The Extra Punch!

How Mac graphics can add pizzazz to your presentations

Three Power Databases

New Business Applications
Take the heat off your Mac.

MACBCOOL™
for your Macintosh™

A cooling enhancement module designed to keep your Macintosh cool and eliminate the threat of overheating.

FORCED AIR COOLING with a quiet efficient fan providing a continuous flow of fresh air through your Macintosh. The results are better reliability and longer operating life of your computer.

CONTROL CENTER OPERATION with system power distribution through your MACBCOOL module. Conveniently located front mounted power switches control both main power for your complete system and power for peripherals through two rear mounted power outlets.

BUILT-IN SURGE PROTECTION provides extra protection against power line surges, fluctuations, and noise which can cause permanent damage or intermittent operation to sensitive computer equipment.

A PERFECT FIT because MACBCOOL is designed specifically for the Macintosh Computer. When positioned on the computer, a sturdy handle firmly locks the MACBCOOL module to the computer and substitutes for the Mac's built-in handle.

EASY INSTALLATION. No tools required.

A continuous flow of fresh cool air passes through your Macintosh cooling your computer's critical components.

*First of the second generation hard disk drives for Macintosh.

You need a Macbottom™ hard disk drive to enhance the power and speed of your Macintosh. Macbottom with ten plus megabytes of storage is the fastest disk you can attach to your Macintosh. And more data storage no longer means sacrificing desk space. Macbottom is the only high capacity hard disk drive system that's two inches high and fits perfectly under your Macintosh. Since it weighs less than five pounds you can take it everywhere you take Mac. Macbottom and your Macintosh are a perfect match.

Macbottom . . . designed by Mac Users . . . for Mac Users!

- Built-in power fail detection protects valuable disk data.
- Automatic turnon feature requires no extra switches.
- Connects to either modem or printer port.
- Variable size volume allocation utilizes all available space efficiently.
- Backup program makes backup foolproof and fast!
- Printer spooler frees the Macintosh™ for more work.
- Works with 128k or 512k Macintosh.
- Warranted for six months—parts and labor.

Come see Macbottom during the Boston MACWORLD Expo at booths 326 and 328.

Macintosh is a trademark licensed to Apple Computer, Inc.

The Expandable Macintosh Modem
With Software And Cable

Just Plug-In And Communicate
If you're a Macintosh user, you need our expandable 1200/300 baud intelligent modem. Supplied with our ProCom-M communications software and "Mac-to-modem" cable, ProModem 1200M is so simple to use that you'll instantly be on-line and communicating. It's Hayes compatible, and the price is right, too. Just $549 complete.

Electronic Mail A Reality
ProModem 1200M gives you something that's not available on any other modem in this price range. Our $99 Communications Buffer and Alphanumeric Display options provide you with a sophisticated electronic mail network.

Amazing but true, your ProModem 1200M answers the phone, collects messages up to 50 pages long, sends out electronic mail, and displays all messages sent or received even though you are gone and MAC is busy or turned off. Thanks to ProModem 1200M, expensive hard-to-use communications software is not needed. The communications is in the modem, and electronic mail becomes a background function, where it belongs.

Communications Software
Our ProCom-M communications software is designed specifically for Macintosh. It's simple to use, and maintains all Macintosh user interfaces such as icons, pull down menus, full windowing, dialog boxes and mouse control of all commands. You can initiate complex dialing sequences with two clicks of the mouse. ProCom-M includes X-modem protocol for error-free communications with any personal computer. This powerful software does a lot, but is so simple that most users will hardly have to refer to the manual.
We've written more Macintosh programs than any other software company:

Microsoft® Multiplan®, Microsoft File, Microsoft Word, Microsoft BASIC and Microsoft Chart.

But we can't write everything.

So when we find something really excellent out there, we publish it.

Every program has to sweat out an interview.

Because we've begun to build up an impressive body of Macintosh work, we founded Microsoft MacLibrary™ programs to house them.

Programs for business, for learning, for fun.

And these disks can't just roll in off the street. Each program has been exhaustively reviewed, previewed, and scrutinized.

We look for highly original, highly useful programs that are easy to learn and use.

Our first releases.

The renowned programming language, Logo, has now come to Macintosh. A mainstay of university curriculums, Logo teaches programming concepts, techniques, and problem solving strategies. And it makes it all fun to boot. Intriguing enough to challenge even an advanced programmer—or motivate a child—this is Logo's latest
dedicated to Macintosh.

generation. And it takes full advantage of all of Mac's
easy to use features.

Learning Microsoft Multiplan and
Microsoft Chart is a superb interactive instruc-
tional program by Micro Courseware Corp.
It walks you through the basics and
into the intricacies of these sophisticated
business tools. Teach yourself quickly and simply how to produce presentation quality graphics. As well as what-if projections, portfolio managers, and financial models.

Finally, there's Entrepreneur™ by Harvard Associates. You're in the software business, competing against one to eight other capitalists of either the human or computer persuasion. With 36 months to boom or bust, prosper or squeak through.

Check out a few programs.

For a list of your nearest dealer stocking MacLibrary software, just call (800) 426-9400. Or in Washington State, Alaska, Hawaii and Canada, call (206) 828-8088. We think you'll be impressed. Because making it into MacLibrary speaks volumes.
March 6, 1985

Jeremy: Spokesman Company.

Thank you for your recent order for immediate shipment.

The following list represents the totals we have received in your shipping department:

- 27" alloy wheel: $22.15 per wheel
- Seat Post: $5.00 each
- Bicycle Bag: $18.00

Total Order: $234.78

I am confident that the products for your order are ample to modify the telephone prices for adequate notice.

Sincerely,

John L. Spokesman

Introducing FileMaker.

Because just having information isn't enough. You have to be able to do whatever you want with it. Arrange it. Rearrange it. Massage it. Embellish it. Make it into something you can use. Easily.

FileMaker lets you not only store and organize your business information, but manipulate it in limitless ways, to create literally any kind of form or report you want.

First of all, FileMaker lets you change direction, any time, without redoing everything. It even lets you start out without a direction.

And in addition to doing all the meat-and-potatoes things a database is supposed to do—calculations, summary reports, sorting of all kinds—FileMaker does everything you bought your Macintosh™ for. Text editing. Graphics. Pull-down menus. Keyboard commands. Windows. Different fonts, styles and graphic design tools. Your information not only makes more sense, it makes an impression. Any kind you want.

With FileMaker, you can even design your own data entry forms, so you can put information in any way you want, without arbitrary limitations. And of course, it does all the tricky little things automatically...like indexing every word, number and date for speed searches.

Because you design your output right on the screen, you can see exactly what you (and your customers) are going to get. And you can create any number of forms for your information to take.

So what might have been a dreary order acknowledgement can now be a clear, friendly letter. Or it can be a meaningful comparison of inventory by vendor. Or parts lists, receiving verifications, purchase orders, labels, name badges, rosters and hit lists.

With FileMaker, you can pick up from other programs, like MacWrite™, MacPaint™, MicroSoft Plan™, Jazz™ and share the applications you've created with other members of your team. You get all the tools you need to easily consolidate group efforts into one database.

And FileMaker takes full advantage of the Macintosh family, including the Macintosh XL™, Macintosh Office™ and LaserWriter™.

So for $195 (suggested retail), things could look considerably better for your entire division, department, professional practice, retail operation, club, organization, or principality.

Contact your Macintosh software dealer for a demonstration, or call 1 800 MACWARE to find out where you can get FileMaker in your area. From Forethought, Inc.
Introducing
The Intelligent Choice Made Simple!

It’s Confusing.
You want to make the intelligent choice, but, whether you’re in baseballs or ballistics, choosing the right accounting program for your business was a difficult task.
Until Now.

Meet MACCOUNTANT™
—The Intelligent Choice Made Simple.

Like the Macintosh™ it was specifically designed for, MACCOUNTANT proves that simple doesn’t mean simple minded. It’s a ferocious number cruncher that’s been civilized so MACCOUNTANT works for you, not against you.

From its 5 journals and 11 reports to its full Windowing, Scrolling, Check Writing, Report Printing, Auto Correction and more; MACCOUNTANT is perhaps the most feature packed program available. Plus, Accounts Payable and Receivable are fully integrated at no additional cost.

Consider all of these features integrated in a program that’s fast, intelligent, and intuitive.
No complex operating commands to master, MACCOUNTANT was designed to work the way you work;
And, That’s Smart.

digital etc.

So join the thousands who have made the Intelligent choice.
It’s Simple!

Just call a dealer of intelligent software in your area or dial (213) 452-5636 and get MACCOUNTANT on your staff — Today!

MACCOUNTANT™

*MACCOUNTANT suggested retail price is $275.00, introductory savings good through June 30, 1985.
MacBase
Not just another pea in the pod!

Many databases promise power and ease of use. Only MacBase delivers both.

MacBase is a true relational database, powerful enough to allow you to create a wide range of applications.

And MacBase works like a Macintosh database... as easy to use as MacWrite and MacPaint.

Place text and data anywhere on the screen. Format fields with a single point and click. Stretch fields with the mouse. Use any available font.

Calculated fields appear right on the screen. Up to 32,000 characters allowed in each formula. Over 25 mathematical functions to use in your calculations. Concatenate text from several fields.

Create listing areas within records. Control printing of every piece of text and every field. Create reports without running a special reporting program!

Create form letters within MacBase. Automatically retrieve data from other forms. Find and update groups of records. Merge files with common data. Change existing forms without losing data.

Import/Export data to and from other Macintosh applications. Nest forms within forms up to 200 deep.

There's no need to learn a special database language. And here's the best part... it's competitively priced.*

MacBase — The pearl in the pod of Data Base Systems

Meet The New Financiers...

General Ledger, Accounts Receivable, and Inventory Control

The Palantir Financial Series -- the first true accounting system to run on a 128K single-disk Macintosh. If you have a small to moderate-sized business, you'll find what you're looking for right here.

**General Ledger**

Here's a true accounting system — so much more than just a cash book or expense file. Look at what it offers:

- Flexible chart of accounts. Up to 9,999 different accounts. Cash, expense, income, etc... in any combination.
- Full double entry system. You cannot go out of balance.
- Six financial statement formats to choose from. You'll find one suited just for your business.
- Up to 12 accounting periods. And even after you rollover to a new period, you can still go back and post to the previous one.
- Comparisons with budget and prior year performance. By period and year-to-date.
- Multiplan™ transfer. Extract data for spreadsheet programs and other forecasting systems.
- 400 accounts on one 400K disc.

Retail price: $145

**Accounts Receivable**

Keep track of who owes you what from how long ago. Print reports or display them on the screen. Either way you've got solid control of your business with features like these:

- Up to 9,999 customers.
- Full three-period aging. You define the periods.
- Open-item or balance-forward accounts or both. Your choice.
- Sales analysis by customer, salesperson, branch, type of sale, product, or just about anything else you can think up. 999 ways to analyze your sales for the period and year-to-date. Pinpoint your problems and your opportunities.
- Compatible output to the Financial Series General Ledger. Analyze profits as well as sales.
- 300 accounts on one 400K disc.

Retail price: $145

**Inventory Control**

The perfect system for your retail or wholesale business.

- Handles all these transactions: purchase orders, receipts, transfers, adjustments, issues and returns.
- Provides complete audit trails.

- Tracks stock by units and dollars. How many dollars you have on order. The dollar value of your inventory, sale prices, and profit margins.
- Controls stock levels. Reorder Report shows quantities below your specified minimums.
- Analyzes your inventory as well as providing cost and sales histories and gross profit margins. Also, product status by type and location is given.
- Keeps salespeople up-to-date. Price list shows quantity on hand, selling price, sales tax, and current average cost.
- 1,000 products and 400 purchase orders on one 400K disc.

Retail price: $145

The new Financial Series from Palantir does more than just help you run your business. It helps you manage it, for growth and profitability.

Requires Microsoft® Basic
I was flabbergasted when I learned that Steve Jobs had been removed as leader of the Macintosh group inside Apple. Steve is the most important person in personal computing, and his involvement was absolutely key to the Mac's success. Without Steve no one would have been able to challenge the monolithic IBM Personal Computer standard and create a radically more advanced computer. No question, the beauty of Macintosh is the result of the collective love and sweat of many driven, creative people: Jef Raskin, who conceived the Mac; Burrell Smith, who designed its electronics; Andy Hertzfeld, who wrote much of its software; Mike Murray and his staff, who got the message out; and many others. But Steve played the role of genius innovator, inquisitor, cheerleader, and facilitator. He instilled a sense of grand importance and inspired downright fanaticism in the Mac team. Like many geniuses, Steve has his dark side. His sarcastic tongue can be as sharp as a scalpel or as destructive as a hand grenade. Stories of Steve's tirades and his brutally honest comments abound in Silicon Valley. But funny stories about Steve abound too, and he is undoubtedly a public figure whose personal life is subject to the public's watchful eye. Everyone who has ever said "Hi" to him likes to think that he's a friend. Steve's major flaw is that he demands too much of himself. He has an intense knowledge of topics outside computers, such as art and architecture. And he is just as opinionated about those subjects as he is about computers. Understandably, as a highly motivated person with strong opinions, he sometimes overlooks other points of view. In the early days of the Macintosh project, Steve told the Mac group that they were corporate pirates; they even hoisted above the Mac building a black flag with white skull and crossbones. If they were the pirates, then the rest of Apple was the Navy. And guess what? The Navy won. The Navy (Apple II division) was feeling pretty downtrodden and ignored. Here they were contributing 80 percent of Apple's revenue, and they were forced to watch the stockholders meeting on closed-circuit TV while the Mac team got front-row seats. Now the Navy is back on top and can get its revenge. I hope the Navy, having hung Jobs and Macintosh marketing director Mike Murray from the mast, will sober up and show some restraint. Otherwise Apple will be the Coleco of 1985. Mike Murray once asked me what I thought Apple should do about the Apple II. I recited the high-tech adage: If you don't make your own product obsolete, someone else will do it for you. Let's be honest; the Apple II is a dog. I hated it back in 1979 when I had a job that required I use it. It was slow and had limited RAM and disk storage space and terrible screen resolution. At least 20 other personal computers on the market at that time were significantly better. The early Apple II required a costly additional circuit board just so it could display lowercase characters. I have often thought that if Steve Wozniak is such a genius, how come he didn't realize that word processing would be one of the leading applications for personal computers? Or did he think we'd all become technoids and convert to writing everything in ALL CAPS? (continued from page 16)
Any growing business needs to organize, analyze and use data. Customer orders. Shipping records. Inventory. Billing. Prospect lists.

Now, depending on your Macintosh software, you can manage data one of two ways.

The simple, stuff-everything-into-one-file theory of data management.

That's how ordinary filers and information managers work.

You jam data into a single file that includes every piece of information you might ever want to know.

With an ordinary data manager, you have to re-enter existing information every time you enter new information. Pretty inefficient.

With MacLion, you only have to enter the new data that has changed. Not only that, you can design your own data entry screens. Now, which is the most efficient way to manage your business data?

The problem?

Well, if you have a sales order entry file, every time you enter new data about a customer's order, you also have to re-enter all the existing data about your customer.

Repeat, repeat, repeat.

Worse, if you ever want to move the data from your sales order entry file to develop a new file, without having to rework it all over again, there's one small problem.

You can't.

Okay. Let's get serious.

MacLion™, on the other hand, is a true relational database management system.
manage your data?

entirely new applications for your existing database just by adding new relations. That's the most efficient way to manage your data.

For a MacLion demonstration, see your dealer. Or, send for our "Serious Buyer's Guide to Database Management Systems," which includes a demonstration disk

Simple vs. serious.

And MacLion gives you some other remarkable features, too. You can design and generate your own custom data entry screens and reports. Just by clicking your mouse through Macintosh pull-down menus—without programming.

Or, if you're a programmer at heart, you can also use MacLion's built-in procedural language and add even more specialized functions. That's serious database power, only possible with MacLion.

So instead of trying to jam all your business data into one massive file, you can set up several smaller, more manageable "relations." (Picture them as a series of neat file folders.)

The advantage? In a sales order entry system, one relation contains biographical data about your customers that doesn't change. Another has their order data that does.

There's no duplication. So when it's time to update customer orders, you only have to enter in new data. Not re-enter what already exists. And you can develop

Macintosh users.

Circle 66 on reader service card
In a recent interview, the GREAT WOZ declared personal computers boring and useless. Comparing them to model trains, he said they were mostly for hobbyists and that all the hobbyists who wanted one already had one.

If that is what Woz really thinks, then he's turned into the Billy Carter of high tech. Perhaps now they've gotten Jobs out of the way, the Navy can bring its mascot back.

The new Atari 512K ST Macalike, with its great color graphics, will be out this Christmas and will sell for about the price of the Apple II. It will have at least as much software as the Mac had when it was introduced, and it will have the advantage of an optional compact disk (CD) interface. This machine and a similar one from Commodore will knock Apple out of the home market unless the Navy gets smart and produces a low-cost Macintosh color graphics machine itself.

Because of its massive software base, the Apple II will survive another year or two in the educational market. Meanwhile, the Mac, probably in spite of the Navy, will capture an increasingly larger share of the small business and independent professional markets, as well as specialized niches in large corporations.

Lotus's Jazz, which could eclipse Lotus 1-2-3 as the greatest piece of personal computer software yet, will fuel the Mac's growth. Millions of people who do not yet use computers will flock to the Mac rather than go to night school to learn the IBM standard.

Other great software, including Microsoft's Excel, will make the demand for the Mac exceed anything Steve Jobs ever imagined.

The personal computer market will likely be divided into four camps: the Atari ST or the Commodore Amiga in the home computer market, the Apple II and its successors in education, the Mac in small business and specialized markets, and the IBM PC and its clones in large corporations.

The only question is whether Apple will get stuck with a huge inventory of immovable computers, as did Texas Instruments with the TI-99, as did IBM with the PGe as did Col-e with Adam.

So the moral of the story is that the story isn't over. The man from Pepsi has no excuses—no Steve to blame for his problems.

The Apple II will die and the Mac will soar. Steve Jobs, like Adam Osborne and many other entrepreneurs, has more than one life to give to his company—or to another company if that's the way it has to be.

Steve will be back—just wait a while. □
JUST ARRIVED!
The first complete desk management program for the Mac.

It's here! A powerful software program featuring dynamic storage/retrieval capabilities for your Mac. It's called THE DESK ORGANIZER™. And it's ready to help you organize yourself, your work, you name it.

At the core of THE DESK ORGANIZER is a free-form filing system that files anything you want, just by typing it. Notes. Letters. Reports. Phone numbers. Names and addresses. And you can retrieve or update at any time.

Surrounding this system are easy-to-use tools that add a new dimension to your Mac:
- THE DESK ORGANIZER's extensive correspondence facility replaces Mac's limited notepad. Its calculator adds an electronic paper tape—and a powerful formula calculator (the Mac has neither). And THE DESK ORGANIZER offers unlimited alarms that chime gently to remind you of meetings. Plus a telephone dialer that automatically searches files, locates the proper number and connects you.
- What's more, THE DESK ORGANIZER increases the filing capacity of the Mac—by storing hundreds of Mac notes and letters on a single diskette.
- Born to run on the Mac, THE DESK ORGANIZER can co-reside with other Mac programs—to keep you completely organized no matter what you're working on.
- To get this infallible electronic secretary for only $99, see your Mac software dealer.

Paradise’s MAC 10,
the 10mb hard disk
subsystem designed
for the MAC.

Your Mac’s been
lonely too long.
You just found the right hard-disk subsystem for your MAC...

Check out the Paradise MAC 10.

Easy To Look At: Beauty isn't everything but most hard disk MAC drives will scare your computer to death in the morning! The MAC 10 is artfully engineered to complement the aesthetics of the MAC.

Nice To Have Around: Just 3.5" wide and no deeper than the MAC, the MAC 10 has a smaller footprint than any other external MAC hard drive subsystem. Nice to carry around too... Only 5 pounds.

The Right Breeding: Paradise Systems is known for innovative engineering. The MAC 10 is the latest in a line of ground breaking micro computer peripheral products from Paradise.

Accommodating: 10 MB of formatted data storage, there when you need it. Equal to 30 MAC floppy drives! Storage you'll want for Jazz and other popular business applications.

Your MAC Can Relate To It: 5 times faster than the add-on MAC floppy.

So Can You: Just plug in the MAC 10 and you're ready to go... That's it!

No Surprises: The MAC 10 won't void your Apple warranty, or require you to modify your system. The user interface uses pull down menus, just like the one you're used to on the MAC.

Long Term Commitment: The MAC 10 comes with a 1 year limited warranty*.

Do Your MAC A Favor: Go see your Apple dealer and look at a MAC 10 or call us toll free at (800) 822-2020 (CA.) or (800) 527-7977 (outside CA.). It will be the beginning of a wonderful relationship.

PARADISE SYSTEMS, INC
Your mind works in mysterious ways.
Thoughts crystallize, change and disappear in a few moments.

**Introducing the one software package powerful enough to capture the way you think—ThinkTank 512.** The outline processor designed specifically for the Macintosh has now been expanded, adding full-featured, high-performance word processing and graphics capabilities.

**From fleeting inspiration to final product.** Inside ThinkTank your ideas are stored in a dynamic outline, ready to accept layers within layers of thought. Begin by entering your first ideas into headings. More ideas will follow. Tuck new thoughts under the main headings. Open windows and let bursts of insight pour out in paragraphs. Or use the Macintosh scrapbook to bring pictures, charts and graphs into your ThinkTank outline.

Reorganize with the stroke of a mouse. Blocks of written and visual information move to any portion of your outline with remarkable ease.

ThinkTank is the ultimate personal productivity tool for all decision makers. One toll free call to 1-800-822-3700 (in California, 1-800-443-4310) will guide you to the nearest dealer.

**You provide the inspiration. ThinkTank provides the rest.**

ThinkTank 512 suggested retail price is $245. A primer and second disk drive are recommended, but not required. Also available ThinkTank 128 ($145). If you upgrade your Mac to 512K, your 128K software is easily upgradeable for $100.

Now you can cut your data input time in half! With the Numeric-Turbo™, a new high-speed input device combining the fast response of the Mac-Turbo-Touch™ with a full-scale numeric keypad. The Numeric-Turbo includes cursor keys and direct function keys, so you no longer have to use the Control or Shift key on the Mac keyboard for function entry. Figures flow directly from your fingertips to your Macintosh, making data entry with Numeric-Turbo 50% faster than with a conventional mouse and Apple keypad. Because there's nothing to get between you and your software.

Numeric-Turbo is ideal for use with Jazz™, Multiplan™, Ensemble™, Quartet™, Dollars and Sense™, and any other Macintosh software where you want your figures faster.

If you already own a Mac-Turbo-Touch™ and want to upgrade to a Numeric-Turbo, just ask your Apple Dealer for details. We've provided Dealers with upgrade kits that are easy to install and priced to please. And, we think you'll be more than pleased with how little it takes to accomplish a lot with Numeric-Turbo.

List Price $149

*The Mac-Turbo-Touch is another way to enhance your Macintosh's performance. This high speed input device is designed to respond as quickly as you do. The slightest touch of the gyroscopic ball positions the pointer quickly and accurately on the screen. The result is software that works even better, faster and more precisely.
Enjoy the graphics and sound capabilities of your Macintosh™ with

Airborne!™
The action packed game.

ACTION

They're coming! Hordes of them! Enemy helicopters, transports, paratroopers and tanks. Your anti-aircraft gun chatters, shooting mouse-guided shells. Let too many of those paratroopers get on the ground and their banzai attack will overrun your position. Quick, to the mortar, take out those ground troops! Look out, the transport plane just air-dropped a tank. Back to the anti-aircraft gun. A tank that makes it down to the ground shoots with deadly accuracy. And then... the jets come screaming in like banshees. Their air-to-ground missiles don't miss!

HOW LONG CAN YOU HOLD THEM OFF?

REAL SOUND

This game has the most realistic sound generation available on a Macintosh. Helicopter rotor wash, the drone of transport planes, the shriek of an attack jet, tank fire, explosions... actual recorded sounds were used in the making of this game. You won't believe your ears. Is this a Macintosh or is it a cassette tape player?!?

A COLLECTOR'S ITEM

Besides all the fun you'll have playing it, you'll want to own this game so you can show off the graphics and sound capabilities of your Mac to all your friends. Every Macintosh owner will want to have Airborne in their collection.

Introducing the Mac·Port-Adaptor.™ Your Macintosh™ connection to the world of IBM-compatible peripherals. Designed to expand the capabilities of your Macintosh, the Mac·Port-Adaptor allows you to team your Mac with top-of-the-line parallel peripherals. And keep your standard Macintosh serial port.

Simply plug the Mac·Port-Adaptor into Mac's printer or modem port. You keep your original port while adding an IBM-type parallel connector. So, you get more out of your Macintosh, for very little.

List price $79.

MacPort-Adaptor includes a five-foot-long parallel cable with a 36-pin Centronics connector.
Introducing

QUICKWORD™

The First Product for the Macintosh that Dramatically Reduces Your Typing Time...Even If You Don't Type!

Quickword is a remarkably powerful word processing expander that sets MacWrite™ or Word™ on its ear while saving you lots of time!

Now typing 2,4,6-Dimethylbenzoxide, "For the party of the first..." or "Sincerely yours," can be as easy as typing an A, B or C.

Quickword lets you create multiple abbreviations tables for phrases of up to 50 characters. Whether speed typed or thoughtfully entered, Quickword will translate your abbreviations "on the Fly" into their full meaning within your documents.

So if you're interested in cutting your typing time in half, see your authorized Apple Computer dealer today. You'll wonder how you ever got along without it.

Requires a 128K, 512K or XL Macintosh
Price: $59.95

Introducing

QUICKPAINT™

The amazing MacPaint™ expander that will never leave you at a loss with pictures.

Quickpaint™ lets you browse through entire volumes of MacPaint™ drawings in minutes rather than hours. Simply use Quickpaint's™ "miniview" feature to locate any of the drawings that come with Quickpaint or to find drawings from any other popular clip art product. Then blow it up for full screen viewing and editing. You can cut, paste, edit and erase selected parts or copy the entire picture into other drawings or documents. And Quickpaint™ does this all from whatever application you're working in!

To see how Quickpaint™ can help enhance the state of your art, stop by your authorized Apple Computer dealer today. You'll wonder how you ever got along without it.

Requires a 128K, 512K or XL Macintosh
Price: $49.95

For the name of your nearest Quickword™ or Quickpaint™ dealer call (800) 556-2283.

Vintage Whine
OK, I will renew my subscription. However, may I make a suggestion, since I pay part of the bills around here? I don’t know how all your readers feel, but a large number of subscribers with whom I have talked are tired of the anti-Mac bias in your editorials. For example, “The Inconvenience of Convenience” [Macworld, April 1985] is just about the last straw. If I want to read about how terrible the Macintosh is, I can easily find other journals that describe how infinitely superior other equipment is. If you truly wish to be the “reader-friendly publication for Mackers,” then knock off the Macintosh criticisms.

Anyone who uses a Macintosh for more than a few days realizes that it’s not perfect. I choose to use the machine because even with its shortcomings it is still the best computer for my purposes. So stop whining about things that may have no relevance to anyone besides yourself. It’s OK to dislike facets of the machine. It’s quite another thing to write an editorial in an effort to convince others that the machine is fatally flawed.

I read Macworld because it offers me information that is hard to gain elsewhere and informs me about new products for the Mac. I do not read it in order to hear the nth version of why the Macintosh should be redesigned. The bottom line: your magazine is good. It provides a valuable service to me. The negative Macintosh propaganda has no place in a Macintosh magazine.

Bryan Johnson
San Jose, California

Slow Disk at Work
In “The Inconvenience of Convenience,” [Macworld, April 1985] Adrian Mello correctly identifies the painfully slow response of the Macintosh to common operations (like quitting and returning to the Finder) as a major problem. But the Mac’s lethargy has little to do with the complexity of its desktop interface. The reason is much simpler—the disk drives are miserably slow.

Run any application on a Mac with a HyperDrive or a RAM disk, and the problems suddenly vanish. It is unfortunate that complicated software fixes will be devised to get around a simple problem that plagues all Apple computers—inadequate disk access speed. Apple should worry less about the elegance of its operating systems and more about getting the basic hardware and low-level software right.

Mark S. Jennings
Durham, North Carolina

While the Mac’s floppy disk drives are partly responsible for its unburied pace, version 1.1g of the Finder makes too many trips to disk when building the desktop. This disk access has been minimized in Finder version 4.1. Comparing the new Finder’s performance with that of the earlier version would be more valid than comparing disk drive speeds because floppy disk drives are inherently slower than hard disk drives or RAM disks.—Adrian Mello

Child’s Play
My name is Amy. I am 12 years old. Several months ago you published a program, named Mouse Ball [“The Mouse Will Play,” Macworld, September/October 1984]. My father put that program on our game disk. On March 8, a Friday, I maneuvered the ball to hit the apples in a certain pattern so it would just hit the apples, row after row. The game played on for an estimated 7 hours. The final score was 32,767 points—as high as it would go.

Amy Kuniyoshi
San Francisco, California

Short Flight
Being an owner of a 128K Mac, I can assure David Bunnell most wholeheartedly that a 512K Mac is not a requirement for enjoying Airborne! [“A Mac Awakening,” Macworld, May 1985]. I play Airborne! constantly on my Mac. In fact, the only difference that I have been able to discern—mention is made of this on Airborne!’s help menu—is that the opening song plays for a shorter time on a 128K Mac than on a 512K Mac (8 seconds instead of 20).

Laurie Ritch
Redwood City, California

Problem Solver
Although “The Larger Equation” [Macworld, May 1985] did a good job of discussing the capabilities and limitations of TK!Solver, it failed to address the major deficiency of this software, that is, its inability to electronically transfer tabular data to other programs such as Chart and BASIC. The program allows only plot figures to be selected and copied to the Clipboard. Obviously, the data listed in the table is more important. The program should have the capability to select all or part of this data for transfer to other programs. As it is, if I
Maccessories. 16 ways to improve the performance of your Macintosh.

Maccessories from Kensington Microware—an entire family of products to enhance your Macintosh. Maccessories make your computer more convenient. They increase your system's flexibility. And they protect your investment.

1 Control Center
Organizes all your power needs. Styled to fit underneath your second disk drive, it provides fingertip control over your whole system. There's a master switch to power the whole system on and off, and individual switches for a printer, modem and one auxiliary device. And Control Center protects your entire Macintosh system from damaging power surges, line noise and static shocks.

2 Surge Suppressor
Portable protection for a travelling Macintosh. Surge Suppressor replaces your power cord, providing UL listed surge suppression and line noise filtering. It's light and fits easily into your carrying case.

3 Universal Printer Stand
 Raises your Apple® Imagewriter® at a slight angle so you can monitor its performance more easily. It solves the problem of where to store paper—several hundred sheets are accommodated neatly underneath. (Also fits most other dot matrix printers.)

4 A-B Box
If you want to take advantage of the AppleTalk™ network, a LaserWriter™ printer or a hard disk in addition to your Imagewriter and modem, you'll have three peripherals competing for the two serial ports on your Macintosh. The A-B Box gives you the extra serial port you need. Just plug two of your peripherals into the A-B Box and plug the Box into one of your Macintosh serial ports. Then simply divert your data output to the peripheral of your choice—press A to send to one, B to the other. Fits perfectly underneath your external disk drive.

5 Tilt/Swivel
Gives you the flexibility to tilt and swivel your Macintosh to the viewing angle most convenient for you.
6 Polarizing Filter

A safe, clean place to keep your Mouse when not in use. Attaches to the side of your Macintosh. Fits under the Maccessories Dust Cover.

10 Mouse Cleaning Kit

A full year's supply of the cleaning materials you'll need to keep your mouse rolling at top speed. Also includes the Mouse Pocket.

13 Professional Type Fonts

Stylished after the most popular type faces in the publishing industry. Type Fonts for Text contains 16 fonts in sizes 12 to 24 point. Type Fonts For Headlines (for the 512K Mac) contains the same fonts in sizes 24 to 72 point. Including versions of Times Roman, Helvetica, Optima, Futura, and a dozen others.

Also available:

14 Swivel

15 Portable Modem

16 Travelling Disk Case

Protection for your system from the elements. Anti-static dust covers for Macintosh, Macintosh XL, Image Writer and External Disk Drive.

12 Graphic Accents

A collection of over 250 professional illustrations, covering everything from business to holidays. Use them for reports, newsletters or greeting cards. Graphic Accents are stored in standard MacPaint™ files, for ease of use.

Circle 11 on reader service card
Letters

want to produce high-quality graphs, I must print the data and type each entry into Chart.
I also question why TK/Solver allows you to save a table. Once a table is saved, what good is it? You cannot manipulate it without the program, and therefore it has little or no value. Perhaps Software Arts should delete this capability and substitute the ability to copy tabular data to the Clipboard.

Overall, I am very pleased with the equation-solving capability of TK/Solver. With the improvement in data selection, this tool would be highly recommended for business, academic, and scientific applications.

Ronald J. Basso
Seminole, Florida

The Last Pioneer
To those who ran out and bought the latest in technology and didn't ponder the age-old law of supply and demand, I say, "Thanks very much!" You are the people who made it possible for people like me to get better prices on the same technology. Had you demonstrated a modicum of patience, you might feel better about your Mac than you do.

