Four-Color Separations for Desktop Publishers

CAD Benchmark: PC versus Mac

Mac II Compatibility—What Works, What Doesn't?

1987 Directory of 1000 Products
Nothing gets the jobs done

Some people never know where their next job's coming from. That's why there's Microsoft® Works, the winner of five major awards—including Macworld's 1987 and MacUser's 1986 Integrated Product of the Year awards.

Microsoft Works is a one-disk software program that gracefully integrates:

Word processing, for writing memos, reports, presentations.

A database tool with reporting, to keep track of clients, jobs, vendors.

A spreadsheet with charting, to compute, analyze, interpret, and then graph anything to do with finance or numbers.

Finally, a communications tool which lets you get stock quotes, make travel reservations, do research, and send reports across the country, right over the phone lines.

Microsoft Works is seamlessly melded together. You can have all four tools on screen at once. Jump instantly...
from one to another. And later combine work done in each part of the program on a single printed page.

This easy exchange of data makes jobs go faster and much, much easier. (Like form letters where you need to combine names from the database with a memo written in the word processor.)

Learning Microsoft Works is a snap. It starts with a painless, step-by-step, computer-based training program. Before you know it, you know it.

All in all, Microsoft Works is a superb solution for day to day, get-it-done problems—an inspiring display of convenience, efficiency, and utility.

And of course, it's a product of Microsoft, the preeminent developer of programs for the Macintosh.

If you're in a business that won't let you stick to one thing, check out Microsoft Works—the program that can change jobs as fast as you do.

Microsoft Works.
For everyone.

"Dad and I have a lot of great times together...UpTimes"

"My family is pretty cool. We go fishing, we go to the science museum and we go for UpTime, because it's fun. "UpTime comes in the mail every month. I like the games. Dad likes the games, but he says he gets it for the business stuff. My sister thinks she's a genius so she gets into all the educational parts. "Mom laughs a lot. She says it makes her happy to see us happy. Mothers go for that kind of stuff. "Dad always brings his briefcase home from the office. But, you know the nights when UpTime comes, he never opens it up."

Circle 537 on reader service card
The hottest sport on a court — the hottest game a Macintosh™ can handle.

Even if you've never been on a racquetball court, you'll spark to the excitement of this challenging simulation.

MacRacquetball turns your Macintosh screen into a full perspective 3-D display of court, players and ball. With the mouse, you have complete control of player position, ball placement, ball speed and shots. Two people can play the same game over AppleTalk® or modem.

Superb graphics give MacRacquetball completely convincing realism. There are more than 1000 frames of ultra high speed digitized animation. It's one racquetball court that's always open when you're ready to play.

Enthusiastic players everywhere have made MacGolf the best selling Macintosh game ever.

MacGolf puts you in the picture, a full perspective 3-D simulation of realistic golf action. You match your skills against fairways, roughs, bunkers, water hazards, sand traps and trees.

MacGolf gives you a player's eye view of the course, in any direction, and an aerial overview of each hole. You have complete control of your position, ball placement, ball speed and direction, and selection of all 14 clubs. Digitized graphics and sounds add to the excitement.

MacGolf is so close to the real thing it will improve your golf game. And by the time you've reached the eighteenth hole you'll know you've been in a real contest.

When you have the best selling Macintosh game in the world, what do you do for an encore?

Here's new turf for adventurous MacGolfers. These are courses to conquer for mouse wielding pros who have taken the measure of the original MacGolf courses.

If you liked MacGolf, you'll love what MacCourses brings to the screen. Four new 18 hole, par 72 courses: Cedar Creek, Golden Sands, Thunder Ridge and PCAI International. The fairways, traps, hazards, and putting greens of MacCourses are in a whole new league.

If you thought MacGolf was good training for the outdoor game, MacCourses should turn you into a pro. Get MacCourses now, use it when you're ready — you never know when you'll need the challenge.
Now check ours.

THINK Technologies proudly presents InBox™, winner of the MacUser Editors' Choice Award for 1986 as the best new desktop communications package. The InBox family of products can be used on AppleTalk™ and NetBIOS LANs to transfer spreadsheet, word processing, database, graphics, publishing and other files from Mac to Mac, Mac to PC, PC to Mac and PC to PC. You can also create, send and receive memos and phone messages. All while running other applications. Plus, new Version 2.0 supports multiple message centers for larger networks and no longer requires a dedicated Mac. Now you can share information, communicate more and meet less. For more information or the name of the dealer nearest you, call 1-617-863-5595. Or write to us at the address below.

You've heard about them. You've read about them. By now, you've probably even seen them.

Our latest leaps in technology, the new Macintosh™ SE and Macintosh II personal computers, have been getting their share of press.

But to add to what you may already know, we'd like to tell you more about their most powerful feature: expandability.

It's something we made possible by adding expansion slots. So you can easily customize your Macintosh to meet the demands of any business.

You can, for example, set up a system that's perfect for major-league number crunching. Or add features to give you even greater power for Apple Desktop Publishing, like displays as big as 21 inches.

The SE sports one expansion slot. While the Macintosh II takes the idea of expansion to the extreme—with six 32-bit NuBus slots. Which have the good sense to configure themselves, and require you to do nothing more than plug in the options of your choice.

Such as an 80286 co-processor card that lets you run programs written for MS-DOS computers. And a video card that produces near-photographic images.
own Macintosh.

from a palette of over 16 million colors.

The new Macintosh computers are
built to be customized in other ways, too.
You can set up your SE with up
to four megabytes of memory, so it has
the power to run the most sophisticated
programs. And configure the II with up
to eight megabytes of memory on the
main board, or a wallowing 1.5 gigabytes
using the expansion slots.

As for storage, there’s plenty. With
either computer, you get the option of an
internal hard disk, or an external one that
can store up to 80 megabytes.

You can also choose between two
keyboards. One of which has 15 function
keys that come in handy when delving
into special applications.

And as you might expect, we’ve
done more than just give you a very good
way to build the Macintosh of your dreams.

We’ve also arranged to make sure
you have the perfect workshop: an author-
ized Apple dealer.

Where you can get some expert
assistance choosing your options.

So all you have to do is stop
in. And get to work.

The power to be your best.
HE'S GOT THREE QUESTIONS.
YOU'VE GOT TWO ANSWERS.
YOU NEED MORE.

Next time, get your act together.
With Living Videotext's MORE, you can organize your presentation, anticipate every objection. And win.
So call 1-800-822-3700. In California, 1-800-443-4310.
And before you know it, you'll be the one asking all the questions.
It's the Future, and It's Free

- If you launch the program on the free Mac disk from General Motors' Buick Division, you'll see a cross section of a motor "run" right on your Mac's screen—at a speed usually reserved for movies.

This animated advertisement, for which General Motors has received over 60,000 orders, also features a moving suspension and a rotating supercharger. Other portions of the interactive program, which is called a Soft Ad, respond to your choices by suggesting which Buick model will best meet your needs.

Soft Ads have been jointly developed by SoftAd and Beck-Tech, which also markets an animation program called MacMovies that lets Macintosh users create "movies" using MacDraw, Easy3D, and MacPaint. (Images can also be created using a video camera or VCR.) The frames can be sequenced, resequenced, played back, and strung together to make longer movies.

Until recently, this "desktop television" technology was available only on systems costing $100,000 or more. But the Macintosh—especially the Mac II—will be used extensively for such applications as preparing video programs and commercials.

Is there a future for Soft Ads or desktop television? See for yourself by ordering the free Buick Dimension disk. Call 800/87-BUICK between 8 a.m. and 5 p.m., EST.

Printer Magic

- Orange Micro is offering a $99 printer cable, called the Grappler, that it says will connect the Macintosh to almost any parallel printer—without a change in software. This means many well-known printers, such as Epson, Okidata, and Panasonic, can emulate an Apple ImageWriter II (including color printing on many printer models).

The Grappler converts Mac serial output into the parallel input of many dot matrix printers, using circuitry contained in an enlarged connector head that plugs into the printer. The cable also works with the Apple IIC or IIGS, and it comes with a one-year warranty.

Backup, the Easy Way

- Most of us tend to have an unjustified faith in the invincibility of electronic equipment, despite the fact that just about every Macintosh user has experienced some kind of hardware or software indiscretion. When the machine on your desk fails and all those files on your hard disk become inaccessible, what's the next step? Reliable tape drives and automatic network backup utilities sound like just the ticket. But though they're in sight, they're probably not going to be available for a while. In the meantime? Why, (groan) it's back to backing up on floppies.

Without the help of some kind of utility, managing regular backup with measly 800K floppy disks becomes a monumental task when you're talking about 20- to 300MB hard disks. Fortunately, there's a program called DiskFit 1.3 from SuperMac Software that performs documents-only and incremental backups. Back up your System Folder and applications using the normal Mac copy function, and then use DiskFit to back up your documents on a daily or weekly basis. It's a back-up strategy that's easy to manage. DiskFit 1.3 is available from SuperMac for $74.95; a network version costs $395.

PC Experience Pays Off

- Tecmar is taking advantage of its expertise as a leader in tape backup systems for the MS-DOS world. It has released the QT-Mac40 40MB tape backup, which relies on the QIC-100 recording standard for high-level error correction.

Tecmar's new Apple Products Division has a series of other products under development, including an expansion chassis for the SE and the Mac II. This external box will provide extra slots and thus the ability to install additional floppy drives, hard disks, and tape backup systems. Tecmar plans to supply graphics and multifunction boards for the new machines, as well as boards dedicated to scientific data acquisition and industrial control and monitoring. Tecmar expects Mac IIs to be used in growing numbers in the latter two areas.

Common Problems

- BMUG (Berkeley Macintosh User Group) members call the group's hotline several hundred times a week. Volunteer consultants find that 80 to 90 percent of the calls touch on the same 20 or so questions.

Right now they're getting calls from Macintosh SE owners who find their computer isn't working correctly after they've copied a number of disks to their internal hard drive. Many of those disks contain uninstalled Systems and Finders that can unexpectedly take over from the startup System. The solution is to go into a disk that's going to be copied to the internal hard disk and select only documents that don't contain a System or Finder.

BMUG also urges its callers to attempt to solve their file problems with a shareware program called FileFixer, which corrects many HFS difficulties. A copy of FileFixer can be found on many bulletin boards and in user group libraries.

Protecting Your Files

- Over half the Macintoshes now sold are used in situations where files are sensitive or confidential. Protecting Mac documents can be difficult, since a file can often be downloaded from a computer or network in just seconds.

To solve this problem, SuperMac's Sentinel program
quickly encrypts files using an algorithm that makes deciphering very difficult, if not impossible. Even if a document goes astray, the scrambling makes it virtually useless.

*Sentinel* encrypts files individually in sets. One password locks or unlocks the files. Locked files appear as locked icons on the desktop. For more information, call SuperMac in Mountain View, California, at 415/964-8884.

**Goodbye, Mac 512KE**

Apple has quietly ceased manufacturing the Macintosh 512KE. Not even a press release marked the passing of the once-heralded enhanced version of the 512K, which was introduced in April 1986.

The decision was prompted by diminished demand, following the introduction of the SE.

Many of the 512KE’s features—such as a 124K operating system, 800K internal drive, and SCSI port—are still included in the 1MB Mac Plus, which now becomes Apple’s entry-level Macintosh computer.

**The Big Apple**

- Look for Macintosh computers to act more and more like minis and mainframes. Their high-end capabilities will come after Apple introduces its UNIX-like operating system, *AUX*, and the upgraded software that will follow.

- One of these potential products is *Sybase*, a high-volume, high-performance relational database that now works on networked workstations from DEC and Sun Microsystems. A Mac version of *Sybase* would allow Macintosh software developers to design databases that run on the kind of extensive distributed networks typically found in large corporations and government agencies.

- The likelihood of such a Mac database was recently heightened by Apple’s minority investment in *Sybase* of Berkeley, California.

**Servant Documentation**

- Although Apple has finally released MultiFinder, many Macintosh enthusiasts may still want to use its precursor. After all, *Servant* requires less memory, allows you to switch instantly from one application to another, performs desktop tasks faster and more conveniently—and it’s free through user groups and bulletin boards.

New documentation about *Servant’s* 56 features is now available from writer Scott Kronick of Berkeley, California. The 92-page manual includes four tutorial chapters and a reference chapter that indexes features by screen shots and by topic.

- Interspersed throughout are comments from *Servant* author Andy Hertzfeld, who talks about how the program works and what makes it fun. For instance, Hertzfeld wrote *Servant* in such a way that any MacPaint or ThunderScan document could become the background for the desktop. More functional features include automatic printing of multiple documents, shrinking or expanding the size of icons, creating custom icons, speaking the names of files, and displaying how memory is utilized.

- To obtain a copy of *Servant*: A New Shell for the Macintosh send a $10 check or money order to Scott Kronick, 1442-A Walnut St. #278, Berkeley, CA 94709.

**PageMaker for User Groups**

- Aldus Corporation offers its *PageMaker* desktop publishing programs and services at reduced rates for qualifying Macintosh user groups.

- Groups can purchase a single copy of *PageMaker 2.0a* for $100 instead of the full $495 retail price. Along with product discounts, qualified user groups can enroll in Aldus’s Extended Technical Support Service, which includes free upgrades and five hours of technical support through a toll-free 800 number. Groups will also receive Aldus’s bimonthly customer newsletter, *The Desktop Publisher*, and quarterly technical journal, *The Aldus File*.

- To qualify your group, send a copy of your newsletter, a letter on the group’s letterhead ordering the Macintosh version of *PageMaker 2.0a*, and a check for $100. Send to: Aldus Customer Relations, 411 First Ave. S #200, Seattle, WA 98104. For more information call 206/628-2320.

**AppleLinking Everyone?**

- Apple dealers and Macintosh user groups have had access to an easy-to-use E-mail and bulletin board system in the form of Apple’s own *AppleLink*, which offers icons and menus just like other Macintosh programs.

- But for the rest of us, life on the phone lines hasn’t been so easy. We’ve often been overhauled by having to remember commands, pick default settings, and go through a whole bunch of other DOS-like incongruities.

- Now we can have simplicity in communications through a new program called *Desktop Express*, which was jointly developed by Dow Jones, Apple Computer, and MCI Mail.

- *Desktop Express* offers icons and pull-down menus, transmission of both text and graphics, offline creation and answering of E-mail, an address book, and integration with the electronic mail functions of MCI Mail (which also offers hard-copy deliveries for people who don’t have computers).

**Trade-ins for Color Monitors**

- Swamped with orders for its new AppleColor high-resolution RGB monitor, Apple has instituted a 90-day “please be patient” program. Owners of Mac II monochrome monitors purchased before October 31, 1987, can exchange them for new color monitors. In order to receive full credit toward the purchase of a color monitor, your monochrome monitor must be turned in to an Apple-authorized dealer between January 1 and March 31, 1988. □
Quadruple The Speed Of Your Macintosh.

The Radius Accelerator™ quadruples the processing speed of every Macintosh application.

If you're doing graphic design or Desktop Publishing, the Accelerator allows you to create and combine pictures and text at unprecedented speeds. We are talking blindingly fast.

For time-intensive processing tasks like spreadsheets, scientific computations or sorting through databases, the Accelerator will redefine your concept of personal productivity.

If you're using a Macintosh™ as a file server, the Accelerator will earn smiles from everyone on your AppleTalk® network.

The Accelerator is powered by the same 32-bit microprocessor that commands the Macintosh II.

In addition, it has a high-speed hardware cache that places frequently used information where it can be retrieved at the full speed of the MC68020.

Although the MC68020 is a commonly used microprocessor, Radius makes it work in an uncommon fashion. Our innovative, proprietary technology translates into a smaller board with fewer power requirements. And that means significantly reduced costs.

Which is one more reason why the Accelerator is such an exceptional value.

For those of you who think numbers speak louder than words, the Accelerator is available with an optional MC68881 coprocessor that blazes through floating point computations at up to 100 times the speed of the Macintosh Plus.

An Authorized Radius Dealer can install an Accelerator board in your Macintosh Plus or SE computer in a matter of minutes.

But wait. Did we really say wait? The Accelerator has another unique feature. The MagicBus™

The MagicBus allows you to expand your Macintosh with another internal expansion board. So you can add future products from Radius or other developers.

Of course, you could use the MagicBus immediately—to install the ultimate Desktop Publishing peripheral. The Radius Full Page Display™ (FPD).

Like the Accelerator, the Full Page Display was designed by several key members of the original Macintosh team.

Today these people are at Radius creating enhancements for the Macintosh that are setting new standards for the industry.

If you really want to get the most out of your Macintosh, see a Radius dealer today.

And save yourself a bundle of time.

Circle 577 on reader service card

We're Helping Deere & Company

The John Deere Dubuque Foundry was the last 'fire-and-brimstone' operation of its kind in the entire John Deere organization. All other foundries have transitioned to new, larger capacity electric melt facilities. The Dubuque Foundry cast all manner of parts for engines, transmissions, hydraulics, control valves and actuator housings, wheels, control levers and pedals, track components and a large variety of replacement parts for John Deere tractors long out of production. The Dubuque Works Foundry was a fascinating and often spectacular place.

Since its beginning in 1846, the Foundry came to represent some of the highest quality and productivity levels attainable in the Deere organization. It kept pace with changing technology and was considered the state of the art in gray-iron casting process. But a changing economy and a company's need to consolidate foundry operations in its larger capacity facilities in Waterloo, Iowa, and Silvis, Illinois, necessitated the closing of the Dubuque Foundry. The Dubuque Foundry wasn't that old, and it wasn't as old as it seemed. As closed, Dubuque's facility was still one of the most productive and cost efficient operations in the chain.

"Come and watch me hand pour molds. We do things here same way the Egyptians did 4,000 years ago."
John Deere's Gary Olsen was in a quandary. As editor of employee communications, he wanted to expand the newsletters and magazines he produced for the people who build John Deere construction equipment at the company's Dubuque and Davenport Works. But he also needed to reduce his publishing expenses.

Then Gary Olsen heard about PageMaker desktop publishing software. Already he's using it to make Tracks magazine, a weekly newsletter, safety updates, business cards, posters—even a four-color book. All for a fraction of the cost of traditional publishing.

But that kind of success should come as no surprise when you consider that more businesses are producing more of their printed materials with PageMaker than with any other desktop publishing software.

So put PageMaker on your staff today. It'll improve your printed work by leaps and bounds.

For a VCR Version of PageMaker, Call 1-800-33-ALDUS.

To see a full demonstration of what PageMaker can do for you, order our 30-minute VHS tape for just $9.95. Or visit your authorized Aldus dealer.
With reviews like these who needs advertising?

They say the best advertising is word of mouth. So we're reprinting some of the multitude of words that have already been said about MicroPhone communications software for the Macintosh.

And what they're saying, universally is that MicroPhone - created by Dennis Brothers - has far outdistanced all its predecessors. That for the novice, MicroPhone is the simplest software ever devised. That for the expert, MicroPhone is the most powerful.

On-line for the lazy.

MicroPhone gives you the means to create infinitely elaborate macro (automated) routines with infinite simplicity. Its powerful script language is written in plain English, and it also features a recording mode that watches, saves, and repeats what you do. So no programming skills are required.

The upshot is that MicroPhone will save you time, hassle, and on-line fees by automating virtually every operation you now have to key by hand. Log on procedures, file transfers, and, for a good example, E-mail retrieval routines.

At a single command from you, MicroPhone will dial your E-mail service, give your ID number and password. Navigate its way through the labyrinth to your mailbox. Check for mail. Log off if there is none. And if there is, MicroPhone will collect, print, and save all messages to your disk. Then, politely log off.

If you prefer, you can direct MicroPhone to initiate this sequence simply by inserting the disk. Or automatically, at any specified time, day, night. Or at regular intervals.

Anything else you need to do, from collecting stock quotes to sending and receiving files, is just as simple.

Try it out at home or office.

You can find out firsthand just what a remarkable program MicroPhone is. Without risking a cent. We give you a thirty-day money-back guarantee, no questions asked. Which is virtually unprecedented in software.

Since MicroPhone is not copy protected, we obviously have vast confidence both in our program. And in you.

Let's get technical.

- 50 to 57,600 baud
- Supports WANG, MACCOMM, MACTERMINAL 11, IX-52
- Emulates VT100, VT52, and other terminal
- Capture line on/off
- Files on/off
- Auto log on scripts for information utilities provided
- Scripts invoked by
- Buttons
- Menus
- Command keys
- Scripts have full logic constructs
- Works with all Macintosh models & LaserWriter
- Works with all ASCII terminals (more included)
- Includes Switcher & CompServe subscription
- Includes True Editor licensed from Dreams of the Phoenix Inc.

MicroPhone Communications Software for the Macintosh

MacUser Editor's Choice Award

2907 Claremont Avenue Suite 220 Berkeley, CA 94705 415-644-3232

Circle 210 on reader service card
The whole notion of hypermedia has been on my mind for a long time. I began to really think about it seriously, though, at Macworld Expo in Boston this past summer. That's when Apple introduced HyperCard, the new software created by Apple Fellow Bill Atkinson and now included with every Macintosh. I was amazed at people's reactions.

HyperCard was greeted variously as "the greatest thing since Mom and apple pie and the Mac," "the most important development since the Macintosh was invented," and "the next step in personal computing." So I feel we owe it to ourselves to give the whole concept of hypermedia its semiannual checkup—a sort of hyperexamination.

Several personal-computer wizards have created different forms of hypermedia over the years. The word hypertext was first coined by visionary Ted Nelson back in 1965, when he was searching for a term to describe nonsequential writing on screen. Mouse inventor Doug Engelbart was also a prophet of the hypertext idea.

A couple of years ago Alan Boyd, president of OWL International in Bellevue, Washington, actually developed a working hypertext product called Guide. We used Guide at PCW Communications to create the world's first hypertext magazine when we did an issue of Macworld on disk early this year.

Another hypertext product in this hypermedia family was created for the IBM PC and the Atari ST around that time. It's called Zoomracks and was produced by Paul Heckel's company, Quickview Systems, in Palo Alto, California.

But none of these efforts seemed to get very far. Now Apple comes along hyping HyperCard for every Mac, and suddenly it's the greatest thing that ever happened to personal computers. People say it out-VisiCalc VisiCalc.

As Ted Nelson likes to say, "The reaction to any new idea is first, 'It isn't true'; then 'It isn't new'; then 'We knew it all the time.'"

So what about HyperCard? In Apple president and CEO John Sculley's words, it's a "new way to organize information." It's not a traditional database with a hierarchical structure. Rather, it allows you to organize text, pictures, and sound by association—by context. The same way we organize information in our minds.

When I first saw it, it seemed wonderful. Just what I always wanted. So why was I also nagged by the thought that HyperCard was for the birds?

It took a conversation with an old friend of mine, Nelson Winkles, to figure it out. Nelson and I go back to Personal Computing magazine, where I was the publisher and he was the editor. He's been a brilliant and iconoclastic commentator on technology for more than 20 years. He pinpointed the fundamental problem with HyperCard by telling me a story that illustrates it perfectly.

Back in 1963, he worked on a project to create a navigating system for satellites. NASA needed a series of landmarks that would be easy for a crew to spot, such as isolated islands, volcanoes, or lakes. Nelson and his project team were trying to find information about an island called Isole Pelado, off the coast of Peru. They had found it on aeronautical charts and needed to know its characteristics.

They needed to find out, for example, if the size of the island changed a lot with the tides, what color the island was, and whether the vegetation changed. Was there a different spectral output in different

Decisions, Decisions,

Choose with confidence from Jasmine's wide range of quality, innovative products at affordable prices. From the pacesetting Direct Drive series, to the unique BackPac 40, you never compromise quality for price when you purchase a Jasmine product. Discover why MacWorld (July 1987) said "It's easy to fall in love with the quiet Jasmine drive."

MegaDrive™

Hard drive power with the freedom of a floppy.

MegaDrive™ is a high speed, SCSI storage device featuring removable, 10 megabyte, MegaFloppy™ diskettes which are much more reliable than other removable, mass storage products. Compact in size, it fits under your Macintosh or into a Macintosh carrying case.

In a word, MegaDrive™ is flexible. It has something for every Macintosh user.

Accountants can put each account on its own disk and lock them away for safe keeping. Desktop publishers can put fonts, clip art, layouts and different clients on separate MegaFloppy disks. Musicians can organize their sound libraries and samplings and the average Macintosh user can finally make heads or tails of the mountains of floppy disks they've acquired over the years!

MegaDrive $999

(MegaFloppy Disk $29.95 each ($41.95 Visa or MC)
MegaFloppy Three-Pack $102.95 ($135.25 Visa or MC)
*Three packs include handy Storage Case.

To Order Call (415) 621-4339

Remember that Jasmine saves you 40% or more.

Our prices include 30 Day Trial/Money Back Guarantee, and Full One Year Warranty.

Every drive is shipped with a technical hotline number to answer any questions. MegaDrive, Direct Drive 20, 40, 50, 80, 100, BackPac 40, Jasmine are trademarks of Jasmine Technologies, Inc. Product specifications and prices are subject to change. Prices include 2 cable and 3.5 floppy. Prices do not include shipping, CA sales tax (8%) or special cash handling. Call for dealer and developer pricing.
Direct Drive™ Series

Hard drives that re-defined value and quality.

From the Direct Drive 20, to the revolutionary Direct Drive 80, Jasmine now offers a full spectrum of drives to meet every user's needs. Our newest addition, the Direct Drive 160, offers an incredible combination of power and speed for just $2899! The Direct Drive series is synonymous with excellent construction, no cost "extras" and high reliability.

"The Jasmine Direct Drive 80 is an excellent value, offering not only outstanding price and performance, but an excellent price against the small disk market as well. InfoWorld highly recommends looking at this drive for your Macintosh."

- InfoWorld
June 29, 1987

"The Drive ran flawlessly during the review period, with very good performance and no compatibility problems of any kind."

- MacWorld
July 1987

BackPac 40™

Portability and Power for the Macintosh Plus

The introduction of the incredible BackPac 40™ has established Jasmine as the leader in innovation as well as value. Weighing less than 3 pounds, BackPac 40 silently integrates 40 megabytes of power into the "upgrade path" Macintosh Plus owners so desperately need. The convenience and portability of an internal hard disk with the reliability and ease of installation of an external SCSI hard disk. BackPac 40.

BackPac 40 $1299
(+$1399 Visa/MasterCard)

JasPort

SCSI Power for the Macintosh 512.

JasPort, a Macintosh Plus compatible SCSI port for the Macintosh 512 Enhanced or 512K with ROM upgrade, permits Macintosh users to utilize Jasmine's Direct Drive, MegaDrive and other SCSI devices. User installable.

JasPort $129

David Bunnell

seasons, and what was the weather like? Nelson couldn’t find out anything. Even the Peruvian consulate couldn’t help.

They finally went to the Department of Systematic Biology at Stanford. The department had just been moved, and its books were all piled up at random, along with lots of stuffed animals. It was an exotic situation, but all of the usual library searching and referencing systems were suspended. Nelson and his team were explaining their dilemma when the librarian said, “Here, try this.”

“It was a book called *Birds of the Americas,*” Nelson said with a smile. “Somehow it had clicked in her mind that we might be able to find something in that book.”

So they rummaged through it and found a passage about Islote Pelado. The author had landed there in 1924, and his crew had had quite a time because the island had cliffs all around it, and there was no beach. Well, that told Nelson the island didn’t change much in size.

The crew had finally climbed onto the chalky-white land, but they were disappointed because there was only about one load of guano from it. It was hardly worth the effort. So Nelson learned the island was guano-colored and that there wasn’t much vegetation.

It turned out everything they needed to know could be figured out from that book. But the interesting thing is that the author thought the book was about birds. The publisher thought it was about birds. The person who did the index thought it was about birds. Nobody in the world thought it was about islands except Nelson and his team. And the only way they happened to make use of it was that a librarian had leafed through the book one day and then thought to show it to them.

The moral of Nelson’s story?

If the person who designs the index thinks the book is about birds, you’ll never find out it’s about islands. Unless you run into the right librarian.

And that is precisely *HyperCard*’s Achilles’ heel. As Nelson concluded, “The basic problem with *HyperCard* is that the classification is determined by the person who does the classifying in the first place—someone who doesn’t know how your mind works. There’s no general solution for this problem, just steps along the way until this stuff is truly content-addressable by anyone.”

Even the most sophisticated desktop publishing system is incomplete without VeloBind.

Don't let your desktop publishing stop at the printer. Complete it with VeloBind, the only binding solution that transforms the promise of desktop publishing into reality. VeloBind provides the crucial finishing touch to desktop publishing by turning any printed material into impressive, authoritative documents. Desktop publishing that increases your document's chances of being noticed, read, and accepted.

Only VeloBind allows you to "publish" your desktop publishing in a library-quality hard cover in under a minute. Or choose from a wide variety of soft cover materials and colors. Even without a cover, desktop publishing bound with VeloBind looks more professional.

All on your desktop. VeloBind binding systems are compact, fast and easy to operate. Binding that complements your desktop publishing and creates a positive reflection on you. So do yourself — and your desktop publishing — justice. Visit your local computer or stationery store today or call us for more information. Or stop by your local copy shop and use their VeloBind system to complete your desktop publishing.

Because, after all, your desktop publishing is just a stack of paper until it's bound. With VeloBind.

David Bunnell

I do think HyperCard is a good step forward because it legitimates the whole concept of hypermedia. I just don't think it's the be-all, end-all package—at least not yet. It's only one manifestation of hypermedia. I think, for example, that Guide should be a tool within HyperCard. So should Zoomracks. Both Guide and Zoomracks can be easier to use when you're working with a huge amount of data. With HyperCard, you're restricted to the size of the screen, or "card," so you have to divide the information into different cards. Zoomracks has card-scrolling capability that lengthens your view to 252 lines.

Furthermore, the reference marks, or "buttons," in Guide are related to the context of the information itself. In HyperCard they relate to the position of the information. So if you move a paragraph in Guide, the button moves with the paragraph. That's how it should be. But in HyperCard, the buttons aren't linked to the text—they're linked to a position on the screen. If you attach a button to a particular word and then go back and edit that line, the button ends up over a different word. That's wrong. The button should be linked to a concept.

On the other hand, HyperCard excites me because it has real potential to become a bona fide hypermedia vehicle. In my opinion, the most important aspect of HyperCard is that it could be the link between personal computers and video.

It could be the much-promised, long-awaited, and passionately predicted product that will finally make the personal computer a genuine communication tool, not just a processor. It could be the window on the worlds of text, video, and sound.

