1-800-663-6904.

Which finally brings us to our admittedly biased outlook for the much touted spreadsheet war. With SuperCalc5, peace is at hand.
Because today's personal computers are powerful enough to run large and complicated applications, users need enormous storage capacity. Helical-scan tape storage offers multi-gigabyte capacities that most other personal computer storage systems can't achieve. Helical-scan techniques also provide higher transfer rates and cost-efficient, removable data storage. Currently, users can't obtain these benefits from tapes recorded by traditional techniques.

By Any Other Name
Helical-scan recording isn't really new. What is new is the name and the fact that, until about 16 years ago, this technology wasn't used for computer applications.

Otherwise known as slant-track or diagonal (versus longitudinal) recording, helical-scan technology has been used in video recording applications since 1956, when Ampex introduced the first commercial videotape recorder. Adaptations of the technique for computer data storage began about 18 years ago. Once again, Ampex was the pioneer when it introduced its Terabit Data Recorder in 1972, but IBM drew significant attention to the format.

In 1973, IBM purchased the rights to the technology from Ampex for $13 million, and in 1974, it introduced the IBM 3850 as the ultimate solution to data-storage problems. The aim was to eliminate the manual handling (and resultant human error) associated with tape reels and disk packs. The 3850 could essentially put all your data on-line by storing between 35 and 472 gigabytes. The 3850 was able to record this much data by using helical-scan technology and a large-width tape.

For various reasons, including the move from batch to transaction processing, in 1985, IBM discontinued support of the 3850. Generally, there was a move to smaller machinery and increasing electronic (versus mechanical) complexity. As video recording technology evolved, tape widths shrank, recording heads started to slant, and, by and large, companies began developing a helical tape format known as VHS, which was adopted first for commercial and then for consumer video recording.

As engineers experimented with this technology for data-storage applications, the form factor changed (from 8-inch to 5-inch), limiting the acceptance of this format and causing most serious tape suppliers to shy away from its use.

Mostly Good News
"Conventional" tape devices write data longitudinally in a pattern parallel to the edge of the tape. In helical-scan recorders, the recording head tilts at a slight angle, causing the tape to wrap around in a barber-pole fashion. The spinning head writes data tracks as portions of a continuing spiral or segments of a helix—thus the name. Figures 1a and 1b show the differences in track layout and head design for typical recording devices, such as the quarter-inch drive and the helical-scan product.

The first helical-scan tape machines used 2-inch-wide tape, but now helical-scan products are produced in several widths, including 4-mm digital audio tape (DAT), 8-mm, quarter-inch, half-inch, and a few nonstandard widths. The 4-mm DAT, which is potentially one of the best tape-storage formats, has been plagued with ongoing controversy that has held back its implementation. (See the text box "The DAT Controversy" on page 384.) DAT technology involves the ability to put well over 1 gigabyte of almost totally pure data on a cassette the size of a credit card (see "DAT Drive Eases Mac Backups" on page 225).

Of course, as with any beneficial technology, along with the advantages come some trade-offs. For instance, as yet, not all the helical-scan standards are in place. Some are here and others are on their way, though, via organizations such as QIC (Quarter-Inch Cartridge) and DDS (Digital Data Storage), which make recommendations and decisions concerning standard tape drive features and formats.

An additional problem has been that because sound can be...
reproduced onto DAT with almost 100 percent integrity, compact disk manufacturers introduced legislation to forestall the production of DAT recorders without safeguards against the copying of prerecorded music. Thus, until recently, firms that make computer storage devices haven't been able to mass-produce DAT drives to offer to the public at low, economy-of-scale prices. Some vendors, though, such as Hewlett Packard, Gigatrend, Wangtek, and WangDAT, are not content to wait. They have already introduced DAT data recorders, albeit at rather high introductory prices (around $1500), to OEMs. You can expect that prices will be between $4000 and $5000 by the time the recorders reach your local computer store.

Enormous Capacity
The principal difference between current and previous computer tape recording devices used on personal computers is the orientation of the data on the medium. Helical-scan techniques can achieve higher recording capacities in a smaller physical package than any other computer storage device, including optical disks.

VHS devices can store from 2.5 to 5.2 gigabytes per tape; 8-mm products store 2.3 gigabytes. Presently, there is only one source for purchasing 8-mm computer products: Exabyte Corp. (Boulder, CO). Thus, in this format, a de facto industry standard exists. DAT products yield between 0.9 and 1.3 gigabytes per unit. Future DAT capacity increases will depend largely on the incorporation of compression algorithms. DAT minimizes, and even eliminates, capacity loss due to track spacing. Progressions in quarter-inch and half-inch tape capacities have been accomplished through media formulation changes and through dividing the tape width into more and more discrete tracks.

Design and Media Considerations
Helical-scan tape drives, which can be used for high-capacity disk backups, including distributed network operations, use a low-cost, cartridge-tape design available for under $10. These drives use guides to provide the necessary precision for passing the tape by the head. Units consistent with the longitudinal QIC standard, however, depend on a relatively expensive cartridge design for proper tape positioning. This mechanism adds cost to the tape cartridge instead of the drive. Thus, there is a fundamental difference in the cartridge design between helical scan and QIC.

The 8-mm product features an embedded SCSI connection and fits into the 5¼-inch full-height form factor. The first available DAT drives will occupy the same space, but they may one day be made in the 3½-inch form factor.

While moving the tape at a rate of almost one-half inch per second, the 8-mm product achieves a 246K-byte-per-second sustained data transfer rate. DAT designs pass the tape at similar speeds and feature a maximum of 192K bytes per second. Most QIC drives achieve 90K bytes per second, with the QIC 320 products achieving 240K bytes per second.

Some helical-scan designs can provide a high-speed search continued

The DAT Controversy

Until recently, the recording industry associations have blocked Japanese companies' attempts to import digital audio tape (DAT) recorders for consumer use. The issue has been one of mechanically preventing the reproduction of compact disk (CD) recordings. Organizations such as the Recording Industry Association of America (RIAA) are lobbying for more time in order to develop better laws governing music copyrights.

With DAT, consumers would, for the first time, be able to reproduce digital-quality music and sounds. Thus, it is feared that a new rash of illegal recordings would be triggered, with the focus being on the lucrative CD market. The RIAA is also against the introduction of rewritable CDs or any other device capable of reproducing professional-quality recordings.

Citing fears of lost revenues from bootleg music reproductions, the RIAA is threatening to take legal action against any company selling a DAT product in the U.S. consumer market without including circuitry that would prevent mass copying. The RIAA is not, however, opposed to DAT recorders being sold for professional recording applications; the Association even has one of its own.

A CBS attempt to thwart would-be pirates has been quashed by the National Bureau of Standards (NBS). This technique blanked out the audio signal around 3840 Hz. If special decoding circuitry detected this "notch" for 15 seconds, the recording would be halted for the next 25 seconds. The NBS found that the scheme didn't work between 40 percent and 90 percent of the time, and that certain harmonics associated with violins, synthesizers, and organ music tended to activate the copy protection.

Both the 4-mm and the 8-mm units depend on a digital recording format; the QIC designs are analog devices. Digital recording is regarded as the more accurate and is required for voice and image representations.

Most camera stores already sell 8-mm tape, and DATs seem destined for widespread consumer distribution. If you purchase uncertified sources for use in backup operations, be careful not to obtain poor-quality tape. If you plan to use a helical-scan device, you need the best tape available, because as bit densities increase, tape defects become magnified. Head clogs are another source of error and will occur more often in a tape containing surface variations.

Error Correction

Defects of the medium are a common source of error in tape-based recording, and there's a big difference in the way helical-scan and longitudinal recording systems deal with the problem. By using the read-after-write verification process, both drives are capable of sensing bad blocks—those containing more errors.
All the power of The Software Link's PC-MOS operating system. All the benefits of both individual and networked PCs. All in one high-performance, low-cost, multi-tasking system. With no terminals and no additional PCs — unless you want to optionally use your old XTs or ATs.

**The UnTerminal™ UnNetwork.**

It's the ideal multiuser system for personal computer users. UnTerminal monitor-keyboard workstations cost less than terminals. Less than text-only "intelligent I/O" solutions. Less than fiber-optic graphics solutions.

An independently operating UnTerminal workstation outperforms them all. With faster screen refresh — text and graphics. Instant switching between single and multiuser screens. Running popular DOS applications. And making every user feel like the only user.

**Just add PC-MOS, monitors & keyboards.**

The Software Link's PC-MOS multiplies the power of your PC. Why pay extra just to get the boxes? You can run up to eight color or 16 monochrome UnTerminal workstations per system — and save thousands.

than can be corrected by the error-correction coding (ECC).

But the longitudinal designs simply rewrite the data farther down the tape, up to 16 times. This rewrite usually takes place on the same track, a process that may not circumvent the problem if the errors were caused by a longitudinal scratch. The design of the 8-mm drive causes it to rewrite bad blocks 11 blocks farther down the tape, a procedure that serves to position the data away from the same horizontal path. The device can rewrite a block up to 12 times. If, after 12 tries, its efforts are still unsuccessful, you should throw out the tape.

Helical-scan recorders possess better error-correction capabilities than just about any other mass storage device, partly because the higher bit densities mandate more sophisticated error-correction algorithms to account for dropouts, or flaws, in the recording area of the tape.

Helical-scan tracks are recorded at an angle of about 5 degrees to the edge of the tape in order to create a longer overall track length. In DAT, the incoming signal is split between two adjacent tracks, referred to as a frame; for error-correction purposes, frames are arranged into groups. The 8-mm drive, however, doesn’t use the frame or the group concept. Instead, it writes data as a set of continuous blocks, and detects and corrects all errors within the data block structure.

One factor further compounding errors is that with helical-scan techniques, the spinning head can create helical scratches (on top of the longitudinal scratches already caused by the tape guides regardless of head design). With helical technology, tape defects are magnified over those found with longitudinal recorders with lower surface or overall recording densities.

Tracking, however, is generally more precise with helical-scan devices, which incorporate an additional head for reading a servo (positional reference) track. It is not yet necessary for most quarter-inch designs to include these capabilities in the drive design; however, future capacity increases will create the need. Since its inception, many improvements have been made to the data cartridge medium that address earlier problems that users encountered with these longitudinal recorders.

An 8-mm format track contains a servo zone (positional reference bits) and eight data blocks, each capable of storing 1024 bytes. The drive’s read-after-write design can handle burst errors of up to 246 bytes within each block, and up to 80 additional single-byte errors—an extremely high level of ECC that results in a nonrecoverable error rate of less than one in $10^{-13}$ bits read.

Products based on 4-mm DAT technology achieve an even higher level of data integrity using various correction techniques in addition to read-after-write. The first two levels of ECC, called C1 and C2, are based on industry-standard Reed-Solomon algorithms. They are a holdover from the audio format. C1 and C2 are designed to handle horizontal error patterns up to 0.3 mm wide.

Data-storage formats include a third algorithm, called C3, for correcting diagonal errors affecting any two frames within the same group. Finally, $n$-group writing (i.e., rewriting the same block $n$ times) can be used to further enhance data reliability, but the trade-off is a decrease in tape capacity. DAT products achieve an uncorrectable error rate of 1 in $10^{-15}$ bits read.

Products based on the DAT technology also incorporate a scheme known as alternate azimuth recording, which maximizes capacity by allowing the overlapping of adjacent tracks. The magnetic cores are mounted in the drum at different angles: The first head is aligned at +20 degrees to horizontal center, the second at -20 degrees. This design permits interleaving, a technique in which incoming data is divided between two tracks so that no major sections of the signal are lost. Alternate azimuth recording also minimizes crosstalk.

Benefits of a New Technology

Increasingly, new personal computers are being marketed with tape drives designed into their peripheral storage systems. Manufacturers developing 4-mm products may decide to adhere to a standard low-end file-interchange format. The result will be that, besides being able to use tape devices as backup storage, you will be able to use them to share large data sets among fellow users without regard to the drive’s manufacturer.

Vendors of 4-mm products are in the process of addressing this key data-cartridge problem involving file-recording formats. QIC developers have long recognized this deficiency, but they have only recently taken significant corrective actions—possibly due to the pressure from DAT.

Development of a standard file format would also facilitate software distribution on tape, a process that heretofore has been limited to floppy disks. Once again, helical-scan technology may have a leg up on existing longitudinal machines.

Because these products use tape formulations with the ability to hold a stronger magnetic signal, software vendors may soon be able to implement a replicating process referred to as contact printing—the process of transferring a signal through the contact of a master tape against a clone tape. By using contact printing for updates rather than sending multiple disks, vendors could achieve significant savings and, hopefully, pass them along to users.

A new technology often adds some more desirable product attributes missing from current systems. On some of the DAT format designs, you will find a feature known as “update-in-place.” With this provision, you can insert new information on a tape as long as the storage requirements for the new data do not exceed the requirements for the data being replaced.

DAT formats also provide an area on the tape called the system log. Information stored in the log, including C3 error activity, is used to indicate the level of data integrity found within the volume. If the log contains a high level of C3 activity, then the tape is bad.

Market Realities

With earlier, longitudinal recording devices, the mechanical parts accounted for most of a tape subsystem’s cost. The use of rotary heads in helical-scan technology shifts much of the cost to the electronic components. Thus, electronic sophistication and tolerances are substituted for mechanical sophistication and tolerances.

To obtain capacities and transfer rates similar to those of helical recorders, companies that make longitudinal recorders will need to develop new heads, stronger motors, and so forth. But these improvements will add cost to an already costly device. Therefore, if capacities and transfer rates remain about equal, there will be a growing disparity between the costs associated with these formats.

**FEATURE**

**A NEW TWIST**

VHS and 8-mm recorders are already available, but they are too large and too expensive to use for personal computers. VHS drives have won acceptance, but only for niche applications on a few minicomputers and workstations. The 8-mm product is slowly gaining acceptance within this same general group. Exabyte claims to have shipped 15,000 units in the last year, and that was before it signed contracts with NCR, Northern Telecom, Motorola, and Data General.

There’s no question about the immediate need for helical-scan recorders in the workstation market. There is a trend toward the use of 32-bit processors, especially for graphics-intensive applications requiring high-capacity storage devices. Of late, the 380-megabyte hard disk drive has been the OEM drive of choice, but a gradual shift is taking place to the higher-capacity 760-megabyte drive. Quarter-inch technology, on the other hand, will be just reaching 320 megabytes in the fourth quarter of this year.

DAT drives for mass storage applications on workstations have recently become available. Expect smaller, half-height products to follow shortly. Early units will be relatively expensive, but they will most assuredly be acquired by system vendors looking to design-in these products. Following the normal one-year development lag, by mid- to late 1990, these DAT drives should be offered as standard equipment on workstation systems. In 1992, expect to see affordable, commercially available 3½-inch-form-factor recording devices for personal computers.

While the 8-mm product is positioned to increase its performance and capacity, the 4-mm drive will continue to shrink in both size and cost, making it a viable personal computer product within the next two to three years. In the meantime, value-added resellers will be building attractive new image processing systems based on Intel’s 80386 and Motorola’s 68030 chips and the DAT mass storage device.

You will also find DAT on LANs created for peripheral sharing. In the past, the principal motivation for networking was to share a laser printer or a large hard disk storage device. The implementation of tape storage devices with gigabyte capacities adds the ability to share backup resources. For some time yet, DAT may not be cost-justifiable for single personal computer systems, but it could easily be added to a LAN for use as a centralized backup device.

**Down the Helical Road**

Although you probably will have to wait until early next year to use helical-scan technology, including DAT, investments by Sony, Hitachi, Hewlett-Packard, and others foreshadow an eventual shift to the slant-track recording technique. Helical-scan recorders should soon be cropping up on workstations and personal computers as depositories for images in such applications as CAD/CAM drawing systems, medical imaging, geophysical data-collection systems, and a myriad of other uses.