Before you get out the rope and come after me, I offer you perturbed "pioneers" some consolation. What if you had purchased the IBM PC when it first came out? How would you like to have paid premium bucks for a ten-year-old technology? You at least had the good sense to purchase a state-of-the-art personal computer that is far and away the best that money can buy.

Paul Crooks
St. Paul, Minnesota

Mac Is a Camera
I very much enjoyed "Pictures to Pixels" [Macworld, April 1985]. I recently purchased a ThunderScan digitizer and really enjoy it. The article was very helpful and made me even more satisfied with the digitizer I bought.

Bobby Truelove
Lewisburg, Tennessee

Lost in the Alps
I bought a Macintosh here in Switzerland some weeks ago and must tell you that I feel like I'm in MacDesert. I don't know of any other Mac user, and I have not been able to hold on to Mac publications other than official Apple literature in German, some manuals with data I already know, a couple of photocopied price lists, and of course Macworld, which makes a big difference. Reading it confirmed that I made the right decision in buying the Mac, but it also made clear that

I get only 20 percent out of my Mac here in MacDesert, since I'm unable to exchange information and encouragement with others.

I want to encourage any Swiss Mac user who wants to change this desert into Mac-Paradise to contact me. I am no computer freak, but I like my Mac and would like to meet others who feel the same way.

Christoph Pfuger
Worb, Switzerland

Minute Waltz
I am sick of reading about how busy people sit around and watch the wristwatch icon on their Mac screen. If their work load is so light that they can't find something to do for 60 seconds, then the last thing they need is a computer.

Bob Deeds
Villa Park, Illinois

AN ERGONOMIC WORKSTATION FOR MACINTOSH ™ THAT MEANS BUSINESS

Ergotron's new MacTilt ™ is the professional ergonomic workstation that provides the utmost in operator flexibility and viewing comfort. With a silky-smooth, one hand motion, your Macintosh can be adjusted to relieve operator stress, ease neck, back and eye strain, and increase productivity. A special bracket is provided to mount your external disk drive providing additional convenience and savings in desk space. The MacTilt by Ergotron ™ elevates the Macintosh approximately 4", and provides 30° tilt/360° rotation at the touch of a finger for only $99.95. If you would like to receive more information on this exciting new product visit your Apple Computer Dealer or contact Ergotron at (800) 328-9839.

Circle 83 on reader service card
Amazing what goes into Macintosh these days.
Macintosh and IBM PC software.
Compatible at last, thanks to MacCharlie, a rather innovative coprocessing system.
And imagine the consequences.
Nearly 10,000 IBM PC software programs designed for general business and specific applications in real estate, insurance, law, medicine, banking, etcetera, can now join forces with Macintosh's own popular programs.
And, the myriad of IBM PC-compatible software adopts Macintosh's many beloved features, including utilities such as the clipboard and the calculator.
In addition, MacCharlie allows IBM PC and Macintosh data files to be exchanged. Talk about flexibility.
But the good news gets better.
You see, MacCharlie delivers hardware compatibility, as well. For example, IBM letter-quality printers can be easily used with Macintosh.
Furthermore, MacCharlie now allows Macintosh to perform virtually any networking an IBM PC can perform. Even to the extent of tying in with IBM mainframes.
In other words, your networking capability goes beyond the Apple family.
How does it happen? As easily as slipping on penny loafers.

In mere moments, MacCharlie combines the best features of the world's premier personal computers. And despite the fact that it turns one computer into two, MacCharlie adds but a handful of square inches to Macintosh's physique.

In short, one of life's most perplexing decisions—whether to buy a Macintosh or an IBM PC—can now be made with the greatest of ease.

Ask for MacCharlie at your local computer store. Suggested retail price for the 256K single disk drive model is only $1,195, and just $1,895 for the 640K dual disk drive version.

For more information, call Operator 15 toll-free, 1-800-531-0600. (In Utah, call 801-531-0600.)

MacCharlie offers 256K RAM, with optional upgrade to 640K RAM. 360KB disk drive, and optional sound disk drive.
If They Only Knew
I read with amusement the letters from early Mac owners expressing their resentment about the high price they paid for their beloved computers. As an Apple II+ pioneer I purchased my 48K system in the late 1970s for a little under $3000. If I had waited four years, I could have saved $2000 for a much better system with 128K RAM.

I never wanted another computer until the Macintosh came along. When we can afford it, my family will buy a Mac for the going price, and I will be envious that the early Mac owners have had a year’s head start.

Unlike automobiles, computers are going to get cheaper and faster. Five years from now they will be cheaper and faster still. You can’t wait forever. The Mac pioneers should be proud of the fact that they had the foresight and vision to recognize a real winner early on.

Chuck Marler
Riverside, California

No Place Like ROM
Being a proud owner of a Macintosh, I use it every day and brag to my friends about it. But one thing I don’t like is that Apple brags about its ROM routines. Big deal. To be able to use them fully, I have to buy Inside Macintosh for—get this—$150. What a rip-off. One of my friends owns an Apple II+ and with his manual he received ROM routines and addresses, pin information, and schematics. The first issue of Macworld is the closest I’ve come to seeing anything that vaguely resembles schematics. Too bad Apple won’t support Mac owners the way it does Apple II people. Perhaps the reason is that Steve Wozniak was not involved in the Mac, but I still would like a little more support than “Give us more money, and we’ll give you what you want.” Come on, Apple— it’s our machine, we bought it, give us a break. Otherwise, I think it’s a great machine.

Timothy Jurik
Huntington Station, New York

The “phone book” edition of Inside Macintosh is available for $25.—Ed.

Correction
An item on HumanForms in Macware News (Macworld, April 1985) contained inaccurate price and address information. The program is available for $79.95 plus $3.50 for shipping and handling from The Reference Corporation, 1133 Broadway #601, New York, NY 10010, 212/645-1200. Our apologies for any confusion that may have resulted.

Mail your letters to Letters, Macworld, 555 De Haro St., San Francisco, CA 94107, or send them electronically to ComputServe 70370,702 or The Source BCW-440.

Easy to use...The first truly "Macish" office product With My Office™ you can create any file you need: clients, vendors, personnel or anything else. You can create office forms, stationery, memos. Then you can enter data on these forms, file them and/or print out. My Office lets you create and print form letters, sort and print labels. It also has a MacPaint™ like graphics designer. With one mouse-click you can move older files to or from the Archives disk for virtually “infinite” storage. My Office also will integrate with other DataPak office modules such as My Accountant™.

One-thousand-one,
One-thousand-two...
Two seconds isn’t a very long time.

You could start your car. Pop a top. Strum a chord.

Cut the cards. Hit the alarm. Pet your puppy.

Return a serve. Pick a daisy. Slip off a shoe.

Now, let us show you what we can do...
What can you do in two ticks of a clock?

- Roll the dice.
- Putt for par.
- Flex a muscle.
- Dunk a donut.
- Catch a ray.
- Snap a shot.
- Lick a stamp.
- Sip a Chablis.
- Or bite an apple.
sequence of commands all by itself. Since a single Macro can contain hundreds of commands, the potential time savings are incredible.

OverVUE's Macro feature makes you the quarterback. Diagram the moves to run the way you want and from then on all you have to do is call the play.

Reports with Style.
Since the totally electronic office hasn't quite arrived yet, creating reports on paper is an important job for any database user. With OverVUE you can visually design custom reports in seconds by dragging fields into position with the mouse. What you see is what you get—a perfect report every time.

Alter the fields are in position, you can type in extra information and titles. Use the headers and footers to include the date, time and page numbers. Crank out mailing labels one, two, three, even four up. And, unlike most other database programs, OverVUE can automatically print the city and state together so there's no unnecessary white space between them.

OverVUE provides room for eight different custom report templates with each database. When you've finished designing one, it's stored as an item in the Print Menu with its own name. So you have to design each report only once.

After you've designed a report, it can be printed out on either the ImageWriter™ or the LaserWriter™ in your MacOffice. You can change the font size and on the LaserWriter™ the report will automatically print sideways if it is too wide.

Getting the facts on paper has never been easier.

We're Clairvoyant.
Nobody likes to type. OverVUE can't eliminate typing, but OverVUE's Clairvoyance feature is a big help. Clairvoyance is great for fields that have repetitive data, like the description column of a checkbook. Checks are often written to the same people over and over. When Clairvoyance is enabled, OverVUE will automatically finish entering the name once you have typed in enough to positively identify it. For instance, you might have to enter only "Pac" for Clairvoyance to realize that you mean Pacific Telephone.

Clairvoyance does more than just save keystrokes, it also helps ensure that information gets entered the same way every time. So, US Widgets Inc. always gets entered precisely that way and not as US Widgets, United States Widgets Inc., or US Widget Company.

Of course Clairvoyance isn't OverVUE's only trick to make typing easier. OverVUE's Input Pattern automatically enters the slashes in a date, or the parentheses and dashes in a phone number. Or there's Value Bar when only a few entries are valid (such as True/False, or Red/Green/Blue).

OverVUE can't quite make data entry fun. But it comes close.

Suggested retail price is $295.00.
Current owners—call for information concerning upgrades.

OverVUE™
PVI ProVUE Development Corporation
222 22nd Street • Huntington Beach, CA 92648 • (714) 969-2431

One-thousand-one,
One-thousand-two.
You bought your Macintosh™ for clout. For the right facts, in the right order, at the right time. And that's exactly what you get with OverVUE.

OverVUE sorts, analyzes, categorizes, calculates, even charts. All in less time than it takes to say one-thousand-one, one-thousand-two.

In fact, OverVUE is the only database available for the Macintosh™ that waits for you instead of making you wait for it. So if you've got sales to analyze, inventory levels to track, customer lists to update, phone charges to allocate, time reporting to simplify, projects to schedule, bank statements to reconcile, employee records to maintain, accounts receivable to monitor; or a power lust to satisfy, rush over to an authorized Apple® dealer for your copy of OverVUE.

You'll be amazed with what you can do with a Macintosh; OverVUE and a few ticks of the clock.
Analyze monthly sales figures.

Import data from another program.

Total last year's expenses.

Zoom in on one record at a time.

OverVUE 2.0. Much More

OverVUE 2.0. Much More

You're the Quarterback.

Meaningful Relationships.

Unlike simple file managers, OverVUE can handle more than one database at a time. OverVUE's Relational Join command acts like a bridge connecting one body of information to another. For instance, OverVUE can calculate payroll by joining salary information in a personnel file with data in a weekly time card file. Given two mailing list files, OverVUE can find all the duplicate names, or all the non-duplicates. Or you could join your invoice file with cash receipts to compute an accounts receivable trial balance.

With OverVUE's Relational Join you can combine data any way that works for you. OverVUE makes relational database management quick and simple. We know you can relate to that.

Ship It In or Out.

OverVUE doesn't live in an isolated world all its own. OverVUE puts you in the import/export business by allowing you to exchange data with almost any other software package — including MacWrite, MacPaint, Multiplan, MacTerminal, Lotus 1-2-3, AppleWorks, dBase II® and many more. Import makes it easy to take advantage of OverVUE's unique capabilities without having to rekey the data you may already have.

In the interest of fair trade, you can also Export OverVUE data into other programs. For instance, you can use OverVUE reports and charts in a MacWrite™ document. Or, you can merge an OverVUE mailing list with a letter in Microsoft® Word to quickly and easily produce hundreds of custom form letters.

With Import/Export you can combine the power of OverVUE with other software to create almost unlimited possibilities.

We think OverVUE will give you a whole new slant on the import/export business.

You're busy enough without trying to wade through reams of numbers. With OverVUE's Charts and Graphs you'll see a clear picture in seconds.

designs for each database.

You're the Quarterback.

Computers are supposed to relieve drudgery. That's why OverVUE gives you Macros.

Macro lets you compress an entire sequence of commands into a single pull-down menu item. You can create up to 20 separate macros for each of your databases. Give each Macro its own descriptive name, like "Balance Checkbook," "Calculate Comissions," "Top 10 Chart," or "Monthly Summary." You can even give your Macro a command key equivalent so that it can be accessed either by the mouse or the keyboard.

Every new Macro is automatically added to a special pull-down menu, the "DO" menu. To use a Macro, simply choose it from the DO menu and OverVUE will take off and run the...
The report cards are in. OverVUE has earned high marks among databases for its mind boggling speed, incredible range of features and its amazing power. Now we could elaborate on these things ourselves. But we figure you'd rather hear it straight from the experts who make out the grades:

Reported INFOWORLD.

April 1, 1985: “OverVUE is rich in features that rank it with the more sophisticated databases available for the Macintosh... the more we worked with it, the more we came to respect OverVUE’s power and capabilities, not to mention its speed.”

According to MACWORLD, January, 1985: “OverVUE is a fascinating program. A cross between a data base manager and an electronic spreadsheet. Its ability to share data with Multiplan makes it a must for serious financial work.”

At, February, 1985 said: “OverVUE is Macintosh software the way it was meant to be. Speed Demon.... geared especially for lightning fast performance. Extremely easy to master.”

PERSONAL COMPUTING, February, 1985 wrote: “OverVUE can execute almost all of its commands in the blink of an eye, or two blinks at the most. Its speed and math capabilities go well beyond what most personal computer data base programs have achieved. It definitely can make the Mac you already have a much more useful tool.”

Stated CLUB MAC, September, 1984: “I know of no other data base that can touch it.... Lots of power here. No doubt about it, this is a sweet system. Sets a behavioral standard for programs in its class.”

Praised MACAZINE, December, 1984: “It may be the best money you've ever spent.... The amount of pure data analysis one can do with their files is mind boggling. This is the Macintosh at its best.”

Well, there you have it. We could have filled up pages with quotes like these, but we think you get the picture. Obviously, we're not the only ones who think OverVUE is terrific. An enormous number of knowledgeable experts feel pretty much the same way.

“Good grades.”

Macworld View

The new Desk Accessory/Font Mover, Apple’s 20-megabyte hard disk, making psychic discoveries with the Mac, Zen programming, and more

Edited by Herschel Schmedick

As the Macintosh community expands, I suspect that many of you have had some strange or enlightening encounters with the Mac. Or perhaps you’ve heard of someone else’s unique application. Your contributions are welcome, and Macworld pays up to $50 for each item published. Send your contributions to Macworld View, 555 De Haro St., San Francisco, CA 94107. I look forward to hearing from you.

The Farmer’s Macintosh

Rural Pennsylvania, where horse-drawn buggies clip along past abandoned nuclear power plants, offers some striking perspectives on technology and its limits. Now, in the midst of an ever-deepening agricultural crisis, county agricultural extension agents have wholeheartedly embraced the technology of the silicon chip in order to provide technical and financial expertise to often-belaboured farmers.

The program, backed by $1.9 million from the state legislature and by university discounts, has sowed over 200 Macintoshes across Pennsylvania; the computers are linked in a statewide network to a university mainframe. Over 900 extension and university staff members have been trained under the program. Ambitious? Consider that the project is also generating its own software—not just a few applications, but scores. And then there’s the vow of the extension computer support service to respond to any call for help within 15 minutes: “If we don’t, we’ll send you a free disk.”

What is farming like these days? You can get a revealing glimpse from the software under development, much of it in the form of Multiplan templates. To name a sampling of what the Mac is busy with in Pennsylvania: Dairy Barn Ventilation Sizing, Land Rent Calculator, Nutrient Grain Mix Calculator, Milk Market Comparisons, and let’s not neglect to mention Agronomic Custom Rate Generator. From the sound of things, running a farm is at least as technically challenging as handling any small business, though the existence of Manure Analysis Worksheet provides comforting assurance that farming is still farming.

One thing is clear: season after season farmers are forced to live with more financial precariousness than most businesspeople would care to see even once in their careers. Fortunately, at least in Pennsylvania, when the bankers drive up in their long black cars, the extension agent has just the disk the farmer needs.—Ted Nace
Know Thine Enemy

In its all-out effort to establish the Macintosh Office in the business community, Apple has been briefing its sales force on the competition. For Apple that means educating its 500 field and sales representatives on the IBM PC and leading PC software such as Lotus's 1-2-3.

Ferrin Corporation, a San Francisco-based personal computing services firm, is giving the Apple sales force in-depth training on the IBM PC in business and insights into corporate personal computing. The Apple sales force has to be able to show prospective customers and dealers the comparative advantages of the Mac over the IBM PC and to discuss how the Mac can interface with other IBM equipment, such as mainframes.

David Ferris, chairman of Ferrin, says, "People in corporations want you to understand the technology as it will have to fit into their environment. The corporations expect salespeople to get to know them and help them in their business."

In essence Apple is following an ancient adage: Know thine enemy as thyself. – Janet McCandless

Fontastic

Creating fonts on a Mac with Apple's Font Editor program is hazardous duty. A part of the Resource Editor utility, the Font Editor requires a great deal of trial and error. It can cause much suffering and anguish when the system crashes and you lose half an hour of tedious FatBitting. As a superior alternative, Alsys offers Fontastic ($39.95), a program that lets you customize an existing font or create your own special-purpose character font. The program includes eight new fonts and has a manual—something Apple's Font Editor sorely needs—that provides background information about fonts and a description of how to use the program's features. For further information contact Alsys at P.O. Box 865410, Plano, TX 75086, 214/596-4970.

New Font and Desk Accessory Mover

One of the benefits of owning a Macintosh is the great variety of fonts and desk accessories available. Macintosh fonts exist for virtually every language, not to mention the picture fonts like Cairo. And there are dozens of unique desk accessories, which are really mini-programs, including calendars, calculators, communications programs, and MacPaint enhancers. Up to now Apple's Font Mover and CE Software's Desk Accessory Mover have been the only tools for adding and removing fonts and desk accessories from the System files of disks (see "Decking Out the Mac's Desktop," Macworld, March 1985). Both programs get their respective jobs done, but wouldn't you prefer a single program that performs both tasks?

If so, you'll be pleased to know that Apple programmer Bert Sloane has created such a program—an integrated font and desk accessory mover. Known as the Font/DA (for desk accessory) Mover, the utility lets you copy fonts and desk accessories between disks or remove them from disks to create more disk space.

The Font/DA Mover is being distributed on the new Macintosh System disk that is available through Apple dealers.
Divining with the Mac

How can researchers use the Macintosh to discover buried archaeological sites, help police solve crimes, or find missing persons? The Mobius Society, a Los Angeles-based research foundation, uses people with psychic abilities to perform the aforementioned tasks. Randall DeMattei, the society's executive director, is quick to point out that Mobius uses many forms of research, scientific and historical, in addition to its psychic methods. Mobius has enlisted the aid of psychics for remote viewing projects, such as pinpointing places on a map to indicate the possible location of a buried treasure, in conjunction with Omni magazine. The group has also found missing persons for various police departments and has worked on a number of archeological projects in the United States, Egypt, and other countries.

The society recently purchased several Macs to help with many aspects of its research. According to Stephan A. Schwartz, chairman and research director of Mobius, one of the society's new projects involves searching for a sunken ship. They use the Thunder-Scan image digitizer to copy a map of the area where the ship is thought to have gone down and then paste the image into MacPaint. The psychics, or "respondents," who are not so-called "professional" psychics but ordinary people who have psychic ability, look at the map on screen and mark the places they feel are likely to contain something. After all the respondents have gone over the map, a consensus map is created to show where the marks cluster.

The respondents keep a running commentary of what they "see," which is later put into a MacWrite document. Mobius plans to use the mouse for this "map dousing" to discover whether gifted psychics can enhance their talent with the mouse and a computer or whether the high-tech method inhibits their ability.—Rob Swigart

Source: InfoCorp
Programmers seeking to understand the Mac might be well advised to put aside their technical manuals and take a trip to the Orient. At least that's the suggestion of author Keith Matthews. While writing his book *Assembly Language Primer for the Apple Macintosh* for New American Library's Plume/Waitie imprint, Matthews noticed a close parallel between the Mac's architecture and many sophisticated organizational concepts of Japanese management.

According to Matthews, computers such as the Apple II and the IBM PC are like the typical Western organization, structured as a "pyramid of authority, with the boss at the top and ever expanding positions as the chart moves to its wider base of workers." For information to flow between the top and the bottom, it has to pass through a number of layers of managers, a cumbersome, unreliable method at best. "There is," he writes, "another type of organization, infinitely more complex in its internal communication and decision-making process. In Japan it is called the magic circle, and Japanese corporate management has exploited this method effectively to solve corporate problems." The distinguishing feature of the magic circle is direct communication among the various levels of authority.

Just as members of a Japanese magic circle are drawn from throughout the company, inside the Mac the ROM routines that constitute a particular manager, such as the Window Manager, are spread out over the entire ROM. The Window Manager, for instance, invokes facilities from several other managers—including QuickDraw, the Control Manager, and the Event Manager—to manipulate a window on the screen. Since the Mac's resources consist of nearly 30 managers, drivers, and handlers, as well as over 400 routines, this system can be confusing for programmers of conventional computer systems. Matthews states, "The big question traditional programmers have to get out of their psyches is, Where is the Window Manager? or any other manager for that matter. The answer is everywhere and nowhere. You cannot point directly to a manager, because a manager is made up of lots of workers [routines]."

But if the system of sharing common functions is confusing to programmers, according to Matthews it is the secret behind how Apple put "so much sophistication into so small a ROM. Don't let this confuse you," he continues, "the routines act like they are grouped together, and that is the important thing for you to know as you develop programs." Is there a hub to the magic circle? Yes, it's called the Trap Dispatcher. But that's another story, one about soul and heart. Read about it in Keith Matthews's book.
Michael Tchao, a senior at Stanford University majoring in product design, is the organizer of a unique computer science course at Stanford: CS 1C, "Using the Macintosh at Stanford." In January 1984 Tchao attended the annual Apple shareholders meeting, where the Macintosh was first unveiled, and heard what he calls "the gospel according to Steve Jobs." The Mac so sparked Tchao's interest that he talked to Stuart Reges, the assistant chairman for undergraduate education in the computer science department, about using Macs in introductory computer science courses.

During the summer Tchao, Reges, and teaching assistant Bill Berner developed an introductory course to teach students how to use applications rather than how to program. They tested a prototype of the course on freshman football players, who spend August practicing on campus. "The Macintosh seemed very small in the hands of Stanford's largest freshmen," Tchao said. "But the enthusiasm was great, and the summer experiment proved a success."

CS 1C was introduced as a one-credit course for fall quarter of 1984. The class consists of small sections that meet once a week, during which teaching assistants give tutorials on specific application programs. Each student is required to purchase a course binder of labs on the software covered in the course. Each class begins with an overview of a product's capabilities, followed by a 1- to 1½-hour exercise designed to help students explore the program in depth.

The course is so popular that about 200 students are enrolled, in ten sections. Some sections meet in classrooms, while others are taught in dormitories as part of a residential education program. Wherever the sections meet, the course is fired by the enthusiasm of the students. Tchao supervises ten undergraduate teaching assistants and is working with them and editors at Apple Computer to publish the course binder. He hopes that after he graduates, his disciples will go on with the class and continue to spread the Macintosh gospel on campus.—Clay Andres

Apple's Hard Disk

There's no scarcity of hard disks for the Mac; I count at least a dozen available. One of the glaring problems in the Macintosh world, however, is the lack of a hard disk standard. Each hard disk has a different way of handling the software interface to the Mac, and none of the strategies works perfectly. Another problem is that most hard disks connect to the Mac through the serial port rather than the disk drive port. The throughput of the disk port—the speed at which data can be transferred to an external device—is two to three times faster than that of the serial port.

Now that Apple has entered the Macintosh hard disk market with a 20-megabyte hard disk that plugs into the disk drive port, you would expect that the sales of non-Apple hard disks would suffer, with the possible exception of General Computer Company, which manufactures the HyperDrive internal hard disk. But Apple product marketing manager Peter Friedman has another analysis: "Apple’s hard disk will legitimize the hard disk market for the Mac and thereby help to increase overall Macintosh sales. The enlarged market will create new opportunities for companies who offer differentiated products, such as hard disks with removable cartridges, and lower- or higher-capacity drives that provide good performance for the price." □
Mail Center™ Delivers!
Electronic Mail for the Macintosh™ Office.

Need to send a memo to everyone in your department? Mail Center will deliver. Even if they are working furiously with other programs on their computer. Designed to be used with the AppleTalk Personal Network™, Mail Center offers every office an easy and efficient means of improving communications. Meeting notices, reports, memos, letters, spreadsheets, charts and graphics can all be sent quickly and easily to everyone who needs to know. In fact, practically any Macintosh document can be sent from one Macintosh to another in record time. Mail Center software for Macintosh. No wait delivery for the Macintosh office.

Suggested Retail Prices

INTRODUCING
the
easel™
THE ULTIMATE DISK HANDLER

The first lightweight, compact carrier for 3½” micro disk.

We're big on ABILITY . . . portability, durability and affordability. That's because the Easel has a "no-nonsense" approach to disk handling. Holding up to 20 diskettes, the Easel's storage design allows you to quickly read each disk label at a glance — no more fumbling through disk after disk to find the one you're looking for. And its portability puts awkward, oversized plastic cases to shame. When you're on the move, the Easel moves easily and safely with you, folding to a thickness of less than an inch. At home or in the office, the Easel unfolds into a sturdy, self-standing holder. Now doesn't that make sense?

Portability doesn't mean sacrificing protection or quality either. The Easel is made of heavy-duty, water-resistant (and anti-static) nylon, and reinforced to guard against impact. Velcro closings keep diskettes safely in their individual pockets—no matter how rough the transport. And the Easel is available in five super colors: silver-grey, burgundy, blue, red and lavender.

Best of all is the price. Retail $19.95. Ask for The Easel at your favorite computer store or call toll free for more information:
1-800-525-2225 (1-800-824-6097 inside California). Dealer inquiries welcome.

Powerful software that turns the ordinary mouse into an intelligent business partner.

How can this be?
Actually, it's quite simple. You see, the people at EXECUCOM Systems Corporation had a great idea. First, develop a powerful Decision Support Software System that allows you to describe (model) your business problems and situations using understandable terms and calculations. A system that helps you analyze information faster and better. A system that can communicate—with other PC's and with our mainframe Decision Support System, IFPS®. And, a system that gives you precise answers for accurate decision-making, and helps turn complex business problems into simple solutions.

Second, design this software system around a computer that understands you. That understands how you think. A computer that's easy for you to learn and simple for you to operate.

This powerful system is called MindSight™. It's designed for the Apple Macintosh™, the computer for the rest of us. And it's from EXECUCOM, the leader in Decision Support technology.

Now people who really need to use computers, like you, have a powerful Decision Support System they can use. MindSight™ is a system that reduces the time required for you to become productive with a computer; a system that helps reduce the time required for you to act on important business matters. And MindSight™ is a system so simple, you can operate it with an ordinary mouse. If you think, as we do, that MindSight™ is a great idea, call us. Or drop us a line. We would love to tell you more about MindSight™ and how it can become your intelligent business partner.

EXECUCOM Systems Corporation 3410 Far West Boulevard, Austin, TX 78731 (1-800-531-5038; in Texas or Canada, 512-346-4980). EXECUCOM, the number one choice of the Fortune 500 in Decision Support Software. Continuing a decade of excellence.
THE MOST REVOLUTIONARY ATTACHMENT TO THE MACINTOSH "SINCE THE MOUSE."

The Bernoulli Box ™, the cartridge disk subsystem that revolutionized mass storage for the IBM PC, XT, AT, most compatibles, and the TI Professional, now proudly adds Apple’s Macintosh to the list.

The Bernoulli Box and its 5-megabyte removable cartridges together deliver unparalleled data base dynamics. And that, more and more, is what your business needs today. Not centralized, monolithic banks of information, but data bases defined by job function and software application. Data bases that give people the versatility to work more productively.

But there is more. More performance and reliability. Transfer rates and access times faster than most Winchesters. No head crashes ever. And cost per megabyte that Winchesters cannot touch.

The Bernoulli Box’s cartridge capacity, portability and absolute interchangeability give your business more options. You can easily build primary data bases. You can package individualized data bases, software and all—for payroll, accounting, marketing, computer graphics—in convenient, dedicated cartridges. And you can pack all of the data into a briefcase, an interoffice envelope, or even a file drawer.

The Bernoulli Box. When placed beside Apple’s “computer for the rest of us,” the best box you can buy. For the dealer nearest you, call 1-800-556-1234, ext. 215.

In California, call 1-800-441-2345 ext. 215.

Only you and your mouse can defend your city and save its people.

5:35 a.m.
Your city is under attack from hostile forces. Hot air balloons have started releasing a deadly shower of bombs in an attempt to break your city's protective shield. Dive bombers are zooming in for a full scale attack.
The battle has just begun...

9:08 a.m.
Smart bombs come hurtling through the air... You fire and miss, fire and miss. What's happening?! You've never seen anything like them... how do you destroy them before they destroy you? OH, NO! You're losing your high-energy shield!

11:23 a.m.
Armed paratroopers are dropping from the skies in droves. You begin to realize that defending your city is no easy mission. You fire from one of your three MacCommand bases. ZapZapZap! Got one, got two... But, they're coming too fast. Paratroopers have penetrated your city...

4:52 p.m.
They've destroyed your main missile base. They've detonated city hall! Ambulances are on their way to collect your wounded. What a disaster!
But there's more to come...

9:47 p.m.
NOT THE DREADED SPINNERS! With spinners zinging through the air, firing smart bombs randomly in rapid succession, how much longer can you hold the enemy back?
To find out, you'll have to get your own copy of MacCommand. And don't worry... if you don't make the high scoreboard your first time around, there's always tomorrow. Remember, dedicated MacCommandos never say die!

Introducing MacCommand

For more information, or the location of your nearest MacCommand dealer, please call or write Creighton Development, Inc.
How to design and produce the perfect page in 15 minutes

Get ReadySetGo™
Because ReadySetGo automates page design and production, turning your Mac into a professional publishing system.

It's ideal for any project requiring page layout, like a presentation, newsletter, report, form, flyer, slide or ad.

Build pages dynamically from blocks containing text or graphics. Move the blocks around the page and resize with the mouse. There's a ruler for visual positioning but a unique specification sheet gives each block's exact design and allows very accurate positioning not possible with the mouse alone.

Keyboard text from scratch or bring it in from other Mac programs. Either way, you get full text editing features with the ability to change font, style and size at any point. ReadySetGo supports all Mac fonts including real typefaces like Times™ and Helvetica™ and all sizes 1 thru 99. When you edit text or resize a block, the display instantly updates and text automatically refits the block.

Use graphics blocks to make frames, solids or pictures. And bring in graphics from other Mac programs. Move and resize graphics blocks just like text blocks.

Create a page of any standard size and use show page for a scaled view of the entire page. Show page updates continuously as your work progresses.

Store pages on disk as full documents or as layouts which can be used for future projects. Print finished pages on the ImageWriter™ or on the LaserWriter™ for superb publication quality output.

At just $125 ReadySetGo is truly the first of its kind. Visit your local dealer or call us at 212-989-6442 for the store nearest you.

The Ultimate Page Processor™

ReadySetGo requires a 512K Mac. ReadySetGo and “The Ultimate Page Processor” are trademarks of Manhattan Graphics Corporation. ImageWriter and LaserWriter are trademarks of Apple Computer, Inc. Times and Helvetica are trademarks of Allied Corporation.
...and a page you can use to share your ideas

"The only software product I would have paid more for."
Nancy Taub, Manager Technical Documentation, Chemical Bank, New York, NY

"The program encourages good design by making it almost effortless to create and modify page layouts."
Brian Arel, Graphic Design Consultant, Fitchburg, MA

"I use ReadySetGo regularly for my newsletters...it's remarkably easy to use and it's simple to construct precise layouts."
David Kosiur, Research Geochemist, Chevron Oil, La Habra, CA

"What I appreciate most about ReadySetGo is the ease and speed of creating formats and the ability to insert photographs and immediately see them in place."
John Lutz, Director of College Printing, Dartmouth College, Hanover, NH

"As a graphic designer, I find the 'save layout only' option is a dream come true."
Jane D. Kunzman, Kunzman Studio, Somerville, NJ

"For me ReadySetGo marks the beginning of the 'personal publishing' revolution."
Tony Gluck, President, Libra Press, London, England

The Ultimate Page Processor

Attention ReadySetGo users! We're considering publishing a ReadySetGo users newsletter on this page, featuring you, your ReadySetGo projects and tips on page processing. Please send your ideas and suggestions to Manhattan Graphics, 163 Varick Street, New York, NY 10013.

Circle 2 on reader service card
Without mass storage that every Macintosh can access, your networked office won't have a prayer. Because you'll still have to share data by swapping floppies. And just consider how fast a floppy disk fills up with an entire workgroup compiling data. To share information, you have to get those floppies neatly stacked, sorted and cataloged. Something your computer should do for you. Which is why we've introduced OmniTalk software. It lets you network your Macintosh Office and LaserWriter printer with an OmniDrive hard disk. So you can store all your files in one place. And share information whenever you want, with whomever you want. Without turning your floppies into little frisbees. Several people can even access the same information at once—something a floppy could never do. With OmniDrive and OmniTalk, your Macintosh Office has faster access to software and data, greater storage capacity, even easier back-up capability. Plus, you get three levels of protection to keep your files safe. And with the Corvus 126MB hard disk, it all costs less per megabyte than any other system. You see, Corvus has more experience networking than anyone else. No one offers more, because no one can. So take it from us. If you're going to add people to your new Macintosh Office, add the mass storage system that everyone can use. OmniDrive from Corvus. Then your Macintoshes can really start talkin' business. For more information, call (800) 4-CORVUS.