Of course, there will be flak. Just as desktop publishing ushered in a wave of ungainly graphics design, HyperCard will probably unleash wild and reckless hie gangs of programmers who will criss-cross the hyperhighways of personal computing, leaving the potholes and debris of incompatibility in their wake.

But I have faith that we will ultimately find our way. I am confident that one day, for example, we will have compatible hypermedia that will run on the IBM PC or the Macintosh or the Apple II or on any machine of your choice. We all have to push for compatibility because it will make the whole personal computer proposition that much more powerful. That's not too much to expect. After all, we already live in a hypermedia world. □

**ARCADE QUALITY on your Mac**

Enter the Dark Castle at your own risk. Watch out for trap doors, boulders and lightning bolts! Fight off rats and bats, knife-throwing guards, mutants, vultures, flying griffins, magic brooms, the relentless floating eye, dragons and the sadistic torturer! "Frankly, online computing costs were real ugly..."

Most online information networks can zap your computing budget faster than you can say "lightning." Not so with GENIE, the General Electric Network for Information Exchange. As part of the world's largest commercially available teleprocessing network of General Electric Information Services Company, GENIE lets you experiment with all of the fun and excitement that online computing has to offer. 

Evenings, weekends, holidays. Just $5 per hour. 

With GENIE, you can make friends, set up travel reservations, get the news, be entertained, even shop for a fraction of what other information services charge.

And you get a lot for your money. 

With GENIE's Coffee MUG Round-Table® Special Interest Group you can discuss the latest in Macintosh products and accessories; download thousands of public domain software programs; and participate in exciting and informative online conferences. And, UPLOADS ARE FREE on GENIE!

There's more! 

Meet friends old and new with GENIE's LiveWire™ CB Simulator or exchange messages with GENIE's electronic mail service. Schedule a trip with American Airlines travel service. Fun and learning for the whole family with Grolier's electronic encyclopedia. Play classic and multiplayer games. Track stock market quotes, check market indicators and maintain an automatically updated personal portfolio online with GENIE's Financial Services. All this and there's more to come. New services are being added each and every month!

With services and savings like these, now you can discover the friendliness of online computing without the high costs that can turn you into a downright monster. Get a happy ending going with GENIE. Sign up today!

Macintosh is a trademark licensed to Apple Computer, Inc.
If you buy the Macintosh SE™ for its expandability, then at some point you’re going to confront the next logical question: what’s the best way to expand it?
And that will lead you to a conclusion that’s logical to the point of being foregone: HyperCharger 020™
This is the enhancement board that sets standards for the others.
It will let you run most Macintosh software up to four times faster. It can contribute an additional megabyte of RAM memory and may be easily upgraded to four.
It’s equipped with an expansion port that lets you add E-Machines’ The Big Picture™ and other large screen monitors. It will even let you add a coprocessor for serious number-crunching (from 5 to 50 times faster).
All of which makes HyperCharger 020 something more than a sensible addition to your Macintosh SE: it’s the first such add-on you almost have to find a logical reason not to add on.
Of course, we fully expect you to be the judge of that. And you can make that judgment at any authorized General Computer dealer. For the name of one near you, call (800) 634-9737.*
To the thousands of Macintosh™ users who find themselves wishing there was a personal printer that lived up to their personal computer.

Including the executives, entrepreneurs, academics and other professionals looking for an affordable entree into the world of desktop publishing.

General Computer presents the reassuring paradox you see illustrated on these pages: the first affordable laser printer that prints like it costs thousands more.

**INTRODUCING THE PERSONAL LASERPRINTER.**

As the documents shown here demonstrate, the General Computer Personal LaserPrinter™ (PLP™) concedes nothing in printing capability to systems selling for twice its price.

If that still seems hard to believe, consider this. Until now, anyone who bought a laser printer was also buying a computer. Because laser printers have always needed a processor, memory and other expensive hardware to create a printable page.

Our laser printer, on the other hand, eliminates a great deal of this expensive hardware in favor of ingenious software.

Software that allows the printer's imaging to be performed by the computer you already own: the Macintosh. (Either the Macintosh Plus, the Macintosh SE, or the Macintosh II with any hard disk.)

This arrangement also means the PLP is much more compact than other laser printers. (An almost diminutive 16" x 16½" x 9½") And having fewer parts, much less likely to need repairs.

**WHICH WAS PRINTED ON WHICH OUR**

**THE PROOF IS IN THE PRINTING.**

As you can see, a case could easily be made for buying the PLP on economics alone. But that would be selling it short.

Because the ultimate measure of any printer is how well it prints.
**A $5000 LASER PRINTER? FOR $2600?**

Like vastly more expensive laser printers, the PLP allows you to print scanned photographs and illustrations, high-resolution graphics created with software like MacDraw* and Microsoft's* Excel, and otherwise juggle words and pictures until you have them exactly where you want them.

Including a choice of Bitstream* fonts limited only by your hard disk's capacity to store them. (Fonts you can easily adjust to any point size, or fraction thereof)

A preview feature that lets you review each page before you print it.

But the PLP also provides assistance even these vastly more expensive printers don't.

And a draft mode that lets you rapidly print out works-in-progress for editing and revision by others.

Then, once all the revisions are complete, the PLP quietly provides extraordinary finished output.

Near-typeset quality presentations, newsletters, memos and reports produced with software like Microsoft's Word and Aldus' PageMaker.* All printed with a new generation of laser technology that turns out richer contrasts than ever before.

**AN INVITATION TO SKEPTICS.**

In other words, the PLP does for printed communications what the Macintosh did for personal computing.

It provides a sophisticated, yet affordable tool for anyone who needs to manage large amounts of information—and wants to work smarter and more creatively in the process.

So to answer the question we began with: the PLP printed the document that appears on the right. But you don't have to take our word for it.

We invite you to make your own comparisons through a PLP demonstration at any authorized General Computer dealer. Where you'll also be able to compare another pair of documents that are far easier to tell apart:

A Personal LaserPrinter price tag: $2800
And that of any other laser printer of equal quality.

For the name of the dealer nearest you, call (800) 634-9737*

*Steven Jobs was the co-founder of Apple Computer, Inc.

"Can you believe it? Our team got picked for the hottest project of the year because they found out we do all our work on Sony diskettes."

The fast-moving, fast-thinking people in today's competitive corporate world are the people pushing for the highest standards. For example, Sony diskettes.

People in the know know that Sony's standards are the very highest. That, after all, is what made Sony a world leader in audio, video and computer magnetic storage media.

But selecting Sony also shows solid business sense because we invented the revolutionary 3.5" disk drive and 3.5" floppy disk. So we simply have much more experience than anyone else at making and perfecting 3.5" floppy disks.

Think of it this way: when your reputations on the line and you've put your very best into your work, you want to be sure that your floppies are every bit as good as you are.

The way to do that is to make sure they're Sony.

Then you'll be in the very best of company.

Letters
A forum for Macworld readers

Noise Pollution
The Mac SE is too loud; Apple's first attempt at installing a fan in a Mac doesn't make it. I ended up disconnecting my SE's fan and drilling holes in the top of the case where the vents on older Macs are. Now I have SE power and quiet in my home, without overheating problems. It would be a shame if this superior machine's sales are hurt because of a cheap, noisy fan.

Barry Smith
San Francisco, California

Because there is ample evidence that heat damages components enough to shorten their lifespan, we don't recommend reducing the power of the SE fan, even though it does sound like a rattletrap in a quiet home environment. Apple hasn't commented for publication, but we understand the company is looking into quieter cooling systems. -Ed.

The Downfall of Upgrades
Last fall, after years of using an Apple IIe, I bought a Mac Plus. Now, having had my new Mac for only four months, I find it superseded by the SE—with no upgrade path. Is this planned obsolescence? If the people at Apple can't provide a reasonably priced upgrade (for which there is ample historical precedent with Apple machines), they should be willing to redeem the Plus at its original cost, to be put toward the pur- chase of an SE or a Mac II.

Rev. Raymond B. Knudsen II
Westwood, New Jersey

Even if Apple doesn't offer an upgrade path to the SE, some dealers may. So far we've heard of one dealer in Utah who offers a trade-in. Anybody know of dealers who do that?—Ed.

Laser Laments
We Mac users need the type of story you published on third-party laser printers ("Laser Wars," June 1987). Even Apple needs such stories—as motivation to make better products. But your article left holes where information should have been.

In addition to reviewing "four representative LaserWriter alternatives," why not list all available PostScript printers? And product reviews need support reviews too. Tell us about these manufacturers and their reputations. What does Apple have in store—a LaserWriter based on a 16-MHz 68020 processor, or one that can print a full 8½- by 14-inch page?

PostScript printers are proliferating rapidly—at press time there were 21. Here's a list of models announced since the June article, with dots-per-inch for each in parentheses: three models (72 to 300) from Apollo Computer, Compugraphic's CG 400-PS (406), two models from DEC (300), IBM's Personal Pageprinter (300), NEC's SilentWriter LC-890 (300), MPI's Model 908 (300), QMS's PS-2400 (300), and Varityper's VT-600 (600). In addition, Orange Micro has introduced a $99 cable adapter that lets you connect your Mac to one of the lower-cost non-PostScript laser printers. Finally, we all have expectations about new Apple products, but until the company firms up its plans our speculations are just that—not the stuff on which to base buying decisions. —Ed.

File Search
As a Mac user and Macworld subscriber, I have trouble staying abreast of software alternatives. It is difficult to locate individual reviews of competing products when the
Quality and price are inseparable at Warp Nine.

Quality. And price. Not a match made in heaven. It's a match made at Warp Nine.

Just look at these prices. They're about 40% lower than you'd expect because we sell directly to you, eliminating the dealer's mark up. And dedicated as we are to low prices, we're even more dedicated to quality. In fact, we're so convinced of our quality that if after 30 days you don't absolutely love our product, return it for a complete refund.

Our commitment to a well-built machine is further reflected in our Quality and Assurance Report. It details every step of production and is signed by the person responsible for each step. Plus, there's a full one-year warranty available for the asking. And when you buy from us, you get an unlimited toll-free number to our technical support team for any questions you may have—something our competition doesn't offer.

So get your drive from Warp Nine. And you'll get more than you bargained for.

PHOTON 20, 30, 40 AND NEW 80.

$695 $795 $949 $1349

A 21, 31, 41 or 81 MB external SCSI hard drive. Fast, dependable, rock-solid performers. HFS and MFS compatible. Daisy chain up to seven SCSI devices. THE Phaser 800.

$189.00

Whisper-quiet 800K double-sided disk drive. Compatible with 128K, 512K, MacPlus and SE. No hardware or software modifications necessary. Distinguishes 400K and 800K diskettes and will read and write to them accordingly. Features push button and automatic electronic ejection. Cable included. All models. $189.00

MEMORY UPGRADES FOR YOUR 512 AND PLUS.

Simply clip on with no modifications necessary. Fully compatible with all your software.

WarpRam—Upgrade for Mac 512k to 1024k RAM. For 512E with 128k ROM—$179.00. For 512 with 64k ROM—$189.00.

DataRam—2Mb upgrade for MacPlus. $259.00

MonsterRam 2.5—2.5 Mb upgrade for MacPlus. Uses 1 megabit chips and SIMM technology. Compatible with internal hard drives and large screens. Low power consumption. $595.00

MonsterRam 4—4Mb upgrade. Same technology as MonsterRam 2.5. $1190.00
OUR SOFTWARE PRODUCTS.

New! LaserSprint. The best Print Spooler for the LaserWriter. Never have to wait for the printer. Manages all jobs while you work. Observe all work in printing queue. All spool documents protected. Works with PageMaker. Compare at $149.00 Our price $59.95.

PrintSprint. A great Imagewriter spooler. $29.95

$799.00 $1399.00

The Transporter is a stand alone 20Mb tape drive. The 2001 a single unit that combines a 20Mb hard drive/20Mb tape drive. The hard drive in the 2001 delivers all the speed, dependability, and flexibility of our Photon 20. Both tape drives will backup and restore data and applications safely onto cassette tapes. Tape drives feature volume, file-by-file and incremental backup. Can backup daily files in as little as three minutes. Transporter and 2001 prices: For MacPlus: $799.00, $949.00 For 512k*: $1399.00 and $1549.00.

INTRODUCING THE MACINTOSH II 50 AND 80MB INTERNAL HARD DRIVES.

Macintosh II 50 $949.00

Macintosh II 80 $1295.00

Comes with everything you would need to mount into your Mac II in less than five minutes. Includes our 30-day-to-love-it warranty. Uses the quantum drive found in original Mac IIs.

*The Warp Nine PlusPort adapter puts a MacPlus type SCSI port on the back of your Mac 512K. It is included with each 512K price. This adapter allows you to connect our SCSI hard drive and tape back up to your 512K and transfer data at the high speed that the MacPlus does. No modifications. No soldering. Just Clip on. Very simple to install.

INTRODUCING THREE INTERNAL HARD DRIVES FOR THE MAC SE.

If you're planning to get a Mac SE, buy it with dual 800k floppies. Then order one of our 20, 30 or 45Mb internal hard drives and install it in place of one of the 800k drives. This gives you a floppy and a hard drive for hundreds less than you'd pay with Apple. And it's very simple to do.

Just remove the 4 screws that hold the 800k in place and replace it with our drive using the same screw holes. In 30 minutes you're done. Plus we'll send you an easy-to-follow manual and a toll-free technical support number should you have any questions.

What's more, our hard drives come with three features that Apple doesn't offer. Ours have 4 shock mounts to absorb the bumps and grinds of everyday usage. You can easily turn termination on or off if you need to chain hard drives or tape drives. And you can quickly change SCSI address to add another hard drive or tape backup.

P20i (20Mb)–$499.00**
P30i (30Mb)–$649.00**
P45i (45Mb)–$899.00**

**This price includes a rebate of $400 if you return the 800k floppy drive to us in our pre-supplied box. P20i, P30i, and P45i wihout rebate $599.00, $749.00 and $999.00 respectively.

MacCalc

MacCalc is faster than Excel:

"Amazingly speedy...MacCalc runs faster than Excel."  
InfoWorld, November 3, 1986

Blindingly fast.

"Special routines in MacCalc make operations such as entering data and recalculating, opening files, scrolling...faster than Excel."  
Macworld, December 1986

MacCalc is easier to use than Excel:

"[Working] in MacCalc is easier than in Excel."  
Macworld

"Designed to be easy to use, and succeeds admirably."  
MACazine, March 1987

"MacCalc makes such excellent use of the Mac Interface that it is a pleasure to use."  
MacUser, September 1986

MacCalc produces quality output:

"MacCalc offers the greatest flexibility in page and font setup, and has the most printing options."  
MacWorld

"MacCalc functioned flawlessly when asked to display or print any combinations of the fonts or style available. As a result, our spreadsheet output could be used directly in reports."  
InfoWorld

Your best choice:

"The result is a clearly superior performer...It is difficult to rate [MacCalc] anything but excellent."  
InfoWorld

"MacCalc is the spreadsheet of choice for users who want useful functionality without undue complexity."  
MACazine

"The Best Spreadsheet."  
MacUser Editor's Choice Award

Special features:

- On-Line Help
- Full Undo command ("fully implemented Undo allows you to recover gracefully from mistakes")  
MACazine
- Cell notes, for audit trails and self-documenting worksheets.  
"(Don't underestimate the value of this feature." — San Jose Mercury News)
- Read and write WKS models (from Lotus 1-2-3 or Excel) and SYLK data
- Variable row height and column width
- Full choice of format, font, size, and style (à la MacWrite) for any cell ("A real boon...adds to that presentation charm." — San Jose Mercury News)
- Paste formatted tables from MacCalc directly into MacWrite or PageMaker documents
- Database sort, search, and fill commands ("More powerful than Excel".— Macworld)
- Full desk accessory (DA) support and Switcher-compatibility: MacCalc integrates with your favorite charting or macro programs and DAs

It all adds up:

The spreadsheet is the premier productivity tool for preparing, analyzing, and presenting financial and budgetary reports (like cash flows, income statements), and for keeping simple lists (like sales, inventory, or price lists).

Accordingly, the major criteria of your spreadsheet purchase decision should be speed, ease of use, and quality of output.

You can buy a slower, more difficult, over-priced, over-featured product from the competition, or you can buy MacCalc, the best spreadsheet for your real needs, for $139.

For technical, corporate or dealer information, please call 415-841-8552.

Complete formatting for any cell:

To order MacCalc for $139 (plus tax in CA), call 800-345-2888, or write:

**Letters**

When time comes to choose. Can't you find a way to solve this dilemma, such as selling disks that group evaluations of software in a given area?

Francis Marburg
Falls Church, Virginia

We agree. That's why we've assembled a 200-page collection of reviews—updated, of course—for new subscribers, to fill them in on what they have missed. And that's why we emphasize comparative reviews and overview articles. You can also use the index we publish each year in the January issue to compare a class of products that we've reviewed one by one.—Ed.

**Getting Started with Satire**

In March, I wrote a letter mocking your simplistic Getting Started column by placing it (I thought with wild exaggeration) in the "how-to-dust-the-keyboard" category of usefulness. Now, I find that very category is the topic for July 1987! What's next—how to plug your Mac into the wall?

Hal Barwood
San Anselmo, California

**On the Other Hand**

For those of us new to computers and to the Mac in particular, it would be helpful if you would run a short glossary of acronyms commonly used in the industry. It is hard to fully benefit from your magazine when one comes across those names without knowing what they mean.

Mark Spiegler
Van Nuys, California

We published "Getting Started with Mac Acronyms" in January 1987. Watch future issues for an updated resource.—Ed.

**Dust to Dust**

I agree with Jim Heid ["Getting Started with Basic Maintenance," July 1987] that unnecessary cleaning of disk-drive heads can be detrimental, but I've found that dust and other particles can be effectively removed using a portable vacuum cleaner like a Dustbuster. You'd be amazed at how much of the stuff comes out.

Bruce E. Wilson
Lynnwood, Washington

**Across the Blue Atlantic**

I will be moving soon to Köln, West Germany, where I would like to buy a Mac II or

an SE. Can you give me any information on their price and availability there?
Laszlo Szabados
Miami, Florida

Apple Computer says that both the Mac II and the SE are available in Germany. For dealer and price details, contact the Apple representative in Köln at telephone number 22,38-505-76.—Ed.

Music for Pros

As a professional music producer and Mac MIDI consultant, I regret the lack of expertise in your review of Sound Lab [“Sound Choice,” July 1987], which laments that “it requires a good deal of practice” to use. Well, who can master a CAD/CAM package instantly? As for the reviewer’s complaint about price, when studio time costs $250 an hour, Sound Lab can pay for itself in one afternoon. Finally, the music community is firmly committed to the Mac, so for a writer in a Macintosh magazine to recommend using an Apple IIe or a Commodore 64 is unbelievable.
Jeremy Roberts
New York City

While the Mac has certainly emerged as the professional musician’s computer of choice, musicians on a budget will use whatever they can afford—and many of them are still using the Commodore 64. You are right about the savings possible once Sound Lab is mastered, but what about the cost of studio time while you figure out how to run it? Musicians are like everyone else: they want tools that make things easier. If we don’t speak up when we think a program could be simplified, how can we expect developers to labor over their software design?—Ed.

Unnecessary Roughness

Our game NFL Challenge [“Monday Morning Quarterbacking,” July 1987] is not, as stated, for the “novice or casual follower of the game”; people choose it because of its sophistication and realism. NFL Challenge’s coaching strategy, based on game plans like those that teams really use, is more appropriate for a simulation than for making up plays as you go along. We have received calls from consumers who say they are ordering the game in spite of Mac-
Turn your Macintosh™ into a high fidelity musical tool.

Buy a Bose® RoomMate® powered speaker system with your new Macintosh™ and Bose will send you an exciting music software package — FREE.

You never knew your Mac™ could sound so good.

The Macintosh is the professional musician's choice for digital composition.

When you pair your Mac with the Bose RoomMate system, your whole room is filled with natural, accurately reproduced high fidelity sound.

The RoomMate system is ideal for MIDI applications. Have you ever heard the 1812 Overture on a Mac? Try it. We've taken some of the best features from our top-of-the-line audio products - a 4.5" full-range driver, an active equalizer, distortion limiting circuitry - and put them into a self-contained, affordable system. Simply plug the RoomMate system into the earphone jack of your Mac and hear your compositions in a way you could only imagine before.

The system also brings out the best in portable CD players, electronic keyboards and personal stereos. And with the optional mounting arms, you can mount the RoomMate system practically anywhere.

Choose the Special Edition Platinum RoomMate system.

Because looks are as important as sound, we designed a special edition RoomMate system with a platinum cabinet and grilles to match your Mac.

Get a high quality music software package free — up to a $69.95 value.

If you buy a Macintosh II, Plus or SE and Bose RoomMate system before December 19, 1987, we'll send you one of the following music software packages free — your choice.

**Opcode's Music Mouse™** — An Intelligent Instrument

Music Mouse offers a truly innovative, immediately satisfying way of making music. And you don't need to have keyboard skills or knowledge of music notation.

Music Mouse interprets how you move the mouse, creating melody and harmony in ways that you direct. Computer logic assists with harmony, letting your musical sensitivity and imagination express themselves. Advanced musicians can experiment with a variety of improvisation options including harmony, transposition, voicing, counterpoint and more.

We chose Music Mouse for you as an easy-to-use, fun program. But Opcode Systems also has a complete line of professional musicware for the Macintosh — call Opcode at (415) 321-8977 for more information.

Great Wave's ConcertWare™ + Version 4

This greatly enhanced new version of the award-winning ConcertWare + program is designed for fun, work and learning.

With Music Writer, you can enter original or sheet music using the mouse or keyboard. Arrange voices on up to eight different staves, with chords of up to eight notes per voice. Use the Record facility for real time entry to play a voice into the Mac while other voices play along with you.

InstrumentMaker™ lets you design your own incredibly realistic instrumental sounds or modify those on the disk. And with Music Player you can play back your full length selections. You can also print out complete or partial scores.

For more information on Great Wave's music programs for the Macintosh, contact Great Wave at (415) 438-1990.

Act now.

Go to your authorized Apple® dealer and audition the Macintosh paired with the Bose RoomMate system. Or order a RoomMate system just by calling (301) 796-3980. But hurry: The Free Software offer expires December 19, 1987.

Profit from the moves most traders miss.

Profitable Buy/Sell signals with about 80% accuracy.

The Right Time™ computerized trading system was developed by an expert portfolio manager for his own personal use. Over the last seven years of in-market use the software has been perfected and made easy to use. Now it's available for any smart trader who wants to make quick profits from quick decisions.

Not only is The Right Time™ the best decision support system ever devised for traders, it's the only software that analyzes volume/price, support/resistance and global market trends - all at the same time.

Amazingly Precise.

The Right Time™ programs run on IBM (and compatible), Apple II and Macintosh personal computers. The software is easy to use, amazingly precise, and very, very clear in its signals. It's also fast. If you decide to download from Dow Jones with a modem, you'll retrieve and update signals for your stocks, commodities, indexes or funds in less than five minutes per day. What's more, you can play "What If" games with individual stocks, commodities, indexes, funds or options.

Results: Winning Trades.

There are four Right Time™ programs available to help you make the right decisions at the right time.

Stock Programs: "The program is amazing. Profitable trades have developed out of nowhere!" M.C., brokerage firm vice president.

Index Program: "Computer whiz finds program for success. This program really works." A.G. financial columnist.

Futures Program: "Very profitable with four out of five winners. Paid for itself the first trade." B.L., investment advisor.

Mutual Funds Program: "Accurately picked my last seven profitable trades. I couldn't trade without it." I.S., individual investor.

For More Information.

Call (213) 312-0154 today for our free twelve page brochure, or place an order with a 30-day guarantee. Each program costs $399, any two $599, any three $899, or invest in all four for just $1199.

Letters

world's review: we expect an occasional bad review, but please try to be accurate.
Robert D. Krutz, Jr.
Chief Technical Officer
XOR Corporation
Minnetonka, Minnesota

We misstated the number of defensive plays, it's 26, and the number of offensive plays is 49. Otherwise, we stand by the review. NFL teams may have predetermined game plans, but because no one knows beforehand exactly how a game will unfold, teams frequently need to rethink strategies and change plays—often at the line of scrimmage. And there's another reason to allow users to devise their own plans: to build their interest. —Ed.

NFL Fan

Having once played football, I find NFL Challenge is most like the actual game and best satisfies my craving for the game. All players move, not just the ball carrier; you play against the clock; and you can substitute players. Injuries and turnovers give the game more realistic flavor. Mac Pro Football's mouse-drawn play selection is reminiscent of sandlot football players scratching out plays in the ground.

John R. Dillard
Waynesville, North Carolina

Another Penalty

Your review of Mac Pro Football [Reviews, July 1987] did not mention a significant programming glitch: the home team always recovers its own onside kick. Furthermore, the computer always coaches the home team, and you can't tell it not to try an onside kick. What a home-field advantage!

John Abbott
Sacramento, California

DaynaFile. The Search For
IBM PC File Compatibility Is Over.

Tired of hacking through the jungles of MS-DOS
in search of data file compatibility for your
Macintosh™? Or fighting a tangle of networks, cables,
and add-on cards, just to edit a simple file?
Discover DaynaFile,™ the simple, practical solution
to IBM PC file compatibility.
DaynaFile is an external disk drive that lets your
Macintosh read from and write to a DOS-formatted
data disk.
A SCSI port connects it to the entire family of
Macintosh computers from the Macintosh Plus to
the SE and Macintosh II, without an add-on card.
Imagine what that means. With a simple disk drive,
you can now access thousands of IBM data files
created by programs such as Lotus 1-2-3,™ dBase
III,™ WordPerfect™ and AutoCAD™—with the ease of
Macintosh. Just point and click.
And, as a single or dual-drive unit, DaynaFile can
handle all the IBM personal computer file formats
you have to deal with, in both 5 1/4" and 3 1/2" disks.
That’s the compatibility you’ve been hunting for.
So call us today. And call off the search.

Everything you need for great presentations.
Introducing Microsoft PowerPoint.

Now you can put together the kind of presentations you've always wanted. Quickly. Easily.

Complete, professional presentations, whether it's for an unexpected sales meeting in 10 minutes, or the annual shareholders' meeting in a month.

With Microsoft® PowerPoint®, you actually plan, compose and edit your entire presentation on your Macintosh™ computer. So you see exactly what you, and your audience, are going to see.

Microsoft PowerPoint is the only presentation package that gives you everything you could want, the way you want it, when you want it—overheads, slides or flipcharts, plus speaker's notes and audience handouts.

It's like having an entire staff of writers, designers, typesetters, artists and a print shop all to yourself. But without the hassles and headaches.

With PowerPoint's free-form design capabilities, you can easily create everything on your screen, no artistic talent required. Mix typeset-quality text with diagrams, graphs and illustrations. Or, you can copy charts, tables and illustrations from other programs just as easily.

Once you've decided on the "look" you want—big logos, thin borders, today's date, whatever—PowerPoint can standardize that format for all your other visuals, automatically.

And with PowerPoint's unique Slide Sorters, you can quickly rearrange your slides or combine them with slides from other presentations, automatically reformatting them to your new look.

Last minute changes? No problem. You can make them in an instant with PowerPoint. Now you're ready to simply print out your notes, handouts, overheads or flipcharts.

Then take a deep breath, pour yourself a glass of water, and you're set to wow 'em.

Because with Microsoft PowerPoint, you have the only program that gives you everything you need to make your points, powerfully.

Call the number below for the name of your nearest dealer, and ask him to show it to you.

He'll give you a great presentation.

Microsoft® PowerPoint™

Call 1-800-541-1261, Dept. A41 for the name of your nearest dealer.

“SIMPLY PUT, CIRRUS DRIVES ARE A JOY TO WORK WITH.”

“The Cirrus drives have the most exciting, simple and elegant design we have seen in a hard drive for the Macintosh.”

Michael Day
The Macintosh Journal

CIRRUS Drives
The Cirrus drives are exciting and excellent performers. They offer impressive speed, flexible software, attractive design and quiet operation.

Ease of Use
Running a Cirrus drive is very simple. It is just a matter of plugging the drive in and turning it on. The drives come preformatted and ready to go. The Cirrus has two DB 25 connectors on its case, so its cables are easier to work with than the "standard" SCSI cables that come with some drives. The design of the Cirrus drives contributes greatly to their ease of use.

The software that comes with the Cirrus drives is very flexible. It follows the Macintosh interface closely, and is well done. With the software, users can partition the drive into several volumes, or combine several drives into one single volume. Volume sizes can be changed or new ones added at any time without losing data. Password protection, manual or automatic mounting, automatic head parking, backup utilities, and disk repair utilities are all standard. In addition, the software performs several diagnostic tests including the ability to map out bad sectors and program the drive's interface. In short, this is some of the most extensive and best written software available for Mac hard drives.

Most of the Cirrus' flexibility comes from their excellent software. However, the physical construction of the drives also contribute to their superior flexibility. Unlike other drives for the Mac, Cirrus drives can be placed vertically or stacked horizontally depending on your desktop requirements.

Performance
Cirrus drives were engineered to perform well in everyday situations. These drives are very fast when performing common operations such as going to the chooser or building the desktop. Reading and writing to and from files is also very fast. Using the Cirrus drives gives us an appreciation of the importance of ergonomic design to performance. For instance, fan noise can increase fatigue in office workers. A drive that is built to be quiet and easy to work with may not increase the data transfer rate, but it will help to get more productivity out of the user. Cirrus drives are quiet and easy to work with, which we consider to be a plus in their performance rating.

Because the Cirrus software is so good, users may want to use it to initialize drives from different manufacturers. In our tests, this worked well, and allowed drives of differing origin to be linked together as one volume. Since many of the older SCSI drives came with poor software, this is a good argument for buying a Cirrus drive and chaining it with other drives after they have been initialized with the Cirrus software.

Design and Construction
The Cirrus drives, though very small and lightweight (about 4 lbs.), are constructed of quality materials designed to last. Their light weight is due to the small number of components in each drive and to their plastic case. The Cirrus drive is both sturdy and durable; the internal power supply is encased in aluminum, and the drives are shock mounted on rubber bearings.

The Cirrus drives have the most exciting, simple and elegant design we have seen in a hard drive for the Macintosh. The modular construction of the drives means that any repair work will be quick and easy. Simply put, Cirrus drives are a joy to work with.