What does all this mean to you? For one thing, you may someday find that backing up your hard disk, regardless of its capacity, will be much easier. With helical-scan technology, you can be assured of a 1-to-1 disk-to-tape capacity ratio even if storage requirements continue to increase at the current rate of 30 percent to 40 percent per year. The trend is toward unattended backup operations, even on personal computers with disk capacities in excess of 150 megabytes.

CSR makes the best built, best backed 286 and 386 systems. Period.

As a national PC repair and maintenance organization, we've repaired every major brand of computer - systems like IBM, Compaq and NEC. Now, after years of fixing their best, we've built ours better.

...and we back them up with the industry's best 2 year warranty.

There's one exclusive feature of every CSR PC that you should know about: CSR's commitment to customer service. Other PC manufacturers don't even come close to matching the support you get with a CSR system - the industry's best 2 year warranty.

For the first year you'll receive complete on-site service on all parts and labor. During the second year we'll replace any parts that fail. Calling our toll-free support hotline connects you to a highly trained Customer Engineer (CE). Your CE will resolve your problem over the phone or dispatch a Service Engineer to your site within 24 hours of your call - guaranteed.

High performance without a high price.

CSR delivers high performance in every machine we make. Like our 286/20: Using an Intel-based 80286 chip running at a blazing 20 MHz, the 286/20 actually outperforms most 386 based PCs.

More proof: Every CSR PC is fully MS-DOS® and OS/2® compatible. Standard equipment on each system includes a high-speed VGA controller, a 101 key tactile response keyboard and a totally IBM-compatible disk controller featuring the latest in track-buffer technology - boosting drive performance by an amazing 30% to 50%! And, all CSR PCs offer either a 3.5" or 5.25" drive as standard equipment. Take a look at the specification chart. We're sure you'll agree that no one tops our PC's features.

Built for your needs and your budget.

Whether you require a stand-alone system or an advanced LAN installation, want to purchase outright or take advantage of our comprehensive leasing and credit card programs, CSR has the systems and expertise to provide all of your computing needs. Tell us the details. Then tell us your budget.

We'll build you a system that's compatible with both.

If you're thinking of putting an IBM monitor on your PS/2, you're not seeing the big picture.

When it comes to displays, bigger is better. That's one reason why the Amdek Monitor/432 monochrome VGA has a big edge over IBM's own standard PS/2 monitor.

But it's not the only reason. Because the 432 is, after all, from Amdek. A company with over 12 years experience in the computer monitor business, and the leading independent monochrome supplier.*

The 432's 14" etched-surface, flat screen produces hardly any glare or distortion. And far less eyestrain than Big Blue's PS/2 monitor with its smaller, 12" curved screen.

What's more, IBM's smaller screen also carries a bigger price tag.

So, if you're choosing a monochrome monitor for a PS/2 or any AT compatible, remember the company that hasn't lost sight of the big picture. Amdek. For the dealer nearest you, call 1-800-PC AMDEK.

The long history of data storage devices is intertwined with the more recent, meteoric rise of personal computers

Robert R. Gaskin

Storage devices used with today's desktop and laptop personal computers are derived from a long history of large and often cumbersome devices. Many storage technologies of the past predominated for a time and then faded from the scene.

The earliest storage device for controlling machines was the punched paper card. It was used as early as 1804 for controlling silk-weaving looms. The first computer-like application was in machines that tabulated the 1890 U.S. census. The inventor of that tabulation machinery was Herman Hollerith, and the media has been called Hollerith cards ever since (see photo 1). The "modern" form of the card was introduced by IBM in 1928 and remained a mainstay of the computer industry through the 1960s.

On the Way There
When computers were in their infancy, many types of esoteric volatile memory appeared on the scene as precursors to the nonvolatile mass storage devices that we know today. The Williams Tube (1948), used on some of the earliest IBM mainframes, was a CRT similar to that found in today's personal computer monitors. Instead of being used as a display, however, it was used as memory. The Williams Tube was not very reliable and was soon abandoned for other schemes.

In 1949, mercury delay lines were used as volatile memory in the EDSAC (for Electronic Delay Storage Automatic Calculator) computer. In 1953, ferrite core memory appeared in the MIT Whirlwind computer (see photo 2) and the IBM 704. Core memory used tiny doughnut-shaped pieces of ferrite to store a single bit. When wired together in what is known as a coincident current array, core memory provides completely random access to any bit location without going through any other bit locations to get there. In addition, core memory is nonvolatile and retains data indefinitely when the power goes off.

The original cores were 80 mils in outside diameter; the diameter was reduced to 14 mils by the late 1970s. Although no longer used in commercial computers, core memory is still used in some military applications. Core memory was expensive and slower than the semiconductor RAM memory that replaced it. The closest that core memory got being used for everyday applications was its use as the song-selection memory in the early Seeburg jukeboxes.

Drum and Bubble Memory
Off-line storage in the form of drum memory appeared in 1951. Drum memory was made up of magnetically coated rotating cylinders with multiple read/write heads (see photo 3). The IBM version had 58 tracks, with 100 characters per track. Fifty tracks were used for storage, and eight were used as an I/O buffer to the card machine or printer. The drums were fast but couldn't be stacked like disk platters, and they faded away in the 1960s.

Bubble memory caused quite a stir in the early 1970s because it was all solid-state, yet nonvolatile. In the presence of a bias field, the bubbles formed cylindrical magnetic domains in a thin film of magnetic material on a garnet-based substrate. Bubble memory faded away in the 1980s, largely because of long design times and cost. One product that still uses this technology, produced by Magnesys, is a floppy disk drive emulator for personal computers used in rugged environments. A 720K-byte version of it for the IBM 7552 Gearbox industrial computer costs $2000.

On to Tape
Of all the magnetic storage devices, tape drives have been around longest. They first appeared as half-inch reel-to-reel audio recording devices in 1934. The first model was made by the German company AEG using tape media made by BASF. By 1945, IBM had developed digital reel-to-reel versions.

The Univac Uniservo reel-to-reel drive, which used 1200 feet of metal tape, was introduced in 1951 (see photo 4). This
was followed in 1952 by IBM's 701, which used plastic-backed tape. IBM followed with several more models through 1971 that pioneered first the NRZI format, then phase encoding, and, finally, group coding. It remained for 3M to introduce the quarter-inch drive and cartridge media in 1971, which made desktop use of tape drives a practical reality. However, the first major use of quarter-inch tape drives did not come about on computers; in 1975, Western Electric endorsed their use by selecting them to handle the storage needs of PBX systems. Quarter-inch drives have since been made smaller, cheaper, and with larger capacities, to the point that 320-megabyte versions are expected to ship this year. The capacity of the drives in 1971 was only 30 megabytes.

In 1985, Irwin Magnetics introduced a low-cost drive based on the ¼-inch DC1000 cartridge that utilized a floppy disk drive interface. The combination of these features in a tape drive proved to be extremely popular.

Floppy and Hard Disk Drives

IBM invented the floppy disk drive as an 8-inch-diameter read-only single-sided device in 1971. The model 23FD was used as a program load device. It was followed in 1973 by the 33FD (code-named Igar), a read/write 8-inch drive with an unformatted capacity of 400K bytes double-sided (formatting consumes about 28 percent to 30 percent of the usable capacity). The 33FD was used as a replacement for punched cards on the 3740 data-entry system. Shugart Associates announced the SA901, an OEM version of the 33FD, that same year. Shugart's modest pricing set the stage for the use of floppy disk drives in personal computers. In 1975, Shugart announced a double-density version of its drive that could store up to 500K bytes (unformatted) and leapfrogged IBM's efforts.

The first IBM hard disk drive was the RAMAC 350, introduced in 1956. It stored 4.4 megabytes on 50 24-inch platters—a capacity chosen because it equaled 50,000 punched cards. IBM produced the first 14-inch drive (the 1311) in 1963, and the first removable-pack drive (the 2314) in 1966. In 1975, the only hard disk drives available were 14-inch-diameter devices that were totally unsuited for personal computers. Therefore, the early personal computers used floppy disk drives, not hard disk drives, for storage.

Then There Were PCs

The first microprocessors, such as the Intel 8008 and 8088, became available in 1975. Their advent marked the beginning of the personal computer era. These pivotal inventions made the downsizing of computers and their storage devices possible. 

The peripheral storage devices available in 1975 did not fit personal computer needs very well. The 3M quarter-inch continued

cartridge drive was a step in the right direction, but it was still too large and expensive. Thus, early microcomputer users converted many audio tape cartridge drives into "home brew" storage systems.

Hard disk drives were unsuitable in both size and cost to be used on personal computers from 1975 until 1980. The 8-inch drives announced in 1979 by both IBM and International Memories were of no help. During these five years, the floppy disk was king.

But Al Shugart and Finis Conner had learned a crucial lesson about product form factor while operating Shugart Associates (before Xerox bought the company). Al Shugart later formed yet another company called Shugart, with Finis Conner as part of the team. Xerox soon persuaded Shugart to change the company name, and it was reborn as Seagate.

Seagate's product was a 10-megabyte 5 1/4-inch hard disk drive that used trailing-edge technology to make it inexpensive and easy to manufacture for the personal computer market. The product was an overnight success in all distribution channels, including retail aftermarket sales. Seagate has been the top producer of affordable hard disk drives ever since, although others, such as MiniScribe, are now challenging Seagate's position.

Several companies, including Maxtor, Micropolis, and Primam, entered the business on the high end of capacity and price, offering drives that now range up to 760 megabytes in the 5 1/4-inch form factor. A number of companies were formed to offer removable cartridges for the hard disk personal computer market, and most of them failed. Exceptions are SyQuest Technology, which makes a 44-megabyte cartridge drive, and Iomega, with its 44-megabyte Bernoulli cartridge, which uses flexible media but performs like a hard disk drive.

The Shrinking Disk

In 1975, Shugart Associates was well positioned in the new 8-inch floppy disk drive market and had little competition. In 1976, Jim Adkisson, one of Shugart Associates' engineering continued

Photo 5: Shown are 8-, 5 ½-, 3 ½-, and 2-inch floppy disks for use with personal computers. At first, as floppy disks decreased in size, so did their capacities. Now they've gone in the opposite direction. The 2-inch floppy disk shown stores 720K bytes, more than the 8-inch disk could hold at one time.

managers, was approached by a customer who was in the personal computer business. Over lunch, the customer told Adkisson that the 8-inch floppy disk drive was far too large to go into a personal computer (see photo 5). Adkisson asked the customer how large he thought the disk should be. The customer pointed to a cocktail napkin on the table and said, “About that size.” Adkisson picked up the napkin and took it back to the lab, where he proceeded to design the 5 ½-inch floppy disk drive.

That drive, introduced in 1976, was the Model SA400, which had a 110K-byte capacity—the first of its kind. The synergism between the 5 ½-inch floppy disk drive and the personal computer was so great that ultimately, at its peak, Shugart Associates was shipping about 4000 drives per day, most of them 5 ½-inch units. The 5 ½-inch production was farmed out to Matsushita in Japan (a move that ultimately led to Matsushita’s becoming the largest floppy disk drive manufacturer in the world).

But it was Alps Electric of Japan that blew Shugart out of the water at one of Shugart’s biggest 5 ½-inch accounts: Apple Computer. The loss of this contract is what started Shugart’s demise in the floppy disk industry. By 1979, another manufacturer—Tandon—had become a major competitor for the 5 ½-inch...

Let There Be Laser Light

The idea of optical storage has been around a long time. In 1927, John L. Baird demonstrated a "Phonovision System" based on a waxed disk with information displayed by an optical scanner. During 1935, Baird Radiovision offered for sale, through a London department store, 6 minutes of video display pictures from the stored images. In 1961, 3M started work on optical recording and, by 1965, was granted several patents.

In July 1971, the Bell System Technical Journal published a paper by D. Maydon entitled "Micromachining and Image Forming on Thin Film by Laser Beams." It was a harbinger of things to come. In 1974, Philips demonstrated a laser recording and playback system. The company followed this with a 1979 demonstration of the CD audio disk system, which has since made the phonograph record obsolete.

The first optical drives for computer use began shipping in 1983. These were 12-inch WORM (write once, read many times) products that are still priced out of the range of the personal computer market. Somewhat more affordable 5 ¼-inch WORM products began shipping in 1985 (see photo 6).

The audio CD formed the basis of the computer CD-ROM, which started shipping in 1985 and has slowly developed into a new form of publishing via storing information, such as encyclopedias, on optical disks. At first, CD-ROM drives were expensive, and disks were few. But this situation is rapidly changing. New titles, such as Microsoft's Office, are now appearing. This program is designed to provide on CD-ROM all the software applications that are needed by the typical small business using a Macintosh environment. NEC and Amdek are now offering CD-ROM drives for $600. The NEC unit is portable and plays CD audio disks, as well as reading CD-ROM disks.

In 1988, Sony, Canon, Ricoh, and Maxoptix introduced 5¼-inch rewritable optical products. Like the early WORM drives, these are expensive and, for the time being, will appeal only to the high-end workstation portion of the personal computer market.

Tomorrow's Mass Storage

During the next five years, you can expect to see the following improvements to personal computer storage products.

**Tape drives.** Quarter-inch cartridge drives will have more than 1 gigabyte of storage. Eastman Kodak has already demonstrated such drives, as has 3M. DAT drives (see photo 7) will provide over 1 gigabyte on a 4-mm tape cartridge, about the size of a credit card but thicker.

**Hard disk drives.** 5¼-inch drives will store up to 1.6 gigabytes. High-end 3 ½-inch drives will be storing 600 megabytes in full-height versions. Notebook-size computers will commonly use 2½-inch hard disk drives that are three-eighths of an inch high and store 50 megabytes.

**Floppy disk drives.** The "floptical" drive from Insite Peripherals will store 20 megabytes on a 3½-inch floppy disk, using a combination of optical and magnetic storage techniques (see photo 8). Insite's president is the same Jim Adkisson who invented the 5¼-inch floppy disk. The Brier Technology magnetic drive will store 20 megabytes and holds promise of storing as much as 50 megabytes on a single 3¼-inch disk. A whole stable of floppy magnetic drives will be available from

Japan in the near future, offering storage capacities of from 4 to 27 megabytes per disk.

The catch in all of this is that none of the present or foreseeable future offerings are compatible with the present interchange standards. This incompatibility will rule out one of the main functions of floppy disks: software distribution. It could eventually lead to software distribution on CD-ROM, which already has an interchange standard.

The 2-inch floppy disk drive, already seen on the Zenith MinisPort and DynaBook notebook-size computers, will prevail among these machines—and possibly among the coming pocket-size computers. The pocket-size machine may be the one that provides the demand for IC memory cards for loading programs.

Optical disk drives. The write-once drive will continue to exist for high-end applications that benefit from a permanent audit trail. Capacity will stabilize at around 1 gigabyte for the 5¼-inch WORM product.

The prices of CD-ROM drives will drop to the $300 range during the next five years, and many personal computer vendors will offer them as options—if not as standard equipment. Write-once CDs (essentially, another type of WORM) will be more widely available than they are now, and rewritable versions will finally appear within five years.

The capacity of 5¼-inch rewritable drives—just beginning to arrive in forms such as the hard disk shell in the NeXT computer—will be mostly 650 megabytes, the present International Standards Organization standard, because most suppliers are adhering to it. Manufacturers will also offer proprietary formats ranging from 1 to 2 gigabytes for users who do not care about data interchange.

A new class of rewritable optical 3½-inch drives will soon appear and will drop in price to less than $1000. At this price level, such drives make sense for personal computer users who could benefit from having a removable disk drive in addition to a magnetic hard disk drive. Capacity will be as high as 260 megabytes on the removable disk.