Corvus
Get Info answers questions about the Macintosh and how it works. Most inquiries deal with application programs, but no topic is too elementary or too advanced. Discussions range from setting up the Mac to programming in BASIC and Pascal. When you need advice about using the Mac, drop me a line. I cannot respond to individual letters, but I will answer the most representative questions.

This month I tackle the problems of three writers: one needs to count the words in a document, another wants to type formulas that use multi-level superscripts and subscripts, and a third wants to save notes on 3-by-5-inch cards but can't find a program that prints them.

And what happens if you plug an extra-high-resolution dot-matrix printer like the Toshiba 1340 into your Mac? A Macintosh Pascal programmer suspects there must be some way to put data files on separate disks, but the manual doesn't say how. If you're into assembly language, I have some information on 68000 assemblers that run on the Mac.

Finally, one spreadsheet jockey asks about the numeric keypad, and another wants to know how to use the Clipboard to transfer data from Multiplan to MacWrite.

Word Counting

Q. Is there any way to use my Mac to count the number of words in a MacWrite document?

Dolores Guynn
Salina, Kansas

A. Almost any spelling-checker program displays a count of the number of words in a document. Assimilation's Mac Spell Right works with MacWrite version 4.0 or later. Hayden's Speller from Hayden Software works with MacWrite and Microsoft Word.

You can use the Get Info command to find out the number of bytes in a document, which approximately equals the number of characters. You can also estimate the number of words in a Microsoft Word document based on the number of characters. Every time Word opens or saves a document, it displays the number of characters in the lower-left corner of the document window. Divide the character count by six (an average of five characters per word plus a space) for an estimate of the number of words.

Subscripted Subscripts and Superscripted Superscripts

Q. I am writing a technical paper that requires double superscripts (superscripts of superscripts) and double subscripts. I have painstakingly been doing the equations in MacPaint, then inserting them into MacWrite. Is there a way to obtain the desired results using only MacWrite or Microsoft Word?

Michael J. Dunn
Manhattan Beach, California

A. Special superscript and subscript fonts contain letters and numerals that are raised above or below the standard position of characters on a line. When you use these fonts in MacWrite's plain text style, you get ordinary superscripts and subscripts. When you use these fonts in Superscript or Subscript style, you get double superscripts and subscripts. Dayton Fonts ($15 from Plugg, P.O. Box 358, Dayton, OH 45459) includes superscripts and subscripts, ornamental Greek and English alphabets, a square root tool kit, fraction connectors, dot, integrals, sums, large brackets, and other symbols used in equations. SciFonts ($49.95 plus $2 shipping from Paragon Courseware,
Let's get right to the point: the computer for the rest of us can bring out the best in us.

All it takes is your Mac, your imagination, and Macworld as your guide. And, of course, the tip of your finger. Experts have called the Macintosh the only "whole-brain" computer. So here's a chance for you to use your entire cerebral creativity with push-button ease.

With more than $20,000 being awarded to winners of the Macworld Art Contest for your Macintosh graphics published in this magazine, you could profit considerably from your subscription to Macworld.

Which brings us to the next point. Right now, unleash your fingertips and remove the postpaid card facing this page. Complete. Mail. Compute! Let your fingers do the talking.

SUDDENLY THERE'S NEON.™

IT PUTS PROGRAMMING IN A WHOLE NEW LIGHT.

Hidden within your Mac is the programming power, flexibility, and speed to match your imagination. Neon is your key to this object-oriented world. Based on the same design philosophy as the Mac itself, Neon lets you create and command objects—program modules that you build, perfect, and add to your personal collection of tools. In this Smalltalk-like environment, you wield the power to quickly assemble and test ideas, tuning as you go for maximum speed and efficiency.

Neon is lean and works well in 128K. Dynamic overlays multiply this capacity for the fattest Mac you can use. Neon is easy to work with from the beginning, and quickly puts you at the leading edge of professional software development. With Neon, you're already in the software business because there are no licensing fees. Ever.

If you are about to program for the first time, you'll appreciate the comprehensive manual by Danny Goodman that guides you through the commands and concepts. For the professional, Neon is the only choice.

Created by Kriya Systems, Inc. for the development of our Typing Tutor III™ keyboard instruction program, Neon is your answer to software artistry with the Mac.

Call 1-800-621-0660 now with Visa or MasterCard, or send your check to Kriya Systems, Inc. 505 N. Lake Shore Drive, Suite 5510, Chicago, IL 60611, (312) 822-0624, to order your copy of Neon. The price is $299. As a special introductory offer, you may purchase Neon and full documentation through June 30, 1985 for $155, including shipping and handling.
4954 Sun Valley Rd., Del Mar, CA 92014, (619/481-1477) includes a 12-point cursive font and 12-point regular, 9-point superscript, and 9-point subscript fonts of the English and Greek alphabets, Arabic numerals, and mathematical symbols. The fonts can be installed in any System file with the Font Mover program and work well with both MacWrite and Microsoft Word.

Imagewriter-Compatible Printers

Q. Can the Toshiba 1340, an "Imagewriter-compatible" printer, print Macintosh documents at its claimed resolution of 240 dots per inch?  
Julius Bazan  
Glen Oaks, New York

A. Like many printer manufacturers, Toshiba offers a program called a printer driver that allows you to print MacWrite and MacPaint documents with one of its printers instead of an Imagewriter. The Toshiba driver gives you a choice of standard-, high-, or letter-quality printing. The standard- and high-quality printing options on the Toshiba 1340 produce printouts that look the same as on the Imagewriter, they do not take advantage of the Toshiba printer's extra-high resolution. Letter-quality printing does take advantage of the Toshiba printer's 240 dots per inch with a font built into the printer. However, the letter-quality font comes in only one size and in plain, bold, italic, underline, superscript, and subscript styles. Also, pictures in a MacWrite document are not printed if you choose letter-quality printing. Toshiba advises against using its printer driver with applications other than MacWrite and MacPaint.

LetterWare and MatrixWare, printer drivers from Intrepid Technologies (P.O. Box 31211, Santa Barbara, CA 93130, 805/685-6770), allow the Mac to print graphics and letter-quality text on the Toshiba printer. ProPrint from Creighton Development (4931 Birch St., Newport Beach, CA 92660, 714/476-1973) prints only letter-quality text on the Toshiba 1340. These drivers also work with many other printers.

MacPascal Data Disks

Q. How can MacPascal access a data file on another disk? The MacPascal application disk, which must be inserted to run a MacPascal program, has only about 100K available after you remove nonessential files—not nearly enough for the data file used by the program I am writing.  
Miguel Karen O'Brien de Lacy  
Sorocaba, São Paulo  
Brazil

A. Accessing data on a separate disk is best done with an external drive. Doing so with only the internal disk drive calls for some single-minded disk swapping. Gaining access to a file on another disk in a MacPascal program requires you to prefix the name of the file with the name of the disk, called the volume name, and a colon. The sample program FileDemo (see the listing) opens three files—named Subscribers, Advertisers, and Distributors—on a disk named Magazine.

If the disk named Magazine has been ejected, a dialog box appears, asking you to insert the disk. However, if the disk was not inserted prior to starting MacPascal, the program stops with the message, "At-
Fonts and Images for the Macintosh

Make your memos, flyers, newsletters or reports come alive with ClickArt images and fonts. Instead of having to create graphics from scratch, ClickArt puts hundreds of professionally drawn images at your fingertips. You can use the drawings in the ClickArt series as is, or as a starting point for your own creativity.

There are three ClickArt packages to choose from:

**ClickArt Personal Graphics**

Personal Graphics is a disk-full of contemporary images from small dingbats to full-screen portraits. Images include Einstein, Michelangelo's David, animals, cartoons, cars, wine bottle, city skyline. They're great for adding a personal touch to invitations, stationery or announcements.

**ClickArt Publications**

ClickArt Publications is a collection of images specifically designed for creating newsletters, flyers and invitations. It includes two- and three-column layout guides with illustrated headlines (like "Letters to the Editor," "On Vacation," "Party," "Thanks" and "Bon Voyage") sized to fit the layouts. It also contains cartoons, maps of the USA and Europe, illustrated alphabets, and much more.

**ClickArt Letters**

ClickArt Letters contains 24 high quality typefaces in large point sizes (24, 36, 48 and 72 point) that make your headlines and overhead transparencies come alive. Fifteen of the typefaces are installable fonts. Typefaces up to two inches high are included in MacPaint files.

**Macintosh Software from T/Maker Graphics**

Stop by your dealer and check out all our Macintosh products—including our two newest: ClickArt Effects, which adds rotate, slant, distort and perspective to MacPaint, and the ClickOn Worksheet, a spreadsheet/grapher that operates as a desk accessory. Or call or write to us to receive a free catalog showing all the images and describing each package.

Price: $49.95 each
If you thought all small business accounting software was made only for IBM, think again...

Hmmmmmmmm....

BizMac™
The small business accounting system for the Macintosh™

BIZMAC Small Business System: General Ledger, Inventory, Accounts Receivable, Accounts Payable and two Payroll versions. The complete small business software package specially designed for the Macintosh computer. BIZMAC software enables you to link all parts of the company into a cohesive unit. Single entries in accounts receivable and accounts payable update the other modules automatically. At the click of the mouse, various historical data is at your fingertips, in easy to use form. Built in pie and bar charts make your analysis visual. BIZMAC software gets the job done quickly and efficiently. BIZMAC software, is as “State of the Art” as the Macintosh itself. Every small business needs to have the competitive edge in today’s marketplace; for yours, contact your local Apple dealer..... or for more information:

ClickArt Effects

Four New Tools for MacPaint

ClickArt Effects Picks Up Where MacPaint Left Off

Now you can produce the special effects you've always wanted in MacPaint. Rotate your words or pictures a few degrees at a time. Or slant them. Or give them perspective through a vanishing point. Or even use a distortion box to create the perception of a twist. All with four new tools called ClickArt Effects.

Really Special Effects

These tools are great simply for their stated purpose. But the included tips manual will give you some ideas for even wilder effects. You can use the tools to create unusual patterns, to generate a gradual gradation, to create shadows and monument effects, and much more.

It's like discovering MacPaint all over again.

Works Right Within MacPaint

Effects gives you four new tools—rotate, slant, distort and perspective—which work directly from within MacPaint.

One click installs Effects onto your MacPaint disk. Then, whenever you need one of the new tools, simply reach under the apple icon and select ClickArt Effects. The four Effects tools temporarily replace the standard MacPaint tools—ready for you to use just like any you're already familiar with. Another click instantly brings back the standard tools—it's that easy!

Check Out All Our Macintosh Products

Stop by your dealer to see the full line of Macintosh software from T/Maker Graphics—ClickArt Effects, ClickArt image portfolios and fonts, and the ClickOn Worksheet, a spreadsheet/grapher that operates as a desk accessory. Or call or write to us to receive a free catalog.

Get Info

A simple way to avoid this interruption is to declare a string variable, such as filename: string, and add the following line to the program ahead of the first Open procedure:

```
fileName := OldFileName('Insert Magazine disk, click Cancel')
```

The Macintosh Pascal standard procedure OldFileName displays the specified message inside a dialog box. The box gives you a chance to insert the required data disk after you eject the program disk if you have only one disk drive or to insert the data disk in the external drive. However, if you instead try to open one of the files listed in the dialog box, that file is not opened.

A better way to access a file on another disk is to use Macintosh Pascal's InLine facilities to directly access procedures and functions such as Eject and GetVollnfo in the ROM Toolbox. For a description of the InLine facilities, see the InLines document on the MacPascal disk. For a description of the Toolbox procedures and functions relevant to disks, see the File Manager section of Inside Macintosh (Apple Computer, 1985).

### Native Mac Assemblers

**Q.** I am interested in an assembler for the Macintosh. I can't afford a Lisa and must limit my programming to the Mac. Also, is the bound version of Inside Macintosh available yet?

**A.** In April Apple released its Macintosh 68000 Development System (MDS), which runs on a 128K or a 512K Mac with an external drive recommended.

---

**ExperTelligence™** has the "tools" to transform your Macintosh™ into a powerful Artificial Intelligence workstation. **ExperLisp™** is the first complete implementation of LISP on a microcomputer. Developed on a Symbolics 3600™, the compiler generates efficient MC68000 code providing speed and function ideal for the development and delivery of sophisticated AI applications. **ExperOPS5™** by Science Applications International Corporation, is a complete implementation of the well-known OPS5 expert systems building tool. It provides a fast and efficient method for constructing complex Expert Systems.

**ExperLogo™** features 3-D and spherical graphics, English-like commands and shares the speed and function of ExperLisp. In the classroom or in the lab, ExperLogo provides an environment for discovery and exploration for children and developers alike.

Call today for more information about these and other innovative AI products.

**ExperTelligence, Inc.**

Macintosh is a trademark licensed to Apple Computer, Inc.
Symbolics 3600 is a registered trademark of Symbolics, Inc.

---

**FileDemo**

A short MacPascal program that opens three files on a disk whose volume name is Magazine. Each file consists of the records defined as "MailRecd."

```
program FileDemo;

type
  MailRecd = record
    idNo: integer;
    name, title, address, city: string[30];
    state: string[2];
    zip: string[9];
  end;

var
  MailFile = file of MailRecd;

begin
  Open(SubscrFile, 'Magazine:Subscribers');
  Open(AdFile, 'Magazine:Advertisers');
  Open(DistrFile, 'Magazine:Distributors');
end.
```
Integrate spreadsheets and graphics into MacWrite™ (or any other application)

Let's say you're in MacWrite. Without leaving it, you click on a spreadsheet for some quick calculations. Then click on a bar, pie or line chart, made directly from your spreadsheet. Now paste them both into your MacWrite document. Done. All without leaving MacWrite, and without changing programs or disks. And even on your 128k Mac.

MacWrite Memo and ClickOn Worksheet

New Power for your Desktop

ClickOn Worksheet is a desk accessory that adds a spreadsheet and grapher to any application. The 50 row x 20 column spreadsheet includes features such as variable column widths, absolute/relative addressing, built-in financial calculations (like net present value, compounding, future value) and logical operators. In addition, you can "fold" the spreadsheet to see and graph different parts of it at the same time.

Presentation-quality Charts in an Instant

By simply selecting the data you want charted, the Worksheet creates pie charts, bar graphs (stacked or adjacent) or line charts, complete with automatic axes and legends. Any changes in the spreadsheet are immediately reflected in the graph.

Ready-made Solutions

To make your job even easier, we've included a dozen popular applications templates, including income statement/balance sheet with financial ratios, lease/purchase analysis, loan repayment schedule, stock portfolio, and depreciation schedules.

Requirements: 128k or 512k Macintosh™  Price: $79.95
NOW YOU'RE TALKING!
Macintosh™ software that talks!
Software-only synthesized speech.

SMOOTH TALKER™
SmoothTalker can literally proofread to you most of your word processing, spreadsheet, and data base documents. Plus, hobbisters can now include speech in their own Microsoft® BASIC programs. Call (213) 427-0178 24-hours-a-day to learn why SmoothTalker is the “talk of the industry™”!

KID TALK™
KidTalk is the revolutionary “talking notebook™” that will increase pre-school through junior high children's ability to read, write, and communicate their ideas. For the first time, self-contained speech has been added to the creative writing environment. Just imagine the possibilities . . .

SPELLER BEE™
Speller Bee is part of the exciting “talking notebook series” using self-contained speech. Speller Bee is a powerful learning tool for spelling mastery for pre-school through junior high students. Speller Bee provides children with a self-paced skill builder that is both fun and challenging.

**Make Your Mac Sing, Dance, and Create Great Art.**

**VideoWorks™ puts your ideas in motion.**
Create your own animations. Anything you can imagine, you can bring to life on your screen. Assemble your characters using the artwork included with VideoWorks. Or use MacPaint™ to create characters and locales of your own. Then use VideoWorks to get your creations moving. This could be your first step to an Academy Award!

**MusicWorks™ brings out the music in you.**
Compose music directly on your Macintosh™ and hear the results instantly. Even if you can't read a note, you can produce musical scores with just a sweep and click of the mouse. Play back your whole composition, or any part of it, whenever you want. Hear your music played by any of eight instruments. And write that Top 40 hit you've always dreamed of.

**Art Grabber™ with BodyShop™ improves your image.**
Art Grabber speeds up your design process by letting you instantly transfer screen images from one MacPaint document to another. BodyShop gives you a selection of human forms which you can assemble any way you want. You get both for the price of one.

Hayden creativity tools are available for the Macintosh at your local software dealer or contact Hayden Software, 600 Suffolk Street, Lowell, MA 01854, or call 800-343-1218.

MusicWorks and you can make beautiful music together.

Art Grabber helps you make beautiful images together.

Make faces in a blink of an eye with BodyShop.
Get Info

MDS includes a 68000 assembler, an editor, a linker, a set of debuggers, a Mac-to-Mac connecting cable, several utilities, an MDS user manual, a Motorola 68000 programmer manual, a copy of *Inside Macintosh*, and a list of system traps and equates. MDS costs $195 and can be ordered through any authorized Apple dealer or the Certified Developer Program.

Assemblers are also available from other companies. Hippo-C Level 2 ($399.95 from Hippopotamus Software) is a C development system for the Mac that includes an assembler designed for optimizing C code, not for developing complete applications. Aztek C68K-C ($499 from Manx Software) is another C development system for the Mac; its assembler is claimed to be adequate for program development in assembly language. *CP/M for the Macintosh* ($395 from I.Q. Software) is an eclectic selection of ten programs, including a 68000 macroassembler that is reputedly adequate for program development.

The "phone book" edition of *Inside Macintosh*, which is bound and uses thin paper like a telephone directory, is available for $25 from Apple Computer Mailing Facility, 467 Saratoga Ave. #621, San Jose, CA 95129. Addison-Wesley plans to publish a three-volume regular edition by October as part of the Apple Technical Library.

Lost between Multiplan and MacWrite

Q. How do you move a Multiplan document to MacWrite? I lose the worksheet when I use the Clipboard.

A. From Multiplan select the cells whose values you want to copy and choose Copy from the Edit menu or press Ctrl-C. Then choose Quit from Multiplan's File menu. If you copied a large block of cells to the Clipboard, a dialog box states "Saving large Clipboard" and gives you two options: "Save formatted values" and "Save unformatted values." Make sure an X is in the small box next to "Save formatted values" before clicking the OK button, or the Multiplan values will not make it to MacWrite. The values (not the formulas) of the selected cells are copied to the Clipboard with invisible tab characters between fields.

From the desktop you can inspect the values on the Clipboard by choosing Show Clipboard on the Edit menu. Since the Clipboard window has no scroll bar, you may not be able to see everything it contains. However, if it is empty or contains only the words "(Custom Clipboard)," you made the wrong choice in the dialog box when you quit Multiplan; go back and re-copy the cells.

With your Multiplan values on the Clipboard, open MacWrite. Move the cursor to the spot in the MacWrite document where you want to paste the Multiplan values. Insert a formatting ruler there and set one tab for each column you're copying. Finally, with the blinking insertion point below the ruler, choose Paste on the Edit menu or press Ctrl-V. The invisible tab characters Multiplan inserted between the values are converted to "tab" characters in MacWrite.

The Bar Code Reader for the Macintosh™ Office... and the Macintosh Factory

The TPS PC-380 Bar Code Reader for the Macintosh... Chosen by Apple® for use on the Mac production line. The PC-380 connects easily, allowing the user to read standard bar codes.

- Simple keyboard interface
- No port required
- Metal case and wand
- Transparent to any software

List price $795. Bar code printing software $50 with the purchase of a reader. Credit card readers and combination units also available.

4047 Transport St., Palo Alto, CA 94303 (415) 856-6833

Feathers & Space

Macworld 67
There's this island off the coast somewhere... The Harrier Jump Jet, one of the world's most sophisticated technological marvels, combines the ability to take off and land vertically like a helicopter with the speed and punch of the latest in modern jet armament. Your mission, should you decide to accept it, is to pilot your Harrier from the deck of an aircraft carrier, take out enemy aircraft, locate and destroy enemy headquarters & fuel depot, and safely land on the deck of your aircraft carrier.

Simple isn't it? Hardly! Facing you will be some of the world's nastiest enemy fighter planes. The bad news is you have only one plane between five enemy aircraft and your carrier.

Now wipe that sweat off your brow, don your helmet and gloves, strap yourself into your seat and launching heat seeking missiles.

The good news is that you have 3 Sidewinder missiles, two 30mm Aden cannon pods and the ability to maneuver like no other jet in history!

GOOD LUCK! Nuff said, it's Clobberin' time! Harrier Strike Mission—a 3-Dimensional Flight Combat Simulator for your 128K or 512K Macintosh. The first in a series of new projective 3-D simulations from MILES COMPUTING, INC. (those great folks that brought you MacAttack! and Mac the Knife!)

Circle 37 on reader service card
serts between values make the values line up according to the tabs in MacWrite's formatting ruler. Adjust the tabs to get the column spacing you want.

Printing on Index Cards

Q. I would like to print ideas and research information on pin-feed 3-by 5-inch index cards but can't use my ImageWriter to do so. I would also like to print a heading on each index card. The heading will sometimes be the same or similar on several cards. Do you have any suggestions?

Judith A. Stockman
Philadelphia, Pennsylvania

A. The Page Setup dialog box on most application programs doesn't accommodate a page as small as 3 by 5 inches. However, MegaForm (\$295 from Megahaus) allows you to customize page sizes in inches or millimeters. While you normally use MegaForm to design complex forms such as invoices (see "The Mac Goes Pro Forma," Macworld, July 1985), you can also use it to set up a form that looks like a blank 3-by 5-inch card. Information on the card can come from a variety of sources: the keyboard, spreadsheet-style formulas, tables, and files in the companion MegaFiler database program. You specify the sources when you design the form. You could create a MegaFiler database containing your notes and headings and use MegaForm to print the index cards.

The Numeric Keypad's Special Keys

Q. I bought the numeric keypad to use with Multiplan. However, Microsoft's manual doesn't explain how the cursor keys work with the program.

R. Campbell
Lansdale, Pennsylvania

A. Microsoft manuals may not mention the numeric keypad, but Microsoft programs recognize it. Multiplan uses the arrow keys to move the selected cell up, down, right, and left the way Shift-Return, Return, Tab, and Shift-Tab do on the standard keyboard, as described on page 35 of the Multiplan manual. The Clear key on the keypad clears the contents of the selected cell; choosing Undo on the Edit menu restores the contents. All other keys on the numeric keypad function like their counterparts on the standard keyboard.

Other Microsoft programs recognize the special keys on the numeric keypad. Chart uses the up- and down-arrow keys to move up and down a list. In File the arrow keys allow you to select an adjacent field or record, while the keypad's Clear key duplicates the keyboard's Backspace key. Word lets you use the arrow keys to move the insertion point, select text, and scroll the document.

Send your questions about the Macintosh, Macintosh software, and Macintosh programming to Get Info, Macworld, 555 De Haro St., San Francisco, CA 94107. Send electronic mail to CompuServe 70370.702 or The Source BCW-440.

With Macintosh hardware and software, prices are changing rapidly, please call for our most recent -- low discount prices.

Apple is a trademark of Apple Computers, Inc. Macintosh is a trademark licensed to Apple Computer, Inc.
Now that you have the computer for the rest of us, do yourself another favor. Read this ad.

Like most Macintosh™ users, you probably don’t realize the many benefits of the International Apple Core.™ Or what we can do for you and your Mac.

The International Apple Core is a nonprofit organization of Apple users and user groups. We’re just like your Macintosh, friendly and helpful.

We’re dedicated to providing education, information and support to users of Macintosh and Apple products.

You can enjoy all the special benefits we have been providing user groups since 1979. You may share information on new applications. Or learn the latest on Macintosh products. Or keep up on Apple events.

If you’d like to join a local user group or contact other Macintosh enthusiasts, we can help.

A membership that pays you.

Our individual membership brings you discounts on public domain software, computer insurance, Micro Disk Minder™ and Penila Pac™ to keep your 3.5s in order, and a subscription to MACWORLD. If you have a subscription now, it will be extended for thirteen issues.

You’ll receive all this and more for only $40 yearly membership fee.* If you get together with other Macintosh owners, you’re on your way to forming a user group. And that’s good. Because you can benefit even further from the IAC.

Our user group membership includes a subscription to MACWORLD, plus group purchases at bigger discounts. All the benefits of an individual membership and more. For not much more. Just $65 yearly.*

If you’ve considered forming a user group, you’ll want our Club Management Binder. For only $35 you receive sample bylaws, ideas on forming and running your group, and electing officers and directors. All enclosed in a hard bound ring binder with two disks.

Individually or as a group you can’t lose. So fill out the membership coupon below. And do yourself another favor.

I want more for me and my Mac. Please see my choice below:

- $40 Individual Membership (US, Canada)
- $65 User Group Membership (US, Canada)
- $100 Individual Membership
- $125 User Group Membership
- $35 Club Management Binder

CONCEPTS COMPUTERIZED

Atlas™

©1985, Software Concepts, Incorporated
Give us $6.95 and we'll give you
the World!

Quick, what's the capital of Sri Lanka? What countries do you pass through traveling from Copenhagen to Rome? For learning, explaining, or just plain daydreaming, there's nothing like an atlas. Now, with CONCEPTS COMPUTERIZED ATLAS, the world enters the computer age. You can too. In your own home and for only $6.95. Thanks to our unique Phoenix Plan.

What Is a Computerized Atlas?

You can forget the bulky volume with the endless index. We put a three-dimensional globe on your screen. Turn it east, west, north, or south. Select an area that interests you and enlarge it.

Visit any state in the United States, any province in Canada. Visit any country in the world! Simply type the name, and the Atlas brings it to the center of the screen. A closer look? Magnify it twice, three times, five times! Call up the Fact Sheet to find the population, the size, the capital, the monetary unit and more.

Our Atlas can give you information on more than 2,500 cities. Just type the name, and the Atlas shows you where it is. And tells you the city's latitude and longitude, its population, and facts about the country it's part of. Big cities, historical cities, vacation spots, places in the news.

With our Atlas, you can even find the distance between any two places in the world, a feature no bulky volume can duplicate. And the Atlas can calculate it in land miles, nautical miles, or kilometers. How far is it from London to Moscow in kilometers? Iceland to the Virgin Islands in nautical miles? It's easy with our Atlas.

Our Atlas was compiled from a number of sources, including a CIA satellite. Over three years of research have gone into our Atlas to make sure that it has the latest, most up-to-date information available.

Of course, you have to try our Atlas to appreciate it. We know that. So we have devised the Phoenix Plan to let you do just that—and for little more than the cost of a blank disk.

The Phoenix Plan

The Plan is simple. Try our Atlas before you buy it. For only $6.95, you get the complete Atlas software and with it our easy-to-follow instruction booklet. This is not a demonstration disk—you have all the capabilities of Atlas at your fingertips.

You can load the program three times and experience all its capabilities. After the third time, the program locks. If you decide not to keep Atlas, simply format the disk and you have a blank disk. The blank disk alone is a $5.00 value.

But if you want to keep Atlas (and we think you will), simply dial our toll-free number and charge it to your American Express, MasterCard, or VISA. The operator will take your order and give you the unlocking code over the phone. Our Atlas costs only $69.95. (Of course, we'll deduct the $6.95 you paid for the Phoenix.)

Our patented Phoenix Plan has been successfully used to market our business software by Lanier, Philips and Xerox—to name a few. Now, for the first time we are making the Phoenix Plan available to the PC marketplace. So why don't you try it? Fill out the order form below and send it with your $6.95 today. You've got nothing to lose and the world to gain.

System requirements: just your MAC with at least 128k of memory.

YES, put the world on my MAC. I enclose my $6.95. Please send the Atlas to:

We live in a three-dimensional world. Why then, should you settle for a flat, two-dimensional graphics package?

MacPaint and MacDraw allow you to create objects that have width and height. Mac3D goes further and gives you the added dimension of depth. It helps bring your thoughts and ideas into the third dimension.

In the real world, you have the freedom to see anything you create from any side. A new perspective often leads to improved results. This freedom has been incorporated into Mac3D, increasing your creative potential. A simple change in viewing position will give you the freedom to see your objects from any angle.

Virtually anything from the real world can be represented in Mac3D’s flexible environment. You start with simple tools that are similar to the ones found in MacPaint and MacDraw. Examples include cones, pyramids, spheres, and prisms. You can then sculpt, combine, and rotate these shapes as if they were made of clay.

This flexibility is increased even further with Mac3D’s custom patterns. Textures such as woodgrains or fabrics can be created in great detail. This allows you to give shapes practically any texture. You can also design with great accuracy, because Mac3D includes custom rulers and other precision tools.

All of these features enable you to design buildings, create engineering diagrams, or simply plan your next work of art, because now you have the power to comfortably work in two or three dimensions.

So say goodbye to flat software, and say hello to Mac3D.

CHALLENGER SOFTWARE
Adding new dimensions to software.

Concerning the nature of speed and its rightful place within the Macintosh.
The Macintosh™ gave the world the notion of “radical ease of use.” But in order to do so, it had to do a great deal of extra work. A process that also consumes a great deal of time.

Then along came the external hard disk drive. Which made the Macintosh work faster, but still not fast enough for most business people.

So we thought of our own solution. HyperDrive™.

HyperDrive. It's the fastest, because it's where it belongs.

HyperDrive is the only hard disk made to go inside the Macintosh.

Which obviously means one more port is free for other things, like Apple Talk™. But more important, HyperDrive works up to 15 times faster than a floppy. And 50 to 100% faster than external drives.

Because it hooks right onto the Macintosh circuit board.

HyperDrive. It's engineered to give the Macintosh a place in the business world.

Unlike other hard disks, HyperDrive will run any software that a regular Macintosh runs. Including Apple's own Finder™. What's more, HyperDrive's own software will allow you to back up and restore whatever's on the hard disk to and from floppies. At a rate of one floppy in under 50 seconds.

And for really going to work with items like Apple's LaserWriter™ or Lotus™ Jazz™, you'll find you need HyperDrive. Because HyperDrive will actually make them work to their maximum, something no other disk drive can do.

HyperDrive. It will actually keep you busy.

With HyperDrive, a Lake Tahoe resort manager doubled his business in four months. Simply by being able to produce twice as many reports and mailings.

Unfortunately, you can't please everyone.

One software developer used to watch the Phil Donahue show while waiting for his Macintosh to compile. But once he started using HyperDrive, he didn't have that free time. And as he said, "I don't know what's going on in the world anymore."

Find out how to keep yourself busy. Call us at 1-800-422-0101. In Massachusetts (617) 492-5500.

WITH MEGAHAUS, YOU CAN TURN YOUR MACINTOSH INTO

SUPER MAC.

NOW! NEW, SUPER SOFTWARE FOR THE MACINTOSH!

Look! It's a bird! It's a plane! No...it's four super new programs from Megahaus Corp. Each one compliments the other to make your Macintosh into a super machine by forming a powerful, integrated system!

MegaMerge

MegaMerge is the mail merge program for MacWrite! With MegaMerge, you can use MacWrite to create form letters, print mailing labels and more! You can even overcome MacWrite's limited document size by "chaining" several documents together and printing them as one, long document.

MegaFiler

If you do any filing at all in your home or office, you NEED MegaFiler! It's the file management system for the Macintosh that lets you file and retrieve information with ease!

You can store names, addresses or other information using MegaFiler's library of ready-made files for:

- Mailing Lists
- Customer Orders and Invoices
- Home Management
- Business Inventory
- Customer Files
- And MUCH more!

You can also design your own files using MegaFiler's easy-to-use design file. You can also print lists, tables, mailing labels and MegaMerge mailing lists. You can even incorporate them into MacWrite and other Macintosh applications!

Here's what else MegaFiler can do:

- Sort information on any field.
- Find forms based on any criteria you choose. For example, find all the people who live in California whose names begin with "S" and own a Macintosh and print them in zip code order.
- You can manage several files at one time.
- You can cut information from one file and "paste" it into another.

MegaFiler is truly the file management system you've been waiting for. Discover how super it really is!

MegaForm

MegaForm is an easy-to-use forms and reports generator. You can use MegaForm to create actual-size forms and reports such as:

- Invoice Forms
- Order Forms
- Purchase Orders
- Expense Reports
- And MUCH more!

With MegaForm you can draw forms and reports exactly the way you want them to appear. It will also help you fill out the form you just created, using MegaFiler. With MegaForm you can also draw, file, calculate and even sequentially number your forms!

MegaDesk

MegaDesk is something almost all of us can use. With MegaDesk, you get three desktop accessories...in other words, a program that you can run at the same time as other programs.

With MegaDesk you'll get: * A Desktop "Appointment Book" which is a calendar that shows you month, day and date. Every day has its own page on which you can jot down information. * A "Quicklook" accessory which gives you a brief look into any MegaFiler file on your desk. * A Reference Card accessory which allows you to flip up a "window" containing any information you choose. We supply a complete library of reference cards and you can add your own.

The Megahaus family of software products truly does make your computer work harder and easier. They can also turn a mild-mannered Macintosh into "Super Mac"...faster than a speeding bullet.

The Megahaus family of Software will turn your Macintosh into a "Super Mac"
LIBERATE YOUR MAC

Inside every 128K Macintosh™ beats the heart of a superb machine, but you will never know what it can do until you let it have at least 512K of RAM. It has probably been begging you already. Does it ask you to swap disks too often? Does it take forever to copy data? Does it stop in the middle of a program with the cryptic message, "There is not enough memory to complete this task"? Your Mac needs 512K of RAM to run the newest generation of software and would love the freedom of 1 Meg. So liberate it with an upgrade from Micro Conversions.