Recommendations
Cirrus drives were designed for the professional user. They were not engineered to be low cost products, or to be "just adequate performers," they are built with premium components. These are powerful drives with powerful software. Cirrus drives are an excellent solution for users who demand a lot. Readers should also note that several new products are in the pipeline and that a 40MB tape backup and 30MB hard drive are currently available. We give the Cirrus 20, 40 and 60 drives an excellent rating (8 on a scale of 10) and recommend that other drive manufacturers follow the Cirrus example.

A Fool’s Errand
Or, a Baedeker
for the Boston Macworld Expo

Twenty-five thousand strong they came to the Boston expo. Enough people to clog the aisles and make some of us long for the good old days when we could get to know all the developers on a first-name basis—nevermore. The Mac industry is now big business. Fortunately there were enough exciting products to justify all the enthusiasm—and the effort of wading through the crowds. Here is a sampler of the new products I saw.

Hardware. Oh! Large-screen monitors for the Mac SE or the II—from Moniterm, MacPeak Systems, New Image Technology, and SuperMac. Accelerators from Leveco, MacPeak, and MicroDynamics. The TransLink II from Leveco carries one to four INMOS transputer chips. At up to 20 million instructions per second, that makes the Mac a churning urn of burning umph. And there’s a small version for the SE. Color printers. Computer Friends showed a driver for the Shinko color thermal printer, while Hewlett-Packard showed Coloflex, the first color ink-jet printer for the Mac. Computer Friends also bundled PosterMaker with the printer. In fact, the company produced the backdrop for its 12-by-8-foot booth with colored sheets from the printer. Neat.

Laser printers were dominated by the GCC Personal LaserPrinter at $2500. However, other vendors were showing similar technology (albeit without GCC’s fonts and complete strategy) at even lower prices. Orange Micro promises a QuickDraw (definitely not PostScript) laser printer for under $1500, and Laser Connection was showing—but not commenting upon for the press—a Canon-based printer for under $2000.

Scanners are struggling into the real world at last. Microtek demonstrated an 8-bit gray-scale input ability, while Datapen demonstrated 4-bit gray-scale input software. Okuva’s has some interesting software that allows us to train its scanner to read new fonts. New Image Technology has added a flanged scanner to its line, and Spectrum Digital showed a new scanner. Quark, of XPress fame, has wrangled an option to sell the color scanner from Canon now sold by Howtek.

Remember MacViz, publisher of MacLink Plus? Well, the company, now called Pixelogic, showed standard video digitized onto a Mac II—real-time video on a Mac.

Hard disks have again become the most volatile segment of the marketplace, as they did during the boom years of the IBM PC. Rodime and NuData have set the benchmark for larger disks, 100MB and above, at $10 per megabyte. NuData showed its tower: a gigabyte of memory in a chassis that includes a Mac II acting as a dedicated server on a network. More spoolers and backup software, from La Cie, Fifth Generation Systems, and NuData. NuData’s looked particularly easy to use. Tangent takes the “best use of an IBM PC” honors for this show; the PC serves as a PostScript spooler for Macs. So if you have a cheap PC clone, or one that you no longer use, it can eliminate those mandatory lunch breaks you’ve taken while the Mac and the laser printer generated complex documents.

RAM memory upgrades. Now the big three—Dove, MacMemory, and Mass Micro—have competition from Microtech International and Hard & Soft. They can actually ship us some memory to ease the MultiFinder pinch.

Strawberry Tree announced data-acquisition cards for the Mac II and the (continues)
Adobe Illustrator is the most powerful illustration program you can buy for producing high quality art of all kinds. It lets you draw with precise lines and curves instead of pixels. Yet you don’t have to know how to draw to use it.

Besides working freehand, Adobe Illustrator lets you and your Macintosh Plus, SE or II trace over all kinds of already-made art: blueprints, photos, logotypes, roughs, scrap art, even files from MacPaint and compatible software.

You can also scale, rotate, add type, combine one image with another, share images with other users, or paste images into the most popular page make-up systems.

Adobe Illustrator also automates art production. So you can get camera ready art at your desk.

Make radical changes and get new art in minutes.

And keep every image in small electronic “art files” you can recall, refine, combine or change at will.

Adobe Illustrator is based on POSTSCRIPT,® the language of desktop publishing. Which means you can get output on any POSTSCRIPT-equipped printer from a 300-dpi laser printer to a 2500-dpi typesetter.

Call us at (800) 29-ADOBE, (800) 85-ADOBE in California, or (415) 961-4400 from Canada. We’ll tell you where you can see, and buy, the Adobe Illustrator.

That way, the next time you have to draw a transmission, it’ll be automatic.

Now a work of art doesn’t have to be a lot of work.
Mac SE. Automatix showed the Mac II built into an industrial controller driving a pick-and-place robot arm. This is the first Mac II implementation of this kind in the United States. By comparison, it took the IBM PC two years from its inception to move into this area.

The expo was also a hotbed for communications products. Solana Electronics showed a specialized modem that allows access to AppleTalk networks via phone lines, like the Hayes InterBridge. Modem servers—products that allow multiple users to share a single modem over a network—are finally here. We’re using the Shiva modem here at Macworld, shared among 20 editors. Abaton demo’d its MultiTalk shared modem. Infosphere announced ComServe, extending the concept to include any resources shared on the network—printers, for example. La Cie’s Silver Server went even further, allowing remote access to hard drives attached to individual Macs on a remote network. Centram has beaten out Apple with a version of TCP/IP for the Mac. Admittedly, as a part of Sun, Centram has the motive and the resources to access files on Sun Microsystems workstations; at least someone has provided this link.

Two companies introduced facsimile modems: Apple Computer and Mystic Valley Research (MVR). Both companies were running a Panasonic modem. MVR has the advantage of having licensed a major directory of fax addresses, available to its users as a disk file. Enter address codes offline to send the same message to multiple sources.

Computer graphics led in the software realm. New painting packages included Letraset’s Image Studio and SuperMac’s PixelPaint. A lot of people seemed to think that PixelPaint was merely MacPaint in color. Look again—it rivals the minicomputer paint systems that have had five years to mature. LaserPaint now works on color displays. Cricket announced a raft of printer drivers. The first Adobe Illustrator-based clip art collections appeared from T’Maker, Image Club, and (in optical-disk form) from Multi-Ad Services. There were new fonts from Adobe, Casady, and Invincible. Those of you using Comic Strip Factory should check out the new characters disk.

Both mechanical and electrical CAD fared well at the show. Douglas Electronics’ Professional System for PC design and layout functions stands up to much more expensive systems. DKL Technology showed...
Princeton LS-300 SCANNER

Critically Acclaimed...

"The PGS LS-300 is a competent image scanner that is compact, reasonably priced and extremely fast and easy to set-up and operate...The LS-300 will stand out as an excellent value."

Personal Computing, April 1987

"The ability to alter the image in detail using the zoom feature gives this product a big advantage over many other scanners that rely on screen grabbers or their own graphics editors...The LS-300 is a good candidate for users who want a general purpose scanner for desktop publishing."

PC Magazine, April 1987

Imagine being able to scan photos, graphics, and illustrations into your personal computer and being able to precisely position them in reports and proposals. Preview the graphic impact of charts and tables, modifying at will, before they appear in print on your laser printer.

The Princeton LS-300 allows you to scan a full page of text and images into your IBM PC/XT/AT or compatible at a laser-perfect 300 dots per inch in as fast as 12 seconds per page.

The LS-300 can be used with PC systems that utilize CGA, EGA or monochrome displays. Or team it up with the Princeton LM-300 Monitor, to allow you to view full page visual effects before printing. An optional trainable OCR software package enables your PC to read and store typewritten pages.

PC Paintbrush Plus Included!

A $149 retail value, the amazing PC Paintbrush Plus is included with the purchase of the LS-300 Scanner. The Paintbrush Plus lets you create image files, compatible with Ventura Publisher, Page Maker, etc. for professional-quality drawings, diagrams, charts, graphics, and headlines, with your mouse, joystick or digitizer. Manipulate images to create precisely the effect you want. Incorporate company logos, too!

Put a spark into your reports with the quick creative and productive LS-300. It’s available with adapter board, PC Paintbrush Plus, and all cables, for a suggested retail price that’s remarkably affordable, $1,095.

Also available is an "SCSI" interface Mac Scan* for the Apple Macintosh. You can scan, edit and store a variety of Mac desktop publishing applications — MacPaint, MacWrite, PageMaker, ReadySetGo, Ragtime and Just Text — and print on your Apple LaserWriter.

For Apple Systems call direct:
"New Image Technology, Inc.

Icon Review Offers Quality & Value

High-Quality, Low-Cost Drive

SC40A SCSI Drive
From CMS Corp.

A special purchase allows us to offer this quality 40-meg drive at an unbelievably low price. The SC40A is a drive you can depend on to get the job done — quickly and economically.

A major player in the IBM market, CMS has had years of experience building feature-rich drives known for their dependability.

And the SC40A has all the outstanding features you've come to expect from CMS — a well-vented case that requires no fan, heads that park automatically on shut down to protect your drive and data during transport, handy backup software, and an extra SCSI port for daisychaining additional drives.

Compact and lightweight, the SC40A features an access time of 65ms, a shock rating of 40g (the industry standard), and a convenient fold-away handle for easy transport.

This 40-meg drive is an incomparable value — order today while supplies last!

2100 • Plug into SCSI port

$799

Your Resource for Select Macintosh Products

Many Macintosh owners already know us; but if we are a new name to you, let us introduce ourselves. Icon Review is a consumer-direct marketing company that specializes in quality hardware, software, and accessories for the Apple Macintosh. We have built our reputation as a reliable and friendly supplier of the latest and best Mac-related products.

Put Icon Review to work for you and take advantage of our extensive research of the Mac marketplace. Each and every product we carry is evaluated for quality and value, then offered at the lowest possible discount price. Pick up the phone and order today. You'll be glad you did!

800/228-8910
Good anywhere in U.S.

Why pay more for a 40-meg drive when you can get the SC40A for the price of a 20? This SCSI Drive offers the best combination of quality and value on the market.
MacCalc
From Bravo Technologies

$85

MacCalc, the spreadsheet program you've been waiting for. It's fast and powerful, easy to learn and use, and inexpensive — a perfect combination for novice and expert alike.

Setting up a worksheet has never been easier! Access all commands from the menus; attach explanatory notes to any cell; import data from other Macintosh programs without losing formatting particulars (MacCalc even reads/writes Lotus 1-2-3 files and SYLK data); then assign each cell its own font, format, and style for maximum clarity and impact.

Buy MacCalc — MacUser's "Best New Spreadsheet" — at a price that's too good to miss.

1995 • Works w/512K, Mac Plus, SE & II

$159
Commentary/Jerry Borrell

the first integrated-circuit design system on the Mac II. **ADSTation** added color and multiple windowing. Versacad—the second-largest supplier of IBM PC-based CAD software—announced its Mac package, and Computer Shoppe showed a new 2-D CAD product, **PowerDraw**.

In the miscellaneous category we had two companies with interesting input devices: Anatec's Personal Writer, which allows handwritten characters to be input via a graphics tablet, and MicroTouch's valuable screen input that replaces all mouse functions. We'll probably be seeing that touch screen installed in shopping malls and stores soon. Primera Software had the first of a new generation of music programs for the Mac: **Different Drummer** stands apart in its realism and ingenuity.

Games are making a mild comeback. Broderbund showed **Bogus**, SES had **Quarterstaff**, Miles Computing had Fool's **Errand** and promised Harrier Strike by the end of September. And Spectrum Holobyte showed a pair of war games: **Falcon** and **PT 109**. Still no games, sad to report, making use of the color and graphics on the Mac II.

I had come to the conclusion, before the show, that we had already entered the era of the minimum 2MB RAM Mac. How we could afford to upgrade all the editors was one question; whether the Mac Plus that many of us had would stand up to such an upgrade was an even more troublesome matter. My own Mac Plus promptly showed out the power supply on my large-screen monitor. "Well, I'll switch to the Mac II in my office," says I. After spending an hour figuring out why the SuperMac monitor wasn't working (older model), building up the System file with all the products that we use internally—**Appleshare, InterMail, Shiva's NetModem**—and a few applications, and tracking down why the laser spooler was not working, I was ready to go. "Faw, I thought. Now I'm on a power machine."

Then I tried to install some Adobe fonts. System error. An II only wanted to type a memo. God forbid I should try to "test the network"—that's our internal code for what occurs when someone downloads **HyperCard** from our central hard disk.

I am reminded, as we embark on the product testing that follows an expo, of how I felt after I'd had my old PC rigged out to suit my needs: "If it's not broken, don't fix it." Not an auspicious beginning for a Brave New World of products.

Circle 562 on reader service card
ntroducing the PostScript laser printer that blacks out at high speeds.

The new QMS-PS® 810 can compose and print the most complex pages in record times, with richer, more saturated blacks than ever before. All with the desktop publishing power of Adobe PostScript®, and the superior print know-how of QMS, an industry leader.

Under the hood QMS ASAP™ (Advanced System Architecture for PostScript) is proprietary technology that helps eliminate the hardware bottlenecks that hinder other PostScript printers. As a result, QMS-PS 810 boasts processing speeds remarkably faster than other PostScript printers in its class. And faster output means greater productivity. In addition, the QMS-PS 810 laser printer's new Canon® SX® print engine covers solid areas and prints fine detail better than previous-generation engines.

Fast start, strong finish You can adorn your documents with one or all of the 35 Adobe typefaces. Thanks to PostScript, there's an infinite number of font variations available. You can also make type as large or as small as you want. And put it anywhere on the page. In fact, with PostScript you enjoy total control over the design of your page. It gives you the complete desktop publishing power to do things that would otherwise be virtually impossible. So you get high-quality output exactly how you want it.

Along with PostScript, the HP LaserJet+™, Diablo® 630 and HP-GL™ printer emulations are added for your non-PostScript software.

The QMS-PS 810 laser printer is easy to use, maintain, and comes with a one-year warranty. It's available from Laser Connection dealers. Laser Connection is a sales and marketing subsidiary of QMS. For the dealer nearest you call 1-800-523-2696.
The PostScript laser printer sure to get high ratings at its network debut.

The QMS-PS' 800 II is an 8-page-per-minute laser printer that combines the desktop publishing power of Adobe PostScript® with the superior printer technology of QMS, a leader in printer technology for 10 years. Exceptional paper handling, faster processing speed and a Canon® CXD® print engine with 10,000-page-per-month duty cycle give QMS-PS 800 II the versatility your Macintosh® network needs.

A network sensation QMS-PS 800 II holds 500 pages, so operators aren't constantly refilling depleted paper trays. Users can even designate automatic switching between the two trays for doing letterhead/second page printing. Select faceup or facedown collation. And manually feed odd-sized paper stock.

With QMS ASAP™ (Advanced System Architecture for PostScript) proprietary technology, QMS-PS 800 II delivers outstanding performance. In fact, the more complex the page, the more it outperforms other PostScript printers. Two megabytes of memory, expandable to three megabytes, also add to the overall page processing speed when you are creating complex documents.

Type casting The QMS-PS 800 II comes with 35 resident typefaces (you can download more if you like). PostScript allows you to scale type to virtually any size, from minuscule to mammoth. PostScript also enables you to design, and redesign, your documents with exacting detail. You have total control over the final appearance of documents, with the ability to place text and graphics anywhere on the page. In short, you get the complete desktop publishing power that only PostScript can give you.

Critical acclaim The QMS-PS 800 II is certain to receive rave reviews on your network. And for a single-user set-up, there's the QMS-PS 810 laser printer. For a demonstration of either, call 1-800-523-2696 for the location of the Laser Connection dealer nearest you. And be sure to ask for The Sourcebook™ — our exclusive catalog filled with the latest laser printer products and enhancements.

ossing a laser printer's used toner cartridge is like paying someone $60 to take out the trash.

Why? Because it can be refilled with toner and restored to its original condition, for about half the cost of a brand-new toner cartridge. That's how Laser Connection's Toner Refill Certificate Program can save you nearly $700 a year for each laser printer in your office. And while other programs can promise savings, they lack our expertise. Expertise that guarantees you quality.

Break an expensive habit Not only does a toner refill certificate save you money, your cartridge comes back better than new.

Our reconditioning and patent pending resealing process enables us to refill a used toner cartridge with 50% more toner than it first contained. With a blue toner refill, your cartridge is returned with 25% more of that color. So your reconditioned cartridge will actually last longer than a new one.

To further insure print quality, we use toner that's denser than new and replace your old cleaning rod with a new one.

Get with the program Any toner cartridge used on laser printers employing the Canon' CX" print engine (that includes printers made by Hewlett-Packard, Apple, QMS, Canon and others) can be reconditioned.

A participating dealer can get you started. Just purchase a Laser Connection Refill Certificate for each cartridge. You'll find instructions and shipping materials for sending us your empty toner cartridge. You'll get back a factory-reconditioned cartridge returned to you via Federal Express: A cartridge that costs less and works better than new ones. It's also backed by our guarantee—if you're not happy with the performance of your cartridge, we'll give you another refill certificate to replace it.

To start putting away your $700 in savings, call 1-800-523-2696 for the Laser Connection dealer nearest you. And be sure to ask for The Sourcebook" — our exclusive catalog filled with the latest laser printer products and enhancements.

A QMS' Company
you don't stop to be fed every 12½ minutes. Neither should your Apple LaserWriter.

The PaperPlus 500 Sheet Feeder is for the Apple LaserWriter and all other laser printers that use the Canon CX print engine.

Constantly refilling the paper tray on your Apple* LaserWriter* can eat up lots of your time. Keep that from happening with the PaperPlus 500* feeder from Laser Connection.

An appetizing solution PaperPlus 500 easily attaches to the back of your LaserWriter, or any laser printer that uses a Canon* CX* engine, including QMS-FS' 800+, QMS KISS*, HP LaserJet**, and others. Its 500-sheet capacity keeps you from giving your laser printer constant attention, especially when you're printing large volumes of documents at one time. You can keep your printer humming continuously for nearly an hour without taking a break—that's a 300% increase in your efficiency.

There's also an increase in your LaserWriter's flexibility. You can load the front tray of your LaserWriter with letterhead, and PaperPlus 500 with second sheets. You can then instruct the printer to pull a sheet from the front tray first, then instructions to pull second sheets from PaperPlus 500.

If after printing your documents you need to mail them, you can quickly turn the PaperPlus 500 into an envelope feeder. It can hold up to 50 envelopes, so you don't have to feed them through by hand one at a time as you would on most other laser printers.

Come and get it Setting up the PaperPlus 500 is quick and easy; you get clear instructions to show you how. It also comes with a high-capacity output stacker to replace the one on your printer.

To satisfy your LaserWriter's hunger with PaperPlus 500, call 1-800-523-2696 for the location of the Laser Connection dealer nearest you. And be sure to ask for The Sourcebook™—our exclusive catalog filled with the latest laser printer products and enhancements.

Circle 708 on reader service card
This spring, a company called Laser Connection introduced a new concept to laser printing.

It didn’t come in the form of hardware, or software.

Instead, it came as a book. A catalog, actually.

Titled *The Sourcebook*, it brought together for the first time the full array of products available for laser printing and desktop publishing.

Printers. Controller upgrades. Sheet feeders. Scanners. Monitors. Type fonts. Plus notes, articles and how-to’s that help you make the most of your laser printing system.

**A collection of best-sellers** *The Sourcebook* committed to paper what Laser Connection has been doing quite successfully for some time. That is, working with top manufacturers to give you laser printing solutions that offer greater performance, convenience and cost savings.

Granted, we had some help. Laser Connection is part of QMS, a recognized leader in the development of intelligent printing systems. So teaming with their 10 years of print technology experience, we can give you products that take in all the latest advancements. That’s why the QMS KISS® laser printer and PS Jet® PostScript controller kit were voted best of 1986 by PC Magazine. And why we can offer the widest range of Adobe PostScript® products anywhere, products that time and again have been chosen by industry experts as best in their class.

**Where to find our guide in the field** Laser Connection products are available from selected dealers throughout the country. For the location nearest you, or for your own copy of *The Sourcebook*, call 1-800-523-2696.

©1987 Laser Connection.
A guide to the care and feeding of your laser printer.

Get the best advice on the care of your laser printer from Laser Connection—one of the world's leading suppliers of laser printers and desktop publishing accessories. Our dealers carry many of the latest products that enhance the value and productivity of your printer.

**Feeding time** Decrease your laser printer's daily feedings with the PaperPlus 500" sheet feeder. Its greater paper handling capacity increases the continuous operation of your printer from 12 1/2 minutes to one hour, leaving your office staff to more important work than feeding the printer.

The PaperPlus 500 can accommodate a varied diet of envelopes and letter-size paper, and is compatible with all Canon' CX" laser printers, including the QMS-PS' 800+, Apple' LaserWriter", and the HP' LaserJet".

**Scan this** The IS-300" sheet-fed scanner transfers any text, illustration, art, or photograph into your computer. You then have full control to manipulate the entire image with your PC and software. Combine scanned images with text to create reports and newsletters. You save time, get graphics flexibility, and increase your desktop publishing power. The IS-300 scanner is compact, lightweight, and works with an IBM" PC/XT/AT", PC compatible, or an Apple Macintosh".

**Colorful language** Besides basic black, Laser Connection offers toner cartridges with blue and brown toner. Our dense, high-quality toner insures full, even coverage in whatever color you choose. And our toner cartridges work with any laser printer that uses a Canon CX print engine.

**Toner Cartridges**

- Black
- Brown
- Blue

**A valuable alternative** Don't trash your laser printer's empty toner cartridge. Refill and recondition it with the Laser Connection's Toner Refill Certificate Program. You'll save about half the cost of a new toner cartridge. And while other programs can promise savings, they lack the expertise of Laser Connection. Expertise that guarantees you quality. Each reconditioned cartridge is refilled with more toner than it started with. So you save money, and you get a cartridge that lasts longer, satisfaction guaranteed, or we'll give you a free replacement certificate. Only at participating Laser Connection dealers.

Call 1-800-523-2696 for the Laser Connection dealer nearest you. And be sure to ask for The Sourcebook"—our exclusive catalog filled with the latest laser printer products and enhancements.

Circle 520 on reader service card
Pity the pioneers. They’ve all heard the old chestnut about fools rushing in where wise men fear to tread. Yet, virtually barefoot, they eagerly propel themselves into the unknown—and tread, tread, tread. Not a sole remains unscathed. Those of us who consider ourselves wise men and women give those intrepid ones pleasant fare—theirs and hang out until they return from the frontiers. We watch them unravel the bandages from their feet. We listen to their tales, shudder at their travails, and make note of the trails they have blazed. Those are trails on which we will later travel. When they are paved, and there are no thorns and stones to bruise our Adidas.

And what do the pioneers get for their troubles? They get to be pioneers.

I interrupt this column to make a confession. When I chose the pioneer metaphor, I noticed that it was sadly tattered. And I admit that there was a label reading “Avoid applying this metaphor to anything about personal computers…” But after exhaustive examination of the metaphor rack, I was forced to use the pioneer model—because it so neatly fit my subject.

You see, my concern here is the question that arises whenever a desirable new computer is introduced. Especially the Macintosh II, a computer with breathtaking power, hair-raising speed, an ample color display, and the ever-popular open architecture. Obviously, the machine ratchets up the conception of what a Macintosh is, maybe even what a personal computer is, by two or three notches. The very existence of an object like this can drive a certain kind of person wild. “You want to know why I want a Mac II now?” asks early buyer Lee Snover, in response to a query I posted on CompuServe. “It’s quite simple. PURE, UNADULTERATED, ILLOGICAL L-U-S-T.”

Lust has its price. History instructs us that computers are never so expensive as when they are first introduced. Price increases are almost unheard of in the personal computer business. But new computers are doubly expensive, since the first units reach the stores in a trickle, and stores seldom find it necessary to offer discounts on those early arrivals. The first Macintosh is a good example: people who bought the original 128K version at its $2495 list later had to spend as much as $2000 more to upgrade the machine to the level of a Macintosh Plus, which now has a street price of around $1700 new.

History also suggests that the first computers off a production line do not emerge as perfect objects. Flaws are inevitable. To the dismay of the manufacturer, those flaws are never apparent until the machines reach the eager hands of the first purchasers. Strike two against premature buying.

(continues)
Ashton-Tate and the most powerful database ever.
ounces the most used by man or mouse.

It's called dBASE* Mac.
And it's the most powerful relational database designed for the Macintosh™.
Especially since, unlike other databases, you can get that power without knowing a thing about programming.

Begin by creating and relating your files. Not just linking them, but relating them. So when you update one file, all your related files will be updated. Automatically. Immediately.
And remember, with dBASE Mac you can do all this without programming.

With a few clicks of your mouse, you can quickly redesign and rearrange your files to look at your data in any number of ways. Without disrupting it.
And without any programming.

Also using the selection of fonts and MacDraw*-like tools, you can design reports from the very simple to the very sophisticated. Right on the screen. So you'll know how it looks before you print it.

We're not talking about just text and graphics. With dBASE Mac, you can incorporate photos of people, parts and places into your database.
You can even import data from Ashton-Tate's dBASE III PLUS®, dBASE II®, or dBASE II, as well as ASCII files. All without programming.
And all with the help of Macintosh's on-screen prompts and pull-down menus.
But if you want to go still deeper, the powerful dBASE Mac programming language will take you into a world of power and capability where no Macintosh has ever gone before.

If you would like a demo disk for $4.95,* or the name of the dealer nearest you, call (800) 437-4329, extension 2400.**
You'll see how this Ashton-Tate relational database will make your Macintosh office work smarter.

Whether you are a huge organization.
Or a one-mouse shop.

*While supplies last. **In Colorado, call (303) 729-3996. Extension 2400. Trademarks owned: dBASE, dBASE II, dBASE III, dBASE III PLUS, Ashton-Tate Ashton-Tate Corporation.

Telecommunications
inTalk version 3.0

* Powerful Script Language
* Work for new Mac SE & Mac II
* Digital PBX Data Network Support
* Support for High-speed modems
* Built-In text Editor
* Terminal Emulation
* Support International Character Set
* File Transfers

The latest release of inTalk includes a variety of new high-powered features. The user-interface has been improved greatly allowing the windows to be resized and relocated. Use the text editor, CCL editor and terminal at the same time. The screen drawing speed has been improved. Function Keys are in their own window and can be moved or hidden altogether. The file transfer status window has been improved. The "Connect" protocol has been added for binary file transfers with CDC mainframes. A unique new feature has been added, allowing users to paste graphics and other data to a remote Mac Clipboard. The CCL command language has been given more power. Support for the new Mac SE and Mac II, and the new keyboards has been added.

Steven Levy

Finally, there is the danger that a freshly introduced computer will never find general acceptance. Instead of being able to outfit their prize with a cornucopia of innovative new software and peripherals, the orphaned owners might have to band together in die-hard groups. Witness the haunted minions whom you sometimes see wearing T-shirts that read "Lisa Lives."

Treacheryous ground, indeed. Much like the uncharted land that awaited our ancestors more than a century ago. This was land that would inevitably be explored and tamed—but somebody had to do it first. Thus the ineluctability of our metaphor. The Macintosh II will never be the success it deserves to be unless volunteers risk being early buyers. Their fortitude—or foolishness—will enable everyday power users and workstation jockeys to eventually buy their Mac IIs when the computer's viability is beyond question.

How the Webb Was Won

By the time you read these words, that viability may well have been achieved. Stores should have ample inventories of Macintosh IIs—complete systems with color monitors, extra Random Access Memory (RAM), high-capacity hard disk drives, a selection of circuit boards to plug into the six internal slots, and shelves of updated software guaranteed to run on the computer. In other words, the Macintosh II world should be a bustling new outpost of civilization. But as I write this, in the heat of the summer, it is Frontier Days in Mac II land. Only in the past month has one been able to stroll into a computer store and examine a unit. Even so, at the Computerland I visited the other day, the salesperson kept referring to the thing as an "Apple II." I chalked it up to unfamiliarity.

The first Macintosh IIs were shipped on April 29. The very first one was delivered in May to Dick Webb, an audit partner of the Peat, Marwick, Mitchell accounting firm. Peat Marwick earned its pioneer spurs long ago, having ordered 3500 Macintoshes before the original Mac first shipped. "We wanted them as quickly as we could get them," says Webb, who is quite pleased with the 50 Mac IIs that had arrived by summer. He figures that the larger screen size alone makes the Macintosh II cost-effective for the computer scientists at Peat Marwick who have taken gleeful possession of the computers. Though the actual auditors at the firm will stick to the more portable Mac SEs, Webb
Steven Levy

says that the Mac IIs are seeing service not only as software development tools, but as secretarial workstations as well.

Still, it is perhaps instructive that Dick Webb’s own Mac II, the first one off the line, now rests at home, where Webb uses it mainly to monitor electronic mail. In his office, he relies on a trusty SE. This may be more because of Webb’s fondness for the original Macintosh’s compact design than because of any dissatisfaction with the new version’s capabilities: if there were risks to buying early, Webb has suffered them. Yet he says, “I don’t think we’ve had a machine fail.”

What Bugs Mac II

What, no downside? Could it be that the Mac II is domesticated upon release? Well, not exactly. There is, first of all, the price issue. True, since the Macintosh II runs many important programs of the industry’s most impressive software base with unprecedented power and speed, it begins earning its keep immediately. But that initial investment is quite steep.

Two of the three dealers I spoke to have received so few units of the Macintosh II that they have seen no need to huddle up a system price that runs between $6000 and $8000. The one store that did discount wound up shaving $700 off the price of a $7000 configuration. Not bad, but small change compared to the discounts that will arise during the competitive Christmas sale days. Of course, in a year or so, the retail price of a reasonably loaded Mac II system will undoubtedly approach the $5000 mark.

Still, for those who want a Mac II now, price is less a consideration than getting in on the ground floor. They want to sign up for the excitement of being a pioneer, which this powerful machine provides in spades. But it also provides some headaches.

Here are some of the biggest problems in the early days of the Macintosh II:

No one was able to buy the much-touted Apple color monitor. Apple had contracted with Sony to build these $1000 wonders, but months after the Mac II shipped, the monitors were not available for love or money. The reasons for this failure were subject to heated rumor, but at least part of the problem was a miscalculation on Apple’s part. The company somehow figured that most buyers of the Mac II (a machine so identified with full-color capability that some referred to it as “the color Macintosh”) would buy the optional monitor. Apple put up the money to pay Sony. Later, Sony heard about Apple’s order, and the company then sold the rest of the monitors to the public.

UPS Shipmate™ Software Breakthrough:

How To Ship U.P.S. Without Paying For The Truck.