Laser cards. After years of selling licenses to the technology but not producing drives, the Drexler LaserCard may be getting close to real-world use in the field of medical record keeping for clinics and medical insurance companies. The LaserCard stores up to 2 megabytes of data on a credit card-size card containing an optically written strip (see photo 9). Under development are optical drives and compatible “laser cards” that can store around 40 megabytes.

Digital paper. A write-once Bernoulli Box from Iomega will become available. This 5¼-inch drive will use flexible optical write-once media called digital paper (see photo 10) from Imperial Chemical Industries in a cartridge that stores 1.2 gigabytes (see “Digital Paper,” February BYTE). The cartridge’s target price is about $50. The drive price has not been announced, but it should be affordable for the personal computer business user.

Solid-state disk drives. The products available in the current market tend to cost around $1000 per megabyte—sometimes even higher. They have value in speeding up systems that otherwise would need to be replaced, but the systems that use them are normally in the minicomputer category. Development efforts are under way to bring them down in cost and to make them suitable for the personal computer environment.

Writers Exchange Opens

BIX now has a Writers Exchange, featuring conferences for professional writers and journalists, people who aspire to be professionals, and people who are just interested in the subject. The Exchange, edited by BYTE columnist Wayne Rash, Jr., features conferences run by professional writers and journalists including Hugh Kenner, Jan Ziff, Rick Cook, Jon Hall, and Guy Kewney. Participants may discuss all phases of writing with these and other professionals, gather tips from the pros, and learn how to improve and sell their own writing.

Most Writers Exchange conferences are open to the public, although journalism.pro and writers.pros are reserved for practicing professionals only. A special conference—sfwa—serves as a private forum for members of the Science Fiction Writers of America. Other conferences include: journalism, new.writers, poetry.prose, writers, write.fiction, and writers.talk.

Digital type—like its ancestor, movable type—is revolutionizing the way we publish documents

John Collins

In the beginning was Gutenberg, setting pieces of lead into a press and so mechanizing the process of printing—formerly a laborious job done by hand, one document at a time. (See the text box “Gutenberg Had It Easy” on page 404.) The typesetting machine and the typewriter succeeded Gutenberg’s press, and now the personal computer has largely replaced the typewriter.

At first, all personal computer displays and output devices emulated the look and feel of the typewriter. Characters were generated by specialized hardware that wrote a matrix of bits into a computer’s video memory. Characters appeared on the screen made up of spots corresponding to these bits. Needless to say, the type of font you got was determined solely by the characteristics of the computer’s character-display hardware.

Things really got interesting when you attempted to print the document, because the font used by the printer to print characters onto the page seldom matched the characters in your computer’s video hardware. If you were really resourceful, you might be able to coax out of your printer condensed, expanded, bold, or underlined text. However, there was little chance that what you printed out would match what you saw on your computer’s screen. WYSIWYG it wasn’t.

The Macintosh changed this by merging the imaging operations of the computer screen and the printer. The Mac has no character-display hardware or character-based screen mode—it operates entirely in graphics mode. The System file stores a bit map of a typeface and the point size used. Characters are assembled from a “library” of bit maps—the actual pattern of dots that makes up the shape of each character. When you print a document, the printer operates in the graphics mode and draws the characters in much the same way they’re drawn on the Mac’s screen. This method has important consequences.

Text output is no longer coupled to display hardware; characters can be larger than the typical 9 x 7 matrix. Moreover, since stored bit maps are used to generate the characters, the type style can be anything—for example, Times Roman, Old English, Courier, Cyrillic, kanji, or Arabic.

When you use this process, whatever climbs out onto the printer tray closely matches what you have on the Mac’s screen. Making bit maps appear on a screen or from a printer simply requires copying the data to the output device, so it is virtually instantaneous.

One trade-off with bit maps is that a different one is required for each type style and point size. Furthermore, additional bit maps may be required to handle the resolutions of different output devices. Another major disadvantage of bit maps is that they require enormous storage capacity, especially for large sizes.

Digital Type—Fonts Are Us

With the advent of digital type (i.e., typefaces represented as electronic data) came the potential of using a single typeface master on a wide variety of—perhaps all—output devices produced by different manufacturers. With this technique, you can easily produce output in just about any type style and size you choose on a variety of machines for a variety of applications.

Font portability makes it easier and more economical to create and distribute fonts for use in a variety of devices. It also provides users with a greater availability and wider variety of typefaces. Device-independent digital fonts significantly reduce compatibility problems. As more and more devices are networked together, this device independence becomes particularly important. Finally, portability preserves your investment in type when you upgrade to new devices.

Digital type can be provided in three forms: Bit maps, outlines, and stroke fonts. For situations where only a few faces and point sizes are needed, bit maps are ideal because of their simplicity and high performance. Bit maps can be hand-edited and customized to produce the best-possible type quality on various kinds of output devices (see figure 1).

Where typographic flexibility (e.g., several faces, several point sizes, and rotation) is required, outlines are the preferred form. An outline is a mathematical description of the shape of a...
**Gutenberg Had It Easy**

When Gutenberg introduced movable type 500 years ago, fonts were simple and portable. Hand-cast hot metal type from any one foundry could be easily mixed with that of another foundry. This flexibility gave users great freedom and variety in specifying fonts.

When typesetting became mechanized, about 100 years ago, things got more complicated. Each typesetter manufacturer required—and most designed and sold—a particular kind of type for its equipment. Users who changed from one manufacturer to another had to purchase another library of type for the new device.

With the emergence of phototypesetting 20 years ago, type became even more machine-specific. Phototypesetting machines created type by projecting light through negative images of letters onto photographic paper. The type required for these machines was unique to each model. Even if you wanted to upgrade within the same line of typesetters, you usually had to purchase a completely new library of fonts. While this situation was good business for typesetter manufacturers, it limited users in their choice of type to those styles and formats made for their particular device.

When phototypesetters became digital in the 1970s, type was often encrypted so it would work only within a single installation. This is analogous to compact disks that are specially encoded to be played on one particular CD player. Music lovers would never go for this when their records historically could be played on any phonograph.

What we've seen over the last 500 years is a series of major technical advances in the mechanization of typesetting. These advances, unfortunately, have gradually stripped type of its initial portability to the extent that it has become very specialized and localized.

The irony here is that digital type has greater potential for portability on a number of different machines than any other form that type has taken during its evolution.

Because it has been so long since type was truly portable and device-independent, users have become accustomed to closed font architectures. We are, however, at a stage where technological advances in digital typography are beginning to provide the freedom of choice and open market that existed in the early days of movable type. More and more users are becoming aware of this. As a result, the demand for open and portable font architectures is growing rapidly.

character (see figure 2). As outlines can be scaled and rotated, only one outline is needed to represent a character in any size and for any device resolution. Thus, outlines are much more compact than bit maps, especially where many sizes are required. Their major disadvantage is that a significant amount of computation is required to convert them into the bit-map form eventually required by the output device. As a result, going from an outline to an image on the screen or printer is a relatively slow process. To do so at high speed takes a significant amount of processing power.

The third representation that is occasionally used is stroke fonts (see figure 3). Stroke fonts, sometimes called vector fonts, describe the spine of a character. Drawing a character from a stroke font onto the screen or into the printer memory can be as simple as drawing a series of pixels along the strokes that make up the character. For large point sizes, a thicker path of pixels needs to be drawn to prevent the character from looking stick-like. Like outline fonts, stroke fonts are size- and resolution-independent and can be rotated to any angle.

Less computation is required to image a stroke font than is needed for outlines, so the results are faster. Stroke fonts also require a relatively small amount of storage—typically 50 percent less than outline fonts. The catch with stroke fonts is that only a tiny percentage of the world's typefaces can be effectively represented as stroke fonts. Only those faces with even stroke weights and simple round or square ends of strokes can be represented (e.g., Courier). Attempts to represent other faces will produce results that require more storage and take more time to draw than outline data.

There is more to digital fonts than just the shape of the characters. For an application program to lay out the characters on a page, it needs to know how much space each character takes up. The height of a character is determined simply by the point size that the user specifies. But the width of each character is not so straightforward. Most typefaces in general use are proportionally spaced; that is, each character has a different width. The program needs this information so it can decide how the characters fit side by side, how many characters fit in the line, and where the line should be broken. Character widths are unique to each font.

Merely describing the widths of each character does not ensure the highest-quality reproduction. Certain character pairs, such as "To" and "AV," look much better when the spacing between them is reduced; others look better when the spacing is increased. This technique is known as kerning. Most fonts contain kerning data that describes spacing adjustments to be applied to certain character pairs as they occur in the text.

Other data, such as scale factors for making small caps, superscripts, and subscripts, and instructions for building fractions, is sometimes provided with fonts. This data, along with character widths and kerning data, is called font metrics.
Another aspect of fonts concerns character sets—groups of letters, figures, symbols, and so on. If there were one universal character set, all fonts would provide the same collection of characters. Unfortunately, it’s not that simple. There are character sets associated not only with different countries, but also with different printers (e.g., LaserWriter and LaserJet), operating systems (e.g., Macintosh and DOS), page-description languages (e.g., PostScript and QuickDraw), and application programs (e.g., WordPerfect and Lotus 1-2-3). A great number of character sets is in common use today. Hewlett-Packard’s LaserJet, for example, supports more than 40 sets for its resident fonts.

But Are They Portable?
Even though bit-map output devices are the most common type of output device used today, the manner in which they work with fonts varies widely. Graphical displays can handle a wide range of typographic styles. It is the responsibility of the application program or the operating system to copy the bit-map character data from the font into the appropriate place in the display buffer. The font format required is therefore determined by the application program or the operating system.

Dot-matrix printers operating in graphics mode have capabilities similar to those of graphical displays. They depend on the application program or operating system to build a bit-map image of the page in memory. The resulting data is then output to the printer. As with graphical displays, the font format required for dot-matrix printers depends on the application program or operating system.

Laser printers, on the other hand, have the processing ability to use resident fonts or additional user-installed fonts. Laser printers accept instructions from the host computer by means of a page-description language. The two most common PDLs in use today are Hewlett-Packard’s Printer Control Language and Adobe’s PostScript. PCL devices use bit maps that are either resident or downloaded from the host. Additional fonts may be made available for PCL devices in the published PCL bit-map font format.

PostScript devices expect fonts in outline format. Because PostScript is a programming language, it is possible to encode fonts in various forms. Thus, you can use PostScript fonts from a variety of vendors with PostScript typesetters and laser printers. (See the text box “Open Fonts: A Break for Users?” on page 406.)

Managing Your Fonts
Although MS-DOS is a widely used operating system, it provides no font-management capabilities. That function is left to the application programs. As a result, MS-DOS software developers have chosen different approaches to handling fonts, font metrics, character sets, and other typographical data. Therefore, font formats and font-metric data required for one application program are likely to be different from those required for another.

Graphical user interfaces (GUIs) that are compatible with MS-DOS, such as Microsoft Windows and Digital Research’s GEM, have brought some order to this chaos by managing fonts for displays and dot-matrix printers. Applications that take advantage of these facilities, therefore, use a common font format. Increasing acceptance of these operating environments has helped the IBM PC improve its ability to handle fonts. OS/2 and Presentation Manager promise to accelerate this trend as they become established in the PC environment.

In the Macintosh environment, fonts are managed within the operating system itself. Thus, there is standardization among Mac application programs that use fonts. From the perspective of the independent font vendor, this is a much simpler environment for which to provide fonts. Apple recently announced its System 7.0, which will bring dramatic increases in font capability with future Mac releases.

Unix was late in providing a GUI, let alone any kind of font management. Recent developments along this line, though, should create a trend toward standardization in the way fonts, character sets, and font-metric information are handled for application programs running under future extensions of Unix.

Open Fonts: A Break for Users?

Marlene Neary

While Adobe's PostScript has been a boon to electronic publishing or to those who just want the flexibility of using a variety of fonts in their work, the atmosphere surrounding the use of its technology has been, shall we say, a bit close-ended. Until recently, users had to have a PostScript-licensed printer to read Adobe-encrypted fonts. A couple of events occurred this past spring, however, that changed things for the better—as far as users are concerned, that is.

In an apparent bid to wrest control of Adobe's proprietary technology, Sun Microsystems announced its own font-scaling system, called OpenFonts. According to a Sun spokesperson, the system is a "self-contained font-scaling module that lives independent of the imaging model." In other words, the product (developed by Folio, a company that Sun acquired last summer) is "software that automates the font-description and scaling process. It won't be an end-user program; you will license the technology like you would PostScript and put it into your printer software or your Windows driver." At this writing, however, OpenFonts isn't available and remains an unknown.

About the same time that Sun made its announcement, a Boulder, Colorado, company called Raster Image Processing Systems let loose another salvo at Adobe. RIPS stated that it had broken the encryption scheme used by Adobe's PostScript fonts. Both the character description and the so-called hints were decoded, said company president Lynn King.

What this means is that users can now "purchase Adobe fonts off the shelf and run them on clone printers," stated a RIPS representative. He added that "while others have cracked the PostScript code, we have made it possible for users to run Adobe fonts on less-expensive printer controllers." Until now, because only Adobe-licensed printer controllers could decipher the company's code, the only way you could use Adobe fonts was to run them on more-expensive PostScript-licensed printers.

But this activity hasn't put a damper on Adobe's marketing efforts. If anything, they've ramped up. This past spring, the company announced that it had increased the number of licensed PostScript printers and expanded its PostScript-compatible font library through licensing agreements with three major type foundries—agreements that may yield as many as 600 new typefaces by the end of 1989.

Adobe has also released its font-scaling technology as a separate product for displays. The subset of Display PostScript, a new software utility called Adobe Type Manager, is due to become available this fall to computer and system software OEMs and to Macintosh users, who should be able to purchase ATM directly from their usual retail channels.

drawings to flesh out the idea into the form of a complete typeface. Font foundries take these designs and digitize them. There are two classes of font foundries. First, there is the dedicated foundry that creates fonts only for machines made by the company in which the foundry exists. This is the common situation with typesetter manufacturers. Obviously, such foundries don't have to produce fonts in the different formats and character sets in use elsewhere.

In contrast, independent font foundries are not tied to a specific piece of hardware. They must make fonts that can work with any and all devices. Therefore, it becomes a much more complicated task to accommodate all the different application programs, devices, operating environments, and font formats. Some form of conversion or enabling software is needed to ensure the availability and quality of the fonts with all these different combinations.

There is a third source of fonts—the various do-it-yourself software found mainly in the Macintosh environment. With this type of software, many users are themselves designing fonts. Most people, however, underestimate the difficulty of designing a typeface, thinking that creating 26 letters is just 26 times the trouble of creating one. However, the essence of good typography lies in a high level of consistency among all the characters in the typeface. The type designer's goal is to create a pleasing overall look to the words, sentences, and pages created from the individual letters—not just to make those individual letters look good.

Do-it-yourself font software cannot replace a professional type designer's training and experience, just as music software cannot replace a musician's conservatory education and actual performance experience. Such programs, however, are useful for creating logos and other special characters that may be missing from generally available fonts or character sets.

The Font Store

Some printers and typesetters have fonts built right into PostScript printers, for example, generally come equipped with 35 resident fonts. But many users want a much wider variety than can be accommodated by resident fonts, particularly now that desktop publishing is so popular and people are realizing how many thousands of typefaces exist. User-installed fonts offer a much wider variety of faces than can be provided as resident fonts. They are available from numerous vendors.

A number of such fonts are available that are device-specific. The best known are cartridge fonts for use in printers such as the LaserJet. While these are by far the easiest to use, they have major disadvantages. Cartridge fonts work only on one model of printer, offer limited styles and point sizes, and don't provide fonts for use with screen displays. Font-metric information must be built into the applications or printer drivers or supplied with the cartridge.