512 K
• 512K of linear RAM
• Available to all software
• Electrically identical to Apple™

128K Board swap $299.00*
Kit with tools $229.00*

1 MEG
• 1024K of linear RAM
• Recognized by Mac Finder
• Available to all software

128K Board swap $898.00*
512K Board swap $599.00*

CALL 800 BEST MAC
TOLL FREE OUTSIDE TEXAS AND ALASKA

* Plus shipping and insurance. Prices subject to change without notice. All board swaps include 90 day warranty. Apple and Macintosh are trademarks of Apple Computer, Inc.

Presentations with Punch

Gordon McComb

In boardrooms across the United States this scene is often reenacted. An enterprising middle manager presents a report filled with cogent information, but as the presentation unfolds, the manager senses that something is missing. The figures reflect trend-setting developments, but the entire board seems to be—well, bored. Without an effective means of communication, the diligently compiled numbers fall on deaf ears.

Many people have good ideas to share but don't know how to turn their ideas into visually stimulating presentations. People who complain that they don't have the time or the money to produce the graphics that would sell their ideas have overlooked the perfect presentation tool—the Macintosh. Not only can the Mac create dazzling presentation graphics, it can give people in business, education, and other fields control over
Getting Started

creative presentations. In fact, software is available that allows you to give electronic slide shows and even animate presentations on the Mac.

Why Graphics?

Studies show that the human brain retains only 10 percent of the aural information it receives but retains 50 percent or more of visual information. The brain accepts visual information 27 times faster than it does aural information. Transforming dry statistics into a picture, such as a chart or a graph, not only helps people remember what you say but enables you to say it quickly.

Furthermore, a 1982 study at the University of Pennsylvania's Wharton School of Business revealed that well-designed graphics led to a significant boost in productivity. With graphics, meetings averaged 28 percent shorter than without. Since a typical middle manager spends 12 hours a week in meetings, visual aids could save a manager 168 hours a year.

Macintosh Presentations

Producing a presentation involves the Mac in two ways. First, you can use it to create charts, illustrations, and other materials with software such as MacPaint and Microsoft Chart. Second, you can use the machine for the presentation itself, either by printing out the graphics on paper or acetate or by showing the graphics interactively on the Mac screen. Self-running "slide show" programs, such as Slide Show Magician, turn the Macintosh into an electronic slide projector, flashing picture after picture on the screen. In fact, the U.S. Library of Congress uses such a setup for a visitor information center.

Creating Graphics

Before you begin building charts, analyze the information you want to present. Since illustrating too many concepts can be as confusing as illustrating none at all, limit your presentation to one or two pictures for each major point. Preparing an outline of your presentation is the best way to identify key concepts and to see where a chart or an illustration fits.

Some information is better suited to graphic representation than others. Large sets of numbers or numbers that require comparison are ideal for charts. For instance, Figure 1 shows a table of statistics, a typical sight in business presentations. The same statistics are shown graphed in Figure 2. Notice how quickly you can absorb the main idea behind the numbers when you look at the chart. Odds are, the chart gives you a longer-lasting impression than the table of numbers.

Charting the Numbers

Charts are the most familiar way of graphically representing otherwise colorless data. You can make charts that combine a spreadsheet with graphics capabilities in graphics programs like Microsoft Chart as well as in integrated programs, such as Jazz. The pro-

Figure 1

Long lists of numbers not only take time to read, but the brain must make a mental image of how the numbers relate to one another before it can compare them. Tables like these may delight statisticians but are the downfall of a presentation.

Figure 2

This chart represents the numbers shown in Figure 1. The line chart clearly shows how the 11 years prior to World War II were fraught with economic chaos. Percent of fluctuation refers to how much economic activity deviated from a long-term trend based on economic indicators, such as the Consumer Price Index and the Gross National Product, since 1860.

From Principles of Macroeconomics by Edwin Mansfield (W.W. Norton, 1983), based on data prepared by Amerit Trust Co.
grams let you enter data into a table or a spreadsheet to produce a professional-looking chart. You can usually choose among bar, line, pie, and other types of charts, depending on the kind of information you want to represent.

If you juggle lots of numbers, spreadsheet programs like Microsoft Multiplan and T/Maker's ClickOn Worksheet help you get to the bottom line quickly and accurately. Integrated programs are especially suited for this task, since they allow you to switch back and forth between spreadsheet and chart.

**Text with Texture**

Remember that not all your graphics have to be charts. Display text is used more often in presentations than any other type of graphic. For example, you can show a keyword in large type for each of four ways your company can increase profits. Limit display text to about 36 words, or six lines with six words on each line. Display text is best used to summarize or highlight the points made in the presentation and usually includes graphic elements such as bullets, stars, and check marks (see Figure 3).

You can prepare display text in MacWrite, Microsoft Word, MacDraw, and even MacPaint. Select a large font size, preferably a size labeled in outlined numbers on the style menu. The outlined numbers indicate that the fonts are present in the System file and so don't need to be scaled.

You can add flourish to bold but plain graphics by using MacPaint to dress up charts and display text with illustrations or enhancements such as borders, shading, and arrows. For example, you can take a flat pie chart created in Chart and simulate depth using MacPaint (see Figure 4).

Sometimes you want to include graphics in a written report. Macintosh word processing programs let you mix graphics and text on the same page. To insert a chart or other illustration, copy it from the graphics program, open the word processing program, and click where you want to paste in the chart.

Microsoft Word and MacWrite let you move the chart on the page. You select the chart and drag the border that appears (see Figure 5). Keep in mind that text and graphics can't go on the same line, and you can't paste two graphics side by side. If you want to position the graphics next to each other, you must do so in the graphics program and then copy and paste them that way.
A Chart for All Seasons

Say it with charts, but remember to pick the right one for your data and the story you're trying to tell. Here's a guide to six major chart types and their appropriate applications.

- **Column charts** are useful for comparing the progress of a single variable over a period of time. For example, a column chart would be a good choice to show total dollar amounts over several months or years. A column chart can contain related sets of data, each differentiated from the others by a distinct fill pattern in the appropriate columns. For example, black bars can represent last year's monthly sales, and gray bars can show the current year's monthly sales.

- **Bar charts** are column charts set horizontally. They are often used to compare similar items at a given time. A sliding bar chart shows the correlation of two sets of values. A vertical line in the middle of the graph is known as the zero point. The first set of values determines the lengths of the bars on the left side of the zero point; the second set determines the lengths of the bars on the right side. If a correlation exists, the lengths of the bars slope evenly down the chart. A sliding bar chart, for example, could show how housing starts decline as interest rates increase.

- **Pie charts** show the size of each part as a percentage of the whole. Pie charts compare similar items in terms of their relative contribution to the total. Budgets, assets, and liabilities are usually represented in pie charts.

- **Area charts** are a stylistic variation of line charts. Most often they are used to show the relative contribution of two or more items to a total through time. In this sense area charts are like pie charts with the added dimension of time. Each layer representing a set of values is added on top of the layer below. The effect of the layering is cumulative, with the layers showing the portions of a whole.

- **Line charts** are appropriate when you need to graph four or more sets of data or when you want to show developments over time. They are especially useful for showing trends, since the continuity of a line reflects the continuity of time.

- **Scatter charts** show the relationship between two sets of values. A dot is placed where the two values coincide on the chart. If a correlation exists, a line can be drawn on the chart, following the clusters of dots, to indicate the general trend of the data. Such a line is called, among other terms, a regression line or line of best fit.
Projecting and Positioning

Among the programs suited to specialized graphics applications, Apple's MacProject is excellent for creating step-by-step diagrams of the flow of work and money involved in a project. Project management software is used as a presentation tool as often as it's used to actually manage a project. MacProject can produce visual reports that demonstrate the immediacy of deadlines and the impact of crucial phases on the project as a whole. Bear in mind that a complex project might lead you to produce a complex chart. Although you may be able to understand it, break it down into small chunks for your audience.

MacDraw is another valuable presentation tool. Besides its intended job as an electronic drafting set, MacDraw is suitable for making elaborate flow and organizational charts because it lets you move individual elements around its drawing pad (see Figure 6). Furthermore, you can cut and paste the graphics from most programs that create charts into MacDraw, where you can manipulate the charts as you see fit. Another of MacDraw's strong points is its text-editing capability. The program saves you the trouble of painstakingly positioning text by automatically placing text within a rectangle or other object that you choose.

Presentations in Print

Once you've created the charts, display text, and other graphics, you must decide on a way to make your presentation. The easiest way is to print copies of the charts and other visual aids with the ImageWriter. If the program, like ClickOn Worksheet, doesn't have a print facility, you can either paste the graphics into a program that does or print the contents of the screen by pressing the Shift-4 keys simultaneously.

The ImageWriter's print quality is adequate for informal presentations; a laser printer prints graphics with a professional appearance that is appropriate for formal settings. I've produced superb graphics on both the Apple LaserWriter and the Hewlett-Packard LaserJet. Although at $6995 the LaserWriter is about twice as expensive as the LaserJet, it is more flexible when used with the Macintosh. The LaserWriter prints most types of documents and smooths out the slightly digitized look of computer output to give text and graphics a highly refined appearance.

The LaserJet doesn't smooth out graphics, but it does print them without streaks. You need to install a driver program in the System folder to print MacPaint or other Macintosh documents on the Hewlett-Packard printer. A MacPaint driver is available from New Image Technology; text drivers are available from SoftStyle and Creighton Development.

If you're going to pass around the graphics to a group of people, make photocopies of the printouts.

Figure 5
A MacWrite document with a graph pasted from Microsoft Chart. By selecting the graph and dragging the border that appears, you can position the graph anywhere across the page.

Figure 6
Organizational charts are liable to change. MacDraw's editing features help you update the chart if and when the occasion arises. The drop shadows in this chart were created by duplicating the squares, placing them in the back with the Arrange-Send to Back command, and filling them with the gray pattern.
More to Meet the Eye

The following is a partial list of Macintosh products useful for developing and showing effective presentations.

**ClickOn Worksheet**
T/Maker Co.
2115 Landings Dr.
Mountain View, CA 94043
415/962-0195
List price: $79.95

**LaserJet**
Hewlett-Packard
11311 Chinden Blvd.
Boise, ID 83714
800/367-4772
List price: $3495

**LaserJet Driver**
New Image Technology
10300 Greenbelt Rd. #104
Seabrook, MD 20706
301/464-3100
List price: $59.95

**Jazz**
Lotus Development Corp.
245 First St.
Cambridge, CA 02142
617/494-1270
List price: $595

**LaserStart**
SoftStyle
7192 Kalanianaole Hwy. #205
Honolulu, HI 96825
800/367-5600
List price: $95 including cable

**MacDraw, MacProject, LaserWriter**
Apple Computer
20525 Mariani Ave.
Cupertino, CA 95014
408/996-1010
List price: MacDraw $125,
MacProject $125,
LaserWriter $6995

**ProPrint**
Creighton Development
16 Hughes #C-100
Irvine, CA 92714
714/472-0488
List price: $74

**Overhead and Overheard**
You can use an overhead projector to project transparencies of documents on a screen instead of passing out photocopies of printouts. The LaserWriter can print directly on sheets of clear acetate, and most photocopiers can copy a paper original onto clear acetate. You can give transparencies a professional appearance by mounting each transparency in a frame.

You can make color overhead transparencies using thermographic copiers and film such as 3M type 288, which produces a color image on a clear background. The image on a sheet of this film can be red, blue, green, or purple. By overlapping sheets of different colors, you can create stunning color charts. The process involves making copies in *MacPaint* of the chart or display text, one copy for each color you plan to use. On each copy erase everything except the parts you want thermocopied in a particular color.

**Show and Tell**
The best way to get an audience involved in your presentation is to run it on the Macintosh. Its high-resolution screen and interactive capabilities make it a natural show-and-tell performer. *Slide Show Magician*, from Magnum Software, allows you to simulate a slide show by displaying *MacPaint* documents in sequence.

The program offers a number of Hollywood-style transitions, including fades and washes, to vary the way the *MacPaint* pictures come on screen. For example, a wipe makes an image enter from one side, filling the screen when it reaches the other side. A line chart that appears gradually on screen suggests to the audience that the trends shown developed slowly and not immediately.

You specify the type of transition when you "script" the presentation, telling the program which *MacPaint* documents to show and in what order (see Figure 7). You can also control how long each picture remains on screen. Your specifications are stored in a script that you later play back along with the *MacPaint* pictures, using the program's Projector application.
Slide Show Magician also helps keep people involved by giving the audience some control over the show. When you design a presentation, you can add buttons to the screen that affect slide-projector controls. In addition, the program lets viewers manipulate the Mac’s screen. This feature might add drama to a presentation that you run for a small audience, but it has limited value in a self-running presentation.

Slide Show Magician can even run a presentation without you. You can prepare a disk that, when inserted into the Mac at startup, makes the presentation automatically, loading and starting any script document that has run at the end of its name. You must also set the Projector program as the startup application and make sure the disk has a System file.

When you create a self-running presentation, you may want to grab the audience’s attention the second the computer is turned on. A public-domain program called Screen Maker, available from most Mac user groups, can be used to change the “Welcome to Macintosh” message to a MacPaint picture of your choice. Screen Maker works with Slide Show Magician or any other startup disk.

Another program that can simulate a slide show is ThinkTank 512 from Living Videocast. Although chiefly an outlining program without the sophisticated features of Slide Show Magician, ThinkTank 512 lets you flash several MacPaint pictures on the Mac’s screen each second. You can’t alter the transitions between pictures, but you can combine headlines with graphics. The program lets you run through the pictures once or show them in sequence indefinitely.

Animation

One fascinating way to bring a presentation to life is with an animation program from Hayden Software called VideoWorks. Although not a “slide show” application, the program lets you assemble professional-quality animated programs using full-screen or partial MacPaint images. You might, for example, show a rise in profits by animating a column chart. When you make the presentation, the columns could be short at first, indicating dismal profits. On-screen text would flash: “1984 was a bad year.” Suddenly, the columns would start to inch higher and higher. One column could even burst through the top of the chart, like an overheating mercury thermometer. At the top of the screen the text would finally read, “But we’re alive and well in 1985.”

Up on the Big Screen

The Macintosh’s screen isn’t suitable for presentations to large audiences. If you plan to use the Mac regularly for such presentations, you may want to attach it to a large monitor or big-screen television. To make the attachment, you add an external video output to the Mac with a modification kit, generally available for under $200. Although most external monitor kits come with instructions on how to take the Mac apart to install the video connection, I suggest that you take it to an authorized dealer if you don’t have the tools or aren’t familiar with the inner workings of a computer.

The Mac can’t be used with standard-resolution monitors. If you add an external video output and then hook the Mac up to a big-screen television, you receive a disappointingly fuzzy picture or none at all. Use only high-resolution monitors—ones with scan rates of 22.5 kilohertz or higher—such as those produced by Professional Data Systems.

Preparing and making a presentation with graphics may sound like a lot of work for a few pretty pictures, but remember that several minutes of your time turning ideas into pictures go a long way toward saving time for yourself and your audience. And if those minutes mean that your ideas will be respected—even accepted—then it’s time well spent.

Illuminating Objects

Richard Sprague

One reason the Macintosh is so easy to use is that its designers started from scratch, without preconceived ideas of what a computer has to be. Similarly, developing a new programming language from scratch makes possible a language that is tailored to the unique strengths of a specific machine. Neon, from Kriya Systems, was developed with the Macintosh in mind. Although derived from FORTH, its inspiration comes from Smalltalk, a programming language developed at the Mac's ancestral home, the Xerox Palo Alto Research Center. It differs in many crucial ways from other languages.
State of the Art

Most programming languages let you build programs using procedures in one form or another. In these procedure-oriented languages, programs are sequences of instructions that the computer executes a step at a time.

Programming with Objects

In Neon a program consists of objects sending messages, or instructions, to one another (see "A Glossary of Object-Oriented Terms"). Although this concept can be difficult to grasp at first, especially if you’re used to procedures, object-oriented languages come closer to the way people solve intricate problems than procedure-oriented languages.

In Neon anything can be an object. In a Neon program that draws circles, for example, each circle is treated as an object. A program that goes in and out of files treats each file as an object. And on the Macintosh, menus, windows, and the mouse are objects. You work with these objects by sending messages to them, and they in turn send messages among themselves.

Objects can be organized into classes of similar objects, in much the same way that you organize your perception of reality. For example, you probably have a mental image of a class of objects called "fruits" with subclasses like "apples" and "oranges." This classification lets you think of apples and oranges in similar ways—both are good to eat, both grow on trees—without getting lost in the details of how they are different. "Fruits," in turn, may belong to a larger class called "food." In Neon this larger category is called a superclass.

One particular apple is called an instance of the subclass of apples. Like any object, an instance responds to messages and can in turn send messages to other objects. For example, biting into an apple is like sending a message to it; in response the apple sends back a message revealing its sweet taste or crisp texture.

An important property of a class is that an object in that class inherits all of the characteristics of its superclass. For example, apples have certain things in common with other fruits. In addition to those properties that are inherited, you can define new properties, which apply to a particular class of objects. These properties will be inherited in turn by any succeeding subclasses.

When an object receives a message, the action it takes is defined by a sequence of instructions called a method. A subclass also inherits the methods of its superclass. Therefore an object can perform the methods defined for its class and its superclass.

The Object-Oriented Computer

The Macintosh uses object-oriented, as opposed to procedural, techniques as part of the desktop metaphor. For example, the Print command on the File menu sends a print message to the selected document. Each document on the desktop "knows" how to respond to a print message.

An object that is a MacPaint document, for instance, prints itself using MacPaint, because that action is defined by a method that is inherited by all documents in its class.

---

**Figure 1**

A sample application written by Charles Duff. Neon’s principal designer. You can adjust parameters for the curves using the scroll bars. Other types of curves can be drawn by selecting options on the Graphics menu.

**Listing 1**

A new class called Square is defined here as a special type of rectangle. Square inherits all of the methods of its superclass, MyRect. Two methods, New and Wander, are defined as unique to objects of class Square. Neon allows stack variables, such as TopLeftx and TopLefty, to be referred to by name.
Since the Mac's user interface is object oriented, developing Macintosh applications in an object-oriented language makes sense. With Neon it is easy to create objects like menus and windows (see Figure 1). Much of the complexity in Macintosh programs results from having to recreate an object-oriented environment with a procedure-oriented programming language.

Defining a Neon Square

Neon is best learned by example. The language provides access to the Macintosh's QuickDraw routines in ROM, including one that draws a rectangle given the coordinates of two corners. But suppose you want to create a specialized rectangle called Square, which is like other rectangles except that all four of its sides are of equal length.

Listing 1 is a Neon program that defines the special rectangle. Like FORTH, Neon is structured so that each new command or word is defined in terms of older ones. The new definitions are added to the "dictionary" that makes up a program. Normally, new words are defined by a colon definition, which includes a colon, the name of the new word, and a sequence of previously defined words. A semicolon specifies the end of the definition.

Classes are defined in the same way. In Listing 1:
```
CLASS Square < Super MyRect
```
specifies that a new class called Square is defined as a subclass of the class MyRect, itself a subclass of the class Rect (see Listing 2). The variable Side in Listing 1 stores the integer value of one side of the square. Side is an example of an instance variable, which stores a value for a particular instance. A circle is another class that can be defined as a subclass of a larger class, Oval (see Figure 2).

Neon follows the stack-based Reverse Polish, or PostFix, notation of its predecessors, Smalltalk and FORTH. Like Hewlett-Packard calculators, Neon uses a stack to pass data from one word to another. The last number placed on the stack is the first number read.

In Listing 1 a series of methods for the new class is defined. One method, New:, is a redefinition of the Put: method inherited from the Rect superclass. The Put: method for rectangles expects four numbers on the stack, corresponding to the four corners of the rectangle, and stores them in the rectangle. Since the sides of a square are of equal length, the New: method requires only three numbers: two numbers to specify the coordinates of the upper-left corner and a third number to specify the length of a side. Most other methods for squares are inherited from rectangles and don't need to be redefined.

The Wander: method, however, is a completely new command that tells a square to move itself incrementally across the screen. This method first sends a get: message to Side, an instance variable. The variable responds by leaving its value on the stack. The value becomes an index for a DO loop that moves the square across the screen.

If you need to send a message to an object in the class being defined, you use the word self. For example, in the Wander: method, several messages are sent to self to get values for the top and the bottom of the square and to put the incremented results back into the current object.

(continues on page 93)
State of the Art

Listing 2
The subclass of rectangles called MyRect inherits the methods of its superclass, Rect. A collapse: message sent to an object of class MyRect results in a series of concentric rectangles.

Figure 3
Two objects of class Square are created with the names Object1 and Object2. A draw: message followed by wander: is sent to Object1, resulting in the cascade of squares. A draw: message followed by collapse: is sent to Object2, resulting in the concentric squares.

Figure 2
A new class is defined for Circle, a subclass of Ovals. Following the definition, an instance called Dave of the class Circle is created, and a draw: message tells the circle to draw itself. The collapse: message creates the concentric rings shown in the background.

Figure 4
A window is created by first creating an instance of class Window. The window parameters, which include the window's boundary, title, type, and whether it is visible and has a close box, are placed on the stack prior to sending the new: message. SetDrag: sets the limits within which the window can be dragged. In this example, Diverge creates the cascading pattern each time you click in the window.
For Further Reading

The Neon manual by Danny Goodman is one of the best-written manuals for any program language, but to fully explore object-oriented programming, you need to get closer to primary source material, the most helpful of which is described below.

Smalltalk: The Language and Its Implementation, Adele Goldberg and David Robson (Addison-Wesley, 1983). If there is a definitive volume on the power and implementation of a full-scale object-oriented programming environment, this book is it. The language described here is much more powerful than anything you’ll ever see on a 128K Macintosh, but you won’t find a better book for a thorough introduction to many of the concepts behind Neon and other object-oriented languages.

The Structure and Interpretation of Computer Programs, Harold Abelson, Gerald Jay Sussman, and Julie Sussman (Massachusetts Institute of Technology Press, 1985). This book is an MIT text to introduce students to the fun and the power of well-written computer programs. Chapter 3 is a good introduction to the ideas behind object-oriented programming.

Byte, August 1981. The entire issue is devoted to Smalltalk and object-oriented programming. You’ll find helpful and well-written articles on the implementation of Smalltalk, from which Neon is derived.

(continued from page 91)

To use a square in a program, you create an instance of it by typing the name of the class followed by the name you want to give the instance. For example, in Figure 3 the command Square object1 creates an instance called Object1. Object1 then becomes an object that can receive and respond to messages, including those messages defined for rectangles and other higher classes.

Windows as Objects

Making a Neon window is similar to making rectangles or squares; you create instances of a class called Window. Messages can be sent to the new window, telling it what size it is, where it appears on the screen, and whether it has scroll bars or close boxes.

In Figure 4 a window named Running Squares has been created. The new message specifies what kind of window to use—In this case document signifies a document window—and what title to give it. At the bottom of the listing, a special procedure called Diverge draws a square and, using the wander: message, moves it incrementally across the screen. 's DIVERGE SetDraw: running tells the window to execute the Diverge command each time you click in the window.

Beyond FORTH

Once you get used to working with objects, Neon looks a lot like FORTH. Like FORTH, Neon relies on a parameter stack to pass values to operations. But unlike FORTH, Neon allows you to refer to values in the stack by name, eliminating the need for complex stack manipulations.

Currently, one of the drawbacks that Neon shares with FORTH is the lack of a floating-point arithmetic capability, requiring the use of integer arithmetic for all calculations. Kriya is planning to add floating-point arithmetic as part of an upgrade.

Neon comes with a desk accessory editor that lets you edit sections of a program at any time. You can also use it to browse through source code, eliminating the need for a LIST command as in FORTH or BASIC.

For aspiring software developers who are bothered by MacFORTH’s licensing fees and who don’t want to sell programs that require MacPascal or MacBASIC, Neon is one of the cheapest and easiest ways to produce applications that run without the original language disk. You don’t have to make royalty arrangements with Kriya.

Admittedly, Neon won’t make you a more productive programmer overnight, but its way of organizing large programs and its similarity to the Mac’s object-oriented design should appeal to Macintosh programmers who are faced with increasing complexity and disorganization.

Richard Sprague is a free-lance writer and programmer who studies formal linguistics at Stanford University.

Look into the second generation of Macintosh database managers for file security, relational capability, and other features meant for serious business.
A nightmare that haunts executives is a vision of records so tangled and useless that business comes to a standstill. Key decisions often require timely and well-managed information. In fact, the records a company keeps are often as valuable to its operation as the products or services it offers.

With so much at stake, businesspeople have learned the need for powerful data management tools. While any database manager can store and retrieve information, people with complex data management tasks or confidential data to store require programs with special capabilities. Several database programs have been available for the Macintosh since last year (see “Covering All the Bases,” *Macworld*, January 1985), but the powerful data management programs that many businesses need have become available only this spring.
Review

Omnis 2, Keystroke, and MacLion do more than let you store, sort, and print records. These database managers have sophisticated features, such as password, automatic entry, and file conversion, that let you create powerful and flexible databases. The programs are suited to serious business applications such as accounting, inventory, and personnel.

All three programs let you preset the contents of a field. For example, if most employees in a company live in the same state, a field preset (also called a default) could be used in a personnel database to automatically supply the state's abbreviation, eliminating the need to type it in each record.

The information-checking capabilities of Keystroke and MacLion help ensure the accuracy of a database. The programs let you specify a value or a range of values against which the program checks entered data. In a payroll database, for example, information checking could prevent you from entering salary figures beyond a certain range.

A security feature provided by Omnис 2 and Keystroke lets you assign passwords to a database or to certain fields to keep roving eyes from sensitive information. A personnel director, for example, might use passwords to prevent unauthorized employees from uncovering payroll information.

Keystroke and MacLion are relational database managers, which let you join separate but related files to create a database with information from both. For example, you could keep customers' names and addresses in one file and a list of their orders in another. At billing time the relational data manager could combine the two files to print addressed invoices for each customer.

Finally, no program should make you retype information stored elsewhere. Omnис 2 and Keystroke use documents created by other programs, such as Multiplan and Microsoft Word, and create documents that other programs can open. As information management products increase in number, the ability to share data becomes increasingly important.

Whether you need all the features of these three programs depends on your work. To help you decide, the table "Database Roster" shows the vital statistics of the three products and of other available database managers. Other Mac database managers are available or in development. One new program, Odesta's Helix, is a relational database manager for the 512K Macintosh that makes extensive use of icons.

Omnis 2

When it was first released, Organizational Software's Omnис 2 was criticized for not taking advantage of pull-down menus, the mouse, and other facets of the Macintosh interface. Since then the company has released a revised version that takes advantage of the Mac's attributes. The new version of Omnис 2 isn't relational, but it provides password protection, preset fields, information checking, and file conversion.

Omnis 3 lets you customize data management applications with your own pull-down menus and dialog boxes.

Omnis 2 deals with a database in two parts: the library, which contains the names, lengths, and types of all the fields, and the data entries themselves. The separation of design and data lets you use one library for several databases.

Besides the usual text, date, and numeric field types, Omnис 2 provides calculated fields and Boolean fields (see Figure 1). Calculated fields contain the results of calculations involving values from other fields, such as a Net Income field that subtracts an Expenses field from a Gross Income field. Boolean fields store either of two values: yes or no. A Boolean field called Past Due, for example, would indicate whether or not a customer's account is paid.

When you design a database in Omnис 2, you position a new field by clicking where you want it. You can't drag a field to another position; however, you have to cut and paste it.

Data Entry and Retrieval

After you design a database, you enter and view data in a window using a set of command buttons to the right of the vertical scroll bar (see Figure 2). You have to click the Insert button each time you enter a new record; Omnис 2 lacks a keyboard shortcut for the Insert command that would speed up long data-entry sessions.

After you finish entering data, you can browse through the database with the Next and Prev buttons. Records are displayed in sorting order but with no in-
dication of a record's position in the database. The program should use a record scroll bar or display the record number to show your location in a database.

You can also search for a specific record based on field criteria or for sets of records based on up to 50 criteria. By storing search criteria you can repeat a complex search in one step without reissuing a chain of commands.

The program's multiple update capability helps make substantial changes to a database. For example, if your company changes the name of its engineering department to "Design and Engineering," you could update your personnel database by changing all occurrences of "Engineering" to "Design and Engineering." This feature makes Omnis 2 suitable for large databases that require frequent updates.

**Reports**

Adequate for most tabular printouts, Omnis 2's only noteworthy reporting capability is designing wide reports. The program can generate reports up to 240 characters wide—a valuable feature for owners of printers with 15-inch carriages. Omnis 2 can print mailing labels up to three across.

Besides its own storage format, Omnis 2 can open and save databases in data interchange format (DIF), allowing you to exchange data with other programs such as Keystroke and even 1-2-3 for the IBM PC. The program can also create text-only files, allowing you to transfer data between Omnis 2 and programs such as Microsoft File or Word.

Most important, Omnis 2 data files can be used with Omnis 3, a relational database manager still in development at this writing. A prerelease version of Omnis 3 that I saw lets you customize data management applications with your own pull-down menus and dialog boxes and allows you to access files created by other programs (see Figure 3). Up to 40 people can use the program simultaneously through the AppleTalk network. Because the two programs are compatible, one department of a company could use Omnis 2 for simple databases, such as client directories, while another department could use Omnis 3 for complex, relational databases that could access the first department's Omnis 2 files.

The improved Omnis 2 still isn't a four-star database manager. It has a few shortcomings: a lack of keyboard command shortcuts, no on-line help, and a confusing manual. But enough features make it worth considering, especially if you pair it with Omnis 3's relational capabilities.
Database Roster

A comparison of the features and capabilities of the three programs reviewed here and several other Macintosh database managers. The form design method indicates a program's flexibility in letting you design forms for data entry. Fixed means that the form is preset and can't be changed; free means that you can position fields anywhere but can't change their font style or size unless the table says free with fonts.

¹*pfs:file, pfs:report*. Theoretically, field length is unlimited, although the practical limit is around 60 characters because the programs cannot wrap words in long text fields. While technically correct, the maximum number of fields per record and the maximum record length each imposes an impractical minimum on the other. The programs bundle up to 32,000 records on a hard disk.

²DB Master. A database can be contained on up to 44 floppy disks on a hard disk the limit is 17.6 megabytes. The programs can use LaserWriter fonts.

³OverVUE. Sorts on one field at a time but allows sorts on consecutive fields while maintaining previous sort order.
**Keystroke**

*Keystroke* is a relational data manager from Brock Software that takes data security seriously. It scrambles files into seemingly random strings of characters, decoding them only when you provide the correct password. File scrambling is more secure than password-only schemes, which can be circumvented with a simple BASIC or file-editing program that can be written by almost any knowledgeable programmer. **Keystroke**'s maximum security makes it worth considering if you have sensitive data to manage.

The release version of *Keystroke* that I used had several bugs that shook my confidence in an otherwise well-designed program. While none of the problems I encountered resulted in a loss of data, I don't recommend creating a large database with the program.

### Data Entry and Retrieval

Designing a database in *Keystroke* involves typing field names and choosing commands from the Enhance menu to specify the characteristics of each field. You position fields not by dragging them but by adding or removing carriage returns and spaces. You can also cut and paste fields to move them around, but beware of the Undo command; when I chose it while designing a database, the program suffered a stroke, so to speak, requiring me to restart the Mac.

You move from field to field as you enter data by using the Tab key or clicking scroll arrows. *Keystroke*'s scroll bars are narrower than those in most Mac applications; you need to be precise in your mouse movements (see Figure 4).

*Keystroke*'s scroll bars also behave rather unusually. When you're viewing the first record in a database, the horizontal scroll box appears near the middle of the scroll bar instead of at the left edge. If you drag the scroll box to the far left, it pops back toward the middle again.

According to *Keystroke* product designers, this quirk isn't a bug. They explained that in a database containing only one record, the scroll box appears in the middle. When you add a record, *Keystroke* divides the scroll bar once again and moves the scroll box to the middle of the left half. Every record you add divides the scroll bar again. Once the technique was explained to me, the scroll box's behavior made sense. Still, it contradicts standard Macintosh scrolling tech-
niques. The scroll box is confusing because when you move it to a given point, you expect it to stay there and not jump to another spot.

You locate specific records using a full complement of search characters, such as greater-than (>) and less-than (<) symbols and equal signs (=), and you can save search specifications for later use. Like Omnis 2, Keystroke lets you update an entire set of records at once, eliminating the need to locate and change each one.

**Reports**

Keystroke produces the kinds of reports required by most businesses. It also has the ability to generate form letters that merge information from a database, such as names and addresses, with text written in MacWrite. You indicate where you want a specific field to appear in the letter by enclosing it in braces. A letter that begins Dear {{name}}, for example, causes Keystroke to insert the contents of the Name field in each letter.

To create tabular reports, you indicate which fields you want to appear in which columns. You can print out summary information, such as totals and averages. You can also print records that meet certain conditions, such as a past due account or a sales figure that exceeds a person's quota, in bold type.

Keystroke strikes me as a good product that was released prematurely. Brock Software is aware of the bugs in the program's first release; chances are the problems will be corrected by the time you read this. When they are, Keystroke will most likely take its place as one of the better Macintosh data managers.