Daytona Beach, Fla.

It all started one day around 4:30 p.m. As I sat in my office, I could hear the rumbling of the faithful UPS truck backing up in the shipping area. I felt sorry for the driver. We had a large shipment of heavy boxes that day and the temperature was in the 90’s. The driver and our fulfillment manager were in for at least an hour of filling out forms.

That’s when it hit me! Here I sit in front of my Mac, there’s another Mac in accounting, one in customer service, and even one at the reception desk. But we don’t have one in shipping!

“Surely someone has figured out a way to save time and money by using a personal computer for shipping”. So I picked up the phone and called United Parcel Service. I learned that there are currently 22 UPS approved computerized shipping systems available. They range in price from $5,000 to $16,000! What you end up getting is some huge, expensive system with a whole bunch of hardware and software. (And as you’ve probably guessed, the systems are very IBMish.)

Undaunted, I continued my search. My Mac had slain the IBM Goliath in accounting, production, and customer service. It could do the same in shipping! THE ANSWER.

I didn’t want to pay $16,000 for a computerized shipping system. For that much I could buy my own UPS truck! The answer came in the form of a unique program called UPS ShipMate™ by Positive Works, Inc. It is designed for both the large, frequent shipper, and also for the occasional shipper. It’s priced so that even individuals can afford it. The entire price is only $295, and best of all, it was designed for the Macintosh. It does everything that the big systems do, except that you provide the computer and the scales. It does the rest.

SAVE TIME AND MONEY

No more forms to fill out by hand
No more charts or tables to look up. No more labels to fill out. All is done automatically at the touch of the mouse. UPS ShipMate™ fills out all tags, COD, AOD, manifests, and shipping labels. Paper work that used to take hours can now be accomplished in minutes. This software literally pays for itself in a matter of weeks by saving hundreds of man hours.

In addition, this unique program compiles complete customer files with all current data. The customer filing system boasts an auto lookup function that stores: retrieves information on all frequent shipments and customers.

Not only does UPS ShipMate™ compile all the paperwork, look up all the zones, figure out all of your costs, and even manage your business. As a special feature, UPS ShipMate™ generates timely reports. It automatically keeps track of how much you’re spending per day, per month, per year, etc. In addition, it calculates a cost comparison and graphically shows you how much you would have spent if you had sent the same packages by 2nd day air, by ground transportation, etc. You instantly know how much you are spending by date, by zone, by unit, and even by shipping method.

UPS ShipMate™ is fully approved by United Parcel Service and will handle your domestic and international shipping needs.

TO ORDER

UPS ShipMate™ is available for $295 (or $449 w/ Filemaker Plus) from Florida Mrktg. Int., Inc. 142 Cone Rd. Ormond Beach, Fla. 32074. To order by credit card call 904-677-1918. You will need to have a working copy of Filemaker Plus® to work in conjunction with UPS ShipMate™. Complete documentation, users manual, and customer support number are included with your program.

UPS Shipmate™ by Positive Works, Inc.
Would you leave this document out on your desk?

Then why leave it unprotected on your disk?

Everyone creates confidential documents—payroll analyses, bids, personnel records, to name a few. But documents sitting on the Mac desktop are as vulnerable as papers left out on your desk. Anyone can access your files when you are not around. And with the increased use of hard disks and networks, your data is now more accessible than ever. You need a way to guard your private documents from prying eyes.

SENTINEL: Password Protection and Encryption.

SENTINEL is a data encryption utility that lets you lock your documents right on your desktop. Since password protection is easily circumvented by the determined intruder, SENTINEL uses password and encryption strategies to protect your documents.

For encryption (which actually scrambles the data on your disk), SENTINEL presents a choice of two methods: DES or SuperCrypt™. Both offer speed as well as security. Our DES encrypts a 100K file in less than 90 seconds, SuperCrypt in just under 5.

Standard Macintosh Format.

Documents encrypted by SENTINEL remain in standard Macintosh file format. They can be backed up, copied, transmitted over networks, or sent to remote sites by modem. But unlike all of the other files on your desk top, they can be unlocked and read only by someone possessing the correct password.

Easy and Natural to Use.

SENTINEL also makes working with your secured files more convenient. Creating Sets of files allows you to protect multiple documents efficiently. You can add or delete documents to a Set, and SENTINEL will lock or unlock them all with one password.

The WorkSet feature remembers which files have been opened at any time during a work session, and gives you a quick lock-down capability. SENTINEL was designed to be unobtrusive and easy to use, making file security a natural work practice.

Price: $149.95.

Minimum system requirements:
Macintosh 512e

ment on the back and replace the battery, for under $5. But the Macintosh II has an
unorthodox approach to its lithium battery. It is actually soldered to the system
board. Those without degrees in microcircuitry would be best advised not to
mess with it.

Wait—it gets worse. On the Mac II, the battery's tasks not only include keeping track of the time, date, and various settings while the power is off; a live battery is essential to the process of turning on the machine. So a dead battery means a dead computer. In theory a battery is good for seven years, but as one Apple engineer told me, "No one really knows how long it will last." This fellow guessed that with the level of field service being what it is, eventually people with dead batteries will take their inert Mac IIs to their dealers, who will remedy the problem by replacing the entire system board—several hundred dollars for a worn-out, low-cost part.

No Pain, No Gain

You're reading this in November, of course, and all but the last problem is expected to be resolved. (Apple has been holding firm to the contention that the soldered-in battery is more feature than failure.) But the pioneers had to cope with many of them did it with a fervor that implied that overcoming hardships was as important to these folks as enjoying the pleasures of this neat new machine. For instance, one chap told me of a triumphant cross-country search that culminated in locating the one store in the country that provided a cable to connect a certain monitor to his Mac II. Or take the case of the enterprising hacker who sat down and wrote a patch that made Microsoft Works, previously a Mac II washout, work on the new machine. The patch was in circulation for some time before somebody told Microsoft of its existence.

So be grateful to the pioneers—but don't worry too much about them. When the Macintosh II reaches its final perch on the pinnacle of the personal computer world, the early buyers will be sure to remind us of their perspicacity. Whether or not it was really worth the quick purchase, only they will be able to answer. But before you line up to be one of the first buyers of the Macintosh III, whenever that model shows up, please consider this electronic missive I received from Andy Reese, a candid pioneer from Texas:

"I ordered a Mac II one week [after its introduction and] took delivery of it in late June. As President of our user group, I have usually taken the leap on the latest technology, serving as a guinea pig for our members.... The Mac II I bought had one floppy, no hard disk, and a monochrome monitor (on loan from the dealer until the color one comes in). The theory behind no hard disk was that I would get a 45MB MacBottom to connect to the Mac II at the office and then take home to use on the SE at night. Good theory... I soon discovered myself that the 45MB will not work on the Mac II [yet]. I set up the MacBottom and am using it on the SE for now.

"All this has put quite a damper on my enthusiasm for the Mac II. I use it as a terminal emulator at work. That is all it has been doing for the last two weeks.

"When I am asked for advice on what machine to buy, I find out what kind of user the person is. If they are first-time purchasers, I strongly steer them away from the Mac II toward the SE. If they are power users, I tell them that the machine is nice, but they should wait for the price to drop or for many of the problems to be resolved first."

That was in July. I bet by now Reese is bragging to his friends what a smart purchase he made.
This is why IBM, NCR, HP, Compaq and Apple chose 3M data cartridge tape backup.

The preceding page illustrates why the leading PC makers needed a reliable backup system for their computers.

And this page illustrates why they chose 3M data cartridge tape technology to be that backup system. For 16 years, 3M has been delivering precise, error-free backup to cover yourself when data freezes up, disappears, or suddenly looks like a spilled bowl of alphabet soup.

And for 16 years, through every technological breakthrough, we've proven to be the best way to back up data.

Still not convinced you need it? Then turn back to the first page and imagine it was your annual report. Call (800) 423-3280 for a list of data cartridge drive manufacturers.

If you want to know why FullWrite

Within the next ten minutes, your entire concept word processing will be turned upside down. FullWrite Professional™ sets new standards for word processing. It lets you handle words better, faster, more powerfully, with more versatility than any other word processing program. But competing in today's world requires even more. Now, documents need the persuasive power of text and graphics combined. That's why FullWrite Professional easily turns your words into fully illustrated documents and generates the graphics. Chances are, you'll ever need a page layout program.

FullWrite Professional is going to change the world forever. Here's why.

• **WYSIWYG multi-column display.** What you see on the screen is exactly what prints on the page. With automatic repagination, as you type.

• **Full desktop publishing look.** Drop in any shaped image, and watch the text wrap around it automatically. Create sidebars to mix multiple column sizes on the same page, as well as multi-column headlines. Automatically revises layouts while you edit.

• **An integrated MacDraw®-like drawing environment.** With Bezier curves similar to Adobe's Illustrator™ for smoother, more natural looking curves. Bit-mapped graphics are automatically converted to laser resolution objects for easy cropping, scaling, and re-sizing.

• **Change bars.** Visually highlights changes between drafts of a document.

• **Posted notes.** Append comments and observations directly to a document without affecting the text. Notes are automatically stamped with the time, date and name of person making the comment. Make comments individually or as a group.

• **Browser.** Quickly scan footnotes, posted notes, pictures, virtually any user defined category, through a special window, without looking through the entire document.

• **Outlining.** Sophisticated, powerful outlining that rivals the best stand-alone products.

• **Automatic free upgrade.** All registered owners receive a free media upgrade to the next version, automatically.

• **Power word processing features.** All the stan-
dard editing features plus: user defineable out-
lining styles; base style sheets; custom style
sheets; find and replace by virtually any attribute;
large screen support; spelling checker; thesaurus;
automatic hyphenation; automatic table of contents
and index generation; full undo of all options;
bookmarks; references; glossaries; variables;
mailmerge; full header and footer support with
graphics; automatic renumbering of footnotes,
endnotes, pictures and other user defined items;
kerning; leading; guttering; column rules; strike-
outs; small caps; multiple windows; show pages;
full keyboard shortcuts; true laser grey scales;
intelligent left/right formatting of pages; flexible
printing; directly import other word processing
documents and more!

FullWrite Professional is not just for professional
writers and communicators. It's for managers, acc-
count executives, and secretaries, too. It is the word
processing program for the future. Your future.

If you can operate a Mac Plus, SE, or II (anyone
can operate a Mac), you can use FullWrite
Professional. Right away.

It's what word processing was meant to be.
And it's going to change serious writing.
Forever.

FULLWRITE PROFESSIONAL

ANN ARBOR SOFTWARES
YOU NEED
THE POWER

4th DIMENSION™ is a multi-user relational database for Macintosh™ that provides more power than any other database for a personal computer. For first-time users, it is a database that can start simple and grow. For power users, it is a flexible data management system and programming environment. For consultants and programmers, it is an application development tool to create custom databases.

- Structure containing files, fields and links
- Object-oriented layout tools
- Data entry screen
- Hierarchical password system
- Built-in business graphics
- Flowchart or listing programming
- Custom variable types and formats
- Menu and item editor
- Completed personalized database

SPECIFICATIONS

- Records: Up to 16 million
- Files: 99 at a time
- Fields: 511 per file
- Links: Unlimited
- Subfiles: 511 per file
- Subfields: 511 per subfile
- Layouts: Up to 32,000
- Passwords: 32,000 levels

FUNCTIONS

- Multi-user: Fully compatible with AppleShare™ and other HFS file servers
- Import/Export Data: SYLK, DIF, and text with serial port and file communication control
- Search/Sort: Multiple conditions, ad hoc queries, wildcard, and programmable searches
- Quick Reports: Instant report generation
- Business Graphics: 8 kinds of graphs (pie, bar, column, etc. plus custom pictures)
- Programming: Over 200 built-in commands and operators
- External Routines: Add external routines written in Pascal, C, and other languages
- Customization: Custom menus, check boxes, radio buttons, and dialog boxes

Send us a check for $20 or call (408) 748-7575 with your credit card to receive a demo version of 4th DIMENSION.

An interview with John Sculley, chairman and CEO of Apple Computer

How do you compare what you did at Pepsi—leading it to surpass rival Coca-Cola—to what you want to accomplish at Apple?

The strategy was somewhat similar. Pepsi was number two in the soft drink industry, but our goal was never to take first place by taking existing customers from Coke. Instead of a strategy that required the market leader to fail, we decided to take market share from all the other soft drink companies. We worked to create new markets and get more than our fair share of the growth with innovations in advertising, packaging, and merchandising. We knew Coke would follow suit, so we had to keep innovating. At Apple, we want a share of the business market, but not by taking over IBM’s markets. We want to create new markets and get a large share of this growth. Apple has to leverage technical innovations and play a major role in shaping the direction of our industry. That’s been our strategy for the last two years.

Why were you chosen to come to Apple?

I have always been intrigued by powerful ideas. Steve Jobs and I hit it off well. It seemed that between the two of us we had the combination of talents needed to make Apple great in the future. I had the marketing and business experience, and Steve had technology and dreams. I was as excited as he was in terms of what Apple could be.

Your book Odyssey deals with both dreams and business.

I wanted to write a different kind of business book. Much of it is a narrative of my adventure in going from Pepsi to Apple, and my relationship with Steve Jobs and others along the way. It’s also a book about my mistakes and what I learned from them. In other parts of the book, I project myself and Apple into the 21st century. There may be a second Renaissance in the United States brought about by a combination of global competition, threats to America’s affluent middle class, and opportunities for individual innovation. I talk about information technology and how I believe it will affect schools and the economy by nurturing a new age of the individual. There are some warnings about our tendencies to focus on the short term, which could bring on crisis and important changes. But the book ends on an optimistic note, with the recognition that crisis can produce many constructive changes—including adoption of a longer-term perspective.

Does Apple need to become a more diversified high-technology company, in the same sense as General Electric or Hughes?

Our long-term vision at Apple is still very “personal computing.” We see the computer industry growing and thriving, and the emphasis of computing will shift steadily toward what Apple is already good at. The epicenter of technology shifted in the 1980s from the mainframe to networks. We’re organizing and leading a shift to the user. To move toward that goal, we are committing an amount of resources that is large by any standard. We are already spending hundreds of millions of dollars on research and development. That’s a large percentage of revenue.

But we never want to be in the position of renting our primary technologies from someone else. So we have to spend to keep inventing and revising proprietary technologies.

Generate presentation notes and audience handouts

Create black & white or full color transparencies for overhead projection

Create high-impact flipchart presentations

Produce 35mm slides with film recorders or outside film services
Introducing Cricket Presents...

Finally, there's a presentation graphics tool that gives you the capability to produce high quality, full color or black & white presentations on the Macintosh — Cricket Presents...

Cricket Presents...The Creative Environment

Cricket Presents...provides a comprehensive creative environment. All the tools you need to conceptualize, create, and produce quality, color presentations are built right in — presentation planning, text editing, full object-oriented drawing, graphing, image manipulation, and presentation animation. You'll never have to leave Cricket Presents...to get the job done.

Cricket Presents...Full Color

Black & white is fine for simple presentations, but color makes impact and impact sells. Cricket Presents...lets you put dazzling color into your text, drawings and graphs.

Cricket Presents...Templates

Cricket Presents...uses a powerful feature called Templating to help you build your presentation quickly AND easily. With Templates, simple word-chart slides become a snap. Just select a style from the Template library and type in your text — the rest is done for you automatically!

For creating complex color visuals, Templates really become a timesaver. Simply create templates for areas that repeat from slide-to-slide. Plus you can layer templates on any slide for maximum slidemaking flexibility.

Cricket Presents...Unprecedented Output Device Support

Cricket Presents...lets you free from dependence on PostScript compatible devices. With Cricket's unique Device Drivers you can get full color output from a variety of printers, film recorders and film services including the HP PaintJet, Xerox 4020, Matrix SlideWriter, HP LaserJet, and Autographix Slide Service. Cricket Presents...comes complete with the standard Apple ImageWriter and LaserWriter drivers and your choice of any Cricket Device Driver (includes driver, cable, and standard font package).

THE FIRST FAMILY OF GRAPHICS

When it comes to Macintosh graphics software, there's just one name to remember — Cricket Software. Your local dealer will be happy to introduce you to the entire family: Cricket Graph, Cricket Draw, Cricket Presents...and Cricket Device Drivers.

Cricket Software, 30 Valley Stream Parkway, Great Valley Corporate Center, Malvern PA 19355 (215) 251-9890

Circle 684 on readers service card
One of the fears raised in the late 1970s was that many people would become information poor, disenfranchised by their lack of access to information. Is Apple concerned about that?

Apple has done a lot to make accessing information more affordable, but we have to reshape our outlook still more. We can draw distinctions between information and knowledge, which is the real objective. We must make knowledge itself more accessible by creating tools that deliver it efficiently and inexpensively.

I see two important shifts early in the 21st century. First, the role of the individual will be more important than in the 20th century; the information age is shifting the main role in society back to the individual. Knowledge is power, and making more knowledge available to individuals makes them more powerful. We have to allow computers to give power to individuals, so that they can become more creative and productive. The other important shift is in technology—everyone is trying to develop a better networking strategy. When that happens the epicenter of computing will shift. Until recently the economy of the United States was the global focus. That has shifted, and in the next century the focus will not be on any single nation, but will move toward a global economy, a fluid network of resources and information. The issue is how the U.S. will fit into this network.

What is your vision of Apple's 21st-century technology?

All the major technologies to build revolutionary machines for the 21st century exist today or will be in motion by the end of the 1980s. The performance of the technologies will improve dramatically. Microprocessors of the 21st century will be 100 times faster, yet cost the same as today's. They will process the software loaded with artificial intelligence, sophisticated 3-D image processing, high-resolution animation, speech recognition, and voice synthesis.

Full-motion video—with image quality far better than current television sets—will be what computer users routinely expect.

The problem is the growth of information; the amount of information doubles every two years. So the ultimate aim of computers will not be to create more information. We need the ability to navigate in real time across vast expanses of information. So it is especially important that we develop a new perspective. Information is an interim step to the ultimate goal of knowledge. We have an opportunity in the early 21st century to create breakthrough products as important to people as then movable type was to people in the beginning of the Renaissance.

After Gutenberg developed movable type, it took more than a century of development before it had an impact on society. In 1360, 1 out of every 100 Europeans could read, but by 1500, 80 out of every 100 could read. Gutenberg's invention democratized knowledge in the process.

Apple's near-term challenge is to create an ancestor of the tool that might be vital to us in the next century.

What is your vision of the 21st-century personal computer?

I developed a term, Knowledge Navigator, to describe it. While today's computers take users to the doorsteps of libraries and institutions, the Knowledge Navigator will drive us through them. By the 21st century, we will have the installed base to make the computer a mass personalized knowledge-based system. It will make incredible quantities of information understandable—and personalized. It will customize information automatically, because it will have the ability to "learn" about a user's habits and preferences. It will have the independent

(continues)
There's a new way to make stunning presentation slides for a fraction of the cost, in a fraction of the time, right in your office.

It's called ImageMaker. And it makes creating presentation slides as easy as showing them.

**Produce a $100 slide for 50 cents.**

With overtime charges, the simplest image from a slide service can easily run $100. But with ImageMaker, the most you’ll pay for a high-quality slide is around 50 cents—the cost of film and processing.

**Get finished slides in hours instead of days.**

With ImageMaker you can produce an entire presentation, from idea to projector-ready slides, in under four hours. And it's so easy to use that you, or anyone else, can quickly design professional-looking slides.

**Project the best image possible.**

ImageMaker slides are twice as sharp as most professional service bureau slides. And it allows you to work with a full range of brilliant foreground and background colors, three shading patterns, and your choice of many typefaces.

**Call 800-255-4574 (ext. 355)* for free sample slides.**

Also get our literature kit and a demonstration. Start making your slide presentations sharper, faster and less expensively. It'll turn you into a screen star overnight.

We are still at the machine-enthusiast stage in the personal computer industry.

ability to search databases and perform content analysis on information. It will do a lot to transform information into personally tailored knowledge, thus improving the payback of companies' investments in computers.

The physical appearance of the 21st-century personal computer would be more like a pilot's cockpit than today's machines. A large flat display screen might have navigational joysticks at both sides, allowing you to steer through menus, windows, and stacks. It will instantly accept or provide data in any mode you like: text, graphics, video, speech.

The key benefit of the Knowledge Navigator is that it will encourage learning and creativity. By the 21st century, intelligent information networks will make a world of knowledge much more accessible. Distributed databases will be widely installed. Brick-and-mortar libraries will give way to electronic ones. We will have superhighways of knowledge, and they will have as much impact on the American economy as the railroads did in the 1800s. The Knowledge Navigator will be the tool of choice for helping us understand better. It will be capable of helping us explore, connect concepts, and compare subjects.

Obviously, it will make learning experiences much more interesting for students. Not only that, but teachers will boost their own self-esteem because they will have more power to shape education. Students will be drawn into the educational experience, once it moves away from the mechanical, memorization-oriented path so many schools are on.

In business, the Knowledge Navigator will free the participants in the 21st century's dynamic global economy to spend a greater portion of time experimenting, simulating, creating, and innovating. In short, workers will be able to create more options for adding value—a crucial concern for the industrialized economies of the coming era.

Will you be the one to build the Knowledge Navigator at Apple?

My sense is that we are doing the right things in order to be able to build the 21st-century personal computer. I'm satisfied with Apple's direction, which is mostly what a CEO is concerned with. When I came here we were looking 2 to 3 years ahead; now we're looking 15 years ahead. We bring together people who have special talents—they don't have to be in computer science. But we want to attract the best people, like Jean-Louis Gassée, Larry Tesler, and others who know computers and have a commitment to this vision. That is how to build an organization that will make the Knowledge Navigator the legitimate descendent of the Macintosh.

Apple's current reorganization looks more extensive than the infamous one of June 1985.

Yes. We made as many changes in the first six months of this year as we made in all of 1985. The difference is that in 1985 we were in a crisis, and now we are changing to take advantage of our opportunities. It is part of our shift at Apple in the last two years, from selling primarily to consumers and educators to new areas of focus, primarily increasing business sales.

Many developers originally questioned Apple's intent to move Claris out onto its own. Are you actually accelerating the pace of independence for Claris?

We intended to do that from the start. It is a sort of prototype for things we hope to do. As opportunities appear, we will spin out businesses to fill gaps in the market that are strategically important. If Apple is to be on the leading edge, things in it and its infrastructure must change too. That's why we picked our executive vice-president and
How to give your 512, Plus, or SE the hard disk performance of a Macintosh II.

DataFrame highest performance drives.

The new Macintosh II features a disk technology called 1:1 interleaving for highest performance.

The DataFrame XP family of hard drives has delivered that same 1:1 performance, to any Macintosh, for over a year now.

Who needs faster disk performance?
Everyone. The faster the disk, the faster the Mac system. Faster program loading, faster operation, faster saves. You work faster, because you wait less. That's why InfoWorld concluded DataFrame's speed "shows just how good the Mac can be."

"... leaves the others in the dust." InfoWorld compared. After measuring the DataFrame to be significantly faster than the Macintosh SE internal hard drive, they went on to compare DataFrame to the fastest drive they'd seen for any computer. The result: "It left that pony in the dust, too."

InfoWorld's conclusion: "the fastest drive we've tested."

Loaded with great SuperMac software—including SuperLaserSpool and DiskFit. Says MacWorld, "SuperLaserSpool is the most complete and well designed spooler available for the Mac." And DiskFit earned the highest rating MacUser ever awarded a backup program.

Plus, True Portability. The same 1:1 interleave that makes DataFrame so fast also makes it truly portable. Swap it between any Mac II, SE, Plus, or 512—with full Mac II disk performance. No other drive offers this interchangeability.

No reason to wait!
Equipped with a DataFrame, your 512, Plus, or SE will outperform Apple's new, hard-drive SE. And your Mac II will perform to its fullest potential.

Visit your SuperMac dealer and see why over 25,000 DataFrame owners have moved into the fast lane with what MacWorld called the "Porsche among disk drives."

SuperMac Technology
295 N. Bernardo

Super your Mac!
Verbatim

The Mac II ranks as an industrial-strength product for desktop publishing.

some of our best middle management to direct the new company. They have hired people like Yogan Dalal, a codeveloper of the Ethernet protocols.

Why have you compared the computer industry today to the auto industry in its early years?

It's a good analogy. If you think back to the auto industry's early years, it was supported by machine enthusiasts and made a slow transition to a mass personal transportation industry. That occurred only after technology was made invisible to the user—like the automatic transmission. And gradually we created infrastructure—service stations, highway systems, services.

We are still at the machine-enthusiast stage in the personal computer industry, but in the next century we are sure there will be a transition to mass personalized knowledge-based systems. And that transition will happen only if the technology is invisible enough that the "drivers" have to think only about where they're going.

What do you enjoy doing when you're not working at Apple?

I draw and design. Since I was young I've had an interest in inventions. One of my first inventions—I talk about it in my book—was a color television cathode-ray tube with a single electron gun. That was in 1954. I had a patent application, but Dr. Ernest Lawrence, the inventor of the cyclotron, had a basic patent that covered much of the technology. So my application was denied. He filed his about two weeks before mine. He sold it to ABC-Paramount, which in turn sold it to Sony. Now that technology is the basis of their current line of Trinitron products. I was also a ham radio operator and built my own transmitters and other equipment.

Were you a boy wonder?

Well, a dreamer. I love learning. It's almost an accident that I ended up in business and marketing. At college I studied architecture and industrial design. If there had been a Silicon Valley when I was graduating from school, I'd have been here fast. That's another reason things with Apple worked out.

Desktop publishing has been lauded for some time, but companies attempting to use the current products as heavy production tools are finding that they're not so great. What is a realistic view of desktop publishing?

The reports we get for DTP tell us that there are no limits for the market. The Mac II ranks as an industrial-strength product for professional electronic composing, while the SE and the Plus can serve as personal text- and graphics-editing stations.

We are now seeing the second generation of desktop publishing software—there are new releases from Interleaf, Aldus, Letraset, and, in the area of desktop presentations, from Forethought. So the tools are approaching the quality of dedicated electronic publishing systems.

One System software area that needs some advancement is the graphical user interface—especially in light of multitasking system software like MultiFinder.

In the coming year people will see how the graphics environment is moving. We made a conscious decision to direct the early shipments of Macintosh IIs to developers so they can take advantage of its performance and be able to release a number of exciting new products this year. And at the same time, developers will announce improvements to solutions for the Macintosh Plus, SE, and II, so people will see how we're building on the technology.

FOR THE BEST SELLING ACCOUNTING SOFTWARE
LOOK FOR THE PEACHTREE LABEL

Get Back to Basics™

Peachtree's Back to Basics is the most popular accounting system on the market today. And it's no wonder why Back to Basics is simple to install, easy to use, and priced in line with what small businesses can afford.

But don't take our word for it. Software Digest, a leading consumer organization, rated Back to Basics number one in overall usability when compared to products costing as much as $995 and, for the past two years, Back to Basics has won the A+ Magazine Software of the Year Award for Macintosh business accounting systems thanks to the votes of over 20,000 Apple users.

No Experience Required

Back to Basics assumes you're an expert in only one business—your own.

- Installation of Back to Basics is painless — read only seven pages in the manual and spend 30 minutes using our screen menus.
- If you need to brush up on your accounting, use our accounting primer and tutorial, written by Harvard Business School Professor, Robert N. Anthony, plus our business section on how to handle everyday accounting dilemmas.

$199

Back to Basics Accounting System became a best seller priced at $525. Now, as a result of reduced expenses, we are able to offer all three modules — General Ledger, Accounts Receivable and Accounts Payable — in a complete set for just $199.

Proven Power

Peachtree has long been the first name in accounting software and the powerful features we’ve included in Back to Basics prove we understand what you’re looking for.

- Complete integration of General Ledger with Accounts Receivable and Accounts Payable.
- Single transaction entries up to $999,999.99 and year-to-date totals up to $21,000,000.
- Journals and reports updated as each transaction is recorded.
- Void transaction facility automatically creates reversing entry.
- More than 30 reports can be viewed on screen or printed.

Macintosh Specific

Back to Basics was written specifically for the Apple Macintosh, not simply converted from another computer version. It uses the Macintosh interface (mouse and visual icons) for system operation and groups functions into on-screen “file drawers” for organization and ease of use.

Back to Basics was a featured accounting system in Apple's Initial ads for the Macintosh and is backed by Peachtree's outstanding support, labeled by InfoWorld as “the finest in the industry”. Support is available as you need it, at a nominal charge directly from Peachtree or through our network of local authorized support centers.

Money Back Guarantee

When you purchase Back to Basics directly from Peachtree Software you're protected with a 30-day, money back guarantee (an option even the most expensive accounting products don't offer).

If you're not satisfied, simply return the complete product in saleable condition within 30 days and your purchase price will be promptly refunded. For full details, call the toll-free telephone number below.

Invoicing Coming Soon

Back to Basics Invoicing will soon be available for the Apple Macintosh at an introductory price of $95.

Hardware Specifications

- IBM Personal Computer, PC/XT, PC/AT with two floppy disk drives or one floppy disk drive and a hard disk.
- Apple II+ IIc, IIc, IIgs with 128K and two disk drives or hard disk.
- Apple Macintosh Plus with two disk drives or hard disk.

Features That Made Back to Basics a Best Seller

- General Ledger
- On-line help displays Chart of Accounts
- MTD and YTD show on income statements
- Allows automatic Journal entries
- Check processing and printing capability through Cash Disbursements
- Optional cash balance ranges
- User modifiable Chart of Accounts included
- Allows up to 3 checking accounts
- Up to 10 departments with separate income statements
- ACCOUNTS RECEIVABLE
- Calculates receivables on balance forward basis
- Prints statements and mailing labels
- Allows automatic posting to General Ledger
- Accepts partial payments
- Calculates finance charges
- ACCOUNTS PAYABLE
- Calculates payables on balance forward basis
- Prints statements and mailing labels
- Allows automatic posting to General Ledger
- Accepts partial payments
- Calculates finance charges
- Up-to-date customer information can be scrolled for review at any time
- Customer ID's can be alphabet or numeric
- Verifies customer credit limit
- Calculates up to 5 sales taxes per entry
- ACCOUNTS PAYABLE
- Up to 10 vendor accounts
- Provides standard and custom accounting reports
- Accepts partial payments
- Automatic posting to General Ledger
- Prints vendor mailing labels
- Up-to-date vendor information can be scrolled for review at any time
- Customer ID's can be alphabet or numeric
- Prints computer checks on standard or custom forms
- Invoices automatically or manually selected for payment

HyperCard will stimulate tremendous software development.