Somewhat more flexible device-specific fonts are soft fonts, which consist of a downloadable bit map sent to the printer by the application program or printer driver. Unfortunately, most prepackaged soft fonts are configured for one particular printer and offer a limited set of point sizes for each typeface.

A third kind of device-specific font is the PostScript font. While not quite as device-specific as the others—it works with a wide variety of PostScript printers and typesetters—it will, of course, work on non-PostScript devices. User-installed PostScript fonts are generally provided in downloadable outline form, and, like soft fonts, they are sent by the driver or the

IISC, or into user-defined PostScript fonts for PostScript compatibility.

With Publisher’s Type Foundry by ZSoft Corp. (Marietta, GA), you can create custom fonts, logos, and symbols from scanned typefaces or from scratch. Publisher’s Type Foundry has both a bit-map editor and an outline editor. Fonts can be translated to formats required for PostScript printers, as well as for applications such as Aldus PageMaker and Ventura Publisher. Running under Microsoft Windows, Publisher’s Type Foundry requires scanned type to be entered into PC Paintbrush and then transferred into one of the font editors. With Type Foundry, users can also oblique and boldface the characters.

These are only a sampling of the fonts on the market. There are obvious differences that users should examine closely for variety, flexibility, availability, and compatibility.

A Font’s Golden Years

Most laser printers today come with built-in printer controllers. Thus, they can accept instructions from a PDL, together with downloadable fonts, in order to generate the page image. In the future, more and more laser-printer controllers will be resident in the hosts to which they are attached. Installing the printer controller in a workstation or personal computer simplifies communication to the printer and speeds loading of fonts from a disk. The disk can also be used for caching bit maps, thereby greatly improving the controller’s performance.

Printer controllers, which are currently almost all ROM-based, will most likely become RAM-based in the future. This will provide a much higher level of flexibility. It’s practical to have a RAM-based controller because it can be quickly booted from the disk. A RAM-based controller will provide an upgrade path to new font-scaling technologies and PDLs as they become available. This architecture will create a much higher level of openness than exists in today’s ROM-based printer controllers.

Font management will, in time, become a standard feature of operating environments. With this enhancement, and without having to delve into the intricacies of font technology, software developers will find it easier to develop word processing, desktop publishing, and other application programs requiring fonts. At the same time, they will create a level of standardization that will encourage and improve typeface portability.

There is a trend toward more openness in digital fonts. So you can expect more and more operating environments, printers, and typesetters to have open font architectures that will allow all font vendors, as opposed to multiple and independent font vendors, to provide their products for those devices. More standardization of font formats will minimize the need for format conversion.

It’s interesting that even today, some typeset manufacturers continue to build devices that accept only type made by the manufacturer itself. But it’s likely that users will demand more openness with respect to the source of fonts, especially as different pieces of equipment from different manufacturers get connected and used together. A trend toward openness and standardization will hasten the day when there is complete portability of digital fonts across application programs, operating environments, and output devices. Gutenberg would surely approve.

MACH: THE MODEL FOR FUTURE UNIX

Will a new, object-oriented kernel change the face of Unix?

Avadis Tevanian Jr. and Ben Smith

UNIX is over 20 years old. While the computer hardware for Unix has radically changed since Unix was first designed, the basic concepts of the operating-system kernel have remained the same.

The Mach kernel is designed to take advantage of new computer architectures and provide for the needs of modern programs. It is also a return to the original Unix concept of having only the most essential functions in the kernel—a concept that has been lost in the versions of Unix from the big-iron computer manufacturers, whose kernels can exceed 2 megabytes.

Great Ideas from a Small Team
A small group of researchers at Carnegie Mellon University started the design of Mach in 1984. They wrote the first lines of code in 1985. Originally, Mach was intended to support large-scale parallel computation. However, early on in the design phase, the team decided that designing only for large-scale parallel computation would be of limited life and utility. So they changed the design to make it independent of the hardware architecture. Mach was initially implemented on the VAX-11/780 and now runs on a wide range of hardware, including almost all VAX processors, the IBM RT PC, Sun-3 workstations, the Encore Multimax, the Sequent Balance 21000, various 80386 machines, and the NeXT Computer. Mach is designed to handle problems associated with both parallel programming on multiprocessor machines and distributed programming, where the work is done by several separate computers communicating over a network. The concept of multiple threads of control executing in parallel within a single task facilitates parallel computing. A capability-based interprocess communication mechanism eases distributed programming. Finally, an extremely powerful virtual memory system allows applications of all sizes to efficiently share the memory resources of these complex architectural designs. With Mach, these very same concepts work equally well on inexpensive, single-processor machines.

To derive Mach, the Carnegie Mellon team extended the model of Unix computing by adding five abstractions: the task, the thread, the port, the message, and the memory object. Obviously, the language and concepts of object-oriented programming permeate the design of Mach. Many people call Mach an “object-oriented operating system.”

The Mach kernel maintains only the most basic services: processor scheduling, interprocess communication, and management of virtual memory. All other services are service tasks, independent user-level programs.

Tasks and Threads
Mach splits the traditional Unix abstraction of a process into a task and threads. A task is the environment in which threads run. It includes protected access and control of all system resources, including the CPUs, the physical I/O ports, and memory (virtual and real). The structures associated with files are in the domain of the task. A task address space uses a structured map of memory objects (see below).

A thread is an entity (an object) capable of performing computation, and for low overhead, it contains only the minimal state necessary. Another term for a thread is a lightweight process. A thread contains the processor state, the contents of a machine’s registers. All threads within a task share the virtual memory address space and communications privileges associated with their task. The Unix abstraction of a process is simulated in Mach by combining a task and a single thread. However, Mach goes beyond this abstraction by allowing multiple threads to execute simultaneously within a task. On a multiprocessor, multiple threads can, in fact, execute in parallel on separate processors, whereas on a uniprocessor they only conceptually execute in parallel.

Ports, Port Sets, and Messages
A port is a communications channel, a sort of object reference for tasks, threads, and other objects. Application programs continued
Mach on the NeXT Cube

While most current users of Mach are content to rely on Unix compatibility, NeXT has found the basic functionality of a Unix system to be insufficient to produce high-quality end-user applications software. NeXT utilizes the Mach functionality for communication between applications and window servers, sound playback and recording servers, and other applications. Applications on the NeXT Computer communicate information to a user according to the NextStep User Interface, which comprises several components: The Window Server manages all the windows on a display; the Application Kit is an implementation of the classes that define the user interface; the Interface Builder is a tool that allows the user interface for NextStep-conforming applications to be built with little or no programming; finally, the Workspace Manager provides a graphical user interface to a user's files and applications.

Two major types of communication occur between NextStep applications. First, applications communicate with the Window Server in order to implement a graphical user interface according to the client/server model. Second, applications communicate with each other using the Workspace Manager as a rendezvous point. Both types of communication are performed using Mach's intertask message-passing primitives.

Sound playback and recording make extensive use of Mach features. On a NeXT machine, compact-disk-quality sound can be synthesized in a digital signal processor. The device driver responsible for controlling the DSP and the sound direct-memory-access channels is accessed using Mach's message-passing primitives. This allows great flexibility in how the hardware can be accessed and provides network-transparent access to the driver. Threads are also used by high-level sound software to control sound I/O for an application that needs to perform normal processing while playing or recording sounds.

There are "simple messages," which don't contain any references to other ports; and "non-simple messages," which can make references to other ports—conceptually similar to indirect addressing.

Messages are the primary way that tasks communicate with each other and the kernel. They can even be sent between tasks on different computers.

The Memory Object
Each Mach task can use up to 4 gigabytes of virtual memory for the execution of its threads. This space is used for the memory objects but also for messages and memory-mapped files.

When a task allocates regions of virtual memory, the regions must be aligned on page boundaries. The task can create memory objects for use by its threads; these can actually be mapped onto the space of another task. Spawning new tasks is more efficient because memory does not need to be copied to the child. The child needs only to touch the necessary portions of its parent's address space. When spawning a child task, it is possible to mark the pages to be copied or protected (the child is prohibited access).

Since messages are actually mapped into the virtual memory resources of tasks, intertask (interprocess) communication is far more efficient than old-time Unix implementations where the messages are copied from one task to the limited memory space of the kernel and then to the task receiving the message. In Mach, the message actually resides in the memory space shared by the communicating tasks.

Memory-mapped files facilitate program development by simplifying memory and file operations to a single set of operations for both. However, Mach still supports the standard Unix file read, write, and seek system calls.

Virtual Memory
The Mach virtual memory system provides the programmer with a clean interface, which allows virtual memory to be allocated and deallocated at arbitrary addresses and sizes, restricted only by the page size of the underlying hardware. Applications can, on a page-by-page basis, specify access modes such as read-only, read/write, or shared. Finally, also on a page-by-page basis, virtual memory can be shared between continued

tasks in a controlled fashion that is based on inheritance.

The virtual memory system achieves portability by splitting its implementation into two parts. The first part, the architecture-independent part, is common to all implementations of Mach. The second part, the architecture-dependent part, is specific to each hardware architecture that Mach runs on. This split makes it possible for Mach to provide a consistent, high level of functionality on all hardware architectures with only a minimal porting effort.

Open Memory Management
Instead of limiting virtual memory semantics to those defined by the kernel, Mach provides an interface that allows user-level programs (external memory managers) to define the exact semantics of virtual memory that can be mapped into any task's virtual address space. Such programs are responsible for handling operations such as "page in" (when a page of memory is referenced) and "page out" (when a page of memory is moved out of the normal working set). In addition, external memory managers can instruct the Mach kernel to take special action on memory, such as restrict access to data in order to provide data consistency and security.

External memory management allows Mach to be extended in powerful ways without changing the base Mach kernel. For example, network-consistent shared memory can be implemented by an external memory manager. The shared memory manager can use the external memory interface to control which pages of memory can be accessed by which machines at various times in order to guarantee control. Not only does this remove that complexity from the kernel, but it allows the shared memory manager to choose which algorithms it uses to enforce consistency and security.

The Mach Kernel and IPC
The kernel functions can be classified into the following five groups:

- Task and thread management
- Port management
- Message queuing and support
- Virtual memory management
- Paging management

The kernel is responsible for the creation and management of all tasks and threads, the structure of ports associated with the tasks and threads, the messages between objects (through the object ports), and the allocation of physical and virtual memory. It manages what and how port capabilities are used. The kernel guarantees that only authorized senders or receivers can send or receive messages on each particular port. Thus, the Mach kernel guarantees secure interprocess communication (IPC) within a host.

The Mach kernel automatically queues messages for tasks executing on its machine. However, transmission of messages between separate Mach hosts is performed transparently by an intermediate server task.

The intermachine-process-server task is the network message server, and it maintains the mapping of local "proxy" ports to global "network" ports. It forwards messages using network protocols of its choosing. In addition, it is free to make decisions related to security, a lack of it, depending on the environment in which it is run.

Exception Handling vs. Signal Handling
In traditional Unix, signals are used for notifying programs of events external to the program. The handling of signals is done within the program, but the semantics vary from one kind of signal to another. Signals come from only a portion of the events that affect a program from the outside. Bus errors, segmentation and protection violations, arithmetic processor errors (e.g., underflow, overflow, and divide by zero), and events associated with debugging also need to be able to communicate with programs. External events that affect the execution of a program are called exceptions. The traditional ways of handling exceptions (through application program signal handling and kernel handling of hardware errors) separate the application program or service program from the hardware that caused the exception and assume that there is only one processor (no longer a valid assumption).

Mach has taken a generalized view of all exceptions. An exception requires suspension of the "victim" thread that caused the event and the notification of an exception handler. The handler performs some operations as a result of the exception, and then the victim is either revived or terminated. Because the handler is never within the victim thread, all the exception handling involves a form of RPCs. Mach ports and messages are the elements through which all this happens. The handler's port for communicating with the task is the thread (or task) exception port.

This design provides a single facility with a consistent method of handling all exceptions, a simple interface, full support for debuggers and error handlers, and no duplication of functionality within the kernel. In addition, and of great interest to developers and researchers, this design allows for user-defined exceptions.

System Layers
The Mach kernel provides only the basic primitives needed for building distributed and parallel applications. Although Unix is an operating system, it is also a complete environment suitable for use by developers and end users. Mach is just a kernel. The operating-system environment is built on top of it. But, since Mach makes few traditional operating-system decisions within the kernel itself, it is possible to build a completely different operating-system environment on top of it.

Currently, the Mach kernel is the basis for a BSD 4.3 Unix-compatible system. In this system, the Mach kernel implements the features particular to an operating-system kernel and the features provided by the Mach kernel interface. Unix compatibility is provided by the original BSD 4.3 implementation, modified for use with Mach. In effect, many of the internals of BSD 4.3 have been replaced with Mach equivalents. This technique yields a highly compatible system with performance often exceeding that of the original BSD 4.3 system.

OS/2 and Mach
Like Mach, OS/2 supports threads, virtual memory, and message-passing mechanisms. Although Mach and OS/2 provide similar types of functionality at the lowest levels, they differ in important ways.

OS/2 threads, for example, have some unusual semantics. Instead of the Mach model of all threads being equal, OS/2 treats some threads (e.g., the first thread in a process) specially. It manages virtual memory in segments, rather than pages—a finer grain and more flexible control than segments. Also, OS/2 imposes some other restrictions, such as the use of different memory allocators for different-size memory regions. Rather than provide one coherent mechanism for interprocess communication, OS/2 provides many different mechanisms (e.g., semaphores, pipes, queues, and signals). OS/2 lacks multithreaded operations. Finally, OS/2 was designed to run on Intel 80286/80386 processors and is not portable to other processor families. This is not to say that OS/2 doesn’t do well in its own niche, but it is not as complex or universal as Mach.

The Future of Mach
Unix compatibility makes Mach attractive to a wide audience by allowing it to transcend its role as a research project and emerge as a viable commercial operating system. The NeXT Computer already provides an excellent example of how to tie visual displays to audio input and output. The primitives of Mach were essential for NeXT to implement this functionality efficiently in a true multitasking environment. (See the text box “Mach on the NeXT Cube” on page 412.)

Mach is also influencing how other systems evolve. In the future, more and more systems are likely to support Mach features. Mach has become the platform for experimental Unix operating-system work. For instance, Trusted Information Systems, under a Defense Advanced Research Projects Agency contract, evaluated Mach as a possible base for a verifiably secure operating system, a “trusted system” meeting the B3 level of security as specified in the National Computer Security Center’s “Orange Book.” (See “Safe and Secure?” in the May BYTE.) Researchers at Trusted Information Systems ascertained that Mach’s design made implementation of classification labels and access control lists much easier than in traditional Unix. The design separation of the kernel and services made modification of the operating system much more straightforward and easier to verify as being a trusted system. They have gone on to build a proof-of-concept prototype trusted system. But until Mach is free of BSD code, a truly trusted Mach operating system will not be possible. Meanwhile, they are working with the Mach team at Carnegie Mellon to ensure that facilities for trusted systems be properly implemented in future releases.

Work on Mach continues at Carnegie Mellon and organizations such as NeXT. Eventually Mach will stand on its own and be completely free of BSD code. It will have been shaped by the tortuous tests of many other institutions, including industry and government. Thanks to the availability of Mach on the NeXT Computer, the ideas of thousands of researchers and students will add to its clever design and continue to shape it for modern computer design and software. It’s a great example for all developers of applications and operating systems. But as operating systems go, Mach is very young, and few people understand all the possibilities it really provides.

INSIDE EISA

Probing the mysteries of the newest industry standard for IBM PCs

This fall marks the advent of an important new standard in the Intel/IBM PC-compatible marketplace: the Extended Industry Standard Architecture, or EISA (pronounced “ee-sa”). Created by a consortium of computer, peripheral, and chip vendors ranging from Compaq to AST Research to Intel, EISA machines are built around a unique 32-bit-wide bus structure that’s downward-compatible with older Industry Standard Architecture (ISA, or “eye-sa”) peripheral cards (i.e., cards intended to work in the IBM PC, XT, or AT).