**MacLion**

MacLion is a multirelational database manager that can join and work with up to 14 files at once, instead of only 2. An accounting application, for example, could coordinate databases for accounts receivable, accounts payable, general ledger, inventory, and client directory. A change in one database, such as a new order from a client, causes corresponding changes in the others.

With this capability, MacLion is suited to joining and reorganizing related information stored in a number of databases.

One way I judge a program's simplicity is to begin using it without referring to the documentation. When I tried this approach with MacLion, I felt as if I'd been
given the controls to the space shuttle and told to parallel park it on Fifth Avenue. And as I worked through the manual, the traffic was slow in clearing. MacLion is a powerful program, able to go head-to-head with any database manager running on any personal computer. It's also difficult to use and in many ways doesn't live up to Macintosh software standards.

Leo the Lion
MacLion has seven main sections, such as Query, Program, and Reports, that you select as commands from the Lion menu, which lets you perform tasks such as data entry, reporting, and programming. The

MacLion can join and work with up to 14 files at once.

Query command lets you view your database and add new records. The Define command lets you design new databases and change fields in existing ones. The Screens command lets you customize data-entry screens and specify entry-checking criteria for various fields. The Reports command gives you control over MacLion's report-generating features.

The Editor and Program commands provide access to Leo, MacLion's built-in programming language. When you create a data-entry screen or design a report, MacLion translates your specifications into a Leo program, which you can modify with MacLion's text editor. Advanced programmers can use Leo to create data-entry screens containing buttons such as New, Add, and Quit, write complex report-generating programs, and convert files created by other applications. Unfortunately, writing a Leo program is the only way to get data from other programs into MacLion, which has no built-in data transfer commands.

Leo resembles the FORTH programming language (see "The MacFORTH Dimension," Macworld, November 1984). Like FORTH, Leo uses postfix notation, a method of expressing equations in which arguments are followed by operators. For example, the expression 2 + 2 is written as 2 2 + in Leo. FORTH programmers should feel at home with Leo; those of us accustomed to arithmetical notation, however, need to adjust. It's important to note that you can use most of MacLion's capabilities without ever having to program in Leo, which is for people who want greater control over MacLion's data-entry screens and reports.

Entering and Retrieving
MacLion lets you enter data in one of two ways. You can use the program's Query command for quick data entry, or you can design your own data-entry screen with the Screens command (see Figure 5). When you use the Query command, MacLion presents a rather cryptic display that blatantly ignores everything that makes Macintosh software unique (see Figure 6). For example, concluding data entry requires you to type a slash (/) rather than choose a Stop command or click a Stop button. In my opinion, Macintosh application programs shouldn't make you type anything but data. If a program breaks this rule, it should make you type only familiar words like "stop" or "done." It certainly shouldn't make you type anything as arbitrary as a slash.

Violations and Manual Labor
MacLion flies in the interface of Macintosh software design in other respects as well. The Clipboard, for example, is hardly used. Since the Leo text editor is the only portion of the program with an Edit menu, you can't cut and paste text during data entry or report design. MacLion has an Apple menu, which in other programs usually contains desk accessories, but the only choice on the menu is About MacLion.

When I pointed out MacLion's shortcomings to its designers, they explained that their first priority was to create a powerful database manager that runs on a 128K Macintosh. To me, their reasoning led to the development of a program that is like a high-performance car with no seats—it can outrun the competition, but it isn't very comfortable.

MacLion's documentation could also use some improvement, especially since the program is difficult to figure out. The user guide introduces you to parts of the program as you work on a sample database. Unfortunately, the guide is illogically organized, teaching complex tasks such as report design before tackling basic chores such as structuring a database. The reference manual does a fair job of teaching Leo programming, but both it and the user guide suffer from distracting puns about lions and jungles—perhaps the writers didn't realize that lions don't live in the jungle.
Now you can cut and paste up to an entire MacPaint document!

Do you need to paste a half page MacPaint™ picture into MacWrite™ or MacDraw™? Or maybe combine two large portions of two separate pictures? Now you can overcome the limitations of the MacPaint window size with Paint Cutter™, one of several useful tools on

Accessory Pak 1™

Here are some of the features of

• Paint Cutter™
  - The MacPaint file is displayed using the full screen. When the selection rectangle is dragged to the edge of the screen, the picture scrolls, allowing larger-than-screen selections. You can cut or copy any size selection, up to the entire picture.
  - Paste these larger-than-screen selections into other programs that use the clipboard, like MacWrite and MacDraw.
  - Create custom Startup Screens by selecting this option from the File menu.
  - Move, invert or flip the selection, no matter how big it is.
  - On a 512K Mac, open multiple MacPaint document windows and cut and paste between them instantaneously.

Use PAINT CUTTER™ with SWITCHER™ for lightning fast results!

Also included on the Accessory Pak 1 disk are:

• MacPaint Rulers Desk Accessory
  Install our rulers on the outside of the MacPaint window to measure in inches, centimeters or pixels. The rulers have moving trackers like MacDraw.

• Screen Saver Program
  Save your screen from image burn-in. When there is inactivity, the screen is blanked until the mouse is clicked.

• QuickEject Desk Accessory
  Quickly eject all floppy disks that are on-line and restart the system.

• Coordinates Desk Accessory

• Silicon Beach Font

System requirements: 128K, 512K or XL. Screen Saver is not relevant to the XL.

It’s a shame that MacLion is so difficult to understand and use, because somewhere beneath the slashes and the puns lies a powerful database manager. Computer Software Design says it’s working on a 512K-only version of MacLion that will provide access to Macintosh fonts and let you create applications with your own menus. I hope the 512K version will also be easier to use. If your data-management tasks require MacLion’s power, consider Helix first or wait for Omnis 3. I can’t recommend MacLion in its present form unless you need a powerful database and don’t mind a user interface that neglects the Mac’s attributes.

The Next Wave

Despite the increased power and performance of these three data managers, room for improvement still remains. The next Macintosh data managers should not only provide entry checking, field presets, security, file exchange, and relational capabilities but should also let you use fonts and store graphic images as well as text. The ultimate data manager will combine Microsoft File’s ease of use and picture fields, Omnis 3’s pull-down menus, and MacLion’s data-management power. Only then will the Macintosh have a database manager that takes full advantage of the computer’s power, appealing graphics, and intuitive user interface.

Dial first. Ask questions later.

At most computer retail stores and mail order houses the sales people sell products for a bunch of computers. Not at MacConnection. When you call 1-800/Mac & Lisa you will soon find yourself talking to one of our many Macintosh specialists. Our intrepid band of crack Mac hacks only sell Macintosh add-ons and software. Because of their expertise, they can guide you through virtually any confusion, convolution or conundrum. Before, during, or after the sale.

When you have a question, it's probably something they've already had to figure out. And if they don't know the answer, they know how to get it, fast.

So, if you want the best combination of prices and support, let your fingers walk no further.

Call MacConnection.

disks..........................................................19.
One hundred twenty-nine men sailed from England in May of 1845, under the command of Sir John Franklin. They were looking for a Northwest Passage through the Canadian High Arctic. All of them died. And to this day, no one is sure why.

Not only is their complete demise a puzzle, the mystery of their bizarre behavior before everyone perished remains unsolved. Why did the crew, as they staggered to their death, struggle to drag heavy loads of useless valuables in ironshod sleds and boats? Why didn’t the expedition leave reports in cairns, as required by the British admiralty?

Scientists still seek the answers. Was it scurvy, caused by their proper British aversion to eating blubber? Or were they slowly being poisoned by the lead soldering on their fancy new tin cans?

*Used with permission/Flagan's Cove Music

The mouse who stayed out in the cold.

Last summer, a crew from the University of Alberta Anthropology Department, under the direction of Professor Owen Beattie, went to remote Beechey Island to dig up some clues. They brought along a Mac to sift through them.

The plan was to exhume the bodies of three sailors from the expedition whose graves were marked by solitary cairns. By taking small muscle, bone, and organ samples from the bodies, the scientists hoped to find some new answers.

As the crew picked away at the frozen ground, their Mac picked away at the details of the excavation area—storing fieldnotes, cataloging, and mapping. The Mac was powered by car batteries (through an inverter), recharged by a 1500 watt gas generator. Neither freezing rain, sleet, hail, fog, or cold kept our mighty micro from its appointed tasks.

And, according to our source, researcher Eric Damsky, Mac even entertained the crew on those cold and lonely nights with Frogger and Transylvania.

This expedition was a success. After ten days they uncovered the perfectly preserved body of 20-year-old Chief Petty Officer John Torrington. It was an eerie moment. Even Mac stopped its incessant whirring for a moment of silence.
In Search of a Better Mouse

Gordon McComb

Before the Macintosh, mice were regarded with disdain by most personal computer veterans. "If God had intended us to use mice," a friend once told me, "he would have given us three hands." Good point, but one that many people today are disregarding. More and more of us are using mice and liking it.
I tried over a dozen input devices for the Mac and found that most of them do a remarkable job of making the Macintosh easier to use. But no single device is perfect in all instances. What's good for one job may not be suitable for another.

Types of Devices
Input devices for the Macintosh can be grouped into six main categories: replacement mice, trackballs, joysticks, graphics tablets, optical character readers, and bar-code readers. Many of the devices now available emulate the Mac's mouse; these usually hook up to the mouse port. The devices that don't act like the mouse are plugged into one of the serial ports.

Whatever input device you consider, test it thoroughly before buying. The usefulness of an input device is a subjective matter, and I found that it takes time to get used to each of the devices, to grow accustomed to the way it moves the pointer or interacts with the Mac. For instance, I found the trackball devices difficult to use. Yet I know of several people who swear by them and think my attitude toward them is all wet.

A Mouse for All Seasons
The mouse packed with the Macintosh is a beast that will give you years of faithful companionship. But if you use the Mac a lot, especially with mouse-intensive applications like MacPaint and MacDraw, sooner or later you'll wear the little fellow out. It may take a couple of years, but it will happen.

You can buy a replacement mouse from Apple. But before you spend the money, take a look at the alternatives. All of them offer advantages over the standard Macintosh mouse; some are even cheaper.

The Mac's mouse is a relative positioning device. It doesn't matter where the mouse is located on a desk. Only relative information, the direction and distance of travel, is relayed to the Mac. For example, if you move the mouse to the right, the pointer moves right. If you pick up the mouse, put it back down on another area of the desk, and move it right again, the pointer continues where it left off, joysticks and trackballs are also relative positioning devices.

To understand why some mice are better than others in a given situation, let's take a look at the Mac's mouse. The most important consideration is that the Mac's mouse is optomechanical. When you move the mouse around the desk, the rubber ball protruding from the mouse's underside spins. The ball moves a pair of rollers, each of which turns a shaft. At the end of the two shafts are disks, called light choppers, that have slits in them.

Light shines through the slits and is detected by light-sensitive phototransistors. Because the light choppers spin as the mouse moves, the light reaching the phototransistors flashes on and off. The Mac interprets the flashing as the distance and the direction of mouse movement and moves the pointer accordingly.

The main problem with optomechanical mice is that they pick up dust and dirt and require routine cleaning. If
you use a Mac in a dusty environment, such as a factory or a warehouse, it’s not unusual to have to clean the mouse several times a week.

The alternative is a purely optical mouse, like the A+ Mouse from Mouse Systems. An optical mouse doesn’t have a ball to turn or disks with slits. Instead the mouse glides over a special pad, a piece of flat plastic painted with a fine grid. A light-emitting diode inside the mouse shines a pinpoint of light on the pad. The light is then reflected back to a phototransistor in the mouse. The mouse detects movement as the light passes over the lines on the pad.

Because optical mice have no moving parts, they don’t require routine cleaning. And because you use them with a plastic pad, they slide around more easily than their mechanical cousins. Still, optical mice aren’t without their faults. First, the lines on the pad can be scraped off; the pointer skips when the mouse goes over damaged parts of the pad.

The second problem is that you must keep an optical mouse oriented parallel to the edges of the pad. If you change the orientation of the mouse on the pad, pointer movement is no longer consistent with mouse movement.

One of the newest wrinkles in optical mice for the Macintosh is the Hamster, a wireless mouse from the Kette Group. To use it you connect an included infrared receiver to the mouse port and slide the Hamster around the desk like any other mouse. Incidentally, the product is called Hamster because real hamsters, like wireless mice for the Macintosh, don’t have tails.

**Tracking Trackballs**

Trackballs are nothing more than mice turned upside down. Instead of pushing a mouse around a tabletop, you spin a ball. One or two buttons on the top of the trackball let you click or double-click.

Trackballs are ideally suited for fast and furious arcade games such as Mouse Stampede and Mac Attack. They can also replace the Mac’s mouse with other Macintosh applications. You can, for example, use a trackball with MacPaint or MacDraw and enjoy better than average results.

Trackballs for the Mac are being offered by several companies. One of the best built, albeit expensive, is Assimilation’s Mac Turbo Touch. It’s designed to sit to one side of the keyboard, though I found that I was most comfortable when I placed it in my lap. For added flexibility Mac Turbo Touch has an extra adapter for the mouse; you can easily alternate between trackball and mouse without connecting and reconnecting cables.

### A trackball controller is available from the Kette Group. Like Mac Turbo Touch, the controller is attached to the mouse port.

**Joy with Joysticks**

When I first started investigating input devices for the Mac, I was amazed that no joysticks were available. After all, you can find joysticks for nearly every personal computer. Fortunately, enough enterprising companies felt the same way I did, and now you can choose from many models. Most require a controller that is attached to the mouse port. You plug the joystick into the controller.

Most controllers let you use almost any joystick available, either the digital “Atari type” or the analog “Apple II type.” Some even come with their own digital or analog joystick. Several dozen companies offer a full range of Atari-type and Apple II-type joysticks, as well as joystick-compatible trackballs.

---

**MacNifty Joystick Controller**

The Kette Group’s MacNifty Joystick Controller connects to the mouse port and accepts either digital or analog joysticks.
Unlike other graphics tablets, MacTablet from Summagraphics attaches to the printer or modem port, allowing you to switch easily between the mouse and the graphics tablet.

A few of the controllers, such as the Video 7 MouseStick, let you connect both a mouse and a joystick at the same time. You can alternate between one and the other.

To the Macintosh the joystick/controller pair looks just like a mouse. Its operation is simple. The controller senses the direction in which you move the joystick and sends pulses to the Mac. When you push the joystick up, for example, these pulses replicate the signals generated by the mouse when you move it forward. Pulses are sent corresponding to each direction in which you move the joystick.

Most joystick controllers, including the Video 7 MouseStick and the MacNifty Controller from the Kette Group, come with a speed knob, which allows you to vary the rate of the pulses sent to the Mac. When you turn the speed down and move the joystick, the pointer crawls at a snail's pace. Turn it up, and the pointer zips across the screen.

Joysticks generally work best with games. They aren't particularly suited for drawing in MacPaint though they can help when you draw straight lines, and they aren't very good for moving the insertion point in MacWrite. The mouse is the input device of choice for chores that require you to point to a particular spot on the screen. If, however, you need to move the pointer only in a general direction—as in Silicon Beach's Airborne! or Broderbund's Lode Runner—a joystick is a good choice.

Graphics Tablets

Graphics tablets, have changed all that. With a digitizing pad in front of you and a stylus in your hand, you can doodle and sketch to your heart's content. The pad and stylus work like paper and pen.

Most graphics tablets work by means of minute pulses of electricity that course through a fine mesh of wire immediately beneath the surface of the pad. When you place the tip of the stylus on the pad, the stylus picks up the signals and converts them into pointer coordinates. Since the stylus can detect the electrical pulses through several thicknesses of paper, digitizing pads are ideal for tracing existing artwork in MacPaint.

Graphics tablets are usually absolute positioning devices. Like the Mac's mouse, graphics tablets tell the Mac which way to move the pointer. But unlike with the mouse, the spot you touch on the tablet determines the point on the screen where the pointer goes. Think of the surface of the tablet as the Mac's screen. When you touch the upper-right corner of the tablet with the drawing stylus, the pointer jumps to the corresponding spot on the screen. If you touch the center of the pad with the stylus, the pointer jumps to the center of the screen, no matter where the pointer was before.

Several graphics tablets are available for the Mac, including the Koala KAT, the Summagraphics MacTablet, and the GTCO MacIntizer. Although all three tablets work in much the same way, there are a few marked differences among them.

The biggest difference is in the active drawing area, the part of the pad on which you sketch. KAT has the smallest—4 inches by 4 inches. The only tablet that senses relative position, it also has the smallest all-around dimensions—9½ by 5½ by ¾ inches. Its size makes it ideal for small or cluttered desk tops.

You can enter a 20-page manuscript in about 5 minutes.
MacTablet, about twice the size of the KAT, has an active drawing area of 9 by 6 inches. Macintizer, the biggest at 18 by 15½ by ½ inches, has an active drawing area of about 9 by 14 inches.

The size of the active drawing area is important, depending on the type of work you do. For simple freehand sketching, you can get by with a small active area. For tracing artwork or creating complex schematics or blueprints, you probably need something bigger. To aid in tracing oversize objects, Macintizer provides a 33 percent reduction mode, which neither MacTablet nor the KAT offers.

Another difference among the graphics tablets is the writing stylus. The Koala KAT, which responds to pressure on the pad, lets you draw with a variety of styli, including the plastic stylus that comes with the unit, a pencil, or even the tip of your finger. To simulate clicking, double-clicking, or holding down the mouse button, you can either tap the button on the side of the stylus or strike one of the large buttons located at the top of the pad.

MacTablet and Macintizer must be used with the accompanying pickup stylus. Since these tablets don't sense pressure on the drawing surface, they can't be used for finger painting, nor can they be used with pencil or pen. Fortunately, if you draw original art with either MacTablet or Macintizer, you can replace the plastic stylus with a ballpoint pen cartridge. As an alternative you can replace the entire stylus with a cross-hair cursor, also called a puck. Cross-hair cursors are ideal for exacting work, like floor plans or electrical schematics.

KAT and Macintizer connect to the Macintosh by way of the mouse port. Both are intended to replace the mouse, though you can get an adapter cable for Macintizer that lets you use the tablet and the mouse interchangeably.

MacTablet, on the other hand, attaches to the Mac through either the printer or modem port. Though this allows you to switch easily from the mouse to the digitizing pad, MacTablet requires a special driver program to operate. The program is installed on your work disks as a desk accessory that you select whenever you want to use MacTablet.

That approach has some limitations. One problem is that MacTablet isn't compatible with all Macintosh applications. Though it worked with nearly everything in my library, it didn't operate with FileVision.

Reading the Writing on the Wall

How long do you think it would take you to retype a 20-page typewritten manuscript on the Macintosh? If you were using Omni-Reader, an optical character reader from Oberon International, you could enter the entire manuscript in about 5 minutes. Omni-Reader recognizes typewritten characters, translates them into binary data, and sends the data to the Macintosh. It connects to one of the Mac's serial ports.

Omni-Reader recognizes four typewriter fonts: Courier-10, Courier-12, Letter Gothic-12, and Prestige Elite-12. It can also be programmed to recognize additional fonts by downloading typefaces from the Mac.

Using the device requires you to run a program called Omni to alert the Mac of Omni-Reader's input. Then you tack the actual document onto the surface of Omni-Reader. Finally, you manually move the head of the reader back and forth over each line of type.

The device "reads" the characters it sees into almost any Macintosh application you happen to run, including MacWrite and Microsoft Word.

I found that using Omni-Reader took some practice. It was easy to move the reader head too slowly or too quickly across the paper. An annoyingly loud beep and a series of lights that flash across a control panel warn you when Omni-Reader isn't able to decipher the characters. I also found that it isn't 100 percent accurate. For example, on more than one occasion the letters B and Q were interpreted by Omni-Reader as the numerals 8 and 0.

List price: $200

---

*Scanstar-Mac*
The Scanstar-Mac from Computer Identities allows you to read barcode labels by passing a wand over a preprinted label. Scanstar-Mac attaches to the Mac in place of the keyboard.
View Control System

The Personics View Control System (VCS) lets you control the screen pointer with your head. The VCS contains a lightweight headset, a control unit, and a two-button assembly that mounts on the keyboard.

Switching letters isn’t too bad, since you can usually catch mistakes by proofreading the document. But if you enter a lot of numbers, even one mistake can mean big trouble. When you’re entering just numbers, you can use Omni-Reader in the numbers-only mode. Reliability is increased more than twofold, since the device has to distinguish among only 10 characters.

Most bar-code readers are surprising simple. At the heart of the reader is the wand, which includes both a light emitter and a light detector. The wand is used to read the thick and thin lines common to all bar-code labels. The lines are translated into numbers and letters by the reader’s electronics. Bar-code readers are connected between the Mac and the keyboard, so that data from the reader is treated as data from the keyboard.

More to Come?

Those are but a few of the input devices available for the Mac; others are coming. One interesting alternative that doesn’t fit into any specific category is the View Control System (VCS) Mouse from Personics. By wearing a lightweight headset and lightly touching either of two buttons attached to the bottom of the keyboard, you can control the cursor with your head. Releasing the buttons lets you use the mouse. The VCS consists of the headset, the keyboard buttons, and a small box that sits on top of the Mac. The box is connected to the mouse port and contains an infrared sensor that receives the headset’s signals. Personics plans an upgrade to allow for voice input.

Expect in the next year to see piano-like keyboards for use with music composing and synthesizing programs, voice recognition systems, light pens for on-screen painting, and three-dimensional graphics tablets for digitizing three-dimensional objects.

With all these input devices attached to your Mac, a third hand isn’t such a bad idea after all. 

Gordon McComb is a Contributing Editor of Macworld.
Three Bedrooms, Two Baths, One Mac

Jim Heid

You have come into an inheritance, which finally allows you to move from your modest two-bedroom apartment in the city to a house in the suburbs. You already know exactly what you want—a split-level home in the Sunset or Pine Ridge area for about $125,000, with three bedrooms, a large yard so you can get a dog for your daughter, hardwood floors, and a garage. You meet with your friend Erica, who is a real estate agent, and tell her what you are looking for. On her Macintosh she types the information into a database that includes all the available houses in the metropolitan area. A few minutes later a report containing the houses meeting your criteria is printed out on the LaserWriter.

The scene may seem ordinary for a real estate office, but one difference stands out: the electronically produced report includes a photo of each house.
Let your mouse do the house hunting with real estate listings in Microsoft File, whose picture field opens the door to specialized database applications that include visual information.
Microsoft File’s ability to store graphic images as fields in a record lets you add a visual dimension to databases (see “File, Macintosh Style,” Macworld, May 1985). You can include MacPaint pictures, MacDraw images, and graphs created with Microsoft Chart in a File database.

Combine File with an image digitizer, and the possibilities increase. You can, for example, design a real estate database like the one just described, with digitized images of the houses for sale. A real estate agent can produce a report showing not only the vital statistics of each property but also the property itself. Agents and prospective buyers can use File’s Find command to search for houses meeting their requirements and then print those records.

To illustrate how to set up a visual database with File, I’ve created a sample real estate database. Because of the memory and storage requirements imposed by digitized graphics, you need a 512K Mac with an external disk drive for serious data management jobs. A hard disk is better still, because of its speed and storage advantages.

**Designing the Form**

First start File and design the form for the real estate data (see Figure 1). You can format several fields at once, such as all the number fields. Select the fields by either Shift-clicking on each one or enclosing them in a marquee; then choose Format Field from the Form menu. Keep the design simple. Avoid mixing fonts and styles; the form looks more professional, and File performs better when the program doesn’t have to load several fonts into memory.

When you format the field that holds the pictures of the houses, you have the choice of two options that affect the image. The Clip option causes File to crop any part of the image that doesn’t fit in the picture field box, and the Scale option stretches or shrinks the image to fit in the box, causing some distortion. To avoid cropping or distorting the image and having to redesign the form, I sized the picture field to match the size of the digitized photographs.

The next step is to enter the data for each house. Type the appropriate information in each field, pressing Return or Tab to advance to the next field. Remember File’s keyboard shortcuts; :E-apostrophe (’), for example, copies the contents of a field in a previous record to the same field in the current record. This shortcut is convenient if most of the houses in the database are in the same city or town.

1. **Figure 1**

Remember File’s formatting shortcuts when designing the database. Here, all the selected number fields will be formatted simultaneously. When you format the picture field, select the Clip option rather than Scale to avoid distorting the image.

2. **Figure 2**

To transfer digitized images into File, choose Art Grabber from the Apple menu. When Art Grabber appears on File’s menu bar, choose Open from the Art Grabber menu. Locate the desired picture’s name in the dialog box and click Open. Select the image by enclosing it in the marquee, and copy the image to the clipboard by choosing the Grab command. Finally, close the Art Grabber window, select the picture field, and paste in the image.
Get the Picture

Several digitizing systems are available for creating the images to be stored in File (see “Pictures to Pixels,” Macworld, April 1985). For this application I used Thunderware’s ThunderScan, which is installed in the ImageWriter’s ribbon carriage and scans any document that can be rolled through the printer. I digitized 3½ by 5-inch photos so that the images wouldn’t have to be cropped or scaled extensively to fit in the picture field box.

You need to transfer the digitized image into File. The ThunderScan software allows you to save the image as a MacPaint document. You can use Hayden Software’s Art Grabber desk accessory from within File to retrieve the image and paste it into the database (see Figure 2). If you don’t have Art Grabber, you can store the images in the Scrapbook and paste them into File. First select the image; most digitizer software provides a marquee. Then copy it to the Clipboard and paste it into the Scrapbook. The Scrapbook containing the pictures must be on the same disk as File, unless you have the program on a disk without a System Folder. If the box you created for the picture field is too large or too small, choose File’s Show Form command and drag the lower edge of the picture field box to adjust its size.

Using the Database

Once you’ve entered the data, you can use File’s retrieval and reporting features. You might want to switch to a List Helper view for proofreading or fast browsing. List Helper displays records in rows and fields in columns (see Figure 3). To switch between the List Helper and your custom form, double-click on any record number or type **FILE**. You may want to modify the form so that more data is visible at once on screen. If you just need to view the vital statistics for the house listings, you can hide the picture and comment fields. Return to the Form window and drag the picture field and the Comments text field into the hide area—the large dotted area below the form. The contents of those fields remain in File but are not visible in the form window.

---

**Figure 3**
File’s List Helper displays data in rows and columns, which allow you to see many records on the screen at once for quick reference or proofreading. You can switch views by double-clicking on any record number.

**Figure 4**
The Find window lets you locate specific records, such as all houses in Ashton on one or more acres of land, costing under $100,000, and with two or more bedrooms, one and a half or more baths, and a range and a refrigerator.
To look for specific records, choose Find on the Organize menu. Suppose you have a client looking for a house in the town of Ashton that costs less than $100,000, has two or more bedrooms, and is on at least one acre of land. Set up the window as shown in Figure 4 and click Find. File searches the database and displays the records that meet those criteria (see Figure 5).

You can print the records by choosing Print Records on the File menu. To specify whether headers, footers, grid lines, or record numbers should be printed, choose the Page Setup option. Choose the Report command on the Organize menu to print a columnar report. Drag the fields on which you want the report to be sorted into the Sort area. Drag the fields that you don't want to appear in the report into the Not Shown area. You may want to specify statistical functions for certain fields to spot trends or summarize the data. For example, you can calculate the cost of an average house in each town (see Figure 6). If you want to include pictures in a report, you have to increase the height of all the fields by dragging the line between fields so that the entire picture is shown.

To see what a printed report will look like, click the Preview button (see Figure 7). You can return to the report window and adjust the design if needed. When you're satisfied with the report's design, you can save it by choosing Save Report on the File menu.

More than Real Estate

The real estate database is one example of databases you can create with File and an image digitizer. Here are a few other examples.

- An inventory database containing pictures of widgets and gizmos.
- A personnel database containing photos of employees.
- A personal inventory database containing digitized images of your major belongings along with their serial numbers and other important information. Make sure the disks are safely stored; they won't do you much good if they're stolen along with your belongings.
- A videotape catalog that includes a representative scene from each movie in your collection.
- A baseball card or stamp collection database, with digitized images of each item.

Although the digitized images you include in your File database lack the color and clarity of the original photo or real-world object, you'll have a visual reference that is worth at least a few hundred words.

Jim Heid is a Contributing Editor of Macworld.

### Figure 6
This report design prints a columnar report sorted by location and price. The word Average in the "By Location" row tells File to print the average cost, lot size, number of bedrooms and baths, and 1984 tax figures for each town in the database.

### Figure 7
An on-screen preview of the report defined in Figure 6. You can print a report's text or save it on disk for later embellishment with a word processor.

Circle 321 on reader service card
Now there's a Mouse that flies.

Introducing the View Control System.™
Ultrasonic technology that moves your cursor at the speed of sight.
Your relationship with your Mac is about to change. Dramatically. Because now the View Control System (or VCS) from Personics™ gives you a powerful new way to control the cursor. Fast. Direct. Intuitive. It's the best thing since the Mouse. In fact, it's better.

**View Control**

The VCS uses a remarkable new technology for moving the cursor where you look on the screen. A lightweight headset translates subtle, natural head rotation into cursor movement commands. Look to the right and the cursor moves right. Look down and to the left and the cursor moves accordingly. Zip from corner to corner, or point to a tiny target with ease, even an individual pixel!

**Look Ma, Both Hands!**

Now you don’t have to take your hand off the keyboard to reach for the Mouse. The VCS features a unique button pad which clips on your keyboard just below the space bar. One button activates the headset. Use the second button for clicking and dragging. The VCS gives you instant cursor control without forcing your hands off the home keys. No more reach, grab, roll, click, return.

**Faster than a Speeding Mouse**

The VCS is accurate. Just like a mouse. But since you can look much faster than you can reach and roll, it gives you far greater speed. And because your hands stay on the keyboard you maintain continuity and concentration. For keystroke-intensive applications like word processing and spreadsheet, expect a real boost in productivity.

**Reclaim Your Desktop**

The VCS flies above the ordinary mouse, leaving more space on your desktop. Now you have room for books, papers and your favorite coffee cup. Of course, if you want your mouse within reach, there’s no problem. You can connect your mouse and VCS to the Mac at the same time and use them interchangeably.

**State-of-the-art-Technology**

Personics has developed a proprietary ultrasonic technology for the VCS.* The headset receives an ultrasonic signal transmitted from the VCS Control Unit which sits on top of the Mac. Changes in the rotation and angle of the head are tracked and electronically translated into quadrature signals just like those produced by the Mouse. And the VCS works with any 128K or 512K Mac and off-the-shelf software. Plug it in and you’re ready to go. No hardware or software modifications are required.

*Patent Pending.

**Get Acquainted in 15 Minutes**

The VCS is easy to use. Learning is fun and, before long, view control becomes almost second nature. You’ll simply look and click. The VCS headset is comfortable, lightweight and adjustable. It accommodates eyeglasses and won’t muss up your hair. And since the VCS headset doesn’t rest on your ears, you’re free to talk on the phone.

**Just $199.00 and Easy To Order**

The VCS is available right now, directly from Personics. Call us toll free. A member of our sales staff will be happy to answer your questions and provide additional information. If you’re ready to order, please have your major credit card at hand when you call. All orders are processed immediately and shipped within 24 hours. And we back the VCS with a full one year limited warranty.

CALL TOLL FREE . . . . . . 800-445-3311
In Massachusetts . . . . . 800-447-1196
Or Call Collect . . . . . 617-369-9616

**Satisfaction Guaranteed**

When your VCS arrives, try it for 30 days. If you are not completely satisfied, return it and we will swiftly refund your money. Your satisfaction is the only judge.

The VCS. A simple and direct link between man and computer. Try it, and watch your ideas take off.
Snowflakes and Dragons

Drawing fractals
with Macintosh Pascal

Matthew Zeidenberg
Looking at a snowflake from 6 feet away, you could describe it as a dot. Get a little closer, and the dot takes on detail. Zoom in to within a couple of inches, and its shape becomes difficult to describe. In the natural world you see shapes that have infinite detail, such as the edge of a leaf or the surface of a crystal. Describing detail at the level that occurs in nature is a problem that is addressed in the study of fractals.

If you use Macintosh Pascal, you have probably seen the program Sierpinski, which is on the Pascal disk. This program generates a beautifully complex pattern that is an example of a mathematical object called a fractal. The visual and conceptual appeal of fractals was made popular by mathematician Benoit B. Mandelbrot, whose book *The Fractal Geometry of Nature* (Freeman, 1983) is a collection of exotic mathematical objects and a detailed study of their nature and application in a variety of fields, including biology, physics, and economics.

Mandelbrot asks the question, How long is a coastline? The answer depends on how closely you look. If you measure a coastline on a map of the world, you get one answer, and if you measure each little inlet on a detailed coastal map, you get another. If you measure each grain of sand and every pebble on the beach, you get still another answer. Effectively, the length of a coastline is infinite; a coastline is an example of a fractal, an object of fractional dimension. It is the ultimate zigzag, in which the zigs and the zags are infinitely short.

Besides coastlines, the surfaces of many natural objects, such as forests and mountains, can be simulated with fractals. *Star Trek* fans may remember the planet Genesis in the film *Star Trek II: The Wrath of Khan*. It was created with fractals and computer animation.

Fractals in a plane have a dimension between a line (dimension one) and a surface (dimension two). Fractals in space have a dimension between a surface and a solid (dimension three).

One property common to many fractals is that a part resembles the whole. Each branch of a tree, for example, somewhat resembles the whole tree. Each secondary branch resembles the tree and the primary branch. If the branching in a tree continued ad infinitum, the tree would be a fractal.