What are the implications of HyperCard for user programmability?

HyperCard is an extraordinary and innovative new Macintosh technology. It\textquotesingle;s really an erect set of authoring tools to allow both experienced and beginning programmers to organize information in highly intuitive and unstructured ways. It\textquotesingle;s part of the dream to make personal computing very, very personal. The product could have an impact more significant than Microsoft BASIC did in the '70s for the Apple II. Bill Atkinson worked on it for two years. His work resulted in a product that will promote a new way of organizing thought.

We hope it becomes a root technology that shows up in a very advanced form in our personal computers of the next century. It\textquotesingle;s already on a track that will make it a great development environment for CD-ROM.

How do MacApp and HyperCard compare?

When the Mac was introduced there was no easy way to program the machine. By making the Macintosh easy for users we had to make it harder for developers. It took a while before programming tools were available. You had to develop on a VAX or a Lisa to create Mac programs, a situation similar to Microsoft\textquotesingle;s OS/2 today. In the case of MacApp we took object-oriented programming, like Alan Kay\textquotesingle;s SmallTalk, and tried to make the process of programming better.

MacApp is an extension of application generators that employ the sort of concepts envisioned in SmallTalk for programming without code. Only icon representations on the screen are linked together. This is extremely attractive in that it decreases the time it takes to program the Mac. It gives access to the Tool box, which is extremely rich, with over 400 calls available to the developer.

HyperTalk is the language for HyperCard, which is a new metaphor for programming the Mac. The metaphor is stacks of cards, and each card can contain text, graphics, sound, or commands. You can link a card to any other card. This opens up a new group of people to ideas that have been discussed since Ted Nelson conceived Hypermedia in the 1960s.

It means that you can develop applications that let you use information in a natural way while taking advantage of the Mac\textquotesingle;s power. Opposed to using information in the way that the computer wants you to. All major breakthroughs in personal computing have shared this: they let you accomplish in a more efficient manner something you were already doing. My sense is that HyperCard will stimulate tremendous software development.

What about Apple\textquotesingle;s fax modem and other new products?

Adding those products is a clear indication that we are taking desktop publishing technology to higher levels. The long-term direction is to do everything from text design to the entire design process.

The fax modem we\textquotesingle;ve announced is an important component of our plan. It turns a Macintosh into a facsimile station, which moves documents around quickly. It\textquotesingle;s not always practical to put documents in a binder and send them by Federal Express; you need to transmit them over long-distance networks as easily as putting text in Telex or sending it over E-mail.

When we combine communications and desktop publishing so that their capa-

(continues)
Craftsmanship in the electronic age.

In today's computerized world, the concept of craftsmanship is still very much alive.

At Adobe, man and computer work as a team to craft type true to the original.

Because at Adobe, we still strive to meet time-honored standards.

A good example is the Adobe Type Library.

The Adobe Type Library is created in a modern setting, using sophisticated computer software. And

the people who perform this task are much like the "punch cutters" of another era... each letter in a type family is painstakingly examined, manipulated and refined until, at last, it's as close to the original as humanly possible.

Indeed, the human factor, even in a highly technical environment, is the

driving force in creating a type library that is true to the originals. Naturally, this takes time. But it's time well spent because you can be sure that each Adobe type not only looks and feels like the original, it reproduces perfectly.

Regardless of type size or resolution of the PostScript printer you use, Adobe type faces are always true to the originals, regardless of the resolution of your PostScript printer.

We often do not realize how much time is spent to achieve perfection. At Adobe, we spend hundreds of hours practicing an art that has been performed for centuries.

Craftsmanship does have a place in the electronic age. Because at Adobe we practice it every day.

Adobe Type Library for POSTSCRIPT Printers. The Original.

PostScript is a registered trademark of Adobe Systems Incorporated.

Programs & Peripherals

Pick of the Month

Canvas by Deneba Software

Canvas is an all-new graphics program that will revolutionize the way you draw. You can seamlessly integrate MacDraw objects, high resolution 300 to 2400 dpi images, PostScript and MacPaint graphics in a single document. Canvas supports all the capabilities of MacDraw and MacPaint.

ProModems by Prometheus Products, Inc.

ProModem 1200 and 2400 Baud Standalone Modems are exceptional products that do more and cost less. Standard features include: Hayes command compatibility, real clock/calendar, adaptive dialing, auto redial on busy, two phone jacks for easy switching between voice and data, auto answer/auto dial, and speaker with volume control. And, the ProModem is expandable! It can accept an optional Alphanumeric Display and a Communications Buffer that can automate routine modem tasks making it our choice for the "best buy" in modems!

MacKids Educational Programs by Nordic Software

MacKids is a complete series of twelve quality educational software products for the Mac, specifically designed to teach and entertain kids. Whether your children are preschoolers or young adults, there's a MacKids package that will give them the learning edge.

Preschool Disk 1 (3-7), Preschool Disk 2 (3-7), CoinWorks (4-12), ClockWorks (4-10), Early Elementary 1 (Ages 6-9), Lemonade Stand (6-10), FlashWorks (6-adult), Naval Battle (6-adult), Word Search (6-adult), Alphabetizer (7-adult), EarthWorks (7-adult), or Bodyworks (10-adult).

Numeric-Turbo by Cambridge Automation

Now you can cut your data input time in half. Numeric-Turbo, a new high-speed input device, combines the fast response of a track-ball with a full-scale numeric keypad. It includes cursor keys and direct function keys, so you no longer have to use Control or Shift on the Mac keyboard for function entry. Upgrade your Mac 512/128K with Numeric-Turbo to equal a Mac-Plus with the convenience of a track-ball.

Numeric-Turbo $99.

SYSTAT 3.1 by SYSTAT, Inc.

SYSTAT 3.1 is the most comprehensive statistics package ever written for the Macintosh. Most Mac statistical packages call themselves "professional" or "comprehensive" but, feed them some real problems, and you'll discover how toothless they really are. They can't do multivariate procedures, analyze time series, fit nonlinear models or compute large multi-way crosstabs. That's why, if you're serious about statistics, sooner or later you'll end up with SYSTAT 3.1.

SYSTAT 3.1 $459.

ComServe by Infosphere

ComServe is a modem sharing application that transparently runs in the background of a Macintosh. It allows you to offer telecommunications services to everyone on your Appletalk network. With AppleShare compatible ComServe, you no longer need a modem at each Macintosh (with all the wiring jungles and line charges) to gain network-wide access to moderns, mainframes and minis. Clone your modem now with ComServe and eliminate the need for costly dedicated hardware!

ComServe $125.

Laser Fx by Postcraft International Inc.

Laser Fx is a one-of-a-kind utility program for desktop publishing. It allows you to take any Postscript font and use the 30 special effects included to create dazzling typographical triumphs. You can rotate, skew, shade, shadow or outline text. Choose to print directly from Laser Fx or paste into Quark XPress, Ready, Set, Go! 3, Page Maker 2.0 and most others. You can use any PostScript font, either downloadable or resident in your Laser Printer, to create effects that add extra pizzazz to your communications. With Laser Fx your desktop publishing will never be the same!

Laser Fx $119.

MacMoney by Survivor Software Ltd.

Do you know how much you spent traveling so far this year... how much that dog has cost you... whether your company has reimbursed all those business expenses? MacMoney answers these questions easily. All you have to do is enter checks, deposits, credit card purchases and cash transactions. You can enter these transactions and disburse the amounts over up to eight categories, print checks, print reports or export information for further analysis. With MacMoney you can create a simple or complex system - you're the boss - it's your money.

MacMoney $41.

### Phenomenal Prices...
DOS machines run 30 minutes per day, while the average Mac is used 2 1/2 hours a day.

Several products are missing in action—a color monitor, UNIX, and others. What's going on?

We introduced so many products this year that it's amazing we got as many out on time as we did. The good news is that the new Mac is so well received and supported by third parties. So if we are short of our own color monitors, there are still third-party products available.

UNIX is delayed only by a few months. UNIX is so important that we need a version that's representative of our style of products. No third party has ever before created a simple version of UNIX: maybe that's why there are only 250,000 copies of it running in the world today. We think the real excitement is in bringing good technologies within reach of more people.

For a long time Apple discouraged talk in the press about the Macintosh in the consumer market, yet more than half of our readers have a Mac at home. Has this policy changed?

We have made a major effort to ensure that people don’t have a misconception about the Mac. If it is viewed as a toy, that hurts the availability of powerful applications. We look at the home as a place where the Mac is used, not at the Mac as a home computer.

How have large companies taken to the Mac?

Well, we recently completed a study of how our computers are used in business. We found that on the average, DOS machines are used 30 minutes per day, while the average Mac is used 2 1/2 hours per day. The average DOS user runs two applications while the Mac user runs six.

We also found that others see the importance of our consistent user interface, where all functions such as Cut and Paste, Copy, Print, and so on are the same in each application. Companies understand that training is a large part of total computer cost, and our consistency tends to reduce training time. We got into the business market with the Trojan horse of desktop publishing; once inside, we’re being accepted for other things because users prefer the Mac.  

Interviewed by Jerry Borrell
Denmark rethinks the computer table...

The original MacTable was the perfect place for a Macintosh. Then the Macintosh changed shape. So we thought about it again and built a new one.

Introducing the all-new MacTable. Perfect form and function for the entire Macintosh family.

One table fits all
The new MacTable fits every Mac made, be it 128, 512, Plus, SE, or the Macintosh II.
It has a place for everything. Hard disk, second drive, modem, keyboard, mouse, ImageWriter, and LaserWriter. Plus a carton of paper. Yet even with a full complement of gear, there's room to spread out for serious work.

Every surface interchangeable
Each of MacTable's four surfaces can be independently tilted — and interchanged! You can even make it right or left handed. So it accommodates any peripheral you'll ever have at comfortable working and viewing angles.

Stands the test of time
MacTable is meticulously built in Denmark, by craftsmen using pure beechwood and durable laminates. Its new, sturdy design and quality materials support even the heaviest equipment. And MacTable is now a new color: Platinum Gray, same as the new Macintosh line.

Matching roll-away cabinet
The new free-standing cabinet (optional) is big enough to use as a stand for your LaserWriter or CPU. It features easy-glide casters, space for full-size binders, and a special place in the locking drawer that holds over 100 disks upright and secure.

New lower price
The new MacTable also has a new price. Just $269. Add the sturdy, matching cabinet for $120 more (all prices plus shipping and handling). And if you're not satisfied with MacTable for any reason, return it for a prompt refund (less shipping).

Before you buy an ordinary table for your Macintosh, think again. Then choose the Danish solution. The new MacTable.

Cabinet becomes platform for LaserWriter. Holds disks, manuals, and a full carton of paper.

...again.

The New MacTable®

To order your MacTable or for more information call:
TOLL FREE 1-800-722-6263

Circle 400 on reader service card
Sign up for
MACWORLD Expo / San Francisco
January 15-17
Moscone Center.
And step on it.

Hail the nearest taxi and roll on over to MACWORLD Expo / San Francisco, the original Macintosh computer show.

Test drive an extraordinary array of hardware, software and peripherals firsthand. Weave in and out of traffic. Stop at hundreds of exhibits. Attend dynamic seminars and workshops run by industry experts. Tune up your Macintosh skills. And more.

In three days, under one roof, you'll pick up tips, tricks, techniques, do's, don'ts, how-to's and what's news that would otherwise take weeks to collect.

And if you register before December 15, 1987, you'll save $5. Enough to pay for cab fare. Keep your hands on the wheel, Mac.

MACWORLD Expo / San Francisco is a hands-on, do-it-yourself show. It's exciting. It's challenging. It's fun. And it's fruitful.

Create professional-quality business graphics — on the spot. Compose your own newsletter, ads and brochures. Try your hand at desktop engineering and design. Send or receive messages from Mac to Mac. Witness the power of the latest Mac programming environments. Do all this and more in just three short days.

There's something for everyone.

It doesn't matter whether you're a seasoned hack or just out for your first drive. After three days, you'll be chock full of information on what Macintosh can help you do. In the office, in the lab, at school or at home.

Hail the nearest taxi and roll on over to MACWORLD Expo / San Francisco, the original Macintosh computer show.
Francisco by December 15
for cab fare.

There’s literally something for everyone — including special programs on computer-aided design, business graphics, communications, desktop publishing, education, programming with Mac and then some.

Taxi, anyone?

Avoid long lines at the door. Register now for this exciting three-day conference. And save $5.

Simply fill out the coupon and send it with your check for $35 (or supply credit card information) to the address listed before December 15, 1987. Onsite conference admission is $40. And no credit cards or checks will be accepted at Moscone Center.

This low $35 fee allows you to visit all exhibits and attend all seminars. If you just want to visit the exhibits, admission is $15, payable only at the door.

To register additional people, just copy this form and complete it for each attendee. For group and student rates, please call 617-329-7466 by December 10. This form must be received by December 15. After that, you must register at the show. All registrations are non-refundable.

Don’t miss out on this opportunity to take a free ride. Register now and save $5.

HERE’S A BIG TIP. REGISTER BY DECEMBER 15. AND SAVE $5 — ENOUGH FOR CAB FARE.

☐ Yes, I want to pre-register for MACWORLD Expo/San Francisco, January 15-17, 1988 at the Moscone Center. Please send my badge to:

Every place you look you’ll see rave reviews. Why? Because Cricket Draw has created a new state-of-the-art in Macintosh drawing technology.

**Spectacular Special Effects**
Cricket Draw’s most universally acclaimed capability is its special effects generation. A quick glance at the example at left will give you a feeling for what can be accomplished with a little imagination and Cricket Draw. Graded Tones (fountains), Shading, Text on any path — all these effects and more are simple with Cricket Draw.

**For Creators**...
If you use your Macintosh to create graphics, then you certainly want the industry’s most comprehensive set of drawing tools. You want the industry’s most advanced text manipulation tools. And you want the ability to take full advantage of PostScript equipped devices. With the Power of Cricket Draw, you can finally unleash your true creative potential.

**For Professionals**...
Graphic Arts? Desktop Publishing? Cricket Draw allows you to create prescreened, camera-ready art, complete with typeset copy.

---

**THE FIRST FAMILY OF GRAPHICS**
When it comes to Macintosh graphics software, there’s just one name to remember — Cricket Software. Your local dealer will be happy to introduce you to the entire family: Cricket Graph, Cricket Draw, Cricket Presents, and Cricket Device Drivers.

---

Printed with an Apple LaserWriter™
Ivy League Mac Graphics

Yale University, which boasts one of the top graphic design schools in the country, had a lot of choices when it came to selecting computers for its graduate school of art. According to Alvin Eisenman, who heads up the school's graphic design department, after four generations of graphic arts technology, the design school adopted the Mac for its low cost, its high-quality performance, and its WYSIWYG capability.

The department's students design logos and typefaces using Fontographer. Artwork is created with Adobe Illustrator; layouts are designed with QuarkXPress, and special effects are created directly in PostScript. Comprehensive sketches are printed on a LaserWriter, and camera-ready copy is sent to a Linotronic Imagesetter for high-resolution output.

Although anyone can load Illustrator or XPress, Eisenman feels that these sophisticated tools are not self-explanatory: it takes artistically inclined individuals to produce snappy looking documents using the newly available canned layout formats.

Eisenman also maintains that design offices want to hire graduates who know how to use this type of computer equipment, and that there is a great demand to teach professional designers how to use it. That's why Yale hosts a weeklong summertime seminar attended by alumni who head up New York's top graphic design firms.—Stuart Silverstone

Managing Files
the Fast Way

Now there's a way to deal quickly with all those files without having to return each time to the Finder. DiskTools Plus, a package of productivity tools enhanced and reborn at Electronic Arts, can perform almost all the functions of the Finder and offers some additional features as well. You select your files from a scrollable list and then click the appropriate icon according to what you want done to the files.

You can launch, delete, move, copy, find, rename, get info on, get sizes of multiple files, and even unmount your second hard disk and later remount it—all from within your application. Several DA's can perform most of those functions, but they can't rival DiskTools' ability to create a home base similar to the Finder. For instance, dealing with icons instead of just buttons really helps you feel as if you're in the Finder, and the implementation of a new window-management environment increases productivity.

Unlike standard files, DiskTools remembers exactly how many folders deep you are when you switch between volumes. It even remembers the exact scrolled position of your files list when traversing back up through the hierarchy of folders.

You can also launch your favorite documents and applications from a special customizable Quick Launch window. Or try this: select five different packed documents from one folder and press Return. DiskTools will launch Packit automatically and unpack all the documents.
We were ready for the Mac II almost before they were.

INTRODUCING THE NS8/16 MEMORY EXPANSION BOARD FOR THE MACINTOSH II

National has been providing high-level add-in products for over a decade. We've helped well over a hundred thousand multi-tasking, multi-user business environments run faster and better. So even before Apple was ready with the new Mac™ II, we were ready with the expertise and technology to help it work harder.

In fact, we viewed the Macintosh™ II as an 'open' invitation to provide power users with the right tools. And now we're proud to introduce the NS8/16 Memory Expansion Board.

GET 4, 8, 12, OR 16 MBYTES OF RAM FEATURING:

- Apple/UNIX® (A/UX) compatibility.
- RAMdisk software.
- Advanced NuBus™ support.

AND RUN A/UX MORE EFFICIENTLY

High-end applications will run at top performance levels under A/UX. Without modifications. And the NS8/16 remains completely transparent to the user.

In the Macintosh II operating system, the RAMdisk utility allows an application to treat the NS8/16 as one, or a series, of pseudo disk drives, accessing files at NuBus memory speeds.

So memory intensive applications will go much faster. As will switching between applications.

ALL WITH QUALITY AND SUPPORT YOU CAN Rely ON

Get a full 5-year warranty on the NS8/16. Backed by the leader in memory products. And customer service. National is the company you should think of for add-in products. Now, with our NS8/16 Memory Expansion Board. And in the future — you can expect to see a whole line of add-in products for the Mac II.

It's experience that lets us make a promise like that. So now that you have the Mac II ready to run, you know who can help you see how far it can go.

OUTSIDE OF CALIFORNIA CALL 800-538-8510

Circle 196 on reader service card
Macworld News

To accomplish all this, author Evan Gross (who also wrote the popular spelling-checker DA Thunder) has completely rewritten the standard file interface so it works much more intuitively. As a result, we now have a powerful DA for file management that is fast, easy, and fun to use. For more information, call Electronic Arts in San Mateo, California, at 415/571-7171.— Rob Habu

PC Experience Pays Off

Tecmar offers something different with its new QT-Mac 40 MB tape backup: the expertise gained from becoming a leader in tape backup systems in the MS-DOS world. One result of this experience is Tecmar’s reliance on the QIC-100 recording standard, which features high-level error correction.

According to Gene Della Torre, director of Tecmar’s new Apple Products Division, the external QT-Mac 40 gives Macintosh users all the benefits of Apple’s cartridge tape unit in a portable system at an affordable price. The $1395 device connects to the Mac Plus, SE, or II through a SCSI interface and features both mirror-image and file-by-file backup. Also available from Tecmar is the Lab Master II, a $1250 board for the Mac II that performs analog-to-digital signal conversions.

Tecmar has a series of other products under development, including an expansion chassis for the SE and the Mac II. This external box will provide extra slots and thus the ability to install additional floppy drives, hard disks, and tape backup systems. The company also plans to supply graphics and multifunction boards for the new machines, as well as boards dedicated to scientific data acquisition and industrial control and monitoring. Tecmar expects the Mac II to be used in growing numbers in the latter two areas.

For more information contact Tecmar, 6225 Cochran Rd., Solon, OH 44139, 216/349-0600.— Karen Sorensen

Desktop Construction

Equipped with his desktop CAD system, Tom Smith designs and builds ultra-energy-efficient houses. While the Mac helps Smith to draw faster and be more organized, it benefits him most by improving his design capabilities.

With the Mac, Smith and his clients can examine, change, and refine plans until they get the house looking and functioning exactly the way they want it. Smith’s clients stay involved with the Mac-generated plans longer than before, when he showed them paper blueprints.

When the design is completed, Smith uses ReadySetGo to put together a specification book. The document includes everything from blueprints to brick patterns, so that the customer can show off the soon-to-be-built home. In addition, Smith uses the Mac to display his portfolio of designs to potential clients.

How did this architect begin his Macintosh adventure? Smith originally bought the Mac to write a book describing his architectural philosophy. From preliminary drawings and blueprints prepared as illustrations, Smith progressed to using the Mac for working blueprints, order forms, job controls, and client letters. With the help of Dick Bishop, CAD specialist at Custom Computer Specialists of Hauppauge, New York, Smith put together his CAD system.

Smith’s hardware now includes a Mac Plus, a HyperDrive FX/20, a Radius Full Page Display, a LaserWriter Plus, and a Hewlett-Packard DraftPro Plotter; he uses MacDraft, ReadySetGo 3.0, FileMaker Plus, and Excel for software.

You can see the results of Smith’s Mac-oriented architecture in his book Tom Smith’s Common Sense Architecture, which will be released next spring by Random House.— Brita Meng

MIDI Standard Proposed

A MIDI file format was formally proposed to the MIDI Manufacturers’ Association (MMA) at the June trade show sponsored by the National Association of Music Merchants (NAMM).

Offering the standard was Dave Oppenheim of Opcode Systems, who has been developing the new file-transfer format for the past year, in association with other MIDI developers.
Power to see your best.

The 827,392 pixel window of opportunity

If you are a designer, engineer or a professional in business, marketing or sales you have probably discovered you can work faster and communicate better with a Macintosh.

Add The Big Picture™ from E-Machines and you open new vistas of power. Here is the opportunity to see your best work unfold. The Big Picture™ displays a 1024 by 800 pixel desktop that shows you over four and a half times more information than the standard Macintosh screen, or almost three times as much as either of the optional screens for the new Macintosh II.

Engineered to be the most Macintosh compatible

The Big Picture™ is the ideal large screen for your Macintosh. We have carefully designed and engineered all the major systems from the ground up. The hardware, the software, the ergonomics. Because we designed it right, from the start, following all the Macintosh rules, you get the most Macintosh compatible large screen monitor on the market.

The Big Picture™ supports all standard Macintosh software. Plus, it's compatible with the leading high-performance add-ons. Like Hypercharger-020™ from General Computer and TurboMax™ from MacMemory; products from Levco, Dove, and more.

In fact, one of the most tangible statements about E-Machines' commitment to engineering quality can't be seen on the screen at all. You have to look behind The Big Picture™ to see the FCC "B" certification stamped right on the back.

That's the highest rating attainable. Rather than settle for the easier to get Class 'A' certification, we pushed ourselves for excellence. Class "B" demands rigorous engineering and is reserved only for products that exceed tough standards. Products like The Big Picture™ and the Macintosh.

The Big Picture™ is upgradable to work with any Macintosh

The Big Picture™ is available now for all Macintosh models, including the new -SE and -II. And it's good to know that The Big Picture™ you buy today can be upgraded to work with the Macintosh you may buy tomorrow. Even if you have your sights set on one of Apple's new "Open Macs" or portables from Dynamac™ and Colby™.

See for yourself

Ask your Apple® dealer for The Big Picture™. Dealer installation is quick and easy. There's no drilling or soldering which keeps your Macintosh neat, clean and portable as ever. The Big Picture™ and Macintosh. The power to see your best.
Creates proprietary files.

Two sequencers and two editing tools are being offered by vendors to those who would like to create their own music files.

Proponents of the standard envision three file types: single-track multichannel, like a cassette of a song; n-track parallel, where data is separated; and sequential multichannel. This last format divides a sequence into verses and choruses, the way MIDI hardware often handles a song.

Mac-MIDI software vendors seem to love the proposed format. Already, Intelligent Music's Jam Factory and M read and write the new MIDI files.

Southworth Music Systems' MIDI 1 and One-Step will read them but won't write them "until the proposal is locked down by the MMA," according to Apple's participation has been minimal. In Cupertino, Steve Milne of the Music Engineering Group reports that the most demanding graphic applications.

A case in point is a new program called The Lithographer from Knowledge Engineering that can produce magazine-quality half-tone prints using a typesetter. The Lithographer raises the Mac's graphic output from newspaper quality to magazine quality by taking full advantage of the Macintosh II's ability to display gray levels on the screen. Combine that important function with automatic and mouse-controlled editing tools and you have a kind of electronic stat camera, according to Bill Bates, president of Knowledge Engineering.

This computerized stat camera takes highly detailed scanned images and generates dense bit-mapped images for a typesetter. The Lithographer's output is not PostScript but a pixel-by-pixel representation of the picture. While a bit-mapped image may require much more memory than a PostScript representation, it means that color separations can be rotated without creating the moiré patterns typical of PostScript, claims Bates. (Adobe says moiré patterns can be prevented through standard techniques.)

It's also possible to create mezzotints, using textured screens, etchings, and posterizations.

Out of the Closet

Now your Macintosh SE HD20 can safely stay on your desk at night instead of being relegated to a locked closet for protection of its internal data.

Home users of an SE might not be so concerned about theft or alteration of data, but publishers, government agencies, and big banks are especially interested in data security, explains Harry Sweere, SWS chief executive officer Bill Southworth. The Japanese MIDI Standards Committee must also approve it. There's a glimmer of Macintosh piracy in one coder's comment: "We just got tired of sitting around and waiting."

Apple's participation has been minimal. In Cupertino, Steve Milne of the Music Engineering Group reports that the most demanding graphic applications.

A case in point is a new program called The Lithographer from Knowledge Engineering that can produce magazine-quality half-tone prints using a typesetter. The Lithographer raises the Mac's graphic output from newspaper quality to magazine quality by taking full advantage of the Macintosh II's ability to display gray levels on the screen. Combine that important function with automatic and mouse-controlled editing tools and you have a kind of electronic stat camera, according to Bill Bates, president of Knowledge Engineering.

Instead of This...  You Can Do This...

MAKE EXCEL EASIER — AND MORE POWERFUL
Now you can have your own on-disk library of shortcuts, utilities, keystroke savers and mousestroke savers that will work with ANY Excel worksheet. No more dull, repetitive operations, no more pulling down and clicking through multiple menus, no more hours wasted with manual input that could be automated.

Introducing the ultimate collection of 101 pre-typed, ready-to-use, all purpose macros on disk. Imagine being able to:

- Automatically double space and print a worksheet
- Set up and maintain data bases with a single command
- Create slide show presentations
- Add menu-driven financial functions
- Automatically overlay and clean up all the worksheets on the screen with a single keystroke

- Plus 96 more features to save time and multiply the power and ease-of-use of Excel.

With 101 MACROS FOR EXCEL you can save keystrokes & mousestrokes, save menu steps, save time and automate your worksheet. Whip through complicated menus and worksheet setups with a single keystroke. Eliminate repetitive operations with macros that will move down columns or across cells, changing each cell to your specifications. Operations that previously required several mousestrokes, like swapping columns or inserting rows, can now be done with single keystrokes.

With This. $69.95 Suggested Retail

ELIMINATE FRUSTRATION
How many times have you had to go back to the manual to learn how to do some simple function that seems overly complicated in Excel? How often have you wasted through charting, database operations and building tables? How often have you wished that you didn’t have to wear out your arm reaching for the mouse to perform just about every operation? The macros in 101 MACROS FOR EXCEL help you out with everything from simple mousestroke and keystroke savers, to sophisticated, interactive macros which “walks you through” more complicated Excel operations.

EASY TO USE
These macros are extremely easy to use. Just load the macro sheet called 101 into Excel and you’ll have all 101 macros available for instant use at any time.

By pressing the option key, the command key and a single letter you can insert new rows that copy data automatically. Or enter long phrases instantly. You can even toggle the gridlines and headings on and off with a single keystroke combination.

EASY TO LEARN
101 MACROS FOR EXCEL comes complete with a comprehensive, step-by-step manual that includes a short tutorial chapter and explains each of the macros and how to use them. The macros are fully documented, so they’re easy to review, change and learn from — which gives you an excellent starting point for writing your own custom macros.

FREE!
HANDY REFERENCE GUIDE
Act now. For a limited time you get not only a complete collection of 101 macros with User’s Manual, you will also receive a handy reference guide listing all 101 macros and their call-up keystrokes.

### Filling the Interface Gaps

**Ever say to yourself, “There must be an easier way?”** Well, so did Loftus Becker, Jr., who by now has probably written more small utilities for the Mac than anyone else. Now thousands of Macintosh users are enjoying Becker's shortcuts.

One of Becker’s first contributions was showing us how to reconfigure our keyboards using *Feedit*—a technique he popularized on various telecommunication services.

This System hack was the precursor to Becker’s popular and free DA *ToggleKeys 1.03*, which allows the typing of commas and periods while in shift mode by eliminating the `<` and `>` symbols. Want those symbols back? Just select *ToggleKeys* once again.

Becker went on to release two commercial programs: *ToggleKeys Fkey 1.31*, and *Keyboard 1.0*, which can reconfigure the entire keyboard. Both products are being revised for the new System and will be shareware offerings in their new incarnation.

Next, Becker wanted to use both fonts and DAs while working in any application. So he wrote two shareware contributions called *Other...* (version 3.09, $10) and *Fontsie* (version 3.06, $10), which can run DAs and fonts stored on a disk.

In a similar manner, Becker’s DA Key 2.15 ($10) allows DAs to be run from a file by invoking an F-key. Another DA, Launch DA/Fkey 1.4, a free F-key, takes the matter further. It instantly creates a window for typing the name of any installed DA or F-key, which is launched as soon as a unique match is found—often after you've typed only a few letters of the name.

By now you might be wondering how to use all these F-keys, given the Mac’s standard limitation of eight new F-keys. Becker’s FKey Runner 1.01, a commercial desk accessory, comes to the rescue by allowing numerous F-keys to be run from a menu.

One of Becker’s more complex programs is *Time Logger 2.11* ($15), a shareware DA that tracks how the Mac is used. It works automatically or manually and has many optional features, including the capacity to save records to any number of files.

*Change Appl Font* (1.03), a desk accessory, sets the default fonts and font sizes of documents.

Other valuable and free contributions from Becker prepare messages for upload to online services. *ClipperKey* 1.5 and 1.6, F-keys that format text files by inserting or stripping carriage returns, also monitor line length and number of characters and operate invisibly through keyboard commands.

When not adding to the Mac’s capabilities, Becker teaches law at the University of Connecticut, where he specializes in criminal law, constitutional law, law and psychiatry, and computer law.