When IBM announced the PS/2 series of computers, it announced that these machines used a new 16-/32-bit bus—the Micro Channel—which was not compatible with the ISA bus. Users balked at the high cost and limited availability of peripheral cards for the Micro Channel, and manufacturers balked at IBM’s demands for licensing fees—which included not only a percentage of revenue acquired from using the new bus design, but also a retroactive fee for use of the ISA bus that IBM was putting out to pasture.

The result was the formation of the EISA consortium—centered around a group of clone makers, the “Gang of Nine” (i.e., Wyse, AST Research, Tandy, Compaq, Hewlett-Packard, Zenith, Olivetti, NEC, and Epson)—mnemonically, watchzone). Struggling to finish their EISA specification while the Micro Channel gained market share, this group kept information on EISA mostly under wraps. You could obtain detailed information about the bus only by signing a nondisclosure agreement and paying $2500.

The lack of publicly available information on EISA has led some to call it a “vapor bus.” However, by the time this issue of BYTE arrives on the newsstand, the wait will be over, and EISA systems—and the specification—will be available to everyone. See “EISA Arrives” on page 93.

What’s inside EISA? And how does it work? The best way to understand EISA is to trace its evolution from its earliest roots: the 8-bit backplane of the original IBM PC.

Recapitulating Phylogeny

The original PC and XT bus was introduced in the first IBM PCs in 1981. It’s a relatively simple synchronous 8-bit bus with parity protection and edge-triggered interrupts, which means that each interrupt line can be used by only one adapter card (see table 1).

The original PC bus had no provision for an external bus master; either the host CPU or the direct-memory-access (DMA) controller on the motherboard controlled the bus at all times. Enter the IBM PC AT, circa 1984. IBM wanted to extend the 8-bit IBM PC bus to 16-bit operation in a compatible way, so all the signals on the original 62-pin connector were maintained and a new connector was added at the bottom. Table 2 shows the additions that created the AT bus.

IBM added a number of features to the AT for downward compatibility. Because the AT’s 80286 ran faster than the original PC’s 8088, the company added a wait-state generator to lengthen bus cycles. Also, the one previously unused line was assigned a function: Pin B8 became the ØWS (zero wait state) line. When this line is pulled low, some or all of the wait states generated by the AT motherboard are removed. By putting this signal on the 62-pin connector, IBM let manufacturers make fast 8-bit boards as well as fast 16-bit boards.

The new connector, which had two rows of 19 pins each, added four new address lines (LA20-LA23), plus copies of three lower address lines (LA17-LA19). Why the duplication? Because the address lines on the original PC bus were latched, and the latching process caused propagation delays that would slow down peripheral boards. (See the glossary on page 423 for definitions of latched and other bus-related terms.) By providing these unlatched address lines, the AT bus let 16-bit cards find out early in the cycle whether they were being addressed. They could then activate special signals that said, “I’m a 16-bit card; please make this a 16-bit cycle, if you can.”

Those special signals—MEM CS16 and I/O CS16—are key to the AT bus’s downward compatibility. If the 80286 attempts to perform a 16-bit access to a board and one of these signals is not asserted, special hardware on the motherboard takes over and causes two 8-bit cycles to be performed.

Alas, there was a catch. Only seven unlatched address lines could fit on the connector, meaning that this “early warning” could tell the board only which 128K-byte region of memory was being addressed. Thus, memory boards that didn’t consume a full 128K-byte block of scarce real-mode address space could not activate the signal, and thus couldn’t do 16-bit transfers. In practice, this meant that most EMS boards and memory-mapped peripherals were forced to do transfers 8 bits at a time, even over the 16-bit AT bus.

Enter EISA

Like the AT bus before it, the EISA bus was built on the older standard by adding more address lines, more data lines, and more control signals. Before this could be done, however, its designers had to generate a firm specification for the ISA bus.

The timings of the PC and AT backplanes were never formally specified in continued...
Because of its simple design, each interrupt line can be used by only one adapter card.

any published IBM document. EISA, which was to extend the bus yet again, could not be so lax. It needed to rigorously define not only the new standard, but also a set of timings that would retain compatibility with the older ones. Fortunately, the participants in the EISA consortium were old hands at IBM clone design and probably the best people to do the job.

As the specification developed, the developers exchanged timing information as spreadsheet files. The spreadsheet format let them watch what happened to the worst-case timings as they tuned the specification, and it helped them flag problems.

Table 2 shows the resulting new signals. The new pins for the EISA bus were placed physically between the pins of the ISA bus. (See figure 1 for a comparison of the lines.)

### Covering All the Bases

Now that I’ve listed the signals that EISA adds to the standard PC bus, I’ll look at some of the features they provide. A key feature of EISA is that the host or any bus master can access any memory device or peripheral in the system, even if their bus widths differ.

The EISA bus controller can adapt accesses from the host CPU, a 32- or 16-bit EISA master, or even an ISA bus master to any of five kinds of slaves on a cycle-by-cycle basis. These include EISA 32-bit slaves, EISA 16-bit slaves with burst capability, EISA 16-bit slaves without...
burst capability, ISA 16-bit slaves, and ISA 8-bit slaves. How is this accomplished? The answer lies in a key feature of the EISA bus—and its controller—called cycle translation.

Suppose that a 32-bit EISA bus master card wants to do a write into a memory location on an 8-bit ISA card. The bus master will begin by requesting the bus, setting up the address and data, and asserting the START signal. It will then look at the signals EX32, EX16, MEM CS16 (called MT6 in the EISA specification), and OWS. As these signals return, the bus controller samples them, too.

When the bus master and the bus controller see that the cycle can’t be completed with a simple 32-bit transfer, the bus controller takes over. Having sampled the address and data from the bus master, the bus controller begins to drive the same signals onto the bus while the bus master is still doing so. (There’s no conflict and no glitch because both are driving each line the same way.) Then, half a cycle of the bus clock later, the bus master bows out by turning off its drivers. The bus controller, now in charge of the cycle, executes four separate ISA byte transfers to deliver the data, much the same as the AT motherboard can break up a word access into two byte-size accesses.

The beauty of this “handoff” facility is that none of the DMA peripherals or bus masters need to contain the byte-shifting and cycle-generating logic to handle the wide variety of possible transfers. For example, Intel’s 32-bit bus master chip, the Bus Master Interface Controller (BMIC), can handle only 32- and 16-bit burst transfers without help, but the other combinations are neatly handled by the EISA Bus Controller (EBC) chip (see table 4).

Another novel situation occurs when a 16-bit master addresses the upper word of a 32-bit memory location on a 32-bit slave. The EBC handles this situation by copying the information from the lower two byte-wide lanes of the data bus up to the higher two lanes, so that the information arrives at the right place. This procedure is known as copy-up, and it lets a 16-bit master access a 32-bit slave without containing drivers for all 32 data lines.

**Fast Transfers**

One of EISA’s key selling points is raw speed. Under the right conditions, EISA peripherals can do 32-bit burst transfers at up to 33 megabytes per second. This sort of bandwidth is necessary when a machine is servicing a high-speed LAN (e.g., Fiber Distributed Data Interface, or FDDI), a fast disk drive (e.g., IPI or SCSI-2), or a high-resolution graphics display.

But not all bus transactions will fall into this category. If you’re using ISA peripheral cards, they will exhibit lackluster performance compared to EISA-specific cards.

**Shared Interrupts**

One of the most common and frustrating problems you encounter when expanding an IBM PC or compatible is a lack of available interrupt lines. ISA machines do not allow sharing of interrupt lines; each is edge-triggered and driven by a TTL tristate driver.

EISA, however, provides pull-ups on the interrupt lines and can make them level-sensitive. This means that EISA cards, which use open-collector drivers to drive the interrupt lines, can share

Taking Turns

The memory refresh controller, the highest-priority DMA channel, and candidates for bus mastership compete for ownership of the EISA bus via a three-way rotating arbitration scheme. This scheme guarantees that no bus master will ever starve, although it is possible for a low-priority DMA channel to be starved for use of the bus. It also ensures that memory will be refreshed on a regular basis. In addition, the Intel chip set contains a special watchdog timer that makes sure no one entity retains control of the bus for too long. If this timer expires, the master is removed from the bus and a nonmaskable interrupt is generated on the host CPU.

Words of Caution and Encouragement for Those Choosing a CASE Tool

Your software projects are growing more complex, and maintenance is growing more expensive. You think that CASE tools could help, but some say CASE is more trouble than it's worth. What should you believe? Should you jump in? Be cautious. Expensive CASE tools with rigid methodologies demand a commitment of time and money so large that anything short of revolutionary success can seriously damage your budget and your career. Now, however, you can eliminate methodology grid-lock with an affordable, flexible, world-class CASE tool. Literally every programmer and analyst in your company can have the power of vsDesigner™ on their PS/2 or PC.

The Price/Performance Leader

vsDesigner costs only $495 for a single-user license, but don't be fooled by its low price — vsDesigner has the features and power of CASE tools costing over ten times more. The Expert version of vsDesigner costs $1995 for a single-user license and includes all vsDesigner features plus LAN support, design database reporting and the ability to modify or create methodologies.

Use Multiple Methodologies

vsDesigner supports the structured design methods you prefer: Data Flow, Structured Chart, State Diagrams, Flow Chart, etc. It supports multiple methodologies or "syntaxes" simultaneously so that a design can contain layers (nodes) using different syntaxes. For example, you can use Data Flow Diagrams for the top level of your design and then decompose each module into Structure Charts, State Diagrams, Entity-Relationship Diagrams, etc.

Customize Methodologies Or Create Your Own

With the Expert version of vsDesigner, you can modify the syntaxes we supply, or you can even create your own syntaxes for ultimate flexibility. We believe that the tool should adapt to and then enforce your team's standards and practices rather than vice versa.

Quality Code From Quality Design

Although many CASE tool users have had significant productivity gains, structured design improves quality even more than productivity. The design checking programs included with vs Designer allow you to check the logical integrity of your designs before you begin writing code. The resulting code will be more reliable, and maintenance costs will be much lower because operations are logically consistent.

Collaborate over a LAN

The Expert version of vsDesigner also adds LAN support so that all your designers can simultaneously work on the same design. Node locking allows design collaboration while preventing conflicting changes to the shared design. The Expert version of vsDesigner also provides the database and reporting capabilities necessary to predict lines of code, number of modules, completion dates, responsibilities and project complexity.

One Picture Is Worth A Thousand Meetings

vsDesigner has powerful on-line help, and the User's Manual has an extensive tutorial. Your choice of Lotus-style menus or pop-up menus make command selection easy. The built-in word processor even emulates popular word processors to reduce learning time. Color graphics make your designs easier to understand.

A World-Class Design/Analysis Tool From The Best-Rated CASE Vendor

When you choose vsDesigner, you become a valued customer of Sage Software, the "Best-Rated CASE Vendor" in the Donohue 1989 Fortune 1000 Software Industry Report. Sage is committed to meeting your needs with excellent customer support, training and best-in-class tools including APSSPC and APS/MVS Application Generators, PCS, PolyMake and vsDesigner.

Both versions of vsDesigner require an IBM-compatible PC or PS/2 with 640K RAM, EGA monitor and a hard disk. A mouse is recommended. Printers supported are: Epson FX85, FX286 & MX80, HP LaserJet + and LaserJet Series II.

contacts in the card edge connector are arranged in two tiers: an upper tier, which carries all the ISA signals, and a lower tier, which carries all the new EISA signals (see figure 2).

Plastic keys prevent an ISA card from descending far enough into the slot to connect with the EISA signals but slide smoothly into notches in an ISA card. The metal "fingers" on the edge of an EISA card are thinner than those on an ISA card, and the new signals are interleaved with the old. This arrangement lets nearly twice as many leads reach the card edge.

Skeptics originally voiced concern that the insertion and removal forces of the EISA connector would be extremely high, but this has not turned out to be the case. I found that I was able to insert and remove EISA cards with one hand with relatively little effort.

The Intel Chip Set
Intel's EISA chip set—currently the only game in town—consists of three key components (see figure 3): the Integrated System Peripheral (ISP) and the aforementioned BMC and EBC.

The EBC generates cycles on the EISA bus and manages the buffers that connect it to the host CPU's local bus. The EBC also provides reset signals for the CPU and the cache controller, and it supports snooping on the EISA bus for either the 82385 or the 80486's internal cache. (It's not clear, however, whether it's possible to use the EBC with a more powerful cache controller or with a write-back cache.)

The EBC is closely coupled to (and, in fact, can't run without) the ISP. The ISP

Figure 1: The evolution from PC to AT to EISA. The expansion bus has contacts for both sides of the expansion cards. The original PC bus (black) had only 62 lines. The ISA 16-bit (AT) bus (blue) changes only line 8A of the PC bus but extends the bus with 36 new lines. The EISA bus (red) added 59 new lines at a different card depth from the ISA bus. Otherwise, the basic 62 lines stayed the same. Note that EISA attempts to "wrap" power and ground lines around clock lines and to position power rails so that they can be combined into thick traces on a motherboard. EISA nearly doubles ISA's number of bus lines.
EISA vs. the Micro Channel

IBM announced its Micro Channel architecture in 1987. Because EISA is being released more than two years later, its designers have had the benefit of being able to track industry experience with IBM's design. (Intel has developed both a Micro Channel chip set and the first EISA chip set.)

Some similarities are found between the two standards. As is true with Micro Channel systems, EISA systems can do full 32-bit transfers and can configure themselves automatically. (EISA systems can even tell you how to set the DIP switches on older ISA-type cards.) But unlike the Micro Channel, the EISA bus is fully synchronous and can perform cycles in long rapid-fire bursts. (The maximum throughput of the Micro Channel is 20 megabytes per second, while the EISA bus can support a maximum burst transfer rate of 33 megabytes per second.)

It may be easier to manufacture EISA boards than Micro Channel cards. They sport nearly double the surface area, making expensive surface-mount technology less of a necessity. An EISA adapter can use more than twice the power of a Micro Channel card. This will make peripherals like on-the-card hard disks, relay boards, and intelligent I/O boards with a large amount of RAM (e.g., disk-caching controllers and laser printer controllers) simpler and cheaper to implement on EISA than on the Micro Channel.

IBM makes Micro Channel machines with both 16- and 32-bit CPUs today. But while it's possible to build an EISA system with a 16-bit host processor (e.g., a 16- or 20-MHz 80286), it may be a while before you see such systems on the market. Intel—in an attempt, perhaps, to discourage the use of these second-sourced processors—supports only the 80386 and 80486 with its EISA chip set. Since Intel's chips are, at this writing, the only ones available to support the EISA bus, users may have to wait for silicon from other vendors before they can enjoy the economic benefits of the 80286—or even Intel's own 80386SX.

EISA's main advantage is that it does not have to "catch up" to the Micro Channel right away in order to be useful. Users can install cards designed for ISA machines while waiting for fast EISA cards to appear.

Glossary

bus master The entity that drives the address lines and the control signals for a bus cycle; with EISA, the bus controller can operate some of the lines on behalf of the bus master.

DMA Direct memory access, the process by which information is transferred between two slaves on the bus (e.g., a memory card and an I/O device), under the supervision of a DMA controller.

edge-triggered An edge-triggered interrupt is one that is activated by a transition in an interrupt signal on the backplane. Compare to level-sensitive.