**Generating Fractals**

Fractals can be constructed by repeatedly applying a set of rules to a given shape. Each fractal grows in generations from a seed called an *initiator*. The initiator can have the value \( n = 0 \) or \( n = 1 \), depending on where you choose to start counting generations. Each generation \((n)\) is the product of the previous generation \((n - 1)\). The rule or set of rules that you use to transform a given fractal from its initiator to each succeeding generation is called the *generator*. While the initiator and the generator completely describe how to construct a given fractal, its final shape is defined when the number of generations approaches infinity.

Since it’s impossible to run a program for an infinite length of time, you can’t create an actual fractal on a computer—or any other way, for that matter—but you can produce a good approximation.

**Using Recursion**

Since fractals are recursive objects, you can draw them on a computer using a recursive procedure or function. A recursive function is one that calls itself. The classic example of a recursive function computes the factorial of an integer \( n \). The factorial of \( n \) is the product of the integers from 1 to \( n \), expressed mathematically as \( F(n) = n \times F(n-1) \).

For a good introduction to the mysteries of recursion, see Douglas Hofstadter’s *Godel, Escher, Bach: The Eternal Golden Braid* (Basic Books, 1979).

---

**Fractal Programs**

The Macintosh is probably the first personal computer with adequate graphics for producing fractals. The fractals shown on the following pages are included in Mandelbrot’s book and were created by programs in Macintosh Pascal using recursive Pascal procedures (see Listings 2, 3, and 4). If you type the programs in and run them, you can watch the fractals grow.

The fractal programs share the procedure `Init`, which asks you for the generation \((n)\) of the fractal and creates the drawing window. If you plan to type more than one of these programs into the Mac, save `Init` in a separate file, which you can paste into each program through the Clipboard.

The statement `SaveDrawing("Filename")` right before the end of each program saves the contents of the drawing window in a file that can be read by `MacPaint`. You can also press Shift-3 to take a snapshot of the screen.

Another interesting modification you can make is to allow the initiator and the generator to be entered with the mouse and to generate a fractal based on the input.

The next six pages contain three examples of the infinite variety of fractals and the Pascal programs that produced them. You can generate many of the others in Mandelbrot’s book, or you can invent your own. Many beautiful fractals have yet to see the light of the Macintosh screen.

Matthew Zeidenberg is a graduate student in computer science at the University of Wisconsin, Madison.
**Koch**
Generated by the Koch program (see Listing 2), this fractal begins with an equilateral triangle. The generator replaces the middle third of each side with two sides of an equilateral triangle erected from the endpoints of the removed segment, forming a Star of David. The procedure is repeated for each generation.

Since the initiator consists of three line segments, the main program calls the procedure koch3 three times, once for each segment. The intermediate points necessary to create the second generation define four new segments that become initiators in recursive calls to koch3.
program koch;
const
sin60 = 0.8660254;
scaling = 100.0;
(xorig, yorig is center point of koch)
xorig = 250;
yorig = 150;
var
x1, y1, x2, y2, n, x3, y3 : integer;

{Procedure to create nth generation curve}
given two points that define the initiator
procedure kochr (x1, y1, x2, y2, n : integer);
var
xdiff, ydiff, x3, y3, x4, y4, x5, y5 : integer;
begin
{if n=1, draw the curve}
if (n = 1)
then
drawline(x1 + xorig, y1 + yorig, x2 + xorig, y2 + yorig)
else
{otherwise create the next generation}
begin
{calculate the points of the next generation}
xdiff := x2 - x1;
ydiff := y2 - y1;
x3 := x1 + round(xdiff / 3);
y3 := y1 + round(ydiff / 3);
x4 := x1 + round(xdiff / 2 - ydiff * sin60 / 3);
y4 := y1 + round(ydiff / 2 + xdiff * sin60 / 3);
x5 := x1 + round(xdiff * 2 / 3);
y5 := y1 + round(ydiff * 2 / 3);
{recursive calls to koch for each new segment}
kochr(x1, y1, x3, y3, n - 1);
kochr(x3, y3, x4, y4, n - 1);
kochr(x4, y4, x5, y5, n - 1);
kochr(x5, y5, x2, y2, n - 1)
end;
end;

(Draw text window, prompt for n)
(Display drawing window)
procedure init (var n : integer);
var
drawwin : rect;
begin
hideall;
showtext;
write(' Input order of curve:');
readln(n);
hideall;
drawwin.top := 40;
drawwin.left := 0;
drawwin.right := 512;
drawwin.bottom := 512;
setdrawingrect(drawwin);
showdrawing;
end;

(main program to draw Koch curve)
begin
init(n);
{define initiator}
x1 := 0;
y1 := round(scaling * sin60);
x2 := round(scaling);
y2 := -round(scaling * sin60);
x3 := -round(scaling);
y3 := -round(scaling * sin60);
{call kochr for each segment}
kochr(x1, y1, x2, y2, n);
kochr(x2, y2, x3, y3, n);
kochr(x3, y3, x1, y1, n);
end.
Dragon

The Dragon program produces this fractal (see Listing 3). Each generation replaces each line segment in the previous generation with two line segments at a right angle to each other. Like the snowflake fractal, this fractal is an example of how complex and apparently inexplicable patterns in nature can be generated with relatively simple rules.

The procedure dragon takes the initiator, which is defined by three points, and calculates two intermediate points. The resulting five points define two new initiators, which are used in recursive calls to dragon.

```
Listing 3.
```

```
```
program dragon;
const
  (Center point of dragon)
  xorig = 250;
  yorig = 180;
  scaling = 100;
var
  x1, y1, x2, y2, x3, y3, n: integer;

{Procedure to create nth generation}
{Given three points for the initiator}
procedure dragonr(x1, y1, x2, y2, x3, y3, n: integer);
var
  x4, y4, x5, y5, ydiff, xdiff: integer;
begin
  if (n = 1) then
    begin
      drawline(x1, y1, x2, y2);
      drawline(x2, y2, x3, y3);
    end
  else
    begin
      x4 := ((x1 + x3) div 2);
      y4 := ((y1 + y3) div 2);
      x5 := x3 + (x2 - x4);
      y5 := y3 + (y2 - y4);
      dragonr(x2, y2, x4, y4, x1, y1, n - 1);
      dragonr(x2, y2, x5, y5, x3, y3, n - 1);
    end;
end;

procedure init(var n: integer);
var
drawwin: rect;
beg
  hideall;
  showtext;
  readln(n);
  hideall;
  drawwin.top := 40;
  drawwin.left := 0;
  drawwin.right := 512;
  drawwin.bottom := 512;
  setdrawingrect(drawwin);
  showdrawing;
end;

begin
  init(n);
  begin
    x1 := xorig + scaling;
    y1 := yorig;
    x2 := xorig;
    y2 := yorig - scaling;
    x3 := xorig - scaling;
    y3 := yorig;
    dragonr(x1, y1, x2, y2, x3, y3, n);
  end.
end.

Listing 3
**Snowflake**

Produced by the Snowflake program (see Listing 4), this fractal gives you some insight into how snowflakes grow in nature, although it doesn’t have true sixfold symmetry. The initiator is a line segment. The generator replaces each line segment with seven line segments defined by 12 numbered points, as shown in the first generation ($n = 1$).

The procedure `snow` takes the initiator and defines 12 intermediate points that define 11 segments. Each line segment is used as input in a recursive call to `snow`.

![Image of snowflake generation](image-url)
program snowflake;
const
   (Center point of snowflake)
      xorig = 250;
      yorig = 230;
      scaling = 100;
      s = 0.5773;
var
   x1, y1, x2, y2, n : integer;

[Procedure to create nth generation curve]
[Given two points that define the initiator]
procedure snowr (x1, y1, x2, y2, n : integer);
var
gdiff, xdiff, i : integer;
(arrays store 12 points of next generation)
   x : array[2..12] of integer;
   y : array[2..12] of integer;
begin
   (Calculate the points of the next generation)
   x[12] := x12;
   y[12] := y12;
   xdiff := x12 - x1;
   ydiff := y12 - y1;
   x[10] := x1 + xdiff div 3;
   y[10] := y1 + ydiff div 3;
   x[11] := x1 + (xdiff * 2) div 3;
   y[11] := y1 + (ydiff * 2) div 3;
   x[3] := x[10] + round(ydiff * s);
   y[3] := y[10] - round(xdiff * s);
   x[9] := x[10] + round(ydiff * s * 2 / 3);
   y[9] := y[10] - round(xdiff * s * 2 / 3);
   x[8] := x[10] + round(ydiff * s * 2 / 3);
   y[8] := y[10] - round(xdiff * s * 2 / 3);
   x[2] := (x1 + x[3]) div 2;
   y[2] := (y1 + y[3]) div 2;
   x[5] := (x12 + x[4]) div 2;
   y[5] := (y12 + y[4]) div 2;
   (otherwise calculate the next generation)
   else
      begin
         (recursive calls to snowr for each of the 11 segments)
         snowr(x[2], y[2], x[3], y[3], n - 1);
         snowr(x[3], y[3], x[4], y[4], n - 1);
         snowr(x[4], y[4], x[5], y[5], n - 1);
         snowr(x[5], y[5], x[6], y[6], n - 1);
         snowr(x[6], y[6], x[7], y[7], n - 1);
         snowr(x[7], y[7], x[8], y[8], n - 1);
         snowr(x[8], y[8], x[9], y[9], n - 1);
         snowr(x[9], y[9], x[10], y[10], n - 1);
         snowr(x[10], y[10], x[11], y[11], n - 1);
         snowr(x[11], y[11], x[12], y[12], n - 1);
      end;
end;

[Display the drawing window]
procedure init (var n : integer);
var
drawwin : rect;
begin
   hideall;
   showtext;
   write('Input order of curve:');
   readln(n);
   hideall;
   drawwin.top := 40;
   drawwin.left := 0;
   drawwin.right := 512;
   drawwin.bottom := 512;
   setdrawingrect(drawwin);
   showdrawing;
end;

[main program to draw snowflake]
begin
   init(n);
   (define the initiator)
   x1 := xorig - scaling;
   y1 := yorig;
   x2 := xorig + scaling;
   y2 := yorig;
   (call snowr to create nth generation curve)
   snowr(x1, y1, x2, y2, n);
end.
Announcing the only devoted entirely to

Sponsored by MACWORLD, the Macintosh Magazine, August 21-23, 1985, Bayside Exposition Center, Boston

The second standard in business computing has arrived, and it's called the Macintosh Office. The power, flexibility, and ease of use of the Macintosh offer you the alternative you've been waiting for. And the introduction of the Macintosh Office provides all levels of business with a choice.

The Macworld Exposition is your chance to see it all in one place—software, hardware, and peripherals developed for the Macintosh. See for yourself the products available now that will help you work faster, easier, and smarter.

All of the elements of the Macintosh Office will be on display. The 512K Macintosh, the LaserWriter, and AppleTalk™, as well as Jazz™ from Lotus, are just a few of the products you’ll get to see.

The Macworld Exposition has a targeted schedule designed to fit your busy schedule. As a dealer, a distributor, a retailer, a business user, or an educator, the three-day conference and exposition is designed for you.

Day one is for dealers, distributors, retailers, and other third-party vendors to talk to Apple and the 100+ exhibiting companies about their products.

Days two and three are specifically geared for people interested in the Macintosh as a tool for business and anyone else interested in the Mac.

Who should attend?

Industry: Dealers, distributors, retailers, wholesalers, manufacturers, systems houses, consultants, technical programmers, all other ISOs

Business: CEOs, presidents, vice presidents, managers, comptrollers, owners/partners

Professionals: Doctors, nurses, bankers, lawyers, engineers, stockbrokers, real estate and insurance agents, CPAs, consultants

Education: Administrators, faculty, students

Here's a look at some of the conference sessions designed for you:

- The Outlook for the Mac in the Office
- Developing Software for the Macintosh
- How to Start and Survive in Business with a Macintosh
- Maximizing MacPaint®
- The Mac Clinic
- Maximizing MacWrite®
- Database Management on the Macintosh
- Getting the Most out of Spreadsheet Programs
- How to Get Your Programs Published
- What's Available in Mac Software
- File Management Tips and Techniques
- Maximizing Macintosh Disk Storage
- The Mac in the Classroom
- The Mac in Higher Education
- Developing University Courseware with a Macintosh
Here are some of the companies who will be showing Macintosh products:

- Advanced Logic Systems
- Aegis Development
- Ann Arbor Softworks
- A+ /Ziff-Davis Publishing Co.
- Apple Computer, Inc.
- Applied Logic Systems
- Apropos Software, Inc.
- Artline Industries
- Assimilation, Inc.
- Blue Chip Software
- Boston Software
- Brain Power, Inc.
- Cadmus Computer Systems
- The Cobb Group
- Communications Packaging Corp.
- Computer Additions
- Computer Identities
- Computer Learning Systems
- Computer Shopper
- Computer Software Designs, Inc.
- The Computer Store
- Corvus Systems, Inc.
- Consolidation/ T/Maker

The fog hangs heavy over the Berkeley hills on a Saturday morning. Above the sprawling campus of the University of California, the armed guard at the Lawrence Berkeley Laboratory (LBL) gate stays huddled inside her booth, scribbling out a visitor's pass for Building 50. The institutional, earth-tone structure, an early attempt at blending architecture into its terrain, is perched almost directly above the guard post. On a less foggy day the Golden Gate Bridge would be visible across the bay to the west.

No one seems to be in Building 50. But up half a flight of stairs and down a long, linoleum-paved corridor, a door is open on the left, leading the way to the three-room astrophysics office. In the westernmost room are books strewn haphazardly on shelves and papers piled high on desks and chairs. In the middle of all the printed matter, a lone Macintosh computer whirs. On its screen five small, round objects rotate around a bigger round object. Farther out a seventh orb travels in circles around them all. The only clue to the meaning of the screen display is the program's name: Nemesis Simulator.

Hovering over the Mac, a Three Mile Island Memorial Coffee Cup in hand, is physicist Rich Muller, his person an extension of the cluttered room. Later, after a lengthy discussion about his severely rumpled style of dress, Muller called me at home to say that pilgrims to Mecca wear old clothes as a sign of humility; he then sang--in German--the chorus from "The Ruins of Athens," a masque about the pilgrims, and finally proclaimed, "My clothes aren't rumpled by physics standards." The 41-year-old Muller is a world-renowned scientist who tempers his view of life with witty catchalls and a strong sense of humor. A self-proclaimed Macintosh freak who jokes about things being either "pre-Mac" or "post-Mac," he keeps a 128K memory board stuffed in a box in his crowded study because "like the HP-35 calculator, it's a real keepsake."

In 1978 Muller received the National Science Foundation's Waterman Award, a $150,000 research grant given to top scientists under 35 years old. That same year, he received the Texas Instruments prize presented to the year's preeminent scientist or engineer. And four years later he received the coveted MacArthur grant--$180,000 awarded tax free and with no restrictions. Muller could do whatever he wanted with the money; he was told that he need not even send a thank-you letter. The award allows you, he notes, "to do what you've always wanted to do. Well, I was doing what I wanted to do, and I liked my job."
Did a cosmic phenomenon cause the extinction of the dinosaurs? A Macintosh is helping physicist Richard Muller find out.
Nemesis

One of Muller's most significant scientific accomplishments was coming up with the first accurate measurement of the earth's velocity through space (around 1 million miles per hour, depending on when you measure), but he is best known as the force behind Nemesis, a.k.a. the Death Star. Muller leads a team of scientists in search of a star—thus far hypothetical—believed to be the cause of comet showers on the earth every 26 million years or so. Such a hail of comets has the potential to render most life-forms extinct.

A self-proclaimed Macintosh freak, Muller jokes about things being either 'pre-Mac' or 'post-Mac.'

The select team is an assemblage of graduate students and professionals; often in attendance are such notables as Nobel laureate Luis Alvarez, U.C. Berkeley geologist Walter Alvarez (Luis's son), and eminent nuclear chemist Frank Asaro. The meetings, held in the easternmost room of the astrophysics office, are a hodgepodge of updates, brainstorming, and technical problem solving in which terms of higher mathematics and properties of light waves are casually bandied about.

Muller's Nemesis star may seem farfetched, but it is an outgrowth of a now generally accepted theory put forth by his mentor and LBL colleague Luis Alvarez. Like Alvarez, Muller has been catapulted from the typically less turbulent realms of subatomic particles and cosmology into a controversy that has raged on the Berkeley campus for nearly six years—the debate over why numerous life-forms became extinct at approximately the same time in the earth's history.

The Alvarez theory arose when Walter discovered a worldwide layer of iridium in the geological record of some 65 million years ago, the boundary between the Cretaceous and Tertiary periods. Iridium, one of the platinum group of elements, is rarely found close to the earth's surface and is generally associated with meteorites and comets. Along with Asaro and fellow LBL nuclear chemist Helen Michel, who together confirmed the iridium anomaly, the Alvarezes proposed a fantastic scenario: around 65 million years ago a giant asteroid slammed into the earth, raising a huge dust cloud that blocked sunlight and prevented photosynthesis. The event, in which some 70 percent of existing species died out, was one of several mass extinctions in the earth's history. This cataclysm, the scientists said, would have affected all life-forms, especially marine and land animals, including dinosaurs.

Criticism was rampant, but the Alvarezes stood fast, and evidence has slowly accumulated in their favor. Muller was fascinated when he read a report by paleontologists at the University of Chicago who reviewed the past 250 million years and concluded that mass extinctions occurred in regular, 26-million-year intervals. Recalls Muller, "I thought there must be some astronomical explanation."

He applied himself to formulating an astronomical model of periodicity that would explain the phenomenon. Often he would walk around the corner and down the hall from the astrophysics department to the roomy corner office of Luis Alvarez. There, in the shadow of Alvarez's immense transparent star dome, he used his mentor as a sounding board. "He didn't believe in periodicity, and I did," Muller says, "so I started looking for explanations, with Luis acting the devil's advocate."

One of Muller's ideas is that the catalyst for the periodic global destruction is an undiscovered companion star that orbits the sun every 26 million years. The concept is logical enough—two-thirds of known stars have companions—but Muller couldn't see any way such a star could let loose the asteroid storms postulated by the Alvarezes.

During Christmas break in 1983, Muller discussed the problem over espressos with astronomers Marc Davis of Berkeley and Piet Hut, who was visiting from Princeton. Hut listened intently to Muller's summary and suggested that instead of asteroids, the companion might trigger a rain of comets. After all, the existence of a theoretical band of comets called the Oort cloud has long been accepted by astronomers. Consisting of billions of comets, the cloud is thought to ring the sun from as close as just beyond Pluto to more than 100,000 astronomical units—the distance between the earth and the sun—away. If the companion star passed through the thickest part of the cloud every 26 million years or so, its gravitational force would send millions of the heavenly voyagers flying in all directions, and some would undoubtedly strike Earth. The three men grew excited. Muller recalls, "We wrote the first draft of our paper that day."
Nobel laureate Luis Alvarez and his son, geologist Walter Alvarez, behind the immense star dome that dominates the senator Alvarez’s office.
The catalyst for the periodic global destruction is an undiscovered companion star that orbits the sun every 26 million years.

The Nemesis Simulator

Back in his office, Muller is smiling over the simplistic version of his theory depicted on the Mac screen. The five small bodies on the screen, he explains, represent comets in the Oort cloud rotating around the sun. The solitary orb is the Death Star. As it passes close to the sun, it moves through the Oort cloud and sends comets hurtling toward the solar system. Muller wrote the program in half an hour in Microsoft BASIC and spent a week refining it. The fact that he wrote the program at all marks a dramatic switch in his attitude toward computers. As a graduate student Muller came to hate them. He talks in horrified terms about "dumps," "hexadeimals," and thumping through stacks of cards trying to spot a programming glitch. He remembers the stuffy keypunchers who wouldn't give his projects priority and considers keypunchers "worse than computer programmers in terms of being totally obnoxious."

The Macintosh changed all that. Muller keeps one at home and another in the office, cultivates user grapevines, and writes reviews for the Berkeley Macintosh user group. His desk at home is occupied by nearly 100 disks, including 40 commercial programs and practically all the public-domain software in existence. And all his post-Mac Nemesis work—including scientific papers and the article he wrote for the New York Times magazine—has been done on the machine.

One day Muller was in his inner office chatting with Luis Alvarez, when his long-awaited copy of Sargon III arrived. He ripped open the package, plodded the program in the computer, and began a game, ignoring the instruction manual. As a small crowd gathered and urged Muller on to victory, Alvarez watched dumbfounded. He had never seen a computer that made applications so simple. "I was totally impressed," Alvarez says. "I've used a lot of computers, and you have to spend a week or two studying the manual before you can do anything."

Last October Muller upgraded his Mac to 512K. The physicist gathered three of his graduate students to help install the new board. "We weren't going to call in any technician. It was an opportunity to open up the Mac," he says. The scientists-turned-hobbyists were not discouraged by the deeply recessed screws and the unusually shaped heads. They removed five screws from the back of the machine and tugged. When the case wouldn't budge, they discussed the situation and decided that the five screws were all there were. They gave the case a yank. It worked, and the upgrade was installed. In typical fashion, Muller filters the experience through the eyes of a physicist—the Macintosh is just another universe to unravel. "Taking apart the Mac is a little bit like exploring the atom," he says. "You don't know what you're getting into, and you have to have some degree of confidence that you won't do any irreparable damage." □

Feed your Mac.

Introducing ThunderScan.
Now you can turn any printed image into a detailed, high-resolution Macintosh graphic.

ThunderScan turns Mac's Imagewriter printer into an image reader. So you can digitize any printed image and turn it into a detailed, high-resolution MacPaint document. Anything, including forms, half-tones, photos, mechanical drawings, maps, floorplans, logos, signatures and more. From black and white and color originals. ThunderScan reproduces them at over 200 dots per inch and in 32 shades of gray.

ThunderScan's application software, written by Mac-team-member, Andy Hertzfeld, makes it an extremely versatile and useful tool. You can generate full-page images or selected parts of them. Enlarge and reduce them. Manipulate them. Control the contrast and brightness. Create your own personal image disk. "Cut" and "paste" images together, creating new documents. And print them out on your Imagewriter. Or send them by modem to another Mac. The possibilities are nearly endless.

No lights, no camera, just action.

What you see here is the complete ThunderScan system. You don't have to buy an expensive video camera. Just pop out your Imagewriter's ribbon cartridge, snap in ThunderScan and you're set. It can even work in the dark (maybe you can think of an application for that).

If you bought a Mac at least partly for its graphics, only to find you couldn't take full advantage of them, now you can. With ThunderScan.

At an introductory price of just $229, it's a small price to pay for a whole new graphics capability.

For more information or a ThunderScan of your own, see your dealer or call us today:

HOW TO BUY THE

ICON REVIEW

MAKES BUYING SOFTWARE EASY.

Every three months, we feature candid reviews of the most promising Mac products. Along with each review, you'll find screen images of the product in use.

Read the reviews and select the products you want at your leisure. Then call our toll-free number to order your software at prices 30% to 40% less than retail. Sound simple? It is.

Identifies the best Mac software products from among the 500+ available.
Helps provide the information you need to make informed buying decisions.
No advertising means extreme candor: A consumer advocate viewpoint.
Convenient shopping by phone, mail, or CompuServe.
Rock Bottom Prices.

VOLUME PURCHASE PROGRAM

Icon Review has initiated a Volume Purchase Program to serve the Special needs of the many companies, user groups, schools and government agencies that have sought us out as a source of information and a supplier of Macintosh software and accessories. For detailed information, mail the coupon or call 408/484-2159 and ask for Brett La Sorella.

ORDERING IS EASY.

Icon Review is dedicated to supplying top rated software, same-day service, and discounted prices. Call toll-free, order by mail, or shop the electronic way on CompuServe.

Macbottom

Second Generation Hard Disk Drive From Personal Computer Peripherals Corp.
This 10.7 megabyte 3½-inch Winchester hard disk has been designed from the ground up to be totally "Mac-ish". We rated it "Best of Show" at the Mac Expo, San Francisco. Macbottom is two inches high and has the same footprint as the Mac. It supports multiple, resizeable volumes which can be mounted from a pull-down menu. Total weight is five pounds. Macbottom is our choice as the best buy in personal hard drives for the Mac. Complete with cables, software and instructions. Includes a six month parts and labor manufacturer’s warranty. Retail $1395.

Icon Review $LOWEST PRICE
Volume discounts for 3 or more 25% off for Apple certified developers.

Powerful business tools don't have to be complicated.

The manual filing system helped people do incredibly powerful things—like effectively organize their businesses. Yet it wasn't a complicated tool.

PFS:FILE and PFS:REPORT are software programs that are so powerful they can help you run your business even more effectively. Yet they're so uncomplicated, you can learn how to use them easily.

Both programs are designed for people without computer expertise. All instructions are written in plain English so you can be productive right away.

FILE lets you create the filing system that will best fit your particular needs. Unlike other database software, you can design forms any way you want without having to follow a lot of complicated rules.

You can find and print information like mailing labels, client records, inventory lists or purchase orders. Instantly!

REPORT is the perfect companion to FILE. It lets you quickly create summaries of your FILE data with totals, averages, counts and other calculations. So you can get a quick look at the bottom line.

FILE and REPORT are fully integrated with the PFS Family of Software. So you can easily use information from FILE and REPORT in other PFS programs and get more done in less time. For example, you can produce personalized form letters complete with addressed envelopes with PFS:WRITE.

PFS—it's the powerful software that's simple to learn. It's the power of simplicity.

See your computer dealer for a demonstration and discover how powerful the power of simplicity really is.

PFS SOFTWARE
The Power of Simplicity™

PFS:FILE and PFS:REPORT run on Apple IIe and IIc, Macintosh, IBM, Compaq, Commodore 64, Tandy, Panasonic, Data General, ACT, NEC, TI, Hewlett-Packard, Wang and other personal computers.

Macware Reviews

Edited by Erfert Nielson

Two home accounting programs, an action game, strategies for making your first million, and a program that makes the Mac talk

In response to reader requests for more reviews, Macworld has added a new section, Macware Reviews. Each month this department will feature brief reviews of Macintosh hardware and software, from arcade-style games to accounting packages and printers. Write to Macware Reviews and let us know what programs you'd like reviewed.

The Mac Talks Back

Speech is the easiest, most natural form of human communication. The written word has its advantages, but most people's phone bills far outweigh their expenditures for postage stamps. It follows that people would like to extend this preference for speech to their interactions with computers. Science-fiction stories abound with computers that listen to spoken commands and respond politely in suave, synthesized tones. The Mac cannot yet respond to your verbal commands, but it can now talk to you.

SmoothTalker, by First Byte, gives you an easy way to generate speech with the Macintosh: you type English text at the keyboard, and the program causes the Mac to "say" the words through its built-in speaker. You often have to make adjustments in inflection and pronunciation to make the Mac's speech understandable, but for what it is—an inexpensive, software-based speech generator—SmoothTalker is impressive.

When you start up SmoothTalker, you can choose one of the program's existing demos, open the application itself to compose a new document using SmoothTalker's text editor, or open SmoothTalker and load a text file from any Macintosh program that can save data as a text file (MacWrite or Microsoft Word, for example). You can also transfer blocks of text from other programs to the Clipboard or the Scrapbook—each automatically saves data as text files—and paste the text into a SmoothTalker document.

You'll first encounter SmoothTalker's speaking abilities when you select About SmoothTalker from the Apple menu. A typical dialog box is displayed, but then the program speaks the text of the dialog box (perhaps it should be called a monolog box in this case).
Once text has been typed or loaded into SmoothTalker’s document window, you can test and modify the generated speech. The Speech menu commands tell the program to “say” either a selected portion of the document or the entire document.

Dictionaries and Diction
SmoothTalker compares the text in the document window to the words in its dictionary. It then interprets the syntax by applying more than 1000 conditional instructions to the text. For example, the program adjusts the inflection of a phrase upward if it is followed by a question mark. SmoothTalker also correctly translates common abbreviations and speaks the complete word or phrase; for example, Mr. is pronounced master. Not many people know what to call the number 999,000,000,000,000,000,000,000; SmoothTalker does.

Language, however, is very complex, and every rule has an exception. When you need to adjust SmoothTalker’s speech, two options are available. First is a set of controls called Speech Settings. When you choose Show Speech Settings from the Speech menu, you can adjust the volume, pitch, speed, tone, and voice. At the time of this review only a male voice was available, but a First Byte representative informs me that a female voice will be included in version 2.0, which registered owners of version 1.0 will receive at no charge.

The second option for fine-tuning SmoothTalker’s speech is the Dictionary menu. You can control the pronunciation of unusual words by storing exceptions to SmoothTalker’s interpretations of correct pronunciation. Up to 50 such exceptions can be stored in the dictionary. You note exceptions by identifying the text that requires special attention and then attaching either a corrupted English spelling that produces the right pronunciation or a phonetic spelling that SmoothTalker can speak without interpretation. Chibituauba, for example, can be specified as “cha waw waw” in corrupted English or as “CHAX-AWAA” in phonetics. A list of phonetic symbols is provided in the User’s Guide menu (see “Talking Document”).

Adding Speech to Programs
A First Byte spokesperson says that version 2.0 of SmoothTalker will allow programmers to incorporate speech into non-commercial programs. The SmoothTalker master disk must be inserted when the program calls the SmoothTalker speech.

A version of SmoothTalker for developers, which allows programmers to incorporate speech into commercial applications, is also available. Software developers receive a special set of documentation and software routines that link SmoothTalker to the Lisa/Pascal programming environment. First Byte also plans to allow programmers to add speech to programs written in Microsoft BASIC 2.0 and Creative Solutions’ MacFORTH.

Sound Quality
Sound generated on the Macintosh, whether music or speech, is restricted to the performance capabilities of the speaker and the audio circuits. Speech coming from the Mac’s small, built-in speaker is distorted at high volumes. No software can overcome these hardware limitations. Using an external speaker connected to an amplifier via the Mac’s speaker jack greatly improves sound quality. First Byte is also working with developers to produce a series of filters to reduce distortion and further improve the program’s sound.

SmoothTalker allows you to produce reasonably understandable speech by typing English text. This feat is a significant achievement that exemplifies the sound capabilities of the Mac. Potential applications might include spoken help messages in programs, talking terminals for the visually or vocally handicapped, voices incorporated into games, and educational programs that speak to students.—Tom Neudecker

Fun and Games in the Corporation
You know the old joke about what bus drivers do on their days off—they ride buses. What about executives? Well, they play business simulation games. Yes, this is the 1980s—the decade of business, the MBA, and entrepreneurship.

Business simulation games present scenarios that mimic actual business situations. You evaluate the information presented to you, make decisions, and see the results of your decisions. Not surprisingly, success in these games is measured by how much money you make.

Millionaire, from Blue Chip Software, is a simulation of the stock market. The object of the game is to make a million dollars by trading 15 stocks in five industries. You start the game with $10,000 and begin in the 14th week of a 91-week trading period. As your net worth increases, so do your investment alternatives. Until your net worth reaches $12,000, you can buy stocks only at full price. When your net worth reaches $12,000, you can buy on margin,
which means that your broker will lend you up to 50 percent of a stock's purchase price—at a hefty 18 percent interest rate, of course.

When your net worth hits $18,000, you can increase your leverage even further by buying call options. A call option gives you the right to purchase a stock at a price previously agreed upon. If you think the price of a stock will rise significantly during a specified period of time, you can speculate on it by buying a call option. When your net worth reaches $40,000, you can also buy put options. This type of option gives you the right to sell a stock at a price previously agreed upon. For example, if the game's Apple Computer stock is selling at $38 in August, you can make a healthy profit by selling your Apple stock options. Finally, when your net worth reaches $100,000, you can borrow up to 80 percent of your net worth.

Reports

Before deciding which stock to buy or sell, you need to do some market research (see "The Trading Zone"). Millionaire provides you with information on stock market trends and on your specific holdings. Extensive reports begin with a simple 36-week graph of the activities of all 15 stocks and a graph of price fluctuations in one of the five industries.

A financial journal offers news of the week. Stories for one week told that American Motors earnings increased while Ben-
dix decreased, there was high trading volume in U.S. Steel stock, and Control Data had a plant fire that would interrupt shipments. The headlines are taken from actual stories in the Wall Street Journal. As in the real world, news stories sometimes have a direct effect on a stock's price.

You can get a separate graph of the price activity of each stock that you own and a chart showing each stock's historical high and low, the week's closing price, and the net price change for the week. You can also check the current status of your portfolio. A chart tells you what stocks you own, the average price you paid, the current stock price, how much you gained or lost, and how much equity you have in stock that you bought on margin.

The Bottom Line

You probably won't buy or sell stocks on a daily basis, since you have to pay your broker a 1.5 percent commission for each transaction. If the market is down but you can't sell put options, you can do little but hold on to your money until market conditions improve. One weakness of this simulation is that you can't collect interest on unused cash—something any investor would be doing.

The game continues for the 91-week period, but it will take many games for you to reach the goal of $1 million. You can save current holdings at any time during a game. At the completion of a game, the program remembers your current net worth until the next game.
How to Keep Your Macintosh from Frying to a Crisp

Protecting Your Hardware From The 6,000 Volt Destroyer

Over 50% of all hardware and software complaints received by manufacturers have nothing at all to do with product quality. To the contrary, most damage reported is caused by surges in household or business current.

These surges continually degrade sensitive microcircuitry resulting in lost data and, even worse, computer repairs that are often mistakenly blamed on original equipment failure.