### JClock’s Author Wins Timely Award

“*It’s so universal, everyone uses it. Not only that, but it never bombs,*” said Rebecca Waring, codirector of the Boston Computer Society (BCS) Mac user group.

With those words, Waring explained why Jim Sulzen, author of *JClock*, a small utility resource that puts a little digital clock in the Mac’s menu bar, received a $500 grand prize award from the 3000-odd members of BCS Mac, following the July ballott.

Sulzen, who was director of the

Ten thousand pages, take it or leave it.

For those of you going places, here's a little something that solves big storage problems in the time it takes to say "who has the Farnsworth financial files?"

Introducing Totem™

A rather revolutionary Bering 20 mb Bernoulli compact disk drive system for Macintosh computers. And, the first truly portable 5 ½" system. One that lets you tote around 10,000 pages of data on a sleek cartridge about the size of a piece of bread.

Translated, that's 25 times the storage you get on one standard floppy.

Yet unlike floppies, the Totem is no slouch for speed. It's just as fast as a hard disk. In fact, your computer will think it's a hard disk. You can even share it with co-workers. And its advanced Bernoulli aerodynamics make it resist head crashing. If you've ever used hard disks, you know what a pain that can be.

But the real beauty of Totem is that it fits perfectly right under your Mac. No mess. No fuss. And no extra hardware to buy. To add storage, just pick up another Totem cartridge.

Last, but certainly not least, there's a whole family of Totem drives to choose from. They're all in the brochure. To get yours, write or call Bering Industries, Inc., 280 Technology Circle, Scotts Valley, CA 95066. Inside California, call 800 533-DISK. Call 800 BERING 1 outside California. Just say "I'll take it."
BCS Mac technical group, before moving to California two years ago, took the award at the August Macworld Expo in Boston.

BCS members also voted for four runners-up, who received $250 awards: Gil Beecher (author of DiskStop DA); Steve Brecher (author of PowerStation, Da Mob, WayStation, and Regress); Harry Chesley (author of VCO and Packet); and Itty Bitty Software (actually a company, creator of AutoBlack).

They join an elite group of previous winners that includes Bill Atkinson (creator of the Toolbox, MacPaint, and HyperCard), Scott Watson (Mr. Red Ryder), Charles Maurer (designer of the Boston II font for the ImageWriter), and John Raymonds (author of The Dungeon of Doom).

The BCS awards honor contributions to public domain and shareware programs for the Mac. The awards recognize those who have written significant programs and those who serve the computer community—for example, by assisting users over telecommunication services like CompuServe and AppleLink.

Contest rules currently state that previous winners cannot be nominated, but BCS is starting to run out of nominees. Consequently, the BCS Mac group may open up nominations to previous winners, based on new services to the public domain/shareware community. Another option, according to Rebecca Waring, is to award only two prizes and increase the award money. —Brita Meng

Plain-Paper Typesetters

Apple's LaserWriter set new standards for written communication and spawned a new industry: desktop publishing. But it took Linotype's Linotronic electronic typesetters equipped with the PostScript page-description language to give Macintosh users access to typographic-quality printing.

Over the past couple of years, more than a dozen competitors have emerged for Apple's LaserWriter. Now the high-end laser printers, such as the Linotronic printers, are being challenged.

For instance, the Varityper VT600 plain-paper typesetter includes the PostScript RIP (raster imaging processor) and a built-in 20MB hard disk in its list price of $18,750. Varityper claims the VT600's processing speed is two to four times faster than the LaserWriter's, and its 600-dpi resolution is twice the LaserWriter's.

The Varityper VT600 boasts 600-dpi resolution.

Color Printing Now

People inevitably say, "That color looks great on your Mac II screen, but what can you do with it?" While the ultimate solution, a color laser printer, may be a year away, alternatives are available now.

For instance, there's Hewlett-Packard's PaintJet, a $1395 inkjet printer offering a resolution of 360 dots per inch (dpi), which is superior to the ImageWriter's 144 dpi but not equal to the LaserWriter's 300 dpi. The PaintJet is much quieter than most dot matrix printers and prints at a respectable 167 characters per second.

HP has been careful to make this new printer available to Macintosh users; a driver is required to make it Mac compatible. Some Macintosh programs, such as Cricket Draw and Cricket Graph, already include PaintJet drivers, but a generic driver will soon be available from Softstyle Solutions of Honolulu. Connection is through an RS-232C serial port.

Another alternative is Shinko's $4500 thermal printer, which outputs on special paper. Although its 200-dpi resolution can't match the LaserWriter, Shinko's printer has found wide acceptance as a color-proofing machine for desktop publishing, and for making overhead transparencies.

The Shinko printer is distributed by Computer Friends, a company closely related to Reed College's computer development lab in Portland, Oregon. The Reed lab is building links between the Shinko and the Macintosh by releasing a parallel port card for the Mac II ($299) and a software package that includes a printer driver and poster-design capabilities ($399).

Another candidate is Apple's new ImageWriter LQ, which comes with a 27-pin print head that delivers up to 216-dpi resolution with a speed of 250 characters per second in draft mode. A four-color ribbon gives the LQ its color printing capabilities. At press time, the LQ was expected to cost between $1300 and $1500.

Full-color laser printers are being designed by Japanese firms such as Canon, Ricoh, Toshiba, and Sharp. But an American company, Coloroces Corporation, may be the first to market a full-color printer in the United States. Coloroces has reportedly demonstrated a four-color printer with 300-dpi resolution and a speed of 10 pages per minute (ppm)—42 ppm in black-and-white mode. It's expected to cost at least $10,000.
It used to be that Macintoshes and PCs were like oil and water.

But 3+ for Macintosh changes that. As the newest member of our 3+ network software family, it's the first product to integrate both Apple and IBM networking standards on one server. Not to mention the first network product other than Apple's to adhere to the new Macintosh standards.

For you, this means another significant first: genuine transparency.

Now your Macintosh and PC files can actually reside in the same Macintosh folder and PC directory. And coexist with AppleShare servers on the same network.

3+ for Macintosh also works with the whole new generation of Macintosh multi-user applications and products. Like the ACIUS 4th Dimension database and THINK Technologies' InBox electronic mail.

Better still, you enjoy more network services than anywhere else. Like network administration right from your Macintosh. Connectivity to Ethernet, Token Ring, and AppleTalk networks. Electronic mail gateways to MCI Mail and DISOSS systems. And internetworking and remote capabilities that allow you to grow your network as big and powerful as you want.

That's why you should call 1-800-NET-3Com for your nearest 3Com dealer.

After all, when it comes to networks, 3+ for Macintosh is the only one that truly passes the screen test.
In terms of resolution, the VariType is midway between the LaserWriter (300 dpi) and the Linotronic 100 (1200 dpi). For many typesetting uses, this will be adequate to produce camera-ready copy.

The increased speeds come from advanced electronics, and the higher resolution is possible because of an ultrafine toner. The VariType can be connected into a Macintosh system through AppleTalk or an RS-232C port.

Another challenger: Printware’s laser printer, which is packaged as two discrete units, the 720 IQ Laser Imager and the 1200 HD Image Processor. Both are required for operation. Printware will probably already have introduced its own PostScript processor, PrintScript, by the time this is published. PrintScript will be available as a board for Printware’s Image Processor, adding $2000 to the price of the unit.

Including a 20MB built-in hard disk, the total price of the Printware package will be about $17,000. The printer has 1200- by 600-dpi resolution now, with expansion to a full lines-per-inch film unit. The output can be transferred directly to the printer’s plate.

Because of the relatively high price of these plain-paper typesetting machines, those not doing daily typesetting will probably use them through service bureaus.

For the desktop publisher, these machines have bridged the either/or choice between LaserWriter quality and typesetter quality. You can choose the printer for your project on the basis of speed, cost, and quality. For more information call Tegra in Billerica, Massachusetts, 617/663-1449; VariType in East Hanover, New Jersey, 800/423-1829; and Printware in Mendota Heights, Minnesota, 612/454-9522.

—Scott Beamer

HyperCard

Latches

VideoWorks

HyperCard is now grabbing programming hooks strategically placed inside the latest version of VideoWorks. The result: a seamless transition that makes the two programs act as one. It may start an important new trend.

Picture the two programs working together. You sit down to a 19-inch color monitor mounted atop a Mac II. You begin a training program about the human circulatory system. You open up a HyperCard-based program that includes imaginative graphics to make the presentation fun.

Using HyperCard, you select a tour of the human heart. As soon as you release the mouse, you’re on a sleigh ride through a major vein. You come shooting toward a closed heart valve. It opens just in time, and your colorful tour of the human heart has begun—if your own heart hasn’t quit in fright.

This kind of training and educational software is possible because MacroMind has designed its VideoWorks program to work hand in glove with HyperCard, the revolutionary program by Bill Atkinson of Macintosh Toolbox and MacPaint fame. HyperCard is now packaged with every new Macintosh and is available at Apple dealers.

“HyperCard is the fulfillment of a five-year-long dream about the capabilities of the Macintosh system,” said MacroMind president Marc Canter. “In this case, it’s what makes our VideoWorks interactive.”

Citing another example of interactive software, Canter described a disk-based software manual. As the user seeks help, various selections prompt VideoWorks to simulate how the actual program works: the cursor moves, fonts change, and files open and close.

Canter expects that thousands of educational and training programs will be written using HyperCard, because it provides a scripting language that’s relatively easy to implement—something that’s been long awaited by software developers.

VideoWorks has its own authoring language, which Canter hopes will also become a standard. “To help that process along, he’s giving away the ‘projector’ that makes VideoWorks run during an application. (You’ll still have to buy the program to create the movie.)

“I know a few developers don’t like HyperCard because it can replace some of their programs, especially the DAs. But for every ten developers that go out of business, hundreds will take their place using HyperCard,” said Canter.

For more information about VideoWorks, you can contact MacroMind in Chicago at 312/871-0987.

Word Finder Arrives

Microlytics' Word Finder, one of the most highly regarded thesaurus programs for the IBM PC, is now available for the Macintosh.

What makes this DA special, according to Microlytics president Mike Wiener, is not only its speed and the large number of synonyms it offers, but the fact that it functions in a rich and entertaining manner. For example, Word Finder lists 80 synonyms for the word sexy. The program also lets you look up synonyms for any word in the synonym window, ad infinitum.

Once you select Word Finder from the Apple menu, it appears on the menu bar of the program you're using. To find a synonym for a given word, you highlight that word in the text, pull down the Word Finder menu, and choose Lookup. A scrollable window of synonyms instantly appears. The synonyms are separated into noun, adjective, verb, and so on, and groupings of similar meanings are marked with bullets.

Word Finder offers an average of eight synonyms per meaning group. Choose a synonym, double-click on it, and the chosen synonym instantly replaces the highlighted word. If you want to explore further, click once on a synonym and the program will provide you with a new set of words: synonyms for the synonym.

Word Finder works with most popular Mac programs, including MacWrite, WriteNow, Microsoft Word, and ReadySetGo. For more information, call Microlytics in East Rochester, New York, at 716/248-9150.—Felicity O'Meara

Take It With You

Now there's a Macintosh that can go where you go. Colby Systems' WalkMac weighs a scant 15 pounds (compared with 201/2 pounds for a Mac Plus) and it can be used with either a battery pack or a 110-volt outlet.

WalkMac's designer is Chuck Colby, who is an old hand at putting the Macintosh in portable enclosures, having begun with the first Macintosh in April 1984.

WalkMac's exterior consists of a heavy-duty plastic case 16 inches wide, 11 inches deep, and 5 inches thick. It fits under a standard airline seat—even when packed in its optional case that also contains a portable printer. (A Plus or an SE can be disallowed as carry-on luggage because its minimum dimension is 1.7 inches larger than the 8-inch maximum thickness set by airlines.)

An important part of the package is a flip-up gas plasma screen that's 30 percent larger than the Mac Plus or SE display but contains the same number of pixels.

Inside the unusual box are standard Macintosh components, such as a Plus or SE logic board, a Plus keyboard, an 80K disk drive, an AC/DC power supply, and an optional 20- or 100MB hard disk.

WalkMac includes a two-button mouse. "The mouse, which will also be marketed separately, never needs cleaning and will work perfectly when rubbed against nearly any surface—even when upside down," Colby says.

Open the tidy WalkMac pack-

WalkMac: an 8- to 15-pound portable with a sharp picture.

TRACK PROJECTS. CAPTURE CASH. NO SWEAT.

If you bill for your services by the hour, you need TIMESLIPS® III.

Without a good time and billing system, your business isn't collecting all the money it's earned. In addition to getting your invoices out on time, you have to manage the billing process by tracking your expenses and accounts receivables. You need to know who is being billed and why.

**Automatically Tracks Time And Expenses**
TIMESLIPS III gives you quicker, easier, more accurate billing. The ability to recover cash that could have fallen through the cracks. And, a better handle on your own productivity.

**Works Like A Desk Accessory**
TIMESLIPS III runs concurrently with other programs, and can be called up whenever you need it.

Features and functions are so simple they practically run themselves. For example, a built-in "stopwatch" times any phone call or activity as you work. Then automatically calculates the total fee and updates your client file. Instantly. (It will also handle batch entry, if you prefer.)

A unique "dollar clock" can appear in the corner of your screen (even as you work in another program) to keep a running tab of time and billable dollars expended against a task.

Cool, and slick.

**Understands Your Needs**
TIMESLIPS III is cleverly structured to work like you work. Its power lies in its ease of use and intuitive design. Unlike other billing systems, it allows for real-time entry of expense information while within another program.

Like time and billing systems costing many times its price, TIMESLIPS III provides expanded description on each timeslip.

It exports data to virtually any program that accepts tab-delimited files, such as Excel™, Jazz™, and Microsoft Works™.

**Generates Custom Bills And Reports**
With over 5,000 ways to create a bill, you can customize to satisfy virtually any client demand, or meet any office need. And because your bills look more professional, they inspire prompt action.

A full range of comprehensive reports and graphs gives you masterful control and analysis capabilities. Tables, bar graphs, pie-charts, easy-on-the-eye formats leap to the screen.

TIMESLIPS III generates transaction reports, client history, aged receivables, and management reports. Information intelligently organized so you don't have to be.

**TIMESLIPS III Is A Productivity Tool**
It gives you a clear picture of your business by providing an activity-by-activity breakdown for each project. What was accomplished by whom, and how long it took. And the actual fee.

**Your Business Is Growing, Isn't It?**
Fear not. It's difficult to outgrow TIMESLIPS III. It will let 250 of your colleagues handle 2,000 clients with up to 128 projects per client. And track all simultaneously.

**30-Day Money-Back Guarantee.**
If you're not happy, we'll return your money. It's that simple. In the meantime, you'll find our level of technical support virtually unparalleled. INFOWORLD says: "The person we reached knew TIMESLIPS as though he had programmed it."

Send for your copy of TIMESLIPS III. It's one of the most powerful, yet easy to use time and billing systems ever offered. Compare it to any other, at any price.

**CALL TOLL-FREE**

Just How Compatible Is Compatible?

The mysteries of Mac II compatibility: what works, what doesn't, and why

by Bruce F. Webster

The Mac II represents a major development in the Macintosh product line. It has open slots, multiple video options, a new processor (68020) and math coprocessor (68881), room for lots of memory, and significantly modified ROM and operating system routines. Given all that, it's not surprising that the question of software (and, for that matter, hardware) compatibility arises.

On the other hand, the answer is surprisingly evasive. It's clear when a program isn't compatible: it acts funny, crashes, refuses to print, or in a myriad of other ways fails to perform as it would on a "regular" Macintosh. But if you launch a program and no
problems immediately arise, is it really compatible? Or have you just not encountered the bugs yet?

To explore some of the reasons for incompatibility, I've run a number of programs on a Mac II and recorded my results. However, three warnings are in order.

First, since bugs can be difficult to uncover, just because I failed to turn them up doesn't mean they aren't there; it may just mean that I failed to do the right (or wrong) things to invoke them.

Second, the Macintosh software market is too vast to cover effectively. I requested several key software packages, and got only scattered responses. But even so, I ended up with a long list of products to look at, without much time to devote to each. And since I was unfamiliar with many of the products, I did not always know how best to wring them out.

Third, I don't have the latest version of everything. I have old releases of some popular applications and no way to quickly get the latest. In many cases, I chose not to test the software at all rather than use an outdated version.

And there's also the issue of lead time. This article is being written in late July but won't appear for a few months. Many developers are out there furiously modifying their programs to work on the Mac II; revised versions may well be available by the time you read this. Because of that, version numbers (when available) are given for the products tested.

The Test System

The Mac II I used to test all this software included an 800K disk drive, a 40-megabyte hard disk, 1MB of RAM, the Apple video card (640 by 480, 4 bits/pixel) with an Apple monochrome monitor, and the SuperMac Spectrum board (1024 by 865, 8 bits/pixel) with a 19-inch Sony monitor. Current system software was used: version 4.1 of the System and version 5.5 of the Finder. The Sony was used as the main screen (with menu bar), with the Apple display to the left.

Using two screens, one much larger than normal, was crucial to the test. Some of the products that had problems would have run fine with a single regular-size display but that doesn't really make them Mac II compatible, does it?

Reasons for Incompatibility

OK, OK, you've seen this list at least half a dozen times in the past few months, but once again we're going to go over the reasons why a fair number of Macintosh programs have trouble running on the Mac II.

One major reason is that developers (including some at Apple) violated the guidelines set down by Apple a few years ago. Briefly, these guidelines said:

Macintosh designers made a lot of assumptions and built those assumptions into the ROM and operating system routines.
from tracing the instructions as they execute. However, if the 68020 goes to execute a modified instruction, and the unmodified version is still in the cache, then guess which one the 68020 uses? Right: the unmodified one (see "Heading for a Crash").

There are more pitfalls, but these should be enough to give you an idea of the problems inherent with Mac II compatibility. Frankly, I'm amazed that so much software runs as well as it does. Let's look at some of the packages I've tested and see how they did.

**Word Processing**

*Microsoft Word 3.0.* Word runs just fine on the Mac II, or better put, the bugs that show up aren't any news. I've heard some reports of Word having problems with large-screen displays, but I haven't encountered any. (I used Word to write this article.) As this issue went to press, Microsoft had just released version 3.01, which reportedly has corrected the bugs in version 3.0.

*MacWrite 4.6.* Apple violated its own guidelines with the software it produced; it's ironic that neither MacWrite nor MacPaint would work on the Mac II when it was first released. However, the just-released MacWrite version 4.6 does work, with only one annoyance: it always asks if you want to save your changes, even if none were made.

*ReadySetGo 3.0.* No problems encountered. The large screen helps a lot in laying out pages.

*Expressionist 1.0.* It launches and runs fine. However, it didn't want to let me save the scratchpad equations I had created, and it finally crashed during my attempts to do so.

*Doug Clapp's Word Tools 1.01.* One problem, and I don't know if it is specific to the Mac II, or if it's just a run-of-the-mill bug. I modified the suspect punctuation list; after that, the program couldn't find any punctuation problems and finally encountered a system error.

**Painting and Drawing**

*Cricket Draw 1.01.* It seems to work fine; the few occasional glitches are more likely caused by the software itself rather than by Mac II incompatibility. It also runs a heck of a lot faster on a Mac II than it does on a Mac Plus or an SE, which means that it's almost tolerable.

*Cricket Graph 1.1.* This also seems to work fine; no glitches encountered at all.

*FullPaint 1.1.* It wouldn't allow me to open a window larger than standard Mac size; however, I was able to drag windows everywhere, including on the auxiliary screen. I couldn't drag tools over there, though. Most notably, the program crashed when I attempted to open a document outside the folder in which FullPaint resides.
SuperPaint 1.0. Unusable. It litters the screen with a set of little boxes across the top; anything you attempt to draw appears in those boxes, scaled down.

MacPaint 1.4. Well, yes, it is dated. I scrunched around, looking for a copy of version 1.5, but no luck. Version 1.4 does not work well on the Mac II. It performs the same little-box trick SuperPaint does.

MacDraft 1.2a. No problems encountered. It recognizes and uses the large display.

MacDraw 1.9.5. Likewise, no problems were encountered.

Phoenix 3D 10. Dead on launch. It crashed the system so thoroughly that even the power switch didn't work; I had to use the switch on my power strip to turn off the Mac.

Applications

Microsoft Excel 1.04. This spreadsheet works very well on the Mac II, adjusting to the large screen and automatically using the 68881 math coprocessor. No problems here.

MacProject 1.2. This works fine on the Mac II and even makes use of color: the project chart is done in blue, with the critical path (including tasks and milestones) in red.

4th Dimension 1.0.1. As you might guess, this database program (originally code-named "Silver Surfer") also works well on the Mac II.

More 1.1. I had heard rumors of problems with More on the Mac II, but none of my tests showed any bugs at all. More gets a clean bill of health.

Guide 1.0. This hypertext processor for the Mac appears to work without any problems on the Mac II.

Communications

MacTerminal 2.2. This runs on the Mac II and is usable, but it has one limitation: although you can open a terminal window larger than the regular Mac size using the Option-drag technique, MacTerminal will only use a Mac-size portion of the window.

MicroPhone 1.0. A new version of MicroPhone is already out; I suspect it runs fine on the Mac II. Version 1.0, however, does not. It starts out OK, but crashes after a while.

AppleLink 4.0. Runs without any problems at all.

Languages

(A note on languages. None of the compilers used had the necessary libraries to call the new Mac II ROM/OS routines, such as the Color Manager. As a result, I was unable to write any nifty programs that put out lots of colors or used hierarchical menus. Can you imagine what it's like having a Mac II with a 19-inch color monitor and no real way to take advantage of it?)

MacTran 2.0E. This version produces code for the 68020 and 68881 processors. The edit window is limited to the regular Mac size and location, as is the output from the demo programs.

MacFORTH 0.20 2.2c. This FORTH compiler also produces 68020/68881 code. I could compile and link the demo programs; however, when I ran them, the screen would clear, the program name would appear in the menu bar, and then I'd be returned to the Finder. I think the library needs some revamping.

Macintosh Pascal 1.0. Dies on launch, displaying a system error box.

Lightspeed Pascal 1.0. This fudges up and crashes very quickly. Think Technologies says it's close to releasing a version that has, in addition to Mac II compatibility, libraries for all the new ROM/OS routines.

Turbo Pascal 1.0a. This version has one glitch: after you've used it to compile and run a program, the System bombs when you return to Turbo Pascal once the program's done. Borland sent me a prerelease copy of version 1.0e, which works just fine.

Can you imagine what it's like having a Mac II with a 19-inch color monitor and no real way to take advantage of it?

TML Pascal 2.0. No problems here at all; I was able to edit, compile, link, and run programs without encountering any strange behavior.

Mac C 5.01 (68020/68881 version). Since a lot of folks are using this compiler to do Mac II benchmarks, you can guess that it does indeed work on the Mac II. No problems encountered.

Lightspeed C 2.01. Although no immediate problems were apparent, I found increasing flakiness as time went on. Think Technologies has a patched version up on CompuServe, and a fully functional release should be out by the time you read this.

APL Plus 1.0. Not even close. I got a system error box when I started it up, and didn't even get that far when I double-clicked on an APL Plus source code file.

MacFORTH Plus 1.0. This started up without problem, but it displayed erratic behavior with some functions (such as backspacing). Although I had some other problems, I'm not sure if they were Mac II related or just a result of my unfamiliarity with the program.

Object Logo 1.0. Like APL Plus, this one died on launch.
Most Mac games won't work on the Mac II because game programmers use every shortcut they can think of.

World Builder 1.0. This works very well on the Mac II. You'll probably want to use it to build your own games, since so many others don't work at all. The sound libraries also work well.

Strategic Conquest 1.0. There is a later version of this game already out, but the original actually works on the Mac II. When I started it, I got the funny small boxes across the top of the screen (as with SuperPaint), with some sort of squashed image loaded into them. After that point, though, the game ran fine, and I managed to waste a good deal of time playing it.

Chessmaster 2000 1.0. Dies a quick death.

Hardware Compatibilities

I had hoped to report on several SCSI hard disks, but only one manufacturer—General Computer—actually sent one. The HyperDrive FX/20 plugged right into the back of the Mac II and started up without incident. I had to run the Apple SCSI setup program to get the System to recognize the drive, but after that, things went without a hitch. I've transferred lots of files back and forth, run programs off both drives (the FX/20 and the internal Mac II hard disk), and have had no problems.

Looking Ahead

By choosing your software wisely, you can immediately become productive on a Macintosh II, even if your video configuration is a little strange. What's more, a Mac II with a large screen is parsecs ahead of the little beige toaster we all know and love. Market pressures will eventually encourage developers to clean up incompatible products, which will expand your options. Even more exciting will be the products designed specifically for the Mac II, to take advantage of its features and power. With luck, we the consumers will be the ultimate winners.

Desk Accessories

Acta 1.2. This outlining installed as a desk accessory does just fine on the Mac II.

Talking Moose 1.21. Sigh. My favorite desk accessory just won't run on the Mac II. Apparently, the main problem is that Macintallle doesn't work on the Mac II. With luck, someone may have fixed it by the time you read this.

Streets 11. This DA works fine on the Mac II. It blanks both screens, picks a balanced origin (in this case, within the left half of the large screen), and shoots stars at you. Stars that trail off the left edge of the large screen appear on the right edge of the small one. Well done.

BlankScreen, FadeToGray, Idle, MoireDP, PolyDP, ZoomDP (all 1.1), Streets 1.3. All these screen-blanking DAs have the same problem: they work fine on a single screen but not on two. They blank and run on the main one, but leave the other screen unblanked and untouched.

Smart Alarms 2.5. This nifty alarm DA from Imagine Software, which I haven't used extensively, so far appears to work perfectly.

Appointment Diary 2.9. Another DA from Imagine Software, which also appears to work without problems.

Sleep. Another screen saver similar to Idle, which gives you a blacked-out screen and a bouncing Macintosh icon; it's bundled with the previous two DAs. Unfortunately, like the other screen-blanking DAs listed above, it only affects the large (main) screen and doesn't blank the small one.

Glace 1.05. A well-known DA from Solutions International. I had no problems with it at all.

SmartScrap 1.02. Also from Solutions International, this is a replacement for the Scrapbook. Again, no problems with it so far.

The Clipper 1.01. This comes with SmartScrap and is used for high-precision cutting and pasting. No problems so far.

Sidekick 2.0. I've briefly tried out most of the DAs in this package; no immediate problems except the System's limit on DAs.

Games

Most games written for the Macintosh won't work on the Mac II. This is because game programmers tend to use every shortcut and wily trick they can think of. I grew tired of constantly rebooting my Mac II, so you may find this a less-than-comprehensive list. My apologies.

Balance of Power 1.03. I had no problems with this as long as I booted up with its disk. However, when I started up the Mac II with another disk, then put Balance of Power in the drive and double-clicked on it, it died right after it brought up the title screen.

Enchanted Scepters 1.0. This is one game that works well on the Mac II. The large screen isn't much use, but the sound and graphics come through fine. The only problem occurs when you quit: instead of rebooting the System, the game crashes it, so not even the power switch will work.

Looking Ahead

By choosing your software wisely, you can immediately become productive on a Macintosh II, even if your video configuration is a little strange. What's more, a Mac II with a large screen is parsecs ahead of the little beige toaster we all know and love. Market pressures will eventually encourage developers to clean up incompatible products, which will expand your options. Even more exciting will be the products designed specifically for the Mac II, to take advantage of its features and power. With luck, we the consumers will be the ultimate winners.

Looking Ahead
Benchmark: Mechanical CAD

Three Mac programs go function to function against AutoCAD

by David L. Peltz

In the past, when computer-aided design systems cost millions of dollars each, selecting a CAD program was easy. All you did was form a CAD selection committee to draw up a specification of system requirements, issue a request for proposals from CAD vendors, and send the selection committee on a nice long trip to visit all the vendors and run a benchmark.

Today micro systems are nearly as complex as their mainframe-based forebears, but in most cases the full weight of selecting a CAD package falls on the shoulders of you, the user. Finding a CAD package that effectively performs the kind of drafting and design work you do is a difficult and time-consuming undertaking. To help you, Macworld asked me to benchmark some of the leading Macintosh 2-D mechanical CAD programs.

Procedures

Earlier this year a publication called the Computer-Aided Design Report put together a CAD benchmark to test a group of mostly MS-DOS CAD programs (CAD Report, May and June, 1987). The test consists of 21 tasks, each of which is designed to highlight some aspect of CAD systems' functionality. With the CAD Report's permission, Macworld borrowed their benchmark procedures.

The good thing about CAD Report's approach is that the test's creators defined a set of tasks that bring out the features a typical mechanical designer actually uses, yet they realized that different users may put a different value on each of these core features. The Macworld testers assigned each task an importance factor between 1 and 10. This number reflected the testers' assessment of the importance of that aspect of a CAD system to their actual work. The importance factors are listed in Table 1.

Next the testers were asked to conduct the 21 tasks exactly as described, observing and recording the time and/or the number of operations it took to perform each task.

The testers' final step was to give their systems a performance rating of 0 through 10 for each task (see Table 1). For consistency among the testers, we provided detailed guidelines spelling out the degree of ease or difficulty denoted by each rating.

To get final scores, I averaged the importance factors of all four testers to achieve an average importance factor for each task. Those figures were then multi-
plied by the task performance ratings and totaled to produce overall scores.

The Packages

The three Macintosh programs included in the test were those that were commercially available at the time of the test (see "VersaCAD Comes to the Mac") and had the power and features necessary for professional mechanical design applications: MGSStation from Micro CAD/CAM, Minicad from Diehl Graphsoft, and Bridgeport Machines' EZ-Draft, MacDraw and MacDraft were excluded because they simply don't have the capabilities the other CAD programs do, and wouldn't have been able to compete.

Our fourth test subject, AutoCAD from AutoDesk, is the favorite of the MS-DOS world and was included for comparison purposes. AutoDesk claims to have delivered over 100,000 copies of AutoCAD, which makes it the most popular microcomputer-based CAD system in use today.

The Testers

Ideally, the judging panel for a benchmark such as this would be made up of people who were experts on every system being tested. In the real world, however, one is faced with a choice: either have the same group of people test all the programs, which would make the scoring process more consistent, or have only the people who really know a program put that piece of software through its paces.

The original authors of this benchmark followed the first option, which leaves them open to the criticism that perhaps certain programs would have fared better if their operators had had more experience on those systems. Since CAD systems are so complex and take so long to learn, for the Macworld test I decided to follow the second option and have the tests performed only by a panel of professionals who work day to day with the product they tested. The disadvantage of this approach is that it reduces the relative value of the scores, since each tester looks at only one system. The weighting system discussed earlier mitigates this problem, as it reflects a consensus view regarding the importance of the functions tested.