ISA The Industry Standard Architecture, an unofficial designation for the bus upon which the IBM PC AT and compatible systems are built.

latched A signal is latched when its logic level is sampled into and held by a flip-flop. The flip-flop, or latch, is a memory element that is guaranteed to maintain its current output until explicitly set to a different value.

level-sensitive A level-sensitive interrupt is triggered by a specific level (high or low) of that signal. Electrically, it is possible for more than one source to drive a level-triggered interrupt line, but not an edge-triggered one. Compare to edge-triggered.

open-collector An open-collector bus line is one that is normally held at a logic high level by a pull-up resistor. Such a line can be pulled low by a chip output that presents a substantially smaller resistance between that line and a low logic level (ground). An output that drives an open-collector line usually consists of a single transistor whose collector is attached to the pin and nothing else (hence the name open-collector). The transistor is driven to saturation (i.e., turned on all the way) to present the necessary low resistance between the signal line and ground.

parity protection A system with parity protection includes 1 or more bits that accompany the data and indicate whether the number of ones (or zeros) in the data is odd or even. Parity bits can be used to check the integrity of the data. Virtually all IBM PC-compatible memory has 1 parity bit for each 8 bits.

refresh The process by which the DRAM chips are continuously recharged, without which they will lose the data they contain.

reset signals Signals that reset chips (e.g., the CPU) to their power-on conditions.

snooping The process in which a memory cache watches to see how peripherals are accessing memory. (See "Caching in on Memory Systems," March BYTE.)

synchronous In a synchronous system, all state transitions, including changes in the states of bus lines, are synchronized with the transitions of a clock signal. In an asynchronous system, objects can change state at any time.

tristate A driver whose output can be at a low logic level, a high logic level, or high impedance—which means that it does not control the bus line at all.

wait-state generator A circuit that causes a CPU (or other bus master) to increase the length of a bus cycle to accommodate slow memory or peripherals.

provides the host CPU with an interrupt controller, a DMA controller, counters, and timers. It also manages DRAM refresh, performs EISA bus arbitration, and tests for memory parity errors. The ISP even has a "slowdown" mode that delays the CPU and makes it appear to be running at a slower speed—a necessary feature for certain copy-protected software.

Because these two chips integrate so many necessary system components along with the EISA functions, manufacturers who use them are unlikely to use third-party AT chip sets (e.g., those made by Chips & Technologies) in the same machines. Thus, these companies will most likely have to develop their own complete chip sets to cash in on the market for EISA machines.

The final component in the Intel chip set is the BMIC. It’s intended to be used as a bus master interface on intelligent peripheral cards, and it has a local bus interface that’s specifically tailored for use with the 80186. The host can communicate with the processor on the peripheral card using "mailbox" and "doorbell" registers and/or via an interface that lets an entity on the EISA bus access the peripheral card’s local address space. It’s also possible to use the BMIC on a card that doesn’t have a local CPU.

**Identifying EISA Products**

Every EISA card supports a product identifier, which is accessible at a pre-assigned address determined by the slot the card is in. EISA product identifiers identify a peripheral card the same way that Micro Channel card IDs do, but with one important difference: EISA’s product identifiers are not centrally managed, as IBM’s are. The manufacturer creates them, following guidelines published by the EISA consortium.

**Which to Buy?**

The mysteries of EISA have fostered a wait-and-see attitude in the industry. Many corporate customers, unsure which standard will win, have deferred computer purchasing decisions until they know more about EISA.

By the time this article goes to press, there should be real EISA machines that users can see, benchmark, and compare to systems that use the Micro Channel (see the text box "EISA vs. the Micro Channel" on page 423) and other bus architectures.

Part 2

TWO TIN CANS AND SOME STRING

The investigation of network interfaces continues, this time with the popular NetBIOS.

Whether you've got a Macintosh, an IBM PC, a Unix system, or whatever, there's a slot or a connector somewhere on your machine begging to be hooked into a network. The begging has probably gotten louder—some networks are down to just a couple hundred dollars per connection. Soon, you may find yourself capitulating; you'll be bent over your machine, screwing a coaxial umbilical into an adapter card. There, you're jacked in. Now what?

In last month's installment, I described a simple file transfer application as a means of exploring the capabilities of two popular network systems: AppleTalk and NetBIOS. I began with AppleTalk, so now it's time for NetBIOS to show its stuff. I should warn you now, I'll frequently refer to Part 1 to draw parallels between the mechanics of NetBIOS and those of AppleTalk. You may want to keep your October issue on hand.

I spent a good portion of last month's article discussing the layers of functions of which AppleTalk is composed. It's important to be clear about layers, since the AppleTalk Transaction Protocol, which I used in my program last month, resides one floor down from NetBIOS. Specifically, ATP operates at the transaction layer, while NetBIOS operates at the session layer.

After reading this two-part series, you might conclude that NetBIOS has superior capabilities and that ATP should thus be scorned as inferior by comparison. That would be a mistake, for the simple reason that ATP is a transaction-layer protocol and is not meant to include functions from the session layer. For many applications, the transaction-handling functions of AppleTalk are more than sufficient for the task. AppleTalk does have a set of session-layer functions that I intend to cover in a future column.

As in AppleTalk, the upper-layer functions of NetBIOS call on functions in the lower layers. Unlike AppleTalk, most NetBIOS installations hide the lower layers from applications. For simplicity, I'll split the layers of NetBIOS into upper and lower. This division is of my own doing, and it's merely to group the layers into manageable portions.

Upper Layers

The NetBIOS Session Management Protocol (SMP) handles sessions (which I'll describe in a moment) between named processes on the network. A named process is similar to AppleTalk's socket client: a program that has made itself accessible to other programs on the network via a network-visible name.

The Name Management Protocol is the counterpart to AppleTalk's Name Binding Protocol (NBP). NMP allows the user to create unique, symbolic names that are made visible on the network. On AppleTalk, a name is associated with a socket client; in NetBIOS, a name is associated with one end of a session.

AppleTalk names are also more versatile than NetBIOS names. AppleTalk names consist of three fields: zone, object, and type. These fields could be used as filters, or as a mechanism for dividing a physical network into logical subsets (departments). NetBIOS names are flat strings of 16 characters, and NetBIOS provides no filtering or partitioning. For example, you can't perform wild-card searches to locate all the names on the network beginning with "Print." Application programs have to add their own wild-card-matching capabilities.

The NetBIOS User Datagram Protocol is analogous to AppleTalk's Datagram Delivery Protocol. As with AppleTalk's DDP, UDP manages packet transmission from source to destination with no guarantee of delivery. UDP packets can be up to 512 bytes long. There are some advantages to using DDP. Its usage does not require you to first set up a session; you just pick the name you want to send the datagram to and fire away. Also, you can use DDP to send broadcast datagrams, which are sent to all names on the network. The file transfer program I'll present makes no use of UDP functions; for an application of datagrams, see "Understanding NetBIOS" in the January BYTE.

Finally, the NetBIOS Diagnostic and Monitoring Protocol has no real counterpart in AppleTalk (except, perhaps, the AppleTalk Echo Protocol, AEP). DMP commands allow a program to acquire status information from local as well as remote nodes on the network. You can also obtain traffic information, along with data such as the number of cyclic-redundancy-check errors that have occurred, the number of collisions that have occurred, and more.

Lower Layers

The lower layers are less clear than the upper and depend largely on the hardware in use. The transport layer on the PC Network uses IBM's proprietary Reliable Stream Protocol. Other network systems use the Transmission Control Protocol. You can find the Datagram Transport Protocol at the transport layer, as well; UDP and DMP use it heavily.

Beneath the transport layer resides the network layer, which often becomes confused with the layer beneath it. IBM PC networks use the Packet Transfer Protocol, which more or less calls the Link Access Protocol directly. Other vendors may use XNS (Xerox Network Systems), TCP/IP, or—in the case of Novell's NetBIOS emulation—IPX.

Finally, the physical layer is inhabited continued.
by a diversity of creatures. Here you'll find token rings, Ethernets, or even RS-232 connections. As confusing as all this seems, the reality is that unless you're in the business of actually building network hardware, you usually don't have to work in the cat- acombs of the lower layers. I'll focus on the upper layers (the SMP and NMP), since this month's program deals with them.

## Transactions and Sessions

Aside from the fact that NetBIOS and AppleTalk run on completely dissimilar machines, the main difference in the kinds of commands available under these two network systems can be traced to the difference between a transaction and a session. In last month's column, I went into some detail concerning an Apple-Talk transaction: Communication between network entities in ATP takes place as a series of request/response cycles. The requester says “Give me some data,” and the responder replies with “Here it is.” The relationship between applications on ATP does not go beyond this request/response exchange. This is no surprise, since ATP is, after all, a transaction-layer protocol.

Applications under NetBIOS, however, establish a session between one another. A session is like a telephone call. First, both parties must make themselves visible on the network using the ADD NAME command—analagous to providing all phone system subscribers with a universal phone book. Next, one party calls the other using the NetBIOS CALL command. The second party answers using the LISTEN command. Once they have established the session, both sides can talk or listen using the commands SEND and RECEIVE. In fact, both sides can simultaneously send and receive; hence, NetBIOS is said to support full-duplex operation.

NetBIOS, then, is a step up from the transaction layer of ATP. A NetBIOS session can contain numerous request/response transactions. Furthermore, either side can play the role of requester and responder. The dialog continues until one (or, preferably, both) of the parties issues the HANG UP command and terminates the connection.

### Talky Talk

You issue commands to NetBIOS via a data structure known as the NetBIOS control block (see table 1 for a description of the NCB's fields). The NCB's function is roughly equivalent to that of AppleTalk's parameter block, although this is more coincidental than intentional. Each NCB is a message sent to NetBIOS describing a command that the calling application needs carried out. The NCB remains the property of NetBIOS while the command is in progress. (I'll present NetBIOS commands in uppercase.)

Ordinarily, conjuring up NetBIOS involves loading up the fields of the NCB with the information appropriate for whichever command you want NetBIOS to perform, executing an INT 5CH, and examining the RETCODE field of the NCB when NetBIOS returns. (If you're in assembly language, the AL register mirrors the contents of the RETCODE field.) NetBIOS commands issued in this fashion are referred to as “wait” commands; your program waits for the command to complete before proceeding—not the best use of the computer's time.

If you set the high bit of the NCB's COMMAND field to a 1, that command becomes a “no-wait” version. NetBIOS will return immediately and multitask with your application. Your program can be performing computations while NetBIOS twiddles its thumbs, waiting for...

response packets and such.

If you’ve pointed the POST field to an interrupt-handling routine (i.e., one that concludes with an IRET instruction), NetBIOS will call that routine when the command has completed. The post routine can examine the RETCODE field and take appropriate action. Alternatively, you can clear the POST field, call NetBIOS using a no-wait command, and simply monitor the COMMAND COMPLETE field. NetBIOS will set COMMAND COMPLETE to 0 when the job is done. (Sharp-eyed readers will recognize these two ways of handling no-wait commands as being interrupt-driven and polled techniques, respectively.) The sample program I’ve written this month completely wimps out and uses nothing but the wait version of commands. I apologize for my cowardice.

To be fair to AppleTalk, most of its commands can be executed in no-wait fashion, as well. AppleTalk refers to no-wait commands as asynchronous. Calling a routine asynchronously causes an immediate return to your program, whereupon AppleTalk does its work in the background. (For assembly language programmers, you signify an asynchronous command by setting bit 10 of the trap word of the call.) The parallels to NetBIOS go further: You can either poll the AppleTalk command’s parameter block, looking at the ioResult field (typically at offset 16 in the parameter block) and waiting for it to change from 1, or you can specify a completion routine whose job is identical to NetBIOS’s post routine.

The Real Stuff

The code fragment in listing 1 shows most of the source code for the sending side of my NetBIOS application. I’m not including the receiver’s source code for the simple reason that it is virtually a twin of the source in listing 1. The major difference is that the receiver issues a LISTEN command instead of a CALL, and a RECEIVE command instead of a SEND. (You’ll notice functions in listing 1 corresponding to NetBIOS commands. It should be easy to match the function with the command.)

In NetBIOS, both ends of the session log a name on the network using the ADD NAME command. You’ll understand this requirement in a moment. (This is in contrast to ATP, where only the responding side of a transaction must use the NBP to place its name on the network. See last month’s column for details.) As you might expect, each name must be unique. The examples that I’ve provided allow you to define the names as command-line arguments. This permits numerous versions of the same program to run simultaneously on the network.

When a program calls ADD NAME, NetBIOS’s first job is to make certain that no other program has laid claim to the name. It does this by broadcasting a name claim packet across the network. Actually, it broadcasts the packet several times as a fail-safe measure. If no other station contests the name claim, NetBIOS adds the name to its local name table. As with AppleTalk, a single station on the network can be known by several names—aliases, if you will. A typical NetBIOS installation can handle up to 12 names per station.

Once each side has added its name to the network’s name table, it’s time to

establish the session. Harking back to the telephone call analogy, one station—the computer sending the file in my application—issues a CALL. This command requires as one of its parameters the name of the station being called (variable "his name in the listing). The system at the other end of the session—the computer receiving the file—issues a LISTEN command. This command takes as a parameter the name of the station to listen to. When the station listening "picks up" on the station calling, a session has begun. (You see why both stations need to use the ADD NAME command?)

Both the CALL and LISTEN commands return a session number. This 8-bit number is similar in function to a file handle. As you call NetBIOS commands, you indicate which session partner the command is meant for by using the session number. This is more than just a convenience; a single computer can have several simultaneous sessions active. When one command has completed, your program has to figure out which one completed in order to know what action to take next. With no session number, your program would have to scan tables of 16-character names for the one matching the completed NCBI. It boils down to this: 8 bits are easier to carry from routine to routine than a 16-character name.

You send a message to your session partner with the SEND MESSAGE command. This command takes as input the session number and a pointer to the buffer holding your message. A message can be up to 64K bytes long. The program on the receiving end calls the RECEIVE MESSAGE command to accept the message. Again, this will require a session continued on page 482.

The Buyer's Mart

A Directory of Products and Services

The Buyer's Mart is a monthly advertising section which enables readers to locate suppliers by product category. As a unique feature, each Buyer's Mart ad includes a Reader Service number to assist interested readers in requesting information from participating advertisers.

Rates:

1x—$525 3x—$500 6x—$475 12x—$425

Prepayment must accompany each insertion. VISA/MC Accepted.

AD FORMAT: Each ad will be designed and typeset by BYTE. Advertisers must furnish typewritten copy. Ads can include headline (23 characters maximum), descriptive text (250 characters is recommended), but up to 350 characters can be accommodated, plus company name, address and telephone number. Do not send logos or camera-ready artwork.

DEADLINE: Ad copy is due approximately 2 months prior to issue date. For example: November issue closes on September 8. Send your copy and payment to THE BUYER'S MART, BYTE Magazine, 1 Phoenix Mill Lane, Paterborouogh, NH 03458. For more information call Brian Higgins at 803-324-3754.
WHEN EASE-OF-USE COUNTS

Reading bar codes should be as easy as a "quick flick of the wrist." But many bar code readers require you to flick and flick and flick and Flick until the bar code label is finally read. PERCON designed bar code readers that are as easy as a "quick flick of the wrist." PERCON

WHEN EASE-OF-USE COUNTS

We also sell pre-printed labels. Our hardware can work with any of the most widely used bar code label printing software. Whether you have occasional word-processed memos or full-length textbooks, a Duxbury Translator enables conversion to properly contracted and formatted text. The choice of professional publishers worldwide since 1975, Duxbury software for MDSOS, Macintosh, and other systems supports English Braille and Latin East European (bilingual) Braille, French, Spanish, Arabic, and others.

PERSON: THE BAR CODE SPECIALISTS

If you have questions about bar code technology, it's nice to know an experienced, friendly bar code specialist is only a phone call away. Want to know where to start or where to find hard-to-find bar code accessories? Call PERCON for answers.

PERCON: THE BAR CODE SPECIALISTS

New: Remote A-BUS! Use the new Serial (RS-232) Adapter or Processor to control any A-BUS system. Cards can be up to 500 ft away using phone type cable, or off premises using a modem. Call or send for the new A-BUS Catalog which covers all the products.