30,000 Volts At The Tip Of Your Finger

Another common danger to the computer, its peripherals and software, is static electricity. Few people realize that their bodies can carry as much as 30,000 volts of static.

The discharge of static electricity through the operator's fingertips can pose just as great a threat to your system as power line surges.

The Faulty Ground

In addition to operator safety, a properly grounded computer is better able to drain off charges that would otherwise create dangerous voltage levels between the computer's chassis and microcircuitry. Again, the operator is typically not aware of whether the outlet is properly grounded and therefore risks both the operator's safety and hardware damage.

RFI Can Play Havoc With Your Image

While RFI (Radio Frequency Interference) is not a source of damage to computer or operator, it can play havoc with the monitor image and to software. RFI is caused by nearby radio stations, the operator's own radio or television, as well as other electrical devices. RFI shows up on the monitor as a scrambled image and may also appear as data that has been garbled while in memory. If for no other reason, the computer operator should guard against RFI simply because its effect can nullify the time saving benefits provided by the computer.

MacGard: Real Protection For The Serious User

MacGard from Systems Control is the single most complete computer protection device available today. From its inception, MacGard was designed with Macintosh in mind. From its quality injection molded plastic casing which complements your Macintosh's appearance, its at your fingertips convenient placement on the side of your unit, and its combination of superior protection features, the MacGard is the ultimate system accessory for your Macintosh.

MacGard provides the serious user with a complete series of protection benefits:

- It clamps off all line to line and line to ground surges before they can enter your system.
- It provides an anti-static pad you need only touch to safely drain off harmful static.
- It provides an LED light to indicate proper ground of your electrical outlet.
- It provides RFI attenuation to assure a clean monitor image and software safety.
- A master on-off switch provides convenient control to power up your computer and two other peripherals.
- MacGard has a one year limited warranty.

If you're not satisfied within 30 days, return MacGard for a full refund.

If you're a serious user, you owe it to yourself to own a MacGard! Your MacGard can only be purchased directly from Systems Control. Cost of the MacGard is $89.95 plus $5.50 for shipping and handling. To order or request more information, call toll free, 1-800-558-2001 Ext. 115, in Wisconsin, 1-800-242-2102 Ext. 115. We accept both Visa and MasterCard. No C.O.D.

Systems Control P.O. Box 788 M Iron Mountain, MI 49801

MacGard™

A product of Systems Control, a division of M.I. Recise, Inc. MacGard™ is a trademark licensed to Apple Computer Inc.

Like all simulations, Millionaire's depiction of investing in the stock market is simplistic. Few investors buy a stock based only on prices and a few headlines. You get no data about earnings, sales volume, or a company's balance sheet—crucial information for any investment. Stock price activity in Millionaire is not based on the actual fluctuations of the 15 stocks in the game but on a formula that simulates the price performance of many stocks. You can't even buy Bendix stock anymore, since it's been bought out by Allied Corporation. In other words, you should ignore the name of a company and think in more general terms when playing the game.

As a resident of the real world, you know that the business world is incredibly complicated. Distilling numerous complex factors into the Mac's memory means that the model of reality presented in Millionaire is rudimentary, still, the game teaches you basic lessons in stock trading that you'll probably enjoy learning.—Saul D. Feldman

Transaction-Packed Accounting

I always avoided home accounting programs because I didn't want to rush home every time I put a nickel in a parking meter to enter the transaction on my computer while the event was fresh in my mind. But I like to think I have an open mind, so I took a look at the new Macintosh version of The Home Accountant and Financial Planner, a financial management and planning program that has been available on other computers for years.

The Home Accountant helps you monitor your personal earnings, expenses, investments, savings, and debts in much less time than you would take by hand. The program can better prepare you for tax time or any other time you want to know where your money comes from and where it goes. You can also use the program to budget your income and expenses and compare budgeted amounts against actual amounts. The Home Accountant also helps you plan loans, investments, and retirement. To use the program, you need a 128K Mac with an external disk drive. The program works with a single-drive 512K Mac, but using an external drive is more convenient, since you must put your files on a data disk.

Tracking Your Transactions

The Home Accountant keeps track of up to 200 accounts, including bank accounts, credit cards, cash, assets, liabilities, income, and expenses. When you spend money, receive money, or otherwise change the value of an account, the event is called a transaction. The Home Accountant...
Unleash the Musical capabilities of your Macintosh. Enhancements include:

+ **TRIPLETS**
Timing concerns are conquered!

+ **TIMED ENTRY**
Compose as you play the Mac Keyboard. The Music Writer automatically calculates note lengths for you.

+ **PRINT TO MACPAINT**
Print to Imagewriter, Laserwriter or create MacPaint files. Use MacPaint to add text, beam notes or add special notations to beautify your printed scores.

+ **IMMEDIATE PLAYBACK**
Listen to your music as you compose with the enhanced Music Writer.

+ **MULTIPLE INSTRUMENTS**
Create exciting, dynamic playback by changing instruments anywhere within a piece. Instantly transpose. Print high-quality sheet music. Add repeats and special endings. Upgrade music files created by original ConcertWare and some other music programs. The ConcertWare + Music Writer is the “Word Processor” for music.

The ConcertWare + InstrumentMaker™ application is the most powerful and versatile tool available for simulating musical instruments on your Mac. Easily create your own sounds. Allows full control over the harmonics, waveform, envelope and now, even vibrato.

“(ConcertWare) taught me more about music than I thought I'd ever learn. Highly recommended.”

Jerry Pournelle, BYTE

The ConcertWare + Music Player produces the highest quality sound available from the Macintosh. Play directly through the Macintosh speaker or through your home stereo system.

“Exquisite instrument sounds.”

InfoWorld

The ConcertWare + Package includes over 30 pre-defined instruments and over an hour of musical selections. Additional Music and Instrument disks will be available. The ConcertWare + Package is the ideal musical tool for the beginner or professional. $69.95 suggested retail price.

Introducing Accounting For Those With A Mouse In The House. (Or Office)

Back to Basics Accounting System by Peachtree Software® is now available for the Macintosh.

It's named Back to Basics because it is an uncomplicated, easy-to-learn accounting system for small businesses.

You don't need any accounting experience and barely need any computing experience. The straightforward manual teaches both accounting and computing at the same time.

But make no mistake. This is a full-featured series of interactive products including General Ledger, Accounts Payable and Accounts Receivable.

The first business accounting system for the Macintosh. Back to Basics has been enjoyed by owners of Apple® II+, IIc all along. In fact, you've probably seen it featured in Apple Macintosh advertisements.

Uncomplicated—easy-to-learn—yet full featured. That's Back to Basics.

For more information, contact your local dealer or Peachtree Software, 1-800-554-8900.

America's Software grows on the Peachtree.

Macware Reviews

The program handles as many as 50 transactions automatically. You set up in advance which account is affected, how much is involved, and on which day of the month and in which months the transaction should occur. The program notifies you at the beginning of a session if any automatic payments are due.

Graphs and Reports

When it comes time to analyze your finances, The Home Accountant can print or display seven reports and four graphs. The reports range from a balance sheet to a list of names of those with whom you deal regularly. The program can also print checks on standard preprinted forms (a sample comes with the program). The graphs don't show any facts that aren't in the reports, but they do make it easier to see trends and patterns. You can specify the type of information you want included on any report or graph. For example, you could specify a report that listed only tax-related transactions.

The Home Accountant's loan, retirement, and investment planning features are somewhat disappointing. Loan planning doesn't handle variable-rate loans, and the yearly interest totals I got didn't match the totals that my bank gave to the IRS. Retirement and investment planning are complex matters that this program treats very simplistically. For example, the program accommodates only single rates of return and inflation and doesn't figure in tax breaks from investments such as IRAs.

The Home Accountant makes good use of the Mac's graphic user interface. Its eight menus list commands that open dozens of windows. It's not unusual to have six windows open at once (see "Financial Windows"). Most of the information you need to enter a transaction is listed in one window or another, and you can copy (continues on page 154)

You need MailManager. The fast, easy-to-use list, label and letter generator for your Macintosh.

It's easy to get started. MailManager presents a predefined record format. Just fill in the fields (Name, Address, Phone, etc.) and your database is on its way.

Data entry is especially fast, easy, and accurate. Type frequently used information only once—MailManager repeats it for you! Then retrieve data based on up to 72 criteria—great for really targeted mailings! And, printing address lists, phone lists, form letters, mailing labels and envelopes is a breeze with MailManager's predefined output formats.

Plus, you can: • Store more than 2,000 records on a 3.5-inch disk; thousands more on a hard disk. • Merge your data with any MacWrite or Microsoft Word document. • Print any font, anywhere you want.

MailManager is available now from your favorite software dealer for the suggested retail price of just $119. It's equally powerful on a 128K or 512K Macintosh, using one or more drives (hard drive supported).

Get MailManager today. And you'll get lists, labels and letters lickety-split!

Call Customer Sales toll-free for the location of your nearest MailManager dealer: 800-451-8080, Ext. 17
(In California, 800-824-7867, Ext. 17)

MACWORLD Brings Jazz and Excel Face to Face

Macworld's September issue features in-depth reviews of Lotus's eagerly awaited Jazz and Microsoft's mighty Excel. We compare these integrated programs spreadsheet to spreadsheet and cover each database to help you select the better match for your business computing needs. Also, interviews with Bill Gates of Microsoft and Mitch Kapor of Lotus add insight into how these powerful programs enhance the furnishings of the Macintosh Office.

Feature Editorial:
- Jazz and Excel Reviewed and Compared

Plus:
- Hands-On Information about the LaserWriter
- Various Approaches to Integrating Applications
- How to Boost Your Mac's Performance
And much more

Don't miss this exciting issue!
Available at your newsstand on August 20

MACWORLD
The Macintosh™ Magazine
Now Macintosh speaks your language.

The MacAdvantage: UCSD Pascal. Everything the serious programmer needs to develop user-ready applications on the Mac.

Here's the development environment that helps you design fully featured programs directly under control of the Macintosh operating system. In compiled UCSD Pascal, the serious programmer's language of choice. With immediate access to virtually all Mac ROM routines including pull-down menus, overlapping windows, clipboard, desk accessories and, of course, the mouse.

Now you can write large, fast programs for the 128K or 512K Macintosh. Or the Lisa. With Apple Pascal compatibility.

The MacAdvantage: UCSD Pascal comes complete with powerful, easy-to-use development tools and utilities. And one feature that's really easy to like: A low price tag.

For more information, call toll-free 800-451-8080 (in California, 800-824-7867). SofTech Microsystems publishes software, too. Interested? Call our toll-free number or mail the coupon.

Macware Reviews

(continued from page 150)

information to the transaction by pointing and clicking instead of typing. However, the program has no Undo or Show Clipboard feature and can't share data with a spreadsheet or database.

Besides the program disk, The Home Accountant includes a 178-page manual that is easy to read and adequate in scope but tends to explain more about which buttons to push and less about how to apply the program to your finances.

You don't need this program to balance your checkbook or tally the amounts on Form 1040A. But if you are fiscally lost and willing to spend considerable time entering your financial transactions, The Home Accountant will reward you with comprehensive reports and graphs that will help you better understand and manage your finances.—Lon Poole

Checking Out Electric Checkbook

When people first started buying personal computers, a common jest was, "You spent all that money on a computer, and all you can do with it is balance your checkbook?" Of course, computers can do more than replace a check register, and kidding aside, checkbook programs on most personal computers have been popular.

A checkbook program should simplify balancing your checkbook, clarify your spending habits, and list your tax-deductible expenses. Although you can adapt a spreadsheet or a database manager for those tasks, checkbook programs are more convenient. A good checkbook program should also keep track of credit card purchases, electronic banking, and that low-tech method of payment called cash.

The Macintosh now has a checkbook program of its own called Electric Checkbook, by State of the Art. The program is designed on the premise that you use your Mac and Imagewriter to write

Financial Windows

The Home Accountant lets you display several windows at once and transfer information from one window to another.
most of your checks. This system creates more problems than it solves. For example, you have to purchase special checks for the Imagewriter. Although the manual allows that "there are times when it is more practical to write the check yourself by hand," it is in fact almost always more efficient to write personal checks by hand than by computer. If you're like most people, you probably don't take your Mac and Imagewriter with you to the corner grocery. If you follow Electric Checkbook's system, you will be burdened with two sets of checks and subsequently two check-numbering systems.

Setting Up Accounts
The program handles records for up to ten accounts. You set up an account by placing your finances into four categories: assets, liabilities, income, and expenses. You might list your house and car as assets, loan payments as liabilities, your salary as income, and rent as an expense.

If you own stocks, you may list them as assets, but unlike other checkbook programs I've seen, Electric Checkbook has no way to calculate a stock's current value. You must multiply the number of shares by the stock's current price and enter the result.

Once you set up your finances, you enter information about check payments and other transactions. This process is more complicated than using your checkbook because you must use one procedure for entering checks and another for entering deposits, withdrawals, and other transactions. Both procedures complicate entering checks and transactions by forcing you to complete unnecessary steps. These difficulties were evident when I tried to enter a number of checks.

You enter a check by typing the payee and amount in a blank check displayed on the screen (see "Electric Checkbook"). You then post the check in an expense category by clicking the box marked "Category Code." Expense categories scroll slowly by until you find the relevant category, which you click to post the check. One check can be posted to as many as five expense categories, but after posting to each category, the list disappears, so you have to recall it to continue entering data.

Furthermore, when I realized I wanted to add a new expense category while posting a check, I had to close the checking window, add the new category, and go back to entering checks. Sometimes Electric Checkbook requires more memory than a 128K Macintosh has available to handle multiple windows. It's my belief that a program designed for personal use should not require the additional memory of a 512K Mac to be fully functional.

Most people write checks of varying amounts to the same payees month after month. Many checkbook programs allow you to enter a list of payees and the associated expense categories, but Electric Checkbook does not. Finally, once a check has been written to disk, no way is available to correct it, you have to recall the check, delete it, and reenter it.

Let's get right to the point: the computer for the rest of us can bring out the best in us. All it takes is your Mac, your imagination, and Macworld as your guide. And, of course, the tip of your finger. Experts have called the Macintosh the only "whole-brain" computer. So here's a chance for you to use your entire cerebral creativity with push-button ease.

With more than $20,000 being awarded to winners of the Macworld Art Contest for your Macintosh graphics published in this magazine, you could profit considerably from your subscription to Macworld.

Which brings us to the next point. Right now, unleash your fingertips and remove the postpaid card facing this page. Complete. Mail. Compute! Let your fingers do the talking.
Macware Reviews

Electric Checkbook

Electric Checkbook's design assumes you use the program to write most of your personal checks. You write checks by filling out a blank reproduction of a check on the screen.

Too Much Typing

Entering transactions other than checks, such as deposits, interest, and withdrawals, is more complicated than it should be. You have to designate the type of transaction—once by clicking the category and a second time by typing the same information in the box marked "Posting Reference." Most people don't need this feature, and having to enter the same information twice only means extra work.

All transactions must have a date. Since the program assumes that it is writing your checks, it also assumes that today's date is the transaction date or that you post your finances each day. In reality, most people using the program have to delete the default date and enter a new one.

While error checking prevents you from posting an invalid date such as August 32, it doesn't prevent you from entering invalid transactions. I told the program that I was posting a deposit of $80 to my checking account. I then categorized it as a royalty payment of $8754.87. Electric Checkbook accepted it without a whimper.

No easy way exists of posting an entire month's credit card transactions. The people at State of the Art told me they had not taken credit cards into account when they wrote the program. They came up with a solution that is patchwork at best; the program limits credit card transactions to five or fewer a month.

On a positive note, the program allows you to enter your bills and see the effects of various payment schedules on your finances. Without additional work, you can print out your net worth and how much money you have spent and received in the current year. The reports are well laid out and easy to follow. The program comes with pull-down help screens and sample accounts to teach you how to handle financial information.

Electric Checkbook was written to help average consumers make better sense of their finances; unfortunately, the program is poorly thought out. An illogically arranged manual doesn't help matters. If you want the Mac to write all your checks, you might find that this convenience outweighs the program's negatives. If you're like the rest of us and write most checks by hand, you're probably better off keeping your financial records in a shoebox until a better program is available.—Saul D. Feldman

The Galactic Commando Rides Again

You are a Galactic Commando deep in enemy territory. Power-hungry leaders of the repressive Bungeling Empire have stolen a fortune in gold from the people by means of excessive fast food taxes. Your task? To infiltrate each of 150 different treasury rooms, evade the deadly Bungeling guards, and recover every chest of Bungeling booty.
MAC users, your moment has arrived! Now you can get JUKI®-quality printing directly from your MAC! All you need is your MAC, your JUKI 6100* or 6300* printer, a connector cable . . . and our new JUKI LetterPrint™ software kit!

JUKI practically invented low-cost, letter-quality daisywheel printers. Link up your MAC with the economical JUKI 6100 or 6300 printer to create crisply printed documents that look as if they came from an expensive electronic typewriter. Reports that must be letter-perfect. Resumes. Legal briefs. Business letters. Announcements. Presentations.

It's all easy with the new JUKI LetterPrint software kit, complete with fast, easy instructions—just $75.00! (If you also need a connector cable, total cost is $95.00.) Available from your local JUKI dealer or direct from JUKI.

*If you haven't yet selected a letter-quality printer for your MAC, check out the JUKI 6100 (under $600, zips along at 18 cps—and handles all the most-needed word-processing functions such as bar graphs, superscript, subscript, underscoring, boldface, etc.) and the JUKI 6300 (under $995, a full 40 cps, with all the above features, plus spreadsheet capacity and more!)

Macware Reviews

To computer game cognoscenti, Broderbund’s *Lode Runner* has long been the standard against which all arcade-style computer games are judged. Named Best Overall Computer Software (Arcade Style) by *Billboard*, Apple Game of the Year by *Video Game Update*, and Most Popular Apple Program by *Softalk*, *Lode Runner* walked away with major software awards in 1983. Since then it has garnered devotees from all over the world.

**Bricks and Booty**

The game is conceptually simple but, like chess, can be extremely challenging. The protagonist, the Galactic Commando, has to maneuver around a chamber containing ladders, brick catwalks, and overhead bars and collect the Bungelings’ misbegotten wealth with nothing to assist him but superior speed and a laser drill. The drill, it should be noted, is not so much a weapon as a tool; it can do nothing but blast holes in the brick walkways. These holes, however, can momentarily trap Bungelings, who are usually in hot pursuit, allowing the Commando to run over their heads to safety. Some of the booty is stashed beneath layers of bricks, requiring strategic digging by the Commando to avoid getting trapped in his own excavations. If the Commando is skillful enough to retrieve all the gold in a chamber, a ladder appears, reaching the top of the screen. Climbing this ladder brings him to the next chamber and a whole new set of challenges.

For those who wish to create their own treasure chambers, program author Doug Smith has included a Game Editor, providing the true aficionado with the ability to place ladders, bricks, bars, Bungelings, and other elements of the game around an empty screen to custom-design games (see “Building a Chamber”). Many fans who did just that sent their efforts to Broderbund, which responded by culling the best, adding a few of its own, and releasing *Championship Lode Runner*, which consists of 50 diabolically difficult levels.

**Pointer Problems**

Broderbund’s *Lode Runner* for the Macintosh raises the obvious question: How well does this popular game work on the Mac? Frankly, if I were director of product design at Broderbund, I would send this one back for some fine-tuning. First, although the mouse is not as effective as a
The Home Accountant and the Macintosh.
All you need to:

Master your personal finances

- Sure, The Home Accountant will keep your records and write your checks. Now discover how easy it is to take full control of your finances. Find out what you're worth, where your money goes, and how to put some away for tomorrow—all with The Home Accountant and Financial Planner.

Plan your financial future.

- The Home Accountant will show you what you can afford to pay for a new home. Or how to plan your kids' educational costs. It will even tell you when you'll be able to retire and how much money you'll need. Once you start using The Home Accountant, you'll wonder how you ever got along without it.

Organize your small business.

- The Home Accountant is so well-designed that many people find it suitable for small business or professional use. It's the only program of its kind that produces custom reports and graphs to help quickly spot important trends and relationships.

Lode Runner’s Game Editor lets you add bricks, booty, Bungelings, and other game elements to your own treasure chambers with a click of the mouse.

joystick for Commando control, that limitation in itself should not present a problem to a Lode Runner expert. The main drawback is the way the mouse works with the software—what used to be a struggle strictly between the Commando and the Bungelings guards is now also a battle between you and the pointer.

One problem is that the pointer, which is visible all the time, monitors mouse rather than Commando movement. Because Commando movement is not completely tied to mouse movement—for instance, stopping the mouse doesn’t stop the Commando—who cares where the mouse is? In addition, not only does the pointer block your view of the action to some extent, but it also limits the Commando’s movement. If the pointer is at the top edge of the screen, for example, the Commando cannot move any higher unless the pointer is brought back down. But moving the pointer back down also moves the Commando back down, which could spell disaster if a Bungeling is nearby. The manual’s admonition to keep the pointer near the center of the screen is hard to follow; if your Commando climbs up several ladders one after the other, you often find the pointer bumping the top of the screen.

Furthermore, even the Mac’s otherwise useful ability to reposition windows offers no advantage during a skirmish with the Bungelings. When the pointer is at the top of the screen, you may inadvertently shift the game window if you click the mouse to halt the Commando. The dedicated Commando has no need to move the game window during a skirmish; neither does he have any need for pull-down menus under the same circumstances. But again, when that pointer is at the top of the screen, a click can cause menus to appear—a rather pointless (as it were) exercise. The only functions you need during the game are Pause, Quit, and Abort Man if your Commando gets stuck inextricably. As it is, you are presented with all kinds of functions, from clearing the score window to changing from mouse to keyboard control.

In short, Lode Runner’s user interface could be improved. For starters, I would eliminate the pointer altogether and tie the Commando’s movements more directly to the mouse, in real time. The Commando would move only when the mouse is moved and stop only when the mouse did. In addition, I would disable the pull-down menus and the window-moving function during play, so as not to distract the Commando from his all-important mission.

On the positive side, the Game Editor is easily superior to the Apple II version, since the game elements can be manipulated by clicking and dragging rather than through the keyboard. Even so, once you have designed your own scenes and it’s time to play, you’re confronted with the same interface problems.—Nicholas Lavriff

Broderbund Software
17 Paul Dr.
San Rafael, CA 94903
415/479-1170
List price: $39.95
STATVIEW. The most advanced statistics software ever developed for any micro. StatView is comparable to other powerful statistics programs costing hundreds of dollars more. It is the first interactive statistics package for the Mac, taking full advantage of Mac's windows, pull-down menus and mouse. Simultaneous viewing of data and analyses makes it invaluable for economists, scientists, students, teachers, market analysts, accountants, and other professionals. If you work with numbers, StatView is the program to use. Bundled with Dr. Vicki Sharp's popular college textbook, Statistics, $199.95. Demo disk available for $10.00.

CHIPWITS. Teaches you to think logically—like a programmer! Chipwits teaches you programming logic, while you send human-like robots on dangerous missions. No programming knowledge is required; you use illustrated icons to teach the robots. Chipwits offers challenge and adventure, while teaching you problem solving and logical thinking. For all ages. $49.95

THINK FAST. The exciting new way to improve your memory. Think Fast tells you if you're right-brained or left-brained, and improves recognition and recall power for both verbal and graphic information. Race the clock and keep score as you perform various memory tasks. Automatically increases in difficulty as your memory improves. For all ages. Also for Apple// users. $39.95

Then get InMotion™!

If you loved MacPaint,™ were pleased with Chart,™ or marveled at FileVision™...

You’re going to be moved by InMotion. InMotion, from Ann Arbor Softworks, puts your Mac Graphics on the Move." And when your graphics are on the move, you and your audience will be moved ... moved to watch, moved to buy, moved to stand up and cheer!

MacPaint was fine, but sat quietly in a scrapbook. InMotion puts those pictures in motion. InMotion is your ticket to the exciting world of motion pictures—Macintosh™ motion pictures.

InMotion will unleash your creativity. If you enjoyed expressing yourself in MacPaint, you’ll discover a new dimension of your creative personality when you put graphics on the move. And if you think of yourself as a skinny Alfred Hitchcock (or Stephen Spielberg or Walt Disney), you’re going to love InMotion; with it you can produce everything from a cartoon to the next Macintosh film epic to the hottest music video.

InMotion will make your presentations presentable. Effective presentations must do a lot more than list the facts. A presenter must first capture a demanding audiences’ attention. Tough to do on paper or even with slides. But with InMotion the facts will leap into action. Figures will pirouette across the screen. Words will rock ‘n’ scroll. Charts will blossom. And your graphics on the move will make your audience shout for an encore.

InMotion is easy.
Like the best Macintosh products, InMotion is simple to use. If you know how to use the Macintosh desktop, then you are already familiar with the InMotion desktop. Instead of disk icons, we give you movie icons. And instead of file folders, you’ll have acts. All this makes it incredibly easy to organize your motion picture. In fact, it is so easy to produce your work, you’ll probably never open the manual, but don’t tell our writers that.

InMotion is complete.
InMotion comes with TotalPaint, a completely integrated drawing environment. TotalPaint includes the Floating Palette, a complete collection of MacPaint and click-art tools (familiar ones like Fat Bits and Lasso, plus rotate, skew, distort, and more). And since today no motion picture can be considered complete without sound, we’ve included background music and sound effects, too. In fact, everything is included for a blockbuster motion picture ... except the popcorn!

So, whether you’re the director of a movie or the Director of Marketing, InMotion will put your pictures and ideas in motion. And that may just earn you your next raise, your next sale, or ... who knows? You may even win a Macademy Award!

To order or find out more about InMotion, call or write Ann Arbor Softworks, Inc., 3081/2 S. State Street, Ann Arbor, MI 48104, 313-996-3838.

Look for booth 335 at MacWorld Expo in Boston, August 21-23.
Open Window offers tips to help you use your Macintosh more efficiently. Submitted by readers, industry experts, and the Macworld staff, items in this department address all facets of Mac work, from applications to programming routines to capabilities of the Mac and software not covered in documentation.

This month’s tips include a method of vertically centering text in MacWrite, a procedure for replacing the microswitch in the mouse, and a MacPaint tip for drawing small, intricate patterns and borders. Also we have an undocumented feature of Microsoft BASIC’s MENU statement, an undocumented method of deleting text in MacWrite, and the discovery of a $3.99 joystick extension cord that makes an ideal extension cord for any of the Mac’s DB-9 connectors. Finally, we put the performance-enhanced update of Microsoft BASIC version 2.1 through a benchmark program, comparing both the decimal and binary versions to their predecessors and to Apple’s Macintosh BASIC.

MacWrite Vertical Centering
MacWrite doesn’t have an option to vertically center a single-page letter or memo. I use the following technique to create equal top and bottom margins.

- Remove blank lines from the top of the document until the first line of text appears directly under the ruler.
- Scroll to the end of the document and press Return to add blank lines until a page break occurs, represented by a dotted line.
- Move the pointer halfway between the last line of text and the page break, then press the mouse button and drag down to the page break, selecting half the number of blank lines.
- Cut the selected blank lines by choosing Cut on the Edit menu.
- Scroll to the top of the document, click the pointer at the beginning of the first line, and choose Paste on the Edit menu.

Ron Yust
Joplin, Missouri

Making the Switch
Recently my mouse died while I was writing an important report. Needless to say, when the mouse dies, so does the Macintosh; you can’t do much on the Mac without it. I took the mouse apart and checked the miniature switch inside. Sure enough, the 0.1-amp, 250-volt Cherry microswitch was defective. Since my Mac’s warranty had expired, I desoldered the two wires leading to the switch in hopes of installing a new one.

To my surprise, the local Apple dealer told me that in order to get a new switch, I had to purchase the cable soldered to it—a $28 proposition. If I let the dealer repair the mouse, it would cost $28 plus labor.

None of the local electronics distributors had the switch, so I checked Radio Shack, where I found a switch that works perfectly and costs a mere $1.19. With its higher current rating, the Radio Shack switch is electrically superior to the original one. The switch is a subminiature SPDT (single-pole double-throw) lever switch, rated for 5 amps at 250 volts. Its catalog number is 275-016.

To install the switch, first remove the lever attached to it using a pair of needle-nose pliers. Then remove the two screws holding the mouse together, desolder the old switch, and solder in the new one.

Joey Memory
Knoxville, Tennessee

A good tip, but do remember the rules of solid soldering: use a low-wattage soldering pencil (25 to 30 watts), attach the wires firmly for a strong mechanical connection before soldering, heat the connection, and let it, not the soldering iron, melt the solder. Use solder sparingly; you want a shiny, clean solder joint, not a crusty ball of lead. Most importantly, use a 60-40 rosin-core solder, not acid-core, which is for soldering house pipes and gutters. If you doubt your skills in man-to-mouse resuscitation, get help from someone who knows how to solder. Or pay the $28. —Ed.

MacPaint Mirror Designs
Here’s an easy way to make small, intricate designs and borders with MacPaint. First choose Brush Shape on the Goodies menu and click the single-dot brush, then choose Brush Mirrors and click on all four mirrors. Move the paint brush pointer to the center of the drawing window and drag it in a small, circular motion.
No question about it, you can get a reliable “big name” 10 megabyte hard disk for your Apple II+ or IIe. Trouble is, you’re likely to spend a small fortune for it. Because you’re not just paying for the subsystem. You’re also footing the bill for some hefty distribution costs, retail overhead…and the dealer’s profit margin.

Happily, you now have an alternative: the 10 megabyte Sider from First Class Peripherals. This rugged, dependable hard disk offers the speed, convenience and storage capacity to meet your computing needs. But more importantly, it’s sold direct to you for only $695—complete.

State-of-the-art technology at a state-of-the-art price
The Sider features field-proven Winchester disk technology. Direct booting without floppies. Self-contained power supply. And compatibility with all the most popular Apple software.

What’s more, the Sider is plug and play. You get everything you need for quick, easy installation: cables, host adapter card, software and manual.

Built to last by Xebec
There’s good reason for the Sider’s top performance and outstanding reliability. It’s designed and built exclusively for First Class Peripherals by Xebec, the industry’s leading manufacturer of disk drives and controllers…and supplier to giants like IBM, Texas Instruments and HP.

Full guarantee, free Tech Hot-line
Our reassuring, money-back guarantee lets you order the Sider with confidence. Simply use it for 15 days. Then if you’re not 100% satisfied, return it for a full refund. Keep the Sider and enjoy a full one-year limited warranty…plus access to our toll-free technical/service hotline.

Get your Sider—Only $695
Enjoy the quality and performance of a $1000 hard disk—and save over $300—when you order the Sider. Simply use the coupon below. Or for faster service, order by telephone using VISA, MasterCard or American Express. Call toll-free:

MacPaint Designs
To create intricate, snowflake-like patterns in MacPaint, use the single-dot brush with brush mirrors, and draw small circles near the center of the drawing window.

The mirrored image that results is an intricate design. Lasso the design and drag it while holding down the Option key to duplicate and link the designs to make a border [see "MacPaint Designs"]. You may want to experiment with patterns and mirror combinations.

Alan Hughes
Orlando, Florida

Unlocking MacWrite's Enter Key
The Enter key is often thought of as a special Return key and is most frequently used to respond to dialog box queries. I've discovered that in MacWrite the Enter key serves two more purposes.

If you hold down the Enter key while selecting text, the text is deleted as soon as you release the mouse button, eliminating the need to use the Backspace key to clear the text. The instant deletion works with double-clicks and Shift-clicks as well. To remove a word, for example, hold down Enter and double-click on the word.

The Enter key's other hidden function lets you find the insertion point in a lengthy document. Say you've finished reading a long document and want to return to the insertion point to continue typ-
Introducing the Most Powerful Business Software Ever!

FOR YOUR IBM • APPLE • MAC • TRS-80 • KAYPRO • COMMODORE • MSDOS OR CP/M COMPUTER

OVER 100,000 SOLD

The VERSA BUSINESS™ Series

Each VERSA BUSINESS module can be purchased and used independently, or can be linked in any combination to form a complete, coordinated business system.

VERSARECEIVABLES™ $99.95
VERSARECEIVABLES™ is a complete menu-driven accounts receivable, invoicing, and monthly statement-generating system. It keeps track of all information related to who owes you or your company money, and can provide automatic billing for past due accounts. VERSARECEIVABLES™ prints all necessary statements, invoices, and summary reports and can be linked with VERSALENDER II™ and VERSAINVENTORY™.

VERSAPAYABLES™ $99.95
VERSAPAYABLES™ is designed to keep track of current and aged payables, keeping you in touch with all information regarding how much money your company owes, and to whom. VERSAPAYABLES™ maintains a complete record on each vendor, prints checks, checks registers, invoices, and summary reports, and more. With VERSAPAYABLES™ you can even let your computer automatically select which vendors are to be paid.

VERSAPAYROLL™ $99.95
VERSAPAYROLL™ is a powerful and sophisticated, but easy to use payroll system that keeps track of all government-required payroll information. Complete employee records are maintained, and all necessary payroll calculations are performed automatically, with totals displayed on-screen for operator approval. A payroll can be run totally, automatically, or the operator can intervene to prevent a check from being printed or to alter information on it. If desired, totals may be printed to the VERSALENDER II™ system.