The testers were: Victor Anastasia, who uses AutoCAD at Trusco Tank in San Luis Obispo, California; Dennis Stewart, who works with EZ-Draft at Boeing in Seattle; Joe Lewis of the Hollywood/Tokyo Film Consortium in Chatsworth, California, who uses MGSStation; and Richard Wuthrich, who uses Minicad at Chicago PNE in Elk Grove Village, Illinois.

The Tests

Task 1: Tangency

This first task tests the CAD software's ability to work with tangents to circles or arcs. The task requires the operator to draw three unequal circles and then draw a new circle tangent to the original three.

Results: All four systems were able to perform the task, but with widely varying degrees of difficulty. The AutoCAD tester gave this task the highest score, but the lowest importance factor. The MGSStation tester had the easiest time doing it.

Task 2: Accuracy

One factor in determining mechanical design's ultimate accuracy is how well the CAD software calculates the intersection of curved entities such as arcs or circles. Task 2 requires the operator to draw a point at specified coordinates and then to draw two circles tangent to the point. The operator next erases the point and asks the system to create a new point at the intersection of the two circles. The new points' coordinates should match those of the original point.
Task 5: Copy, Rotate, Mirror
Mechanical design often involves the creation and duplication of complex objects that are symmetrical about an axis. If you need only draw half an object and then can produce the rest by copying, rotating, or mirroring that half, you can greatly reduce your drawing time. This task examines a program's ability to perform those functions.

Results: Minicad and AutoCAD were able to do this task with the fewest number of operator steps. EZ-Draft took the most steps. All testers gave their systems a 10 in ease of performance and all gave it a very high importance factor.

Task 6: Circumscribed and Inscribed Polygons
Single-step routines for drawing squares, circles, and rectangles are common. Less common are easy-to-use routines for creating unusual polygons. In this test, a circle is used as the basis for constructing seven-sided polygons. The operator is asked to draw a circle and then circumscribe it and inscribe it with seven-sided polygons.

Results: EZ-Draft took only two steps to perform this task. AutoCAD took three, MGMStation took five, and Minicad took seven. The operators assigned this task widely varying importance factors: the MGMStation tester thought it was a 9; the EZ-Draft man gave it an 8; the Minicad operator gave it a 5; and the AutoCAD tester, only a 4.

Task 7: Constructing Fillets and Chamfers
This test comprises three parts. First, the tester draws two circles of unequal size and then connects them with the eight possible fillets (see figure). This demonstrates the flexibility and the geometric construction power of the CAD software.

Results: Neither AutoCAD nor Minicad was able to complete this drawing. Their testers were able to do only two of the eight fillets. EZ-Draft was able to do all eight fillets in 60 seconds, while MGMStation took 150 seconds.

In the second part, the tester draws two arcs, connects them with a circular fillet of a specified radius, and trims the arcs at the point where they meet the fillet.

Results: Minicad was unable to perform this test. EZ-Draft did it in 2.5 seconds, whereas AutoCAD took 26 seconds and MGMStation took 150 seconds.

For the third part, the operator draws two perpendicular lines and then chamfers them (see figure). The test asks the operator to note whether the program prompts for the length of the chamfer or for its distance from the corner (which is preferable).

Results: Here again the times varied considerably. EZ-Draft completed the test in 2.5 seconds, MGMStation took 20 sec-

**Figure 1**
What's all the fuss over AutoCAD? As you can see, the final scores were quite close—praying the Mac can buck it as a CAD machine. One reason these results don't show more variation is that we tested only the most suitable programs and excluded programs like MacDraft, which we know to be less acceptable for rigorous mechanical design work.
Task 12: Dimensioning
The object is drawn and dimensioned as shown.

Task 13: Feature Control Symbols
The two feature control symbols are to be produced by the CAD system.

Task 13: Feature Control Symbols
Some CAD systems enable you to produce common feature control symbols automatically, while others require that symbols be manually constructed as small, annotated drawings.

For this task, the testers produced two feature control symbols according to ANSI Standard Y14.5 (see figure). They then checked to see how easy it is to change the symbols. If a system generated the symbols automatically, the tester was asked to check whether the symbols conform to ANSI or ISO standards.

Results: Only Minicad lacked facilities for generating these blocks. The other systems were fully equipped for this function. MGAStation and AutoCAD were tied with 10 for ease of use. EZ-Draft rated a 9, and Minicad got an 8.

Task 14: Speed
Users of slow CAD software can spend more time waiting for their system to redraw, pan, and zoom than they spend drawing. Both software and hardware affect the time it takes to do these operations, and it's difficult to separate the effects of each.

The following equipment was used for the Macworld benchmarks: with Minicad, a 1-megabyte Mac SE with a 20MB internal hard disk; EZ-Draft, a 2MB Mac 512KR with a 20MB hard disk; MGAStation, a Mac 512K with a HyperDrive; AutoCAD, an 892K IBM PC AT with a 30MB hard disk. No one indicated the use of accelerators.

This test comprised five timed tasks; each task is assigned a different weighting. First the testers constructed a drawing of 1300 entities by creating a simple figure (a square with rounded corners containing a point and text) and copying it into a 10-by-10 array. The time it took to make the copies was noted (weight for this test: 1). Next the tester filed the 10-by-10 figure away on disk and recalled it, noting the time it took to load the drawing (weight: 2). The third part tested the time it took to zoom from viewing the full array down to only one part (weight: 6). For the fourth, the tester noted how long it took to zoom back out to the full array (weight: 6). The final test asked the operator to redraw the figure using a redraw function (weight: 5).

Results: To score this test, I multiplied the times by the weights and totaled their products (see Table 2). The lower the number, the faster the system. The testers also assigned a rating based on ease of performance; MGAStation got an 8, the rest received 10.

Task 15: Memory
With their 1MB or more of RAM, Macintoshes should be less likely to run out of memory than MS-DOS machines, which can't directly address more than 640K. To see whether memory might run out during a drawing session for a reasonably complex object (about 5200 entities), the testers were asked to copy the 10-by-10 array from Task 14 four times and to note if the system failed or ran out of memory.

Results: Only EZ-Draft ran out of memory, even though its tester had the most RAM (2MB).

Task 16: Directory Management
MS-DOS users aren't blessed with the Mac's Finder, so MS-DOS CAD software should provide some of the Finder's functions. In a CAD environment, for example, designers need to be able to get at previously stored drawings in many ways.

This task asked the testers to check whether their system enables them to sort a drawing list by name, date, or other variables. The testers also noted whether their system allowed them to copy, rename, or delete drawings without having to quit the CAD program. On a Mac, the results were very predictable.

Results: All three Mac testers were able to display drawing lists sorted by name, date, size, kind, and icon. AutoCAD can sort by name, date, drawing extension,
Task 17: Programmable Tablet
The original authors of this benchmark assumed that their IBM audience would be using a tablet, and simply asked whether the system enabled the users to program their tablets. For this test, the operators were asked whether their systems require a tablet and if a tablet can be used. The testers were also asked to consider the ease with which their system let them program tablets to create or group functions.

Results: None of the systems require a tablet, but all except Minicad can use them. The AutoCAD tester was the only one who reported programmability as a built-in function. Although this capability won AutoCAD a 10, the AutoCAD tester thought this feature worth only a 5 importance factor. The EZ-Draft tester, on the other hand, believes tablets have an importance of 8, even though his system earned a 0.

Task 18: Parametric Programming
Parametric programming capabilities enable a user to tell the software to perform complex functions automatically. Some people would call these macros. Unfortunately, none of the Mac CAD systems offers programming capabilities. Even though we knew this going in, we asked the testers to note whether their program includes a language or means for stringing together series of commonly used operations and to judge whether the language has most of the features of a computer programming language. (Mac CAD software developers should take note of their low scores in these areas.)

Results: AutoCAD, with its AutoLISP language, rated highest. The MGStation tester apparently found a way to work around that program's lack of a built-in language, since he gave the program an 8. EZ-Draft received a 3; Minicad received a 1. Once again, the testers who lacked features seemed to be trying to send a message to developers, while the testers with the features take them for granted. The Minicad and EZ-Draft testers assigned this test an importance factor of 8, the AutoCAD tester gave it a 4, and the MGStation tester gave it a 6.

Task 19: Documentation and Online Help
We asked the testers to examine the documentation supplied with the CAD software and to give heavy weight to thorough indexing, clear illustrations, online tutorials, and reasonable explanations of how to work each function.

Results: MGStation and AutoCAD both received 8. EZ-Draft got a 7; Minicad was at the bottom with a 6. The importance factors were in the 9 to 10 range, except for the MGStation tester, who thought documentation is worth a 7.

Task 20: Installation
Installation is something we take for granted on the Mac. In the MS-DOS world, the process can involve up to a dozen or more disks and a great deal of trouble. This task takes into account the ease of installing the software.

Results: As expected, AutoCAD takes more steps (6) and more time (900 seconds) to install than any Mac package. The worst Mac package installed three times faster and took half as many steps. All testers thought this was important.

Task 21: Personal Assessment
This task is the most subjective, but it may also be the most important. We asked the testers to ask themselves the following question: Would I really like to do all my design and drafting work with this software? If the answer was an unqualified yes, the system rated a 10.

Results: If you're among the skeptics who doubt that personal computers—and the Mac in particular—are ready for CAD, the scores for this test should give you pause. All the products were rated 9 or 10, which shows that these CAD users are very satisfied. What these scores can't tell you is which system is the best. This is the relative value problem I mentioned earlier.

Under "Comments," the AutoCAD tester remarked that his system is slow in picture regeneration; the EZ-Draft tester gave his system two ratings, a 10 on a Mac II and a 9 on a Mac Plus.

Bottom Line
As I warned at the start, it's impossible to construct a single CAD benchmark that's both meaningful and objective. While the results of this benchmark differ somewhat from the fact that the different testers have different ideas about what's good and what's important, the tests do reveal a lot about the capabilities of Mac CAD software. They should also make you aware of what the issues are when you're evaluating CAD packages. If you decide to duplicate this test yourself, think carefully about the functions that are the most important to you: drop items that aren't relevant to your work and add other tests as required.

As you can see from Figure 1, it was a close race. Depending on how you score the test, MGStation is either the winner or the runner-up behind AutoCAD. MGStation loses according to the averaged scores but wins according to the individual scores.

In the end, the most important thing these tests reveal is that there's no dramatic difference between the functionality of AutoCAD and the Macintosh packages. It would appear that AutoCAD's popularity is more the result of marketing and support strengths than technical superiority.

As more mechanical designers discover the Macintosh, its share of the CAD market will increase, which will mean even better products for consumers. Perhaps AutoDesk will even follow Versacad's lead and come out with a true Mac version.
Excel's macro facility is one of the package's strongest features. By letting you group sequences of complex commands into files that can be activated with a single keystroke, macros save time and aggravation.

Although Excel's macro command language is easier to learn and use than some others, mastery of it still requires study, practice, and patience. Even with the record feature, which automatically reproduces a sequence of keystrokes, creating a macro can be a formidable task for a new user. Add branching and other logic to the macro structure, and the macro debugging process may raise a novice's frustration level to intolerable heights.

One way to smooth the learning path is to borrow macros written by experienced Excel users. These macros are already in working order, and even if you need to modify one, the basic logic shell is complete. Not only do ready-made macros save time initially, they introduce you to techniques that you can add to your own macros as you gain experience.

Where will you find experienced Excel users willing to share their macros? Business associates, user groups, and bulletin boards are good possibilities. Another option is to explore the books that have been written about Excel macros. This article presents a few macros from a book I have written on the subject (Excel Macro Library, Que Corporation, 1986), as well as macros from other sources.

See Me in Ten Days
Excel Macro Library covers both function and command macros. Our first selection from the book, Plus Weekday, is a function macro for finding a weekday that's a specified number of days from the current date (see Figure 1). The macro must do more than simply add the number of days to the current date, since that sum could fall on a weekend or holiday. Weekday has many scheduling applications: homeowners, for example, might calculate a loan due date with it; doctors might use it to schedule follow-up visits.

The first section of Plus Weekday performs housekeeping functions, including setting the weekday flag (C1) and the holiday flag (C2) to 0 (both will be set to 1 when a nonholiday weekday has been generated). The next section checks whether the date generated by adding the specified number of days to the initial date is a weekday. If the projected date does not pass the test, the macro adds one day and checks again.

The Check Holiday routine in the example knows about only two holidays.

Their dates are stored in B33 and B34. If the projected date matches either of these values, it is a holiday.

The macro manipulates the projected date until it reaches a nonholiday weekday, and then returns that date. You can add more dates to the Check Holiday routine by placing additional holiday dates in B35 and subsequent cells; to place more IF statements in the macro, add lines below A33 and create statements that follow this pattern:

=IF(CHECKDATE = B35,SET.VALUE(C2,0))
shows output from Plus Weekday.
You can perform calculations with function macros like this one by recording the name of the macro sheet, the function macro name, and the macro's arguments (enclosed in parentheses) in the worksheet cells. You cannot execute function macros from the macro menu or with a command option sequence the way that you can execute command macros.

Mail Call
The second example from *Excel Macro Library* is a command macro that creates mailing labels from database records (see Figure 2).

The first instruction in Create Labels is a SELECT statement that in turn contains an INPUT statement. The instruction displays a prompt that asks you to select an area of the worksheet to receive the labels. The subsequent instructions select the top row of that area and an arbitrary limit of the first 500 cells as the label area; you can easily increase the limit to accommodate additional labels. The instruction in line 6 assumes that the database was set before the macro was executed. Lines 7 through 9 determine the maximum number of rows (since this equals the number of labels to be generated) and set other counters.

The next section of the macro, Top Loop, is the real workhorse. It builds each line of the label by accessing a row of data in the database. Instructions in this section increment the line and label counters, check to see if the macro has constructed the last label, and branch to the beginning of the loop. When Top Loop has completed its task, it selects the label area so you can prepare to print the labels. Depending on the size of your stickers, you may wish to add an extra blank line between labels by changing the +3 in line 23 to +4.

Search Me
The next selection, Locator, comes from the *Complete Book of Excel Macros*, by Louis Benjamin, Don Nicholas, and the consultants of Lighthouse Publishing Services (Osborne McGraw-Hill, 1986). This book serves the needs only of relatively sophisticated Excel users, since it assumes a basic grounding in the Excel macro language. However, for the user who doesn't require a lot of explanation, this valuable collection offers some unique macros.

Locator is designed to select records in a database according to preestablished criteria (see Figure 3). It is useful for doing searches that you execute on a periodic basis or each time the database is updated. For example, before producing certain reports, you might find it valuable to check your data for errors. With the proper search criteria in place, Locator makes implementing this safety measure a snap.

The macro begins in A24 by activating the database window containing the search criteria. The criteria window should be set prior to executing the macro and can contain any valid criteria. The macro generates an alert box asking you to confirm that the criteria have been set.

The window containing the database to be searched is activated, and the area named `src` is selected prior to executing the macro.

Error Eradication
Douglas Hergert's book *Microsoft Excel with Macros* (Microsoft Press, 1986) is in some ways the opposite of the *Complete Book of Macros*: it concentrates on explaining Excel's macro facility, rather than providing a macro library. The book does contain some useful examples, however.

Anyone who has ever made a series of data-entry mistakes will appreciate the first macro we'll look at from this book. Called FixCase, it's a command macro designed to correct string values entered inconsistently into a worksheet (see Figure 4). The macro standardizes all the selected entries in a database to the format used for proper nouns (initial capitals only) regardless of what form was used for data entry.
FixCase begins by establishing string values for uppercase and lowercase letters. Line 5 determines the number of rows in the selection. The value of the first cell is determined and is ignored if it is not a string. The command macro invokes a function macro that provides the value of the current cell as the function argument.

The first function macro, UpperLower, calls the function macro Upper to convert the first character to uppercase. Next, the function macro Lower kicks in to convert the remainder of the character string to lowercase. The two pieces are joined together and returned to the command macro FixCase, which then looks at the next cell in the column.

To Whom It May Concern
Our last macro creates form letters (see Figure 5). The example in the book generates the library overdue notice shown in Figure 6, but you can adapt this macro to create form letters for billing, appointment scheduling, or any other purpose. The macro checks a database (not shown) of library information to see if the current date is past the due date for a given book. If it is and if the book has not been returned, the macro generates an overdue notice.

Before executing the macro, you must have entered the search criteria into a worksheet residing in the database to be searched. The criteria area should contain the code Rnd with a value of False beneath it and NOW()-DATE>15 with a value of True. Once the criteria have been entered, invoke the Data Set Criteria command.

The main macro begins by setting up the printer and opening the library information database. It checks for a record matching the criteria and copies the appropriate fields to the notice after activating it. The cycle continues with the database reactivated for a look at the next record.

End
The books represented here provide ready-to-use macros that will have you feeling like an expert in short order. And the advice offered by the authors will raise your skill level enough to justify that confidence. Keep practicing, and before you know it you’ll have a macro collection of your own to share.

For information on the books mentioned in this article, see Where to Buy.
Figure 3
The database macro that locates matching records. Note the use of the documentation entry in line 26. The Alert instruction (lines 28 and 39) places a message on screen.

```
1 Command   FixCase
2 Option=Command+ 
3 big = "ABCDEFGHIJKLMNOPQRSTUVWXYZ"
4 small = "abcdefghijklmnopqrstuvwxyz"
5 items = ROWS(SELECT1(0))
6 inlabel = "ACTIVE.CELLO"
7 outlabel = "UpperLover(inlabel)"
8 skip = SET.VALUE(items,items-1)
9 select = "SELECT(‘(1‘)"
10 next = IF(items=0,GOTO(inlabel))
11 =RETURN()

A macro that generates library book overdue notices. The labels in the left column indicate instructions to build the various label entries.

OVERDUE NOTICE
To: John Que
From: M. Brooks, Librarian
Date: 1/17/87

This is to remind you that a book you have borrowed from the company library is now overdue. The book is:

Title: Chicago Manual of Style
Author: U. of Chicago Press
This book was due on: 1/14/87

Please stop by the library at your earliest convenience to return or renew this book.
Thank you.
```

Figure 4
An example of a command macro that executes a number of function macros. FixCase uses the function macro UpperLover. UpperLover uses both Upper and Lower in turn.

Figure 6
A laser printout of the form letter created by the macro in Figure 5. With a few modifications, the macro can produce letters for any purpose.
Beyond Black and White

Color publishing without a color
Mac—make your own color
separations in black and white

by Jim Morton and Michael Mallery

In 1954 the Color Research Institute conducted a startling experiment. A group of consumers were asked to evaluate which of three laundry detergents cleaned their clothes the best. One detergent came in a yellow box, one came in a blue box, and the third came in a box that was predominantly blue with yellow splashes. After trying the detergents, the consumers complained that the yellow brand was too harsh, while the blue left their clothes dirty. Unanimously, they chose the detergent in the blue and yellow box as the one that did the best job. Later they discovered that all the detergents were the same.

We're a long way from 1954, but this color test demonstrates dramatically the effect color has on our perception of things. The clever use of color can sell a product, while its misuse is often disastrous. This is as true in publishing as it is in advertising. A few well-placed touches of color can turn an otherwise drab newsletter into a thing of beauty.

When the first Macintosh page-layout programs appeared, they were limited to single-color layouts, usually black ink on white paper. Because the Macintosh display came in only one model—basic black and white—few software designers bothered to explore the
possibilities of color separation on the machine. It wasn't considered an option.

Gradually, patient designers learned to separate their publications into two or more colors by hand, but true color separation just wasn't possible. If you wanted a 30 percent red printed over an 80 percent yellow, you had to explain your design to the printers and let them do the work.

With the introduction of the Mac II, color suddenly became an issue, and programmers started working on ways to create color separations on the Macintosh. Although most of these programs are aimed at the Mac II market, a few imaginative software developers have introduced programs that enable you to create spot-color and four-color separations in black and white. By making your own separations, you eliminate the costly process of photomechanical separation to produce negatives for offset printing. You also gain a little more control over the final product.

Before we go into the specifics of Macintosh color-separation programs, a bit of background on various color processes is in order.

**Spot Color**

Spot color is the most common type of color in desktop publishing. A newsletter with black type and a green border is an example of spot color. For simple layouts in which the color elements don't abut, there's really no point in making your own spot separations. You simply indicate on a tissue overlay which portions of the publication should appear in color, and the printer does the rest, separating each color by carefully masking different portions of each page on two negatives of the same original.

For more complicated jobs—as, for example, when a colored headline is knocked out of a black background—printers demand that you make your own overlays. The most popular desktop publishing solution to this type of problem involves creating a master page containing all the page elements and then creating two other files, one with all the black items removed and one with all the color items removed. This manual technique is tedious but it works, and until recently it was the only alternative.

**Process Color**

Since each color in a spot-color job requires a specially mixed ink and a separate press run, this approach is generally used for projects that require only a few colors. Artists and designers who want a full range of colors generally use a system that enables them to generate virtually any color from only four basic shades.

If you look closely at the illustration at the beginning of this article, you'll notice that it is made up not of solid colors, but of dots. Just as printers use black dots of varying sizes to simulate different gray values, they use dot patterns composed of the four process colors—yellow, cyan, magenta, and black—to simulate the full color spectrum. To achieve a desired shade, printers increase or decrease the size of the dots in each of the four-process-color halftones; a denser magenta layer tilts the color to the red end of the spectrum, more cyan adds a blue cast (see “Anatomy of an Illustration”). Halftone densities are specified as screen percentages; a 100 percent cyan screen would be solid cyan, while a 10 percent screen would be very light in color.

To ensure that the dots constituting the four-process-color layers overlay each other in a pleasing way without creating distracting moiré patterns, printers screen the four-process-color halftones at precise angles. When the four colors are printed on top of one another, the angled dots combine to form a tight circle called a rosette. For four-color work, black would usually be angled at 45 degrees, magenta at 75 degrees, yellow at 90 degrees, and cyan at 105 degrees. In the past, the inability to specify screen angles was one of the things that kept desktop publishers from creating their own color separations.

To determine which combination of process colors will add up to a desired shade, artists and des-
Designers use one of three methods. The first employs a device called a color wheel—a round paper disk with four disks of clear acetate fastened to it. Each of the acetate disks is printed with one of the four process colors in screen percentages ranging from 10 percent to 100 percent. By turning the disks you can create almost any color imaginable. The most popular color wheel is the Murphy Color Guide Wheel, which sells for around $30. Smaller wheels are available for about $10.

The second method of finding colors involves a tint-chart book. Like the color wheel, tint charts contain every possible combination of the four process colors in 10-percent increments—a total of over 14,000 possible colors. To use these charts you simply choose the color you want and then look up the screen values that correspond to that particular color swatch. You can find tint charts in many graphic arts books, or buy them separately. Comprehensive tint-chart books can cost up to $120, but less-inclusive books in the $30 to $40 range are sufficient for most people.

The third method of choosing colors is based on the Pantone Matching System (PMS). The Pantone system, which was designed mostly for spot-color work, uses ink mixtures rather than process-color screen percentages to create colors, but for around $85 you can buy a book that lists the screen percentages required to reproduce the Pantone colors. This system gives you access to some shades you would never

---

**Anatomy of an Illustration**

Combining the four process-color layers above yields the full-color illustration shown below. Illustrator was used to create this image and to specify the color percentages for each part of the mouse. The four separations were printed directly to negative at a 133-line screen ruling using Adobe's Separator utility and a Linotronic-100.
achieve with a color wheel. If you can afford to purchase only one color system, however, you’re better off with a color wheel, since the Pantone system provides for only about 500 colors.

XPress

Quark XPress is a powerful page-layout program that incorporates many of the best features of PageMaker and ReadySetGo 3.0, as well as adding a few features of its own. One of these is the ability to create spot-color separations automatically.

XPress lets you assign one of nine colors to text elements or borders, either during the layout process or after the page is complete. When you click on the Make Separations button in the Print dialog box, the program automatically prints a separate page—complete with trim and center marks—for each color you’ve included in your scheme. (A clarification: although XPress lets you specify color intensity using screen percentages, the program offers no method of angling screens or combining colors. A color placed under another color simply won’t print.)

Since spot-color is something many desktop publishers want, including a separating function in a page-layout program is a good idea. Quark’s implementation, however, leaves a few things to be desired.

One caveat for publishers who use LaserWriter output is that the active page size for separated Xpress files is only 7 by 9⅛ inches. When you include the automatic registration marks on the page—which most publishers will want to do—the program pushes the page image down and to the right. Any part of the image that falls within 1 inch of the bottom or right-hand edges of the page won’t print. (This quirk isn’t a problem with Linotronic output, since the printer sheet size is bigger than 9½ by II.)

Another limitation is that the program gives you only five preselected choices, between 10 and 80 percent, for choosing screen percentages. This is a bit crude: you cannot, for example, specify a 30 percent screen tint, because that’s not one of your options.

Cricket Draw

The PostScript drawing program Cricket Draw was the first Mac package to offer screen-angle commands. Before Cricket Draw’s arrival, the only way to change screen angles was via direct PostScript programming. Oddly, Cricket Software neglected to discuss the process for creating specially angled screens in the Cricket Draw documentation.

Separating colors with Cricket Draw is a slow process, similar to the manual methods Mac artists developed for creating spot color. First you must create a master file that contains all the picture elements, layered from top to bottom as you want them to print (don’t forget to include some form of registration marks outside the image area). Close the master file and then open a copy to begin specifying your first process color. You will create a separate file for each color.

Specify the screen percentage of the first color for each object in your drawing by double-clicking on the object and entering the desired percentage in the fill- and line-intensity boxes. If an object doesn’t contain any of the color in question, set the fill and line intensities for that object at zero percent. Save the file with an appropriate suffix such as -cyn, -magenta, -ylw, or -blk.

Next, to set the screen angle and ruling, select the entire picture and click on the fill-pattern box in the lower-left corner of the screen while holding down the Option key. Doing so calls up the Transfer Mode dialog box (see Figure 1). Clicking on the Dot button presents two new choices: Frequency and Angle. Frequency refers to the number of lines per inch; you can choose any number up to 200 lines per inch (because of the way Cricket Draw’s screen-angle algorithm works with the LaserWriter, we got the best results for laser output at the default setting of 72). Set the angle for the cyan, magenta, or yellow file to 105, 75, or 90 degrees, respectively. You don’t need to set the angle for the black file, since the program defaults to 45 degrees. Once you’ve completed one color, repeat the process for the other three.

Notice that the dialog box for selecting fill and line intensity includes a command for color. This com-

Figure 1

Cricket Draw’s obscure and obscurely named Transfer Mode dialog box provides a clumsy but effective mechanism for setting screen angle and ruling.
Comtex has introduced a package for its Imagizer video digitizer that enables Mac owners to make separations using the same system most print shops do now. The Imagizer system uses a high-resolution black-and-white video camera that connects, via a special interface, to the printer port on the Mac Plus or SE. The color-separation accessory includes software for specifying screen angles and line frequency and a set of color filters. You can mount the Imagizer camera on a copy stand or tripod to make separations of flat work or direct video images.

The programs discussed in this article create what are called mechanical color separations. A designer creating mechanical color must choose screen percentages for each shade; if you want an area to print green, you indicate the proper screen percentages on the cyan and yellow overlays. Color photographs are printed using the same four ink colors as are used in mechanical separations, but the technique for creating the separations is quite different. A camera is used, and successive exposures are made using filters that screen out the unwanted colors on each negative. (Although both mechanical and photographic separations use process colors, only the photographic separations are referred to as process color separations.)

The Imagizer enables you to create true process color separations of anything except reproductions that have already been screened. Once you’ve made your four exposures, you can readjust the contrast and brightness for any of the negatives at any time, which saves you from having to reshoot in order to readjust your color mix. Since Imagizer files are saved as TIFF documents, they can be manipulated with Letraset’s ImageStudio. With ImageStudio, you can make detail corrections and changes to any size area on each negative—a feat previously available only to print shops using sophisticated scanners and image-assembly stations.

The biggest limitation of the Imagizer system is its inability to handle large reproductions. Comtex’s black-and-white video camera has a resolution of 750 lines per inch—nearly three times the resolution of a standard home video camera. However, the system works by dividing the video image into a constant number of cells. Each cell contains gray-scale information for the tone in that segment of the picture; how that information is used depends on several factors, such as the size of the final reproduction, the number of dots per inch you select for output, and the type of printer being used. A photo that covers an entire page will have only the same amount of information as one that covers a three-inch square, and will look noticeably worse even when both are printed on the same device using the same screen frequency.

In spite of these drawbacks, it is now possible to create four-color process photographs with a Macintosh—an amazing accomplishment that signals a new era in Mac software. Many of the skills and techniques previously available only to people in the printing profession are now available to desktop publishers. Given the speed with which this equipment can create LaserWriter and Linotronic copies, in a few years we may see the Imagizer and systems like it replace the traditional photostat cameras in many print shops and reproduction houses.

We used the Imagizer to capture this still life directly and then printed the separations on paper with a LaserWriter. Negatives were made from the laser copy by conventional means.
Color in Color

The techniques discussed in this article make color publishing possible on a black-and-white Mac, but the natural Macintosh platform for color work of all types will be the Mac II. As this article went to press, two publishers had announced systems that enable Mac II users to actually see their work on screen while making color separations.

In New York, Knowledge Engineering is working on two programs that together turn the Mac II into a color desktop publishing station. *JustText II* is an updated version of Bill Bates's powerful page-composition package. The new color version accepts images from a second program, *Lithographer*, which enables you to capture and edit images from a color scanner.

*Lithographer* is still command driven, like the original *JustText*, but Bates promises that at least it will be more WYSIWYG. The program has a wide variety of tools for processing images, as well as some color draw and paint capabilities. It's capable of taking densitometer readings into account when printing, allowing a level of control over the final product on a par with expensive image-assembly workstations. Another mark of *Lithographer*'s professionalism is that it prints industry-standard color bars beneath the active page area (these are the color tests printers use to check their ink coverage). The Knowledge Engineering programs can save files in PostScript or EPSF format, but color work must be downloaded using Knowledge Engineering's Document Manager downloading utility.

Pixel-Craft of New York is also preparing a one-two punch for creating color artwork. *Kaleidoscope* is a full-color drawing program that works with the Mac II. It enables you to create shapes and shade them with various tint combinations, displaying the resulting colors on the screen as you work.