A-BUS™ Magic

Classroom to advanced industrial applications.

Be a Wizard in your Lab, Factory, College, Home...

It used to be difficult and costly to do process control, robotics, data acquisition, monitoring and sensing with your computer. Now the low-cost A-BUS system makes it easy to do almost any project you can imagine.

Versatility. A-BUS cards handle most interfacing, from on/off switching, to reading temperatures, to moving robot arms, to counting events, to sensing switches...

Adaptability. The A-BUS is modular, allowing expansion well beyond your needs. It works with almost any computer, or even as a remote data station with the new serial adapters.

Simplicity. You can start using the A-BUS in minutes. It's easy to connect, and software is a breeze to write in any language.

Reliability. Careful design and rugged construction make the A-BUS the first choice in specialized I/O.

An A-BUS system consists of: An A-BUS adapter plugged into your computer. A cable to connect the adapter to 1 or 2 A-BUS function cards. The same cable will also fit an A-BUS motherboard for expansion to up to 25 cards in any combination.

Important

All A-BUS Systems: Come assembled and tested Include detailed manuals with schematics and programming examples Can be used with almost any language (BASIC, Pascal, C, assembler, etc.) using simple "IN" and "OUT" commands (PEEK and POKE on some computers) Can grow to 25 cards (in any combination) per adapter. Provide jumper selectable addressing on each card. Require a single low cost unregulated 12V power supply. Are usually shipped from stock. (Overnight service is available.)

Inputs, Outputs, etc.

Analog Input: 8 analog inputs, 0-5V in 20mV steps (8 bits), 0-10V range possible, 7500 conversions/second.

12 Bit A to D: Analog to digital converter, input range -4V to +4V, expandable to 100V. On-board amplifier. Resolution 1mV. Conversion time 130ms. 1 channel. (Expand to 8 channels with the RE-156 card.)

Auto: 146: $153

Relay Card: 8 individually controlled industrial relays each with status LEDs (3A at 120VAC contacts: SPDT). RE-140: $142

D/A converter: 4 Channel 8 Bit D/A converter with output amplifiers and separate adjustable references.

24 line TTL I/O: Connect 24 input or output signals (TTL 0.5V levels or switches), Variety of models. (8/16/32/64).

Digital Input: 8 optically isolated inputs. Input can be 5 to 100V voltage levels or switch closures.

Digital Output Driver: 8 channels. 250mA at 12V. Drive relays, solenoids, stepper motors, lamps, etc.

Touch Tone Decoder: Each tone is converted into a number which is stored on the board.

A-BUS Prototyping card: 4x6.5" card. Will accept up to 10 I/O's. With power & ground bus.

Counter Time: Three 16 bit counter/timers. Use separately or cascade for long (46 bit) counts.

Motion Control

Smart Quad Encoder Controller: The world's finest. On board microprocessor controls four motors simultaneously. Uses simple English commands like "MOVE ARM 103" (INCHES) LEFT!. For each axis, you control coordinates (absolute or relative), range, speed, units, scale factors, etc. Many inputs for limit switches, etc. On the fly reporting of speed, position... Built in drivers for small motors (such as MO-100 or 102). SC-149: $299

Options: 5 multichannel power boosters for 1 or 2 A-BUS ADAPTERS, RE-156: $93

Remote "teach" keys for direct motor control. RC-154: $215

A-BUS Adapters

- Can address 64 ports and control up to 25 A-BUS cards.
- Requires one cable. Motherboard required for more than 2 cards.
- A-BUS Parallel Adapters for:
  - IBM P-PCXT/A & compatibles. Use one short or long slot.
    AR-135: $89
  - Apple II+ II Plus into any on slot cards.
    AR-134: $89
  - Commodore 64, 128 Plug into Expansion Port on back.
    AR-138: $98
  - TRS-80 Model 2, 200, 4200 via 40 pin "System bus".
    AR-136: $176
  - Model 100 "Turbo Port/II" Plug into serial port.
    AR-137: $125
  - TRS-80 Model 3, 4, 4D/RT/IV-IVB cable available 5-10 pin in serial.
    AR-135: $125
  - TRS-80 Model 5 Plug into 80 pin expansion bus.
    AR-139: $98
  - Tandy Color Computer 95 cable. Multiple or Y-Cable
    AR-140: $49

A-BUS Cable: Necessary to connect any parallel adapter to one A-BUS card or to the motherboard. 50 pin, 3 ft.

Special Cable for two A-BUS cards.

Serial Adapter: Connect A-BUS systems to any RS-232 port. Allows up to 500 ft from computer to A-BUS.

Serial Node: To connect additional SA-129/A-BUS systems to a single RS232 serial port (max 16 nodes).

Serial Processor: Same as above but built in BASIC for on-line monitoring, logging, decision making, etc.

Motherboard: Holds up to 5 A-BUS cards in sturdy aluminum frame with card guides. A sixth connector allows using cables CA-161: $32 additional Motherboards to be added.

Power Supply: Power pack for up to 4 cards.

Ordering Information: We accept Visa, Mastercard, Checks, and M.O. C.O.D. is $1 extra. Purchase orders are subject to credit approval. CT residents add 7.5% sales tax. Shipping: $4 per order (usually UPS ground), UPS 2nd Day Air: $4 extra. Next Day service available. Canada: $10 per order (M/H). Outside US and Canada: 10% of order total.

About Alpha Products

Founded in 1976 for the purpose of developing low cost I/O devices for personal computers, Alpha has grown to serve over 7000 customers in over 60 countries. A-BUS users include many of the Fortune 500 (IBM, Hewlett-Packard, Tandy, Bell Labs, G.M., etc.) as well as most major universities. A-BUS products are U.S. designed, U.S. built, and serviced worldwide.

collimator—alignment in an optical read or write system, and the system collimates the diverging laser light. The laser diode is standard, but a metal guide laser diode with a 90° output angle can be added to create a metal line guide. This collimator pen containing a MOVPE grown gain is collimated with a monitor and expanded to an output that can be used as a target. The housing is collimated with a metal guide laser diode with a 90° output angle.

Computers for the Blind
Talking computers give blind and visually impaired people access to electronic information. The question is how and how much?
The answers can be found in The Second Beginner's Guide to Personal Computers for the Blind and Visually Impaired published by the National Braille Press. This comprehensive book contains reviews, written by blind users, of software that works with speech.

The following articles are in the works for the December issue. Unless something unexpected happens, we'll be able to present them all.

**PRODUCTS IN PERSPECTIVE:**

One of the perennial buzzwords in computing is CASE (computer-aided software engineering). What is it? How well do CASE products perform, and what do they offer? Our December **Product Focus** zeros in on the subject.

System reviews will concentrate on two new 80386 machines from Acer and ADC.

In the **hardware review** category, we have a roundup of Macintosh 32-Bit QuickDraw boards and QMS’s new ColorScript printer, which promises color PostScript at a groundbreaking price.

**Software reviews** include Common View, a C++ class library for Windows and Presentation Manager, and Watcom 386 C, a compiler that taps the full power of Intel’s 80386.

Scheduled **application reviews** are Planet Software’s library of functions that links Clipper applications to SQLBase; Hewlett-Packard’s Accelerated X Window Display Server (AXDS/PC), an excellent budget saver for departments needing to turn IBM PC ATs into quality color X Window user stations; Publish It for the Mac; and Project Scheduler 4, the first midrange, graphically based project management software for the PC.

Our new **Reviewer’s Notebook** section has articles on Aura Systems’ ScuzzyGraph II, which gives other Macs the high resolution and color of their Mac II cousins; Visible Software’s Dr. Pascal; The Rendition II, a medium-to-high-resolution (1024-by-768-pixel) graphics controller for IBM PC ATs and compatibles from Renaissance GRX; and a second look at an updated United Innovations’ wall-mount Mural 8000 plotter.

**IN DEPTH:**

The elusive dream of AI, something that has yet to materialize in a substantial form, is an ongoing quest for software and hardware designers. But some of our five primary senses have been replicated with mixed results. For some specialized tasks, mechanized “seeing,” “hearing,” and “speaking” have emerged at levels competitive with—and sometimes beyond those of—flesh and blood. For most other tasks, however, these computer-based “senses” are still woefully inadequate. Our In Depth section will concentrate on this burgeoning field of sound, voice, and image processing.

**FEATURES:**

This is the tenth anniversary of a product class, the spreadsheet, that many credit with first breaking the ice for the personal computer in business situations. How has the spreadsheet fared over the past decade, and what do its developers think now of their electronic progeny? Tune into the December Features section for some interesting answers.

Also slated for December, Dick Pountain has written a piece on the Occam Transpiler, now under development, which will make writing software for parallel processing easier.

Also, look for the regularly scheduled features of our columnists in both the **Expert Advice** and **Hands On** departments, industry news in Microbytes, new hardware and software of note in What’s New, and the latest in noteworthy items tested by BYTE staffers in **Short Takes**.

Confidence

In an effort to make your telephone purchasing a more successful and pleasurable activity, The Microcomputer Marketing Council of the Direct Marketing Association, Inc. offers this advice, "A knowledgeable buyer will be a successful buyer." These are specific facts you should know about the prospective seller before placing an order:

Ask These Important Questions

- How long has the company been in business?
- Does the company offer technical assistance?
- Is there a service facility?
- Are manufacturer's warranties handled through the company?
- Does the seller have formal return and refund policies?
- Is there an additional charge for use of credit cards?
- Are credit card charges held until time of shipment?
- What are shipping costs for items ordered?

Reputable computer dealers will answer all these questions to your satisfaction. Don't settle for less when buying your computer hardware, software, peripherals and supplies.

Purchasing Guidelines

- State as completely and accurately as you can what merchandise you want including brand name, model number, catalog number.
- Establish that the item is in stock and confirm shipping date.
- Confirm that the price is as advertised.
- Obtain an order number and identification of the sales representative.
- Make a record of your order, noting exact price including shipping, date of order, promised shipping date and order number.

If you ever have a problem, remember to deal first with the seller. If you cannot resolve the problem, write to MAIL ORDER ACTION LINE, c/o DMA, 6 E. 43rd St., New York, NY 10017.

This message is brought to you by:

number and a buffer pointer. In my application, the first character of the message buffer contains either a “D”—indicating that the message buffer holds data—or an “E”—indicating that the message buffer is empty and the complete contents of the file have been transmitted. It's not unlike the way XMODEM works, only I don't supply any error-checking and correcting code. NetBIOS does that.

The heart of the program is a simple loop. The program reads a 1K-byte block from the file, places the data in the message buffer, and sends the message out using the NBIos_SessionSend() function. The receiving end is doing much the same thing: receiving the data and writing it to the file, looping until it receives an EOF (End of File) block.

It's important to note that, once the session is established, the application issuing the CALL command has no special advantage over the application issuing the RECEIVE command. Communication between session partners is bidirectional; both sides of the session can send as well as receive.

Once the business of a session has concluded, both sides terminate the session by calling the HANG UP command. If any RECEIVE commands are pending, they're terminated. If any SEND commands are still awaiting completion, NetBIOS delays the HANG UP until those commands have either completed or timed out. My sample program follows the HANG UP command with a DELETE NAME command, clearing the local session name from the name table.

**Hang Up**

This has been only a brief foray into the coaxial-canopied jungles of networking. There's a great deal more to AppleTalk and NetBIOS that I haven't covered here; you'll have to explore it on your own. By now, however, you should be over your fear of network programming being something just this side of alchemy.

I've included a bibliography of some great sources of information on NetBIOS and AppleTalk. Like me, you'll be amazed at what you can do with software and hardware that—seen from the future of fiber-optic LANs stretching across the globe—will surely seem not much more than two tin cans and some string.

---

**Editor's note:** This month's program comes in three parts. NETSEND.C sends a file via NetBIOS to the NETREC.C program. Both make use of a library of NetBIOS routines in NETLIB.C. All source code is available in a variety of formats. See page 5 for details.

Don't leave your users lost in a maze of information!

A knowledge processor communicates knowledge - the natural extension of everything we do on a computer.

It's the intelligent integration of everyday resources like data, text, logic, graphics, and video that turns information into knowledge.

KnowledgePro is the first knowledge processor. It combines a high-level, object-oriented programming language with hypertext and expert systems technology.

KnowledgePro gives you a total development environment with the tools you need to create intelligent multi-media applications.

PC Magazine, Holland... “KnowledgePro is the first of a new generation of software, the knowledge processor...it has the power of, for example, Pascal or PROLOG, but the programmer isn't troubled with the technical details.”

PC Week, USA... “It's rare, but every so often a PC application comes along that breaks new ground and creates a fundamentally different way to use computers. According to its corporate users...KnowledgePro does just that.”

Infoworld... “We don't live in a computational world. If we're going to move knowledge around we need tools...The same person who will learn macros in Lotus can learn this.”

KnowledgePro costs $495 with no runtime fees. It runs on IBM PC, XT, AT and PS/2 compatible machines with 640k of memory and a hard disk. A working demo with a 100 page manual is available for $33 including shipping ($38 foreign) with credit towards purchase of the full system.

Find out what knowledge processing is all about. Call 518-766-3000 (FAX 518-766-3003) or write to Knowledge Garden Inc., 473A Malden Bridge Rd., Nassau, NY 12123, USA. Amex, Visa or M/C accepted.
About 1800 it occurred to Napoleon that France, which had given the world the metric system, should also sponsor the world's first truly accurate log tables. When he snapped his imperial fingers, lo, it got done! It was done, in effect, by computer. High-level sages chose the algorithms. Programmers (as we'd now call them) worked out sequences of steps to transform each input into a multidigit real number. Now for the hardware.

That consisted of numerous men with quill pens, seated at trestle tables on a vast gymnasium floor. This even pioneered the RISC philosophy, the men having been chosen for deft adding and subtracting, undistracted by any temptation to multiply or divide. The latter were dodges they had somehow never been taught, and specialists of their ilk were at a premium. Someone had observed that a man who added 3.99 to itself five times made fewer mistakes than a wise fool tempted by the highbrow shortcut of just multiplying 3.99 by 6. (The Greeks, by the way, had a word for wise fool: It's sophomor.)

Turn now to figure 2.5 of Beyond the Limits. In the late 1940s, little seems to have changed. We're in a "bullpen" at McDonnell Douglas, where an airplane is being designed. The photograph, which includes just a part of the room, is something that Franz Kafka might have hallucinated. In shirtsleeves, clutching ballpoints, perhaps 100 people hunch over papers. We're to imagine dozens more out of the frame to left and right; imagine, too, all of them putting in tense 8-hour days.

That's a snapshot of the computational machine that had put away the bad old times when "airplanes with structures too weak crashed, while others flew safely but poorly because they were overweight." For we now have "an adequate theory of structural analysis." Unhappily, it demanded millions of calculations.

Then somebody at Northrop Aircraft noticed in the accounting department an amenity the engineers didn't have: a vacuum-tube gizmo from IBM "that could multiply two numbers together and punch the results on a card in a few seconds." One got borrowed and was connected to another IBM machine that could print results on paper. And at IBM, where the policy of renting, not selling, equipment implied a captive customer unfree to make modifications, they were nonplussed at first, then alerted. Aha! "The basis for a new product they could sell to engineering firms that might otherwise not buy from IBM." That's the understatement of the century. Thus, 1949 gave us IBM's Card Programmed Calculator.

And we're off. The theme of Paul E. Ceruzzi's fascinating book is simply that the American computer industry was aerospace-driven from the very start. It was aerospace that needed all that number crunching. As I've noted in a previous column, astronomers also needed it. Astronomers, though, could never put federal billions on the table. The national interest is more tightly involved with the B-52 than with the orbit of Pluto.