VERSAINVENTORY™ $99.95
VERSAINVENTORY™ is a complete inventory control system that gives you instant access to data on any item. VERSAINVENTORY™ keeps track of all information related to what items are on stock, in stock, out of stock, on backorder, etc.; stores sales and pricing data, alerts you when an item falls below a preset reorder point, and allows you to enter and print invoices directly or to link with the VERSARECEIVABLES™ system. VERSAINVENTORY™ prints all desired inventory listings, reports of items below reorder point, inventory value reports, period and year-to-date sales reports, price lists, inventory checklists, etc.

VERSALENDER II™ $149.95
VERSALENDER II™ is a complete accounting system that grows as your business grows. VERSALENDER II™ can be used as a simple personal checkbook register, expanded to a small business or bookkeeping system or developed into a large corporate general ledger system without any additional software.

VERSALENDER II™ gives you almost unlimited storage capacity (300 to 10,000 entries per month, depending on the system), stores all check and general ledger information forever, prints check stubs, check registers, and checks, handles multiple checkbooks and general ledgers, prints 17 customized accounting reports including check registers, balance sheets, income statements, transaction reports, account listings, etc.

VERSALENDER II™ comes with a professionally-written 160 page manual designed for first-time users. The VERSALENDER II™ manual will help you become quickly familiar with VERSALENDER II™, using complete sample data files supplied on diskette and more than 50 pages of sample printouts.

SATISFACTION GUARANTEED!

Every VERSA BUSINESS™ module is guaranteed to superperform all other competitive systems, and at a fraction of their cost. If you are not satisfied with any VERSA BUSINESS™ module, you may return it within 30 days for a refund. Manuals for any VERSA BUSINESS™ module may be purchased for $25 each, credited toward a later purchase of that module. All CPM- and CP/M-based Computers must be equipped with Microsoft BASIC (M-BASIC or BASIC-80).

A powerful tool for data analysis and forecasting

- Very easy to use, even for novices. No commands to memorize, full Mac user interface
- Speed is a crucial issue in statistics: STATFAST is a professionally designed superfast stand-alone application (it completes in seconds what takes BASIC or Pascal programs 20 minutes or more)
- Unlimited size of data files!
- Descriptive Statistics, t-tests (independent and dependent samples), Correlations, Cross-Tabulation, Frequency, Various Non-parametric Statistics, Analysis of Variance/Covariance (4-way, Repeated Measures, Unbalanced Designs), Multiple Regression (up to 25 predictors), Significance Tests, and much more
- User defined (multiple) conditional selection of sub-sets of cases, various ways of treating missing data
- Two flexible Data Editor, easy entering/editing, copying, pasting of data, complex (conditional) transformations, and more
- Can also access files created by spreadsheets (e.g. Multiplan), data bases, and from mainframes
- Superb graphics (Bar charts, Scatterplots), clear comprehensive output, can be "past-ed" into MacWrite documents
- Clear, comprehensive manual, with step by step examples
- Requires 128k or 512k Macintosh®

To order send check or money order for $99 (includes shipping and handling) to:
STATSOFT 2631 East 10th Street, Suite 3, Tulsa, OK 74104. (918) 583-4149

Open Window

ing. Instead of scrolling around in search of the cursor, simply press the Enter key, and the document scrolls to the insertion point.

David Snyder
Rochester, New Hampshire

After reading this tip, I was curious to see if Microsoft Word has similar shortcuts. Here’s what I found: if you bold down the Option key while dragging, the blinking insertion point moves along with the I-beam cursor. You can quickly delete a word using this technique. Hold down the Option key and drag to the word you want to delete. Then, while still holding down Option, press Backspace. Then release everything— the mouse button and the two keys. The word will be selected and then deleted.—Ed.

Battle of the Basics

Microsoft recently previewed version 2.1 of its BASIC. The new version functions identically to version 2.0, except its performance has been improved. To see just how much it’s improved, we ran a prime-number-generating program on both the binary (B) and decimal (D) versions of Microsoft BASIC (MBASIC) and on a pre-release version of Apple’s Macintosh BASIC. Macintosh BASIC ran the program in 353 seconds. MBASIC 2.0B ran it in 1019 seconds, while 2.0D turned in a 1038-second time. MBASIC 2.1B cut its predecessor’s time almost in half, taking 661 seconds, while 2.1D completed the test in 665 seconds.

On the Menu

I’ve found an undocumented feature of Microsoft BASIC 2.0. Using a hyphen as a menu title produces a line of dots across the menu [see “MBASIC Menu”]. Such a line is often used in Mac applications to separate groups of commands.

Edward Rozema
Harrison, Tennessee

Since the dotted line in a menu is for visual separation only, remember to use zero as the state argument in the MENU! command. The zero disables a menu item, making it dimmed and impossible to choose. You don’t want the dotted line to look as if it were a legitimate command when you drag across it.—Ed.

MBASIC Menu

To produce a line of dots between menu items, use a hyphen as a menu title. Remember to use zero as a state argument (the third argument in a MENU statement) to prevent the line of dots from being chosen as a command.
We’ll Mac your day, all right. With MacTablet™, the peripheral that turns your Macintosh™ into a real graphics workstation.

Let’s get one thing straight. MacTablet is not one of those kiddie pads. It’s a serious digitizer. Like the ones we’ve designed for professional six-figure graphics systems since 1972.

We’re Summagraphics. And when we showed up at Comdex last fall with MacTablet, people went ape. Like we’d invented fire. You see, MacTablet makes your Mac do what you always wanted it to do. Gorgeous graphics. And a bunch of other stuff. Face it, a mouse is fine for pointing, but drawing with one is like painting with a bar of soap. With MacTablet though, you have fingertip control, and 500 lines per inch resolution, to make your artwork a work of art.

OK... by now you’re wondering “What Mac programs will it work with?” Good question. You’ll like the answer even better. All of them. Just install MacTablet as a desk accessory, and you’re in business.

If you’re ready to stop mousing around with your graphics, go to your MacDealer and ask for MacTablet. Some will have it in stock or on order. So much the better. But if your dealer doesn’t carry MacTablet, we encourage you to request/demand/beg that he/she do so at once. Tell ’em to Mac your day so you can get what you deserve. A really good pad on the Mac.

Summagraphics Corporation,
777 State Street Extension,
P.O. Box 781, Fairfield,

MacCAD, MacDraft, MacDrafter, CompServCo & the CompServCo logo are trademarks licensed to CompServCo. Apple & Matthew are trademarks licensed to Apple Computer, Inc.
Apple's Macintosh BASIC won the race primarily because it compiles a BASIC program into a compact intermediate code and then interprets that code when you run the program. Both versions of MBASIC, in contrast, simply interpret the original code, a more time-consuming process.

The benchmark test that we ran measures only a language's array-handling and integer arithmetic performance. It does not test other important areas of language performance, such as disk and screen access or string manipulation. If you've done any tests in these areas, we'd like to see your results and your test programs. Keep in mind that the versions of MBASIC 2.1 and Macintosh BASIC we used were pre-release versions. The performance of the final versions may differ slightly.—Ed.

Cheap Extension Cables

I've discovered that Radio Shack's Jovystick Extension Cord (catalog number 276-1978) makes a perfect and cheap extension cord for use with the Macintosh's DB-9 connectors. I've used the cord successfully with the mouse, printer, and modem ports. You can also cut one end to make a custom cable for connecting the Mac to other devices. The joystick cable is color-coded, making it easy to determine which wires go to which pins. The pin and color arrangement is as follows:

<table>
<thead>
<tr>
<th>Macintosh DB-9 Pins</th>
<th>Joystick Wire Color</th>
</tr>
</thead>

</tbody>
</table>

I used this cable to connect Anchor Automation's $69 Volksmodem to the Mac, as described in your March column [see "Volksmodem Goes Mac," Open Window, Macworld, March 1985]. Cut the cable near the female connector (the one with sockets) and connect the brown wire to pin 1 of...
Introducing QuickDisk™

The software that makes your Macintosh™ 10 times faster.

Sometimes the world's easiest computer isn't always as fast as it could be.

But now there's QuickDisk. The RAM disk software that makes your Macintosh 512K or XL run up to ten times faster than ever before. How fast is fast? How about MacPaint™ ready to go in only three seconds. Or saving a complete MacWrite™ document in only one second!

QuickDisk works by making a selectable portion of the Macintosh's memory look and act like a super fast, silent disk drive. In fact, with QuickDisk you may not even need a second disk drive. But if you already have one, QuickDisk becomes your new third disk drive.

Easy to Use

QuickDisk has many easy-to-use features including:

• Easy installation onto any disk • Selectable sizes from 50K all the way up to 350K • Automatic file copy • Eject of the startup disk • And complete user's manual.

And best of all, QuickDisk costs only $34.00. So see your dealer or call us toll free to order.

1-800-624-2485
In Arizona 602-224-5944

And see how fast you can be.
Macworld instantly! Have immediate access to all your recent issues by storing them in these handsome and durable Jesse Jones magazine file boxes. Each file holds up to 14 issues and is bound in rich blue leatherette and embossed in gold leaf lettering. They’re rugged, compact, convenient — a perfect way to keep every Macworld in top condition and always at your fingertips!

**Guarantee:** Complete refund if not totally satisfied!

Please send me the following:

- □ 1/ $6.95
- □ 3/ $20.00
- □ 6/ $36.00

Allow four to six weeks for shipment.

Enclosed is my check or money order for $__________.

Please make checks payable to Jesse Jones Box Corporation, Dept. MAC-W, P.O. Box 5120, Philadelphia, PA 19141.

### Introducing The Macintosh Office support group...

at some very supportive prices!

Supplying software for The Macintosh Office is our business and our business exclusively. That's why we stock only the finest programs from the nation's leading manufacturers at the lowest prices possible. All programs listed are fully guaranteed both by us and the manufacturer. A four dollar shipping charge will be added to the purchase price but there will be no charge for Master Card, Visa, or American Express. A 6% Sales Tax will be added to California residents only and all deliveries will be made within 10 days after placing your order. So if you're looking for quality and price, with some of today's top software programs, just give us a call. We're FLASHWARE and we'd like to hear from you. 1-800-547-0900

RGS "FILE+" makes data on your Macintosh easier to manipulate!
"FILE+" presents you with options to add, delete, or modify data; to combine it, intersect it, select from it, and more! This user-friendly software package is menu-driven and offers you new, exciting ways to approach your database. "FILE+" is a flexible, necessary addition to your software library. Contact your local computer dealer for "FILE+" today. See your computer dealer about Rio Grande Software’s complete line of software packages. Illustrated literature and information are available upon request.

Watch for RGS "File& Report"—data base management system and RGS "Wright+"—word processor at your dealer.

Open Window

Perhaps you’ve come up with a nifty routine, gained some insight into how the Mac or an application program works, or even written a short program that performs a useful function or creates an interesting diversion. Tell us about it, and we’ll pass your discovery along. We’ll also pay $25 to $100 for each Open Window item published. Please send your Macintosh discoveries on disk (which we will return) along with a brief hard copy description to Open Window, Macworld, 555 De Haro St., San Francisco, CA 94107, or electronically to CompuServe 70370,702 or The Source BCW440.

Jim Heid is a Contributing Editor of Macworld.
You already own the ultimate computer

Operate it like a genius with...

CONSULTANT™

helps you use your whole brain to think and work more productively.

...a new concept software program for the Apple® Macintosh™ 128 or 512.

YOU ARE NOT ALONE. Your CONSULTANT™ is always ready to stimulate and supplement your own magnificent mind. CONSULTANT™ helps: detectives solve mysteries, scientists discover principles, engineers create products, generals plan strategies, salespeople develop proposals, executives make decisions, managers supervise, auditors generate reports, lawyers persuade juries, doctors diagnose symptoms, teachers grade exams, writers develop concepts, missionaries make converts, homemakers plan their day and students learn to think. CONSULTANT™ is for any knowledge worker who must solve problems, plan projects, develop expert systems, get results, report their progress and continually grow in their profession.

Mac Inker

Extremely simple operation, with built-in electric motor. We support the Imagewriter®, along with over 750 other types of printers - cartridge, spool, harmonica, or zip pack type. Most MAC INKER(s) cost less than $60.00. The Imagewriter type (our mod#234) is $59.95 (add $3.00 for UPS shipping anywhere in the U.S.).

Use your MAC INKER to re-ink your dry Imagewriter cartridges (for less than 5 cents in ink) and watch the improvement in print-out quality. Our residue-less, lubricated, dot-matrix ink yields a darker print than most new ribbons. Or get any of our 6 basic ink cartridges. Load the cartridge on your Imagewriter and the CHICAGO SUN-TIMES and the YORK TIMES.

We've been reviewed, approved and flattered in most magazines and even in the NEW YORK TIMES.

MAC INKER has been reviewed, approved and flattered in most magazines and even in the NEW YORK TIMES.

Mac Inker

Most MAC INKER(s) cost less than $59.95 (add $3.00 for UPS shipping anywhere in the US).

Macworld 185
Introducing **idd's MacDraft™**

The Ultimate Drawing Package for the Macintosh™

MacDraft™ is the most powerful object oriented drawing tool available for the Macintosh™ today. Its ease of use, combined with its powerful capabilities, allows even the most casual user to produce professional looking drawings. The versatility of MacDraft™ makes it ideal for the beginner, as well as the professional.

Although MacDraft™ is powerful enough to create cabled drawings, schematic diagrams, organizational charts and business illustrations, it is also ideally suited for creating general sketches, greeting cards, and almost any other picture that you might want to draw.

**Features**

- Continuous drawing mode.
- 16 Different scales.
- Zoom in and Zoom Out.
- Automatic dimension lines.
- Circles by radius or diameter.
- Arcs by radius or 3-points.
- Distribute objects along a line.
- Rotate objects in 1 degree increments.
- Create objects by inside or outside diameter.
- 4 Separate documents on the screen at the same time.
- Paste illustrations to and from other documents.
- Paste pictures from MacPaint™.
- 64 Patterns for Fill & Ink.
- Flip objects.

MacDraft™ offers 16 different scales to suit your needs.

Objects created at one scale, can be pasted into a drawing at a different scale. The objects will reduce or enlarge to conform to the new scale. You may also change the scale of the entire drawing.

The Zoom functions allow you to see either a reduced or enlarged view of the drawing. Regardless of the view, you still have full access to all of the drawing capabilities of MacDraft™.

**ZOOM OUT:** to see your entire drawing, and also add large objects that may stretch beyond a normal view.

**ZOOM IN:** to add fine details to your drawing that may not be convenient to create at a normal view.

**MacDraft allows rotation of objects in one degree increments.**

MacDraft features auto dimensioning so that the size of an object can be displayed on the drawing.

**Draw your own conclusions, with MacDraft™.**

For more information, see your dealer or call us today.

Macworld Gallery

An exhibition of Macintosh graphics

Edited by Erfert Nielson

In addition to the three Macworld Art Contest winners, this month's Gallery features a special exhibit of drawings done by children 5 years of age and younger.

To enter the Macworld Art Contest, send a paper copy of your drawing and a description of how you created it to Macworld Gallery, 555 De Haro St., San Francisco, CA 94107. The first-place winner receives $500 and a Summographics MacTablet; two runners-up receive $250 each. Prize-winning drawings become the property of Apple Computer.

$500—First Prize

Crow

This drawing represents an effort to draw in a spontaneous way with the Mac. I began with a wide black brush and later used white brushes. I made quick, freehand brush strokes rather than laboring over details. After I made a sketch, I printed a copy to serve as a guide to the placement of lines and patterns. Then I copied and dragged sections of the drawing, moving as quickly and freely as I did when I made the brush strokes.

PC NETWORK

...WITH THESE 15 UNIQUE BENEFITS

1. COST + 8% PRICING — The PC Network purchases millions of dollars in merchandise each month. You benefit in receiving the lowest price available and all at just 8% above published dealer wholesale prices.

2. BUSINESS SOFTWARE RENTAL LIBRARY — Members receive the 600 page wholesale catalog containing over 20,000 software products for the IBM PC, Apple and over 50 other popular computer companies. The PC Network's catalog is the most complete single catalog of personal computer products available today. New updates quarterly.

3. MONEY INSURED FAST HOME DELIVERY — The PC Network maintains a giant million-dollar inventory of most popular products, allowing us to ship many orders from stock. Non-stock items are typically maintained in local warehouses just days away from The PC Network. We pay all insurance expenses on your shipment. EMERGENCY OVERNIGHT SERVICE IS AVAILABLE ON REQUEST.

4. 10 DAY RETURN POLICY — If you are not satisfied, for any reason, with any hardware or software component purchased from The Network within 10 days of receipt, we will refund your entire purchase (less shipping) with no questions asked.

5. MEMBER SATISFACTION GUARANTEE — For any reason, if not satisfied with your membership within 30 days, we will refund your dues in full.

6. EXPERIENCED CONSULTANTS — The Network hires consultants, not order takers, to advise you in product selection. Our consultants are independent information technology professionals with years of personal computer product experience. We back our consultants with our money back guarantee: IF ANY PRODUCT RECOMMENDED AS FAILED TO PERFORM AS PROMISED, WE WILL TAKE IT BACK AT OUR EXPENSE FOR A 100% REFUND.

7. FREE TECHNICAL SUPPORT — The Network supports new dealers and products. Our Qualified Technical Support staff will help you assemble your system, interpret vendor documentation and get your software and hardware to work! WE WILL HELP YOU WITH ANY TECHNICAL ISSUE FREE!

8. OPTIONAL BUSINESS RENTAL LIBRARY — All members can join our BUSINESS RENTAL LIBRARY featuring over 1000 titles for just $25 PER YEAR above the base membership fee. This database of software is available at just 20% of the discount price for a 14 DAY PERIOD. If you decide to keep the software, the rental fee is deducted from the purchase price. VIP MEMBERS GET A FULL 30 DAYS for just $30 above the V.I.P. base fee. This also includes the game library privileges for a $5 combination savings.

9. OPTIONAL GAME SOFTWARE RENTAL LIBRARY — The Game Rental library is available to members for just 1 PER YEAR and permits evaluation (or just enjoyment) of any game that you want to rent. This library is available at 20% of the discount price for a 14 DAY PERIOD.

10. SPECIAL SAVINGS BULLETINS — The Printout is issued Quarterly at no charge to Network members only. The Printout contains all the New Product listings and prize changes you need to know about so you can take advantage of them.

11. DISCOUNT BOOK LIBRARY — Working with numerous publishers and distributors, The Network has assembled a library of over 1000 related books and manuals at savings of 40 to 75% from the normal store price. The Network mails the discount book library to all members free of charge, which you can use to fill in any gaps in your library.

12. MEMBERSHIP REFERRAL BONUS — Our most valuable source of new members is you! To date almost 40% of our members have been referred by word of mouth from other satisfied members. For any member who refers a new member, The Network will credit a cash bonus to your account applicable to any future purchase.

13. CORPORATE ACCOUNT PROGRAM — Almost 50% of all PC Network memberships are purchased by business and government entities. "The Network" has assembled a program for those who refer multiple business and government entities. "The Network" will credit a cash bonus to your account applicable to any future purchase.

14. QUANTITY DISCOUNTS — For large corporations, businesses, clubs or repeat or quantity buyers The Network can extend additional single order discounts, when available to us from our manufacturers.

15. PRICE PROTECTION — The PC Industry is crazy!! Prices change not yearly or monthly but every day by 10% to 20%!! The Network maintains an atmosphere whereby the network of member refers to a discount price. WE PAY ALL INSURANCE EXPENSES ON YOUR ORDER.

$250—Second Prize

Montage
This drawing started out as a doodle in which the outline of one small shape fit into another, as in a jigsaw puzzle. The drawing grew until it finally filled an entire page. I used a thick brush to outline areas and the paint bucket to fill them in. I frequently went into FatBits to work on details.
Sam Schofield
London, England

$250—Second Prize

North Country
This drawing is of a northeastern country landscape in late fall. I used the spray can with a variety of patterns, altering the patterns slightly so they wouldn't appear too uniform. I drew the trees, the fence, and the background with a number of different brush tips.
Paul Comer
Milpitas, California
Children's Gallery

The drawings exhibited here are the efforts of children aged two through five turned loose on their parents' Macs. MacPaint features such as Brush Mirrors, the paint bucket, and stretchable geometric shapes give young children a degree of control not available to them with traditional drawing tools. Children in this age group generally find the mouse easier to hold than a crayon or a pencil and are able to create amazingly sophisticated compositions. Many of the parents who sent their kids' creations to Macworld Gallery were unable to provide the obligatory description of how the drawing was created because they weren't in the room when it happened. I consider this a tribute to MacPaint's ease of use.

Circle 175 on reader service card

IEEE 488 Bus Control for your Macintosh

Interface your Macintosh to over 4000 different IEEE 488 instruments with the Mac488A controller.

The Mac488A provides full IEEE 488 bus capability, including controller, talker, and listener functions. Commands received from the Macintosh serial port are converted by the Mac488A into IEEE bus protocol.

• Connects directly to the Macintosh serial port at up to 57k baud.
• High-level commands make programming simple with any language -- ENTER, OUTPUT, REMOTE, CLEAR, TRIGGER...
• Advanced capabilities include Pass Control, Receive Control, Secondary Addressing, Serial Poll, and Parallel Poll.
• MACRO buffer stores commands for later execution.

Circle 73 on reader service card
**VersaTerm™**

The First Text and Graphics Communications • Terminal Emulation Program for the Macintosh™

If you use CompuServe™ or manipulate text on a host computer or generate complex mainframe graphics, VersaTerm is the communications program of choice.

**Terminal Emulation**
- DEC VT100
- Tektronix 4014
- Data General D2000

**File Transfer**
- TEXT
- MacTerm™ XModem
- Text XModem Protocol
- MacBinary XModem
- Text Kermit Protocol

VersaTerm-HP™ and TekPrint™

VersaTerm-HP has the same features of VersaTerm shown above except the VT100 emulation is replaced with the Hewlett Packard 2521 emulation.

- Features:
  - HP 2624 Line Drawing Graphic Characters
  - HP 2623 Tektronix Vector Graphics
  - Use with HP1000/3000 screen editors.
  - ENQACK or XON/XOFF handshake

TekPrint is a new application that allows you to Zoom, Rotate and Print high resolution Tektronix 4014 graphics on your ImageWriter or LaserWriter. Generate Pen Plotter quality output with your ImageWriter! Use VersaTerm to preview and create TekPrint documents.

**List Price**
- VersaTerm $99
- VersaTerm-HP $99
- TekPrint $79

POWER HUNGRY?

Sure you are. Admit it. It doesn’t take long to discover that the 128K Apple Macintosh™ is grossly underpowered, a 512K Mac is only adequate, and the more memory the better.

Centa Systems can upgrade your Mac’s RAM in 512K increments up to a maximum of 2Mb while maintaining full system compatibility. This is a true memory expansion, not just a large RAM disk. You’ll be able to do more of everything, faster. The possibilities are endless.

So why settle for 512K? Call or write Centa Systems today for full details on how you can satisfy the lust for power. (Prices start at $350.00. Dealer inquiries welcome.)

The influential Seybold Report on Professional
Computing has this to say about Lionheart
"our sentimental favorite because of its prag-
matic approach to the basic statistical con-
cepts... The thinking is that the computer
merely facilitates the calculations; the impor-
tant thing is to be able to formulate a problem
correctly and to determine what type of analy-
sis will be most valuable."

CIRCLE 109 ON READER SERVICE CARD
Macworld Directory

The Macworld Directory is a comprehensive listing, by category, of products and services available for the Apple Macintosh. It provides advertisers with a low-cost advertising alternative and our readers with an easy reference guide.

FORMAT: The standard format includes a product ID, a 300-character descriptive ad, and a company name, address, and telephone number.

Advertisers may choose among categories already in use, or they may create their own. Display advertisers can cross-reference their current ad to the Macworld Directory for increased exposure.

RATES: Listings are accepted for a three-time consecutive insertion at a rate of $6.27. We offer a six-time insertion at $10.68 that reflects a 15% frequency discount. Listings must be prepaid (except for established display advertisers) upon submission of ad copy. Checks, money orders, Visa, and MasterCard are accepted.

DEADLINE: For copy deadlines and further information please contact Niki Stranz, your Macworld Directory Account Manager, at 415/861-3861 or 800/872-7800 (800/872-7808 in California). Please send copy and prepayment to the Macworld Directory, 555 De Haro St., San Francisco, CA 94107.

Accessories

○ Cables

Mac Custom Cables
The Mac-Modem cables mate with the Hayes (RS232) 1200 and compatible modems and match Mac's original molded cable style and color. $3.00 additional for C.O.D. shipments

MacLink
...the "intelligent" link between your Macintosh and the IBM PC

MacLink allows you to translate spreadsheet and word-processing files between the Macintosh and the IBM PC...easily and quickly.

Now you can translate spreadsheets between Lotus on the PC and Multiplan on the Mac...including formulas, column formats, and functions.

And MacLink allows you to transfer any other type of file between the two machines as well...including binary, comma-delimited, DIF, SYLK, and text files.

MacLink's integrated communications and unique translators work via modems or with an optional PC to Mac cable.

The cost is just $125: This includes the MacLink manual, and a MacLink disk for both the PC and the Mac.

DataViz, Inc.—16 Winfield Street—Norwalk, CT 06855
(203) 866-4944

Macworld Directory

StatWorks
A powerful statistics package with graphics designed for a wide variety of applications on the Macintosh: Regression analysis, descriptive stats, ANOVA, nonparametric tests, and more. Use data from different sources including other Macintosh applications and mainframes via MacTerminal. SI25.

Knowledge Integration Toolkit MacKITT Level 1 brings Knowledge Engineering technology to the rest of us. IF/THEN/DO rule language, certainty factors, back-chaining inference engine will display line of reasoning and show MacPaint documents. Intro. price thru 9/30/85 $75 + $3 s/h. Pa. res. add 6%. MC/Visa.

Knowledge System Environments Inc., P.O. Box 261, Dept. M, Grafton, MA 01737, 717/766-4496

○ Utilities

COPY II MAC
COPY II MAC is the backup insurance you need to protect your software investment! COPY II MAC makes a backup of most protected software quickly & easily, recovers data from damaged disks, and undeletes files. For 128K or 512K Mac, 1 or 2 drives. Also available for IBM, Apple II, Compaq 25, $39.95 + $3 s/h ($8 overseas). Visa/MC/Check.

Central Point Software, 9700 SW Capitol Hwy #100, Portland, OR 97219, 503/244-5782

GRIDS™ Tools for MacPaint
Know where the window is! 2 disks of utility templates for MacPaint for producing professional-looking drawings and charts. A collection of various grids, scales, rulers, promoters, and charts with instruction manual. Use it once and wonder how you did without it! $40 ppd. To order or request information:

Soft Wares Inc., 19 Monroe Dr., Williamsville, NY 14221, U.S.
800/848-5500, NY 800/447-5500, Ext. 50

Typesetting

MacTypeNet
Professional typesetting services for the Macintosh. Send your text and/or graphics via disk or modem for outputting on LineType™ laser typesetter at 2450 lines per inch resolution or on the Apple LaserWriter at 300 lines per inch. 24-hour turnaround in most cases. Write or call for user information.

Lasergraphics, P.O. Box 52188, Licotora, MI 48152, 313/937-9512

The Product Index is published as a service to our advertisers and may be discontinued at the publisher's discretion. Every reasonable effort is made to categorize advertisers correctly. If a listing should be changed, please write us at Macworld, 555 De Haro Street, San Francisco, CA 94107, so that we have the opportunity to change it.

Contact your dealer or GTCO Corporation for more details.
MacLabeler

Organize your software library with custom labels.

MacLabeler™ reads the document, application and folder names off your diskette and prints them out on a wrap-around label. If there are more names than will fit on a label, MacLabeler lets you select the ones you want by just pointing and clicking with the mouse.

MacLabeler doesn't require special labels to work. Use any paper, cut out with scissors, and attach with regular glue stick. Or use pressure-sensitive label sheets if you desire. Pressure-sensitive label material included.

MacLabeler will also display, sort, and print a complete directory of your diskette. Push in your diskette and see the contents immediately. Search diskettes fast!

System Requirements: 128k or 512k Apple Macintosh™ and Imagewriter printer.

$49.95 + $3.00 shipping & handling. Iowa residents add 4% sales tax. Visa and MasterCard accepted.

Ask your dealer or order from:
IDEAFORM INC.
P.O. Box 1540
Fairfield, IA 52556
515 472-7256

Macintosh is a trademark licensed to Apple Computer, Inc.

Circle 208 on reader service card

$39.95 A Dream Come True!

Our programs are:
- Designed from scratch for the Mac: use the full potential of the mouse, windows, and menu-bars; provide the features you'd otherwise pay hundreds of dollars for.
- They're stand-alone applications; they don't require BASIC or any other computer language.
- What's more none of our programs are copy protected. You can make back-ups to your heart's content. However, we'd prefer that you not make copies for all your friends — after all, at our price, your friends can afford to buy their own.

It's easy to get more information on products advertised in Macworld. Here's how:
- Print or type your name and address in the spaces provided, and answer the questions that apply to you or your company. (These questions help us to better meet your needs and the needs of our advertisers.)
- Circle the number(s) on the card that corresponds to the reader service number(s) for the product(s) in which you're interested. For your convenience, the reader service number appears in the ad and in the Advertiser Index.
- Detach the card from the magazine, fold, seal with tape (please do not staple), apply first-class postage, and mail. Literature on the products you're interested in will be mailed to you directly from the manufacturer, free of charge.

1. Your primary job function:
   - (A) Corporate or general management
   - (B) Department manager
   - (C) MIS manager
   - (D) Professional
   - (E) Other

2. Number of employees in your company:
   - (1) 25 or less
   - (2) 26-99
   - (3) 100-499

3. Information requested for:
   - (A) Business applications
   - (B) Home applications

4. Reason for inquiring:
   - (1) Plan to buy—next 3 months
   - (2) Plan to buy—4-6 months
   - (3) Plan to buy—7-12 months
   - (4) Plan to buy—beyond 12 months
   - (5) Reference only

5. For how many personal computers do you buy products?
   - (A) 1
   - (B) 2-4
   - (C) 5-9
   - (D) 10 or more

6. How many of the above are Macintosh(es)?
   - (1) 1
   - (2) 2-4
   - (3) 5-9
   - (4) 10 or more

7. How much do you plan to spend in the next 12 months for peripherals and other add-ons for the Macintosh(es)?
   - Less than $250
   - $250-$499
   - $500-$999
   - $1000 or more

8. How much do you plan to spend in the next 12 months on software for the Macintosh(es)?
   - Less than $250
   - $250-$499
   - $500-$999
   - $1000 or more

Complete this card, fold, seal with tape (please do not staple), apply postage, and mail.
Manufacturers will mail you literature directly, free of charge.

NEC printers are incredibly reliable.

In fact, with normal use, an NEC printer can run an average of 5 years before it needs a repair. And chances are, that repair will take only about 15 minutes.

To become that reliable, an NEC printer has to go through some of the most demanding tests in the industry.

First, we test every single part before it goes into the printer. Then we test the printer itself. Nothing is forgotten. Nothing is left to chance.

But reliability is only part of the story. There's much more. Our printers work with every popular PC. With more leading software programs. And with more forms handlers to make paperwork a snap.

So no matter what your printing needs—and no matter what size your budget—NEC has a printer for you. Our full line of Spinwriter® printers, for low to high speed letter quality printing. And our versatile Pinwriter™ and Color Pinwriter printers, for high resolution dot matrix printing.

To find out more about NEC printers, call 1-800-343-4418 (in Mass. 617-264-8635).
Or write: NEC Information Systems, Department 1610, 1414 Massachusetts Ave., Boxborough, MA 01719.

NEC PRINTERS. THEY ONLY STOP WHEN YOU WANT THEM TO.
How to get the Max out of your MAC

With Tecmar’s MacDrive™ and new version 2.0 software, your Macintosh can work up to 4 times faster, store up to 38 times more information.

Certainly the Macintosh is a terrific business tool. Simple. Versatile. Functional. But without a MacDrive hard disk mass storage system, your Macintosh simply isn’t working up to its maximum potential.

The MacDrive will never keep you waiting
With a MacDrive, the Macintosh data storage and retrieval functions are accelerated as much as 4 times. You’ll load programs faster, save files more quickly. And our unique print spooling feature allows you to continue working even while your printer is running — which means you’ll always be functioning at maximum efficiency.

MacDrive backs you up all the way
Your data storage capacity is limited only by the size of the drive you choose. And, regardless of the size of any given file, you can back it up onto floppy disks. MacDrive will even tell you when it’s time to put in a fresh floppy.

With MacDrive’s new software you can divide and conquer
Thanks to a special partitioning feature, MacDrive software lets you divide the MacDrive into separate, manageable sized volumes. For example, our 10 megabyte hard disk system can be broken up into 20 partitions. So you can set up separate categories for your correspondence, presentations, reports, spreadsheets, games and so on. This smaller-scale organization also means your Macintosh will be able to retrieve the files you want more efficiently.

You’ll be up and running in minutes
MacDrive includes all the cables and software you’ll need to have the system operating in less than 10 minutes. Just plug in two cords and you’re on your way. More good news: MacDrive uses your printer port and comes with its own port for a printer — leaving the modem port free for other important applications.

You’ve got four great choices
MacDrive is available in four flexible configurations:
* 10 megabyte fixed hard disk
* 5 megabyte removable hard disk
* 10 megabyte fixed hard disk plus 5 megabyte removable disk
* Two 5 megabyte removable disks

If you'd like to see a Macintosh working to the max, stop in at your nearest Tecmar dealer for a MacDrive demonstration. To find out who that dealer is, call Tecmar at 216/349-1009.