The Pentagon, for years "the largest office building in the world," was built in 1942 to house myriad clerks doing what the erudite serfs in that McDonnell Douglas photo are doing: chores like working out how to "train a maximum number of pilots in a minimum time period with a minimum number of training airplanes and instructors."

That led to SCOOP (scientific computation of optimum problems), which by 1948 George Dantzig had reduced to sets of linear inequalities. Those sets—you guessed it—could finesse the problem, but they entailed scads of computation. (A sample query—what's in the cheapest bag of groceries with your minimum daily requirement of merely nine nutrients?—consumed 21 days at desk calculators.)
ALL CHARGECARD
Memory Management
Rupp Corporation is pleased to feature the ALL CHARGECARD, an advanced Memory Management Unit (MMU).

Product Profile: It is a credit card-sized board that installs directly into your PS/2 or AT CPU socket on your system board. A hardware-supported memory mapping technique is used to intercept addresses on their way to and from the processor.

ALL CHARGECARD is the one way to standardize all your 286 computers. Now you can run all DOS applications on all of your computers without being concerned about the type of memory you have or need: EMS, FEMS, or EEMS. Just set all your expanded memory to extended memory and buy only extended memory in the future. With complete support for the latest LM 4.0 memory specification, ALL CHARGECARD lets you position the 64KB “page frame” in the region above your resized DOS user program area.

ALL CHARGECARD lets you use your memory for DOS multitasking, multitasking and windowing programs today, and without having to rework your memory configuration. Whatever your reason for outgrowing DOS, the whole process of circumventing its limitations will work much faster and easier with a good memory management unit.

PM3011 CACHING CONTROLLER
Up to 16MB of hardware implemented cache for ESDI, ALL of ST506 drives.

Product Profile: The PM3011 caching controller is the single most effective performance improvement tool available for disk-intensive applications. The PM3011 accesses data in as little as 0.5ms; that's 50 to 150 times faster than a random disk access.

Advanced Caching Algorithms: Such advanced caching features as disk read ahead and elevator sorting during cache write-back increase disk performance to levels unattainable by non-caching controllers. The controller's on-board 68000 microprocessor enables it to access the disk drive at the same time as the computer reads or writes to the controller cache.

Compatibility: Since PM3011 caching controllers operate transparently to the operating system, special software drivers or ROM BIOS changes are not required.

Up to 16MB of Cache: The PM3011 Cache RAM is expandable from the on-board 512KB to 16MB with the optional Cache Expansion board. The cache is totally independent from system memory and does not require device drivers.

PM3011/70 Caching Controller With 512KB cache

BatPak
Ten-Year Battery for an AT

Something that most AT users will experience—probably sooner than later—is the demise of the lithium or nickel cadmium battery that helps retain the machine’s configuration information.

The solution? A rechargeable AT battery that has an expected lifetime of greater than 10 years. Computech's new BatPak is so easy to install. You simply connect it to a standard disc drive power connector, then plug the BatPak's cable into the AT external battery connector. Then make a note in your 1997 calendar to “change battery.”

Exceptional Computer Products
By 1952 a Pentagon UNIVAC, exactly the second UNIVAC to
be built, was crushing away at military SCOOPs. It weighed
15 tons, and just moving it into the Pentagon took three months.
Today's equivalent sits on a desktop.

In 1953 IBM began shipping its answer to UNIVAC, Type
701. That rented for $15,000 a month. Of the 19 that were
built, aerospace companies took 11. Two years later, the same
companies were lining up for its successor, Type 704. You see
the pattern.

We now pay the small sum we do for an IC because Air Force
and NASA guidance drove the development of
digital circuits.

Then there was missile tracking, which helped decide the an-
alog-versus-digital face-off. To model something happening
smoothly—moreover in real time, meaning fast enough for the
model to be of any use—analog once seemed just the thing.
Your nondigital watch is an analog computer. So, by one of
Ceruzzi's smartest examples, is your car's differential gearing,
which computes "a continuous weighted average" either when
you're running straight or when you're rounding a curve and
spinning the outer drive wheel faster than the inner.

Either way, "the differential gear distributes the engine's
power so that the sum of the rotations of the two rear wheels is
proportional to the rotation of the drive shaft." Now that's
computation. And just seven toothed wheels can accomplish it.
There's no time lag while we absorb numbers and get sums; and
output is just what's wanted: torque, not more numbers.

The parallel with tracking a missile seems perfect: What we
want is a correction to apply if it's veering off course. Yet digi-
tal won, for the following two reasons. It suffers less from in-
accuracy buildup as the problem gets more complex (and analog
adds more gears). And it needn't be torn down and rebuilt from
scratch each time we change the equation we want modeled.

Close as we are to the end of what we deem a digital century,
it's hard for us to imagine how cogent such an issue could seem
in our fathers' lifetime. Well, RAYDAC (1953) embodied a
crucial decision: Do things digitally. When Raytheon installed
RAYDAC at Point Magu, it was state of the art: tape data stor-
age, even parity checking! Although it did many things, it
never did track missiles, its memory unit (sound pulses a-
bounce in a tank of mercury) being too slow for real-time re-
trieval. But its sibling, Whirlwind, another Navy project, led to
the Air Force's SAGE (for Semi Automatic Ground Envi-
ronment), which was still monitoring North American skies as late
as 1982. And "SAGE was the beginning of all systems, hard-
ware and software."

But SAGE was big, and cramming a computerized guidance
system into a gunnery or, later, an Apollo capsule meant
something small. True, Bell Labs hadn't developed the transis-
tor with either aerospace or computers in mind. Yet "aerospace
engineers will shave weight from anything they can": by 1957
electronics made up half the cost of any missile, and "Air Force
and NASA guidance drove the development of digital circuits
in the 1960s." Which is why we now pay the trifling sum we do
for an IC: hence the $10 calculator, the Walkman, and the
home computer.

By 1965 IC pricing was down fivefold, to $12. The Air
Force, the largest single purchaser, was arming hundreds of
Minutemen at 2000 ICs each. And ICs since 1962 had been
MIT's designated decision modules for the Apollo Guidance Computer that it had under development for lunar
landings. That happened under an MIT lab director named
Charles Stark Draper. Asked (in 1960) when the equipment
would be ready, he said, "Before you need it." Asked (incred-
ibly), "How do we know you are telling the truth?" he said,
"I'll go along and run it." (They didn't take him up, in any
sense; by the time Apollo 11 moon-landed, Draper was 68.
His equipment, though, yes, all worked.)

It worked so well that alarms were set off that resonate yet.
Can people and computers safely interact? Apollo (if you re-
member) meant detaching the lunar module from a vehicle in
lunar orbit. The module was to (1) settle down on the moon; (2)
stay while astronauts probed about, took rock samples, and set
up a flag; and (3) remount on its own power and rejoin the
orbiter for return to earth. That was the choice among several
scenarios fiercely debated in the early 1960s; for details, see
Charles Murray and Catherine Bly Cx's Apollo: The Ten-Year
Race to Put a Man on the Moon (Simon & Schuster, 1989), a
book that tells the moon-shot story not. Tom-Wolfe-wise, from
the astronautic viewpoint, but from what now seems more co-
gen, the administrative.

Well, in 1969 the very first all-digital autopilot had two jobs.
One was deciding about thrust and steering during descent to
the moon. The other was aiding rendezvous with the orbiter.
And how its memory was limited! Nothing like disk drives—
wires wound through ferrite cores. Splice in a feature, slice
another out.

Alas, combined functions overloaded it by 13 percent, a
glitch that tests failed to reveal. So on the last stages of the
descent, an alarm no one could be sure about sounded repeatedly,
and Houston went half mad, and Neil Armstrong's pulse rate
hit its maximum (I'm not making this up), until he alighted
with 24 seconds of reserve fuel.

It was afterward that he thought up his famous words,
"That's one small step for a man...." (In a sense he told me
in 1976), he didn't occur to him he'd better have something
ready to say. The sweat must have been still on his brow.

That alarm, though, keeps sounding. The computer's intol-
erance of ambiguity: Does that interfere with its usefulness to
us, our ability to interact with it? That debate rages, muted
because it's so seldom that we're dealing with life or death under
a spotlight. I'll contribute: The computer is a difference detec-
tor. The human mind is a similarity detector. I'll go into what
that implies another time.

The HASP Family: Software protection you can trust. Software protection you can afford.

As a software producer, you can't market your software without protecting it. Aladdin Knowledge Systems is a leading company in the field of software protection: during the last four years we have enabled hundreds of software producers in more than 30 countries to protect their software.

We, at Aladdin, believe that software protection is a serious business which demands a high level of knowledge and expertise in order to give you a reliable and lasting protection for your intellectual property.

Basing our research on the experience we accumulated with HASP-II, we are now launching two new HASP plugs designed to protect your software through the coming decade - HASP-3 and MEMOHASP: software protection for the nineties.

HASP-3™ connects to the parallel port* of PC/XT/AT and PS/2 computers and compatibles. HASP-3's advanced technology prevents reverse engineering, making the plug virtually un-crackable.

- Access Password - A unique password supplied to the software developer is needed in order to access the plug's code. The number of available codes and passwords is enormous (more than 256,000 billion!).
- The Highest Compatibility - The plug is transparent to the operation of the computer and the printer.
- Full Software Support - All the software required to link HASP-3 to all high-level languages - including the most sophisticated anti-debugging protection and a utility program to protect EXE/COM files - is supplied.
- Daisy-chaining - Several plugs can be connected one behind the other.
- There is no Battery in the Plug!

MEMOHASP™ is the last word in software protection. In addition to all of HASP-3's advantages, MEMOHASP's 1000 bits of read/write memory enable you to:

- Assign a unique code to every software user.
- Control access to different software modules or different software packages.
- Distribute demos which can be activated only a certain number of times.
- Rent or lease software.
- Save passwords or other sensitive information.

Most important of all: all the above operations are performed on the PC without any special programming equipment!

RISCs: UNSAFE AT ANY SPEED

Is the quest for more and more MIPS worth the RISC?

The newest technical workstations are powered by RISC microprocessors. These microprocessors will soon be available as coprocessors for personal computers, to speed up compute-intensive tasks such as image processing. Yet RISC microprocessors remain controversial, and for good reason.

RISC designers increase average instruction execution speeds by eliminating the complex, multiple-cycle instructions (e.g., floating-point arithmetic and character-string manipulation) found in conventional processors. The remaining instructions (typically register-to-register operations) can then be performed in one simplified machine cycle—the minimum number of steps in which an instruction can be executed.

And the discarded instructions? Their functions are taken over by software, auxiliary coprocessors, or cache-resident subroutines. In any case, they no longer detract from the MIPS (for millions of instructions per second) ratings of the RISC processor. RISC architects eagerly sacrifice instruction-set power to increase MIPS. Unfortunately, as Nick Tredennick (a senior IBM researcher who specializes in processor design) put it, "MIPS are like RPM: They tell you how fast the engine is running, but they don't tell you if it's doing any work."

Whether you think the RISC approach really yields better performance depends on how you measure performance—and there is no general agreement on how to define computer performance, let alone on how to measure it. In any case, processor speed is only one aspect of computer system performance.

Nevertheless, RISC designers focus on processor speed because it is the main determinant of computer performance for their favorite workloads: purely computational tasks. RISC architects make another convenient simplification: They discard instructions that have a low "average frequency of execution."

When an instruction, such as a multiple-character MOVE, is discarded due to low frequency of execution, its function is typically taken over by software. However, that MOVE operation will take much longer to execute as a software subroutine than as a "built-in" processor instruction. This increases the product of (frequency) x (duration) for that operation and reduces overall performance. One result of ignoring duration is that RISC processors sometimes take longer to process a given workload than CISC (complex-instruction-set computer) processors with lower MIPS ratings.

RISC designs also exacerbate the so-called von Neumann bottleneck, which exists when instructions and data are accessed over a single path that connects the processor with its main storage unit. Because a RISC instruction doesn't do much, a processor must access and execute lots of them to accomplish what it could do with a few multicycle instructions in a CISC processor. This consumes processor cycles, main storage accesses, and cache memory space.

To mitigate the effect of RISC's high ratio of instruction-to-operand access, RISC designers introduce complex auxiliary-support mechanisms, such as instruction pipelines and multiple register sets. These mechanisms, together with weak instructions, make system software for a RISC inherently more complicated, and thus less reliable, than the corresponding CISC software.

To speed instruction execution, RISC designers require all operands to be accessed from typeless registers. Thus, RISC processors acquire artificial operand uniformity at the expense of rendering operands typeless and thereby forfeiting processor-based type- and value-checking. Since incorrect operations on data values are a major source of errors, safety is being sacrificed for speed.

The RISC movement is also repeating the history of processor design, a history that began with simple, register-oriented instruction sets. "Enhanced" RISC processors have already appeared. They extend RISC processors with privileged (e.g., cache-resident) subroutines that perform "complex" operations (e.g., operations that actually process data).

RISC chips have had a lasting influence on processor design. In addition to providing tricks for increasing MIPS ratings, the conservative RISC approach has also inspired innovative processor designs. For example, some new minicomputers can execute several instructions per machine cycle due to multiple instruction-execution units, sophisticated synchronization circuitry, and complex compilers.

Safe processor architectures, such as object-oriented designs, are not yet in favor with computer designers. But the same parallelism that lets a processor execute multiple instructions per machine cycle can also support concurrent verification of data and program integrity. When computer designers realize this, they can design safe processors that also have terrific MIPS ratings.
Are you using a DOS-based personal computer for controlling instrumentation? Do you want the best available software tools for acquiring and analyzing data using standard DOS programming languages? If your answer to these questions is yes, LabWindows® is just the solution you're looking for. The unique LabWindows function panel interface lets you interactively control your instrumentation hardware and collect data, as well as automatically generate Microsoft® C or QuickBASIC program code for your application.

With LabWindows you can control GPIB, RS-232, or VXI instruments, or plug-in data acquisition cards for PS/2 and PC-AT computers. For standalone instrument users, the LabWindows instrument library has over 50 ready-to-use instrument drivers so you can program your instrument using intuitive instrument-specific function panels, without knowing the instrument inside-out.

Because acquiring data is only one element of your application, LabWindows has a complete set of QuickBASIC and C compatible libraries for data analysis, presentation, and storage. Manipulate arrays, create a histogram, or use the optional Advanced Analysis Library to perform operations such as Fast Fourier Transforms, digital filtering, and curve fitting. Give your programs a big performance boost using the specially optimized LabWindows analysis routines for computers with an 80387 numeric coprocessor. For your data presentation and storage needs, use the LabWindows Graphics Library to create multiplot graphs, bar charts, or scatter plots, and use the Data Formatting Library for data logging and file operations.

If you're looking for the right tools to take maximum advantage of your DOS computer using QuickBASIC or C for data acquisition and analysis, there is only one solution... LabWindows. Call National Instruments at (800) IEEE-488 to speak with a sales or applications engineer about how LabWindows can help you.

A price/performance breakthrough for 386-based systems, the new Tandy 4000 SX combines more integrated features than ever in a machine at this price.

The Intel® 80386SX microprocessor combines the ability to run high-performance 80386 based software, as well as current 80286 and 8088 based software. You get the best of both worlds—32-bit performance with 16-bit hardware compatibility.

This means the Tandy 4000 SX insures your computer investment for the future. As a low-cost alternative to an expensive 386 system, you won't be left behind when you want to move on to more advanced 386 based applications, like MS® OS/2.

Built-in VGA graphics give you beautifully detailed, high-resolution displays. Add a color analog monitor and create astonishing graphics in up to 256 colors (from a palette of 256,000) for near-photographic clarity.

The 4000 SX's SmartDrive™ Integrated Drive Electronics (IDE) technology allows you to add high-performance hard disk drives without the need or expense of installing a separate disk controller.