*Heaven*, the second half of the Pixel-Craft system, can create four-color separations from color video images. Unlike the Imagizer System (see "A Separator of a Different Color"), *Heaven* does not require filters or separate shots for each color printer. Instead it interprets the RGB or digital signal from color video monitors and uses that to create the standard process-color separations. *Heaven* saves documents in its own format, but they can easily be converted to PostScript files via a conversion program.

Cricket Software has announced a Mac II version of *Cricket Draw*. It will maintain the *MacDraw*-like interface of the current program and will create color separations for any of 256 predefined colors. (You will not be able to enter percentages to create a color not on the on-screen palette.) The system gives you fewer colors than some other Mac II color separation software, but it does ensure that what you see on the screen closely matches your output. As of this writing no firm release date has been set.

Compared to Scitex and other high-end color image-assembly systems, these Mac II programs are still fairly crude. But they don't cost $700 an hour to operate, either. Considering that they represent only the first generation of Macintosh-based color separation software, they are astounding. It is conceivable that within two years the effect of this technology on the printing industry will be no less dramatic than the effect desktop publishing has had on the typesetting industry.
mand is primarily for use with the ImageWriter II and a color ribbon. It has no effect on color separations, so leave it on Black at all times. You should also be aware that Cricket Draw's screen-angle feature does not work with LaserWriters—only with LaserWriter Pluses.

At press time Cricket Draw was just going into beta on a version (1.1) the company says will automate the separation process. That improvement may be available by the time you read this, but as described to us it didn't sound very useful. The beta implementation enables you to use the fill dialog box to specify one of the eight QuickDraw colors for any object in a drawing; when you print, the program calculates the required percentages and makes process-color separations. The program offers no provision for specifying any colors other than the QuickDraw set, however. In our opinion, anyone going to the trouble of printing four-color separations of Mac graphics is going to want more than eight colors. Perhaps Cricket will see the light before final publication.

**LaserPaint**

LaserPaint's color separation function is far more intelligent than Cricket Draw's. The biggest difference between the two systems is that LaserPaint doesn't require you to make four passes through four separate files. Instead, you use a single dialog box to set the percentages of all four process colors for every object in a picture (see Figure 2). If you want to separate for a PMS color, LaserPaint makes the process even easier; you simply enter the PMS number of the color you want an object to be, and LaserPaint supplies the appropriate screen percentages. The program sets screen angles for you and automatically adjusts the fineness of the screen to the output device you're using, printing with a 72-line screen on a laser printer and a 120-line screen on a Linotronic (if you want to change these settings, you must edit the PostScript code directly).

LaserPaint also gives you an option for working with solid Pantone colors instead of process separations. When you push the Sep Line Color button in the color configuration box, LaserPaint prints a separate solid overlay, complete with registration marks, for every PMS color you've chosen.

LaserPaint tries to be as WYSIWYG (what you see is what you get) as possible. For example, it assigns a specific pattern to every color you use, enabling you as far as possible to visualize your color creations in black and white. While this approach has advantages, too much realism isn't always desirable. When you draw with a zero line width in LaserPaint, what you see is exactly what you get—nothing. Of course you can draw your picture and then go back through and set all the lines to zero, but with complex shapes it's easy to miss a line or two and not discover your mistakes until after the separations have been printed.

LaserPaint also falls behind the other programs mentioned here in its handling of layers. Unless you use the Mask tool to specifically tell the program that a certain object covers parts of other objects, LaserPaint won't remove the hidden lines and fills. All the layers simply print on top of one another.

LaserPaint files can be saved in PostScript, EPSF, and TIFF formats as well as in the program's own proprietary file format. As with Cricket Draw, however, no page-layout program can open a separated LaserPaint file. The people at LaserWare bill LaserPaint as an all-purpose drawing and page-layout program (to prove this claim, they laid out their instruction manual with it), but LaserPaint cannot do all the things a true page-layout program should do. For example, it can't open formatted Word or MacWrite documents—you must completely reformat such documents in LaserPaint.

Unlike Cricket Draw, LaserPaint does not emulate the MacDraw format. People used to working with Draw-like graphics programs will find LaserPaint difficult to learn. The toolbox has more dials, buttons, and knobs than the cockpit of a Boeing 747, and some procedures work only when they're performed in a specific order. The problem is com-

![Figure 2](http://example.com/laserpaint.png)

**Figure 2**

LaserPaint enables you to create four-color separations either by specifying screen percentages or by simply entering a Pantone number. Those who can put up with this dizzying display can specify up to 48 colors for a single drawing.
pounded by a manual that’s so poorly written that it actually interferes with learning the program.

Nonetheless, LaserPaint is currently the only program that supports the Pantone Matching System, making it a good choice for graphic artists who prefer working with PMS colors and who aren’t intimidated by the program’s long learning curve and complex interface.

Adobe Separator

The best solution to four-color separation on the Mac has come from Adobe. When it designed Illustrator, Adobe wisely foresaw the day when some people would want to move past black-and-white graphics. From the beginning, Illustrator provided options for specifying four-color screen tints. Adobe’s new Separator desk accessory simply adds the ability to select screen angles and ruling at print time.

Since Separator separates colors based on the PostScript color information encoded into EPSF documents, it should theoretically work with a number of graphics programs. Unfortunately, EPSF is something of a nonstandard standard—especially when it comes to color.

Further Reading

Color separation and the graphic arts in general involve a world of obscure terms and concepts. To help you understand and use these terms, we recommend the following reference books. Each one is both comprehensive and readily available.

Edwards Brothers Graphic Arts Glossary. P.O. Box 1007, Ann Arbor, MI 48106. Free.

to color information. Consequently, *Adobe Separator* can separate files created only from programs that adhere to the Adobe version of EPSF—namely, *Adobe Illustrator* and, to a lesser extent, *PageMaker 2.0.*

If you have experimented with *Illustrator’s* four-color features, you may have noticed that whenever the Color button is selected, the % Black box defaults to zero. Reselecting Black causes the color boxes to turn gray and reset themselves to zero. But many times, a desired color is only possible when you add a touch of black. To get around this problem, select the Color button and set the screen percentages for cyan, magenta, and yellow. Then, without clicking on the Black button, double-click inside the % Black box and set the percentage to the desired amount. Press Return and all four screen percentages will be saved in the document (see Figure 3).

Perhaps the most powerful feature of *Separator* is its ability to combine *Illustrator* and *PageMaker 2.0* into a full four-color page layout system. You can now create and color graphics, borders, and display type in *Illustrator* and save them in EPSF; and place them on a page in *PageMaker.* The EPSF drawings retain their color information. All you have to do then is save your *PageMaker* file as an EPSF document, using the EPS button in the Print dialog box, and print your separations using *Separator.*

### Separating Dross from Gold

A decision about which graphics or desktop publishing program you use probably won't depend on the program’s color separation features alone. You have to look at the total picture. *Quark XPress* makes creating spot-color separations easier, for example, but that feature alone won’t justify switching from a page layout program you’re already comfortable with. In some ways, Quark’s system is less versatile and less useful than the old manual method.

If you want a good, easy-to-use PostScript drawing program, and you occasionally need to make color separations, *Cricket Draw* is a good choice. The program’s color-separating features are cumbersome, but it’s a far simpler drawing tool to use than either *LaserPaint* or *Illustrator.* Anyone familiar with *MacDraw* can be up and running with *Cricket Draw* in 15 minutes.

If you intend to make color separations frequently, you’ll need more power than *Cricket Draw* can provide. *LaserPaint*’s pattern metaphor and its ability to create PMS shades would make it our first choice if the interface weren’t so difficult to master. Only after several tries, many headaches, and a visit to the LaserWare offices were we able to achieve the results we wanted.

The clear winner here is *Separator*—because it works so well with *Illustrator,* which is rapidly becoming the new standard for PostScript graphics, but mostly because it lets you create full-color publications using *PageMaker.* *Separator* also produced the best rosettes and the most accurate screen tints and worked the fastest of the programs we looked at.

All of these programs fall short of being full-featured four-color separation programs. The most serious omission is the lack of a *trap* capability. Whenever two or more colors print next to each other without blending, the lighter color should overlap the other color slightly, so that no gap shows when the two are printed. In all of the programs reviewed here, you can work around the lack of a trap feature by varying the line widths of the lighter-colored objects, but that’s a tedious process at best.

The ability to make color separations on the Mac is a major personal-computer breakthrough. The techniques described in this article not only make color separations possible, but they also make separating graphics easier and cheaper than with the old graphic-arts methods, which sometimes required an artist to mask six, eight, ten, or more overlays by hand.

Since this new Mac capability will probably induce more Mac publishers to add color to their work, two caveats are in order. The first is that color is still expensive. Despite savings on separations, you still have to pay for a separate press run for each color. And don’t overlook typesetting costs. Outputting four-color halftones on a laser printer works fine for cartoons and small illustrations, but any high-quality, close-registration color work should be printed direct to negative on a Linotronic 300.

The second warning is that while the Mac has made color work easier, you still have to know something about graphic arts and printing to get the results you want. This warning is especially pertinent when you consider the cost of printing color materials. Whether the Mac II programs now beginning to arrive (see “Color in Color”) will make Mac color printing more accessible—or merely more sophisticated—remains to be seen. In the meantime, if you have the know-how for color printing—and the budget—and have been saving your money for a Mac II, you can stop waiting. You don’t need color to do color.

*At press time Adobe informed us that it was postponing the release of Separator. We’ll keep you posted as we learn of new developments.—Ed.*

See *Where to Buy* for product details.
What's in a Window?

How the Mac II stands up against other workstation windowing environments
The Macintosh II brings Apple into the workstation market: it has a large high-resolution bit-mapped screen, a mouse, and computing power comparable to a DEC VAX minicomputer. Before, we were limited to choosing among workstations from Sun Microsystems, Apollo, or Digital Equipment; today the Mac II offers similar performance and options—but how do these systems compare?

Apple's modified version of UNIX, A/UX, codeveloped by Unisofr of Berkeley, California, was announced last March. Although by August it was still nowhere on the horizon, we can assume that Apple will push the product to completion, but perhaps not this year. This delay in A/UX availability has produced a sizable gap in Apple's product-line extension into the scientific and engineering marketplace. In recent years, we've seen much effort expended on software development for other UNIX-based workstations: at Carnegie-Mellon (the Andrew project), M.I.T. (Project Athena), Sun Microsystems, and a host of other companies. If Apple is to be competitive within the education and engineering markets, it must produce a version of UNIX comparable to those of other vendors.

As a group, workstations share some system characteristics that the Mac II does not currently support. While the Mac II can connect over a high-speed Ethernet network, it neither allows users to log on to remote workstations on the network nor provides for true multitasking. Furthermore, the Mac II doesn't compare favorably with the workstation mechanisms that allow files to be shared among network users. Theoretically, the Mac II with an EtherTalk card, AppleShare, and MultiFinder could claim to have workstation ca-
pabilities. But without the availability of A/UX, Mac OS-based Apple products cannot really compare in performance to their workstation counterparts.

Unlike the Mac OS, UNIX provides true concurrency—allowing applications to run simultaneously in separate windows. UNIX also supports a versatile, arcane, command language.

Concurrent applications can communicate, and do not conflict or corrupt other users’ data, since files can be locked or protected. Some UNIX versions support virtual memory (a technique for swapping tasks in and out of RAM) so that they appear to have access to virtually unlimited system memory. Finally, there is already an installed base of 80,000 high-performance UNIX-based workstations.

The major complaint about UNIX is its steep learning curve. The windowing systems attempt to remedy this situation by providing a user-friendly “front end.” If they do indeed provide an easy-to-learn user environment, UNIX might become a standard operating system for personal computers.

One strong argument for such a case is the C language in which most of the UNIX system is written. Software written in C (or Pascal) for UNIX is relatively portable, especially since most workstations and their software are developed for Motorola's 68020 microprocessor. This has also helped make the UNIX-based workstation market very competitive in price and functionality. To date, Sun Microsystems has the largest installed base of workstations, partly because of its vast library of software and its competitive pricing.

In entering this market, Apple faces two dilemmas. First, it does not have the marketing, sales, technical support, or training programs necessary to gain a significant share of the vast market for low-cost workstations. Second, it must decide whether to support software applications available on other UNIX-based workstations or to make its own applications compatible with A/UX. By making the majority of Toolbox Calls available to applications, Apple is encouraging developers to make their applications run under A/UX. Whether developers choose to do so remains to be seen. Apple will also seek support from the traditional UNIX software suppliers, a move that would take the company out of its current markets and into unfamiliar territory.

Still remaining, though, is the dissatisfaction of some UNIX users over being forced to use an Apple-dictated window interface, rather than being allowed to develop their own environments. The question of A/UX’s compatibility with other window systems is a crucial one. Of the existing windowing systems, the following three are likely to have the greatest influence on UNIX for the Mac II.

The X Window System

The X Window System, developed at M.I.T. partly for the Project Athena computers-in-education program, uses a client-server model. The availability of 4.3 Berkeley UNIX source code for X has made it one of the more popular window systems at universities. Tools for use with this system continue to be developed at various sites around the country. Several manufacturers support X; DEC funded much of its development and has released a proprietary version of it. Since much of the code is the property of M.I.T., once UNIX is available on the Mac II, versions of X are likely to be provided at no charge. X is an excellent window system, especially considering the price.

X Windows (X/W) runs as a server process, servicing requests for applications (called clients). The application process sends a message to the window system server, asking it to draw the window. This contrasts with the Mac’s method of creating graphics in windows. When an application such as MacPaint wants to draw a window, it calls a Toolbox procedure in the Macintosh ROM.

The client-server method has several advantages: it works well on a network, enabling an application to run on one machine while sending messages to display windows on another; it lets both client and server processes run concurrently; it allows numerous clients to use a single server, so multiple processes run on a single display; and it permits a single client application to send information to many servers in a network. The server manages windows as separate processes, and it offers users a variety of window managers from which to choose.

X, like the Macintosh, uses resources (windows, fonts, images, and cursors): clients allocate resources by requesting them from the server. X allows resource sharing by granting access to any client that knows the resource’s unique identifier. For example, different applications can output to a single window.

X provides for a hierarchy of windows that can, in turn, contain subwindows up to an unlimited level of nesting. The entire screen is called the root window: Window nesting allows an individual application, typically contained within a single window, to use all the facilities of X in handling its own subwindows. For instance, one might have on the screen the system clock, an icon representing the file system, and two applications (a word processor and a
Communications Capabilities

Application to Workstations

Workstation to Applications

File System/Local/Remote File Access

One application can display information on many workstations. The mechanism that allows multiple applications to run on a workstation is different for NeWS than for X and Andrew. All three systems allow remote access to files via the network.
Carnegie-Mellon student and faculty workstations to enhance campus productivity. Although the project was financed by IBM, initial development was done on VAXs and Sun workstations, since IBM did not then have a workstation of sufficient quality. Now IBM PC and Macintosh versions of Andrew are in the works, and because source code for Andrew has been widely distributed around the country, much additional development is under way.

Designed in conjunction with a network file system, Andrew’s window system allows workstations on the network to access files anywhere. Workstations are grouped into clusters, with each one connected as a local area network. The clusters, each with its own file server, are grouped in another local area network. The system also allows for phone line communications.

Andrew’s window system is different from most others in its use of tiling, which does not allow windows to overlap on the screen. This speeds window management. If there are too many windows on the screen, they can be reduced or eliminated. Andrew uses pop-up menus, visible anywhere in a window. Since menus lie on top of one another like a fanned-out deck of cards, any of them can be readily selected.

Like X, the Macintosh Toolbox, and NeWS, Andrew supports programming procedures to draw windows, to paint text in various fonts, to draw, and to handle menus and input.

Andrew supports a variety of data types with associated user interfaces, such as buttons, documents, and scroll bars. It also has a built-in database that allows records to be displayed in various ways. You can construct indexes on various fields in the database to produce sorted lists, and the program supports a simple query language. The database makes it relatively easy for applications to integrate large amounts of data.

Of the three window systems described, Andrew has the most application software, including a text editor that sizes text to fit the shape of the window that contains it. In addition, the standard UNIX command interpreter (the shell) has been adapted so that you can use a cut-and-paste editor when typing commands; it also provides a scrollable history of your interactions with the system.

Andrew supports various paint programs, as well as applications that can display files as icons and others that explicitly show the tree structure of UNIX’s hierarchical file system (much like the Mac’s System). Andrew also has electronic mail and bulletin board utilities.

Much of the development effort at Carnegie-Mellon is going into educational software. Andrew already supports a community of hundreds at the university, a working laboratory for the system. Although most users seem relatively satisfied, some are concerned about Andrew’s reportedly slow performance.
**NeWS**

Sun Microsystems describes its NeWS (Network Extensible Window System) as a second-generation window system, in contrast to X and Andrew. *Extensible* describes how the server allows application programs to define their own functions for their own use.

NeWS is programmed in PostScript, which Sun has extended to deal with windowing, and its server runs on workstations. When a client application constructs its user interface, it transmits a PostScript program to NeWS, which interprets it and paints the appropriate image on the screen. The client can also send a PostScript function definition to the server, which is retained in the server's memory for as long as the server remains connected to the client. Since commonly used command sequences need not be repeated, the results are a significant reduction in client/server communications and improved performance.

Its extensibility makes NeWS far more customizable than either X or Andrew. By directly programming the server, the client application can reprogram the user interface to resemble X, Andrew, the Macintosh Finder, or any other window system.

A variety of utility functions enables you to program parts of the user interface, such as menu styles and window management techniques. Using applications with different interface styles is not a problem—you can run them concurrently, easily switching back and forth between, say, an application with pull-down menus and one with hierarchical menus. And because NeWS translates display commands for every device it supports, NeWS clients can automatically access the power of any display device without any additional programming.

PostScript allows the NeWS client application to tailor graphics functions to specific needs. For example, it's relatively simple to write a function `drawpiece (i,j)` to draw a checkers piece at the `(i,j)` square on a previously drawn checkerboard.

Like X and Andrew, NeWS allows a single workstation to run many applications concurrently. NeWS manages this by creating a separate *lightweight* process for each client application to which the server is connected. Lightweight processes are quite efficient to run, since they all share the same address space and require no operating system support. The NeWS server itself contains all the lightweight processes, and hundreds of them can run concurrently without hurting server performance.

NeWS is probably the most advanced of the three window systems discussed here. But it's also the only proprietary one, which is likely to make it more expensive than either X or Andrew.

**The Future of Window Systems**

One of the strengths of windowing systems is that they allow users who do a lot of computing to tap the processing time of less heavily used workstations. To do this, one needs an operating system that makes the network seem transparent—as if it were a single computer. LOCUS, built at UCLA, is such a system. Since LOCUS is already being marketed, it's probably just a matter of time before it becomes available for UNIX-based workstations.

It's not clear whether Apple intends to let A/UX and UNIX languish while it allows the Mac OS time to develop into a more advanced windowing environment. Nor is it clear whether Apple's engineers and managers believe in sharing resources and processing power across networks. The issue has brought harsh reaction from many, who've said, in effect, "I don't want someone using the unused CPU cycles on my workstation." However, such statements probably reflect an era that has, albeit quietly, already passed. Clearly the Mac II, with only the Mac OS, does provide a cost-effective solution for many workstation needs. That may itself become the future of workstation windowing. □
No Problem.

Here in the pristine village of Marlow, NH (pop. 549) we just don't get to see a whole lot of anger, envy, gluttony, greed, lust, pride, or sloth. But we do have a lot of experience with the seven (or more) deadly computer errors—and how to absolve yourself thereof. If you ever have a question about something you bought from us, we'll do everything we can to get you and your Mac back on the straight and narrow.

Speaking of travelling the straight and narrow, there's no safer way to take your Mac SE on the road than with the Macinware SE Bag from I/O Design, Inc.

It has padded pockets for your mouse, cords, and keyboard, as well as a special compartment for a disk drive, modem, or accessories. Solid construction and serious padding throughout. Available in navy blue or platinum grey. Or you can stay home and let your Mac go calling with MicroPhone from Software Ventures. With this highly-rated communications program you can easily create single commands for complex sequences (e.g.: log on, check mail, print and save messages, log off—all in one stroke). And even direct the program to do the sequence at regular intervals.

The virtuous user always backs up files. Network DiskFit from SuperMac Software will save your entire group from falling from grace by automatically backing up (onto floppies, cartridges, or tape) both server and user hard drives. It's fast and efficient—only changed files are recorded during each new backup session.

Salvation from disk swapping is yours with the MacBottom SCSI 21 Meg Hard Disk Drive.

10 Design, Inc.
Macinware SE Bag $79

Software Ventures
MicroPhone $119

SuperMac Software
Network DiskFit $259

PCFC MacBottom SCSI
21 Meg Hard Disk Drive $769
from Personal Computer Peripherals. It comes fully formatted and ready to roll, with software utilities including a print spooler, disk duplicator, and lost file locator. Plus, at only 5 pounds, you can easily take it wherever your computer takes you. One of the most innovative (and good looking) products of the year is Migent's 1200 baud Pocket Modem. Now, when you travel, and know you'll have access to a computer, you can guarantee you'll have access to a 100% Hayes compatible modem. It works on a 9V battery or AC power and has a serial port to connect with virtually any type of micro. If you spend too much time trying to remember file folder names and then trying to find them, try HFS Navigator from THINK Technologies, Inc.

It installs in the system file and keeps track of frequently used files. Plus, it helps you search for buried files/folders with just a partial name, and facilitates renaming and deleting. You can get that abacus, slide rule, and fancy scientific calculator off your desk if you have MathView from BrainPower. It's a heavy-duty numerical analysis package that can solve the most extravagant problems including systems of linear and non-linear equations, ODEs, PDEs, optimizations, numerical integrations, and many others. Sophisticated 2D and 3D function plotting, too!

SuperPaint from Silicon Beach Software takes the Mac several light years past MacPaint. Its vastly-expanded features include multiple windows, automatic scrolling, new shape tools, and "LaserBits," which lets you magnify and work on dots at 300 dpi resolution. You can even print in color on the ImageWriter II. FileMaker Plus from Forethought makes it easy to enter your data however you like, and print it however you need. There's even a whole disk full of typical formats, if you don't want to design your own. Calculations, reports, and sorts are a breeze. You can view multiple records screen, combine info from different files, even include graphics in your reports.

So, if you're looking for Mac products at sinfully low prices, combined with the support and service that's certainly down to earth, if not heavenly, call our free-from-toll number. Looking for a specific product? Check our complete list, or just ask one of our sales consultants. We don't always have room to list all our products and new ones arrive every day.

### MacConnection Software Special

**FORTEHOUGHT **... NCP  
This month, we are pleased to offer the full line of quality products from ForteThought, one of the software leaders in the Macintosh market, and at tremendous savings, too!

**FactFinder 1.1**  
Easy to learn and use. An information organizer that allows free-form entry of data.  
$39.

**FileMaker 1.0**  
Create a variety of custom-designed forms and reports that include text and graphics. Organize customer files, inventory and personnel records.  
49.

**FileMaker Plus 2.0**  
Powerful database capabilities and flexible forms functionality. Provides summary reports, calculations and sorting. Includes templates for Holmes cards, mailing lists, sales forms, etc.  
139.

**PowerPoint 1.0**  
Compose and maintain materials for business and group presentations. Design and arrange overhead transparencies.  
189.

Cricket Graph (multiple windows).  
$125.

Cricket Draw (advanced draw capabilities).  
$175.

**Data Tailor **... NCP  
Tracpeze (spreadsheet, reqs. 512k).  
159.

**DataViz **... NCP  
MacLink Plus (transfer Mac/IBM data).  
59.

48.

**Monogram **... NCP  
Dollars & Sense (home, small business).  
81.
Out on a limb.

We don’t want to offend anyone, but people who still use hard copy are seriously out of date. Just take a look at the artistic strokes of genius on our temporarily tattooed friend. Why, for the right price, you could present your next newsletter, spreadsheet, or epic poem in real living color. Picture your logo rippling across someone’s exotic exterior. Amaze your boss as the gentle undulations of breath do things to your five-year plan that you never imagined possible. Why, even editing could be fun again!

Fleshtop publishing

David Chalk and his partner Roy Zuckerman at Temptu Marketing in New York are designing tattoos on their Mac which are turning traditional marketing literally inside out.

It all started when Roy saw what his father, one of the world’s leading cosmetics chemists, had developed for the movie “Tattoo”—a safer and longer-lasting body paint than anything previously available. He and David were soon selling the paint in kits along with design transfers which can be applied in seconds with good old rubbing alcohol.

They’ve done custom work for everyone from Miami Vice to Guinness Stout. And, for quick designs, the Mac is starting to come in handy (and footy, and everywhere in between). Temptu can now digitize very custom images for transfer to very custom parts.

According to our winners, temporary tattooing is “the contact sport of the 80’s.” So it’s only natural that they’ve chosen the micro of the 80’s to help with their design and marketing. Oh, Lydia, could you have had fun with this one. Eh, Groucho?

### Primera Software ... CP
Smash Hit Racquetball (top-rated!) $15.

### Psion ... CP
Psion Chess (3D and multi-lingual) $31.

### Sierra On-Line ... CP
King’s Quest or King’s Quest II $30.
Space Quest $30.

### Silicon Beach Software
Airbornel (CP the classic) $20.
Enchanted Scepters (CP, over 200 scenes) $21.
Dark Castle (NCP arcade action) $28.
World Builder (NCP, program creator) $41.

### Simon & Schuster ... CP
Star Trek—The Kobayashi Adventure $24.

### Sierra On-Line ... CP
King’s Quest or King’s Quest II $30.

### TurboScanner
Megabyte SCSI Hard Drive (6 outlets; 60 MEG, 60 MEG tape) $569.

### Time-Port
MagNet 40X (40 Meg, 40 MEG tape) $401.
MagNet 20 Backup (40 Meg, 20 Meg tape) $139.
MagNet 2000 (20 Meg, 20 Meg tape) $1395.
MagNet 4000 (74 Meg, 60 Meg tape) $3695.

### Curtis Manufacturing ... life-time
Diamond (6 outlets) $29.
Emerald (6 outlets, 6 ft cord) $36.
Sapphire (3 outlets; EMII/FII filtered) $47.
Ruby (6 outlets; EMII/FII filtered; 6 ft cord) $55.

### Apple II "Dust Covers"
Basic Dust Cover $4.
Mac Plus Cover $8.
XL Dust Cover $10.

### MacConnection Hardware Special through November 30, 1987

### PERSONAL COMPUTER PERIPHERALS

The PCPC MacBottom drives are proven winners for quality, speed and reliability. And now your cost is even lower! All drive units come complete with cables, documentation, Imagewriter and LaserWriter print spooling, HFS Backup, and locator software. Additional features include:

- All new 2-year warranty
- Quiet & lightweight, fits under Mac
- Optional built-in 1200 bps modem available for each drive

MacBottom HD 21 Meg SCSI ... $749.
MacBottom HD 32 Meg SCSI ... $959.
MacBottom HD 45 Meg SCSI ... $1199.

### Mouse Cleaning Kit

- Mouse Cleaning Kit w/Mouse Pocket ... 17.
- Disk Case (holds 36 Mac disks) ... 19.
- Disk Drive Cleaning Kit ... 20.
- TiltSwivel ... 22.
- Universal Copy Stand ... 24.

Four of a Kind

HyperDrive FX/40
SCSI hard disk. Pros: Includes very good software. Cons: Bulky case; technical support available only from dealers. List price: $1799. Requires: 512KE.

Jasmine Direct Drive 50
SCSI hard disk. Pros: Low price; good technical support; includes 9MB of shareware and public domain software; good manual. Cons: Units frequently back-ordered; weak backup software. List price: $1159. Requires: 512KE.

MacBottom HD45

Rodime 45 Plus

Forties are replacing twenties as the standard SCSI hard disk. The increase in capacity has not been reflected in cost; the list prices compare favorably to those of 20MB drives just a year ago. All four hard disks evaluated here are comparable in speed and performance, differing only in bundled software, detailing, price, and technical support. All will work with a 512KE, a Mac Plus, or an SE, and by now, probably with the Mac II (although a slightly different formatter is required). For testing purposes, the four drives were reformatted, then loaded with identical systems and files, and used for several days under normal working conditions.

HyperDrive FX/40
General Computer’s new external hard disk has a separate rather than a built-in terminator, which makes the drive slightly inconvenient to use (except for those who plan to daisy-chain more than two SCSI devices). It also lacks a light to indicate when it’s on or being accessed. It’s packaged in a mod plastic case, but the molded handle does not provide an adequate grip. I also found this unit to be the loudest of the four.

The software General Computer included with the FX/40 is the best of the lot. FX Manager 3.0 lets you change the SCSI address, park the heads, test the disk, and initialize it. The advanced backup utility allows you to back up to other hard disks as well as to floppies. The software package also includes a password utility and print spoolers for the ImageWriter and the Laser-Writer. Although the two manuals (one for disk use and installation, the other for the software) are thin, they are well indexed and adequate.

General Computer has attempted to shift responsibility for technical support to the dealers. Unfortunately, not all dealers return phone calls. I fared little better with the factory number intended only for dealers. I had to wait over 24 hours for a response, but the person who called back was knowledgeable and attentive.

Jasmine Direct Drive 50
Since you buy Jasmine hard disks direct from the factory, they’re among the least expensive. Each comes with a 30-day money-back guarantee, but expect about a two-week delay.

The Direct Drive 50 comes in either beige or platinum. With its low profile, it fits nicely under the Mac but can just as easily be operated on its side. The paper air filter is visible through the ventilation slots on the front, a good example of Jasmine’s attention to detail.

A switch on the back changes the SCSI address. A surge suppressor and an externally accessible fuse protect the drive and its two 110-volt receptacles. Although

This standard benchmark measures the time it takes to read to and write from the disk 100 times with a 24K file. All four drives showed similar results, comparing favorably with a floppy.
there's no indicator light on the front, the drive makes a sound when it's being accessed, reassuring the user it's busy. Shutting off the drive automatically parks the heads.

The intelligently written manual is the best I've seen for any hard disk; it includes information usually glossed over or skipped entirely, such as a technical discussion of disk speed related to interleave factor. A large section on file recovery is supported by extensive software on the disk.

Of the four companies, this was the only one I could get through to for technical support on the first try. Jasmine also maintains its own bulletin board service. You can use it to leave questions or download the latest software, including a SCSI address checker, a formatter, and a mounter for those annoying occasions when the drive does not mount itself. There is even a program, to be used with caution, that can initialize the drive without erasing any of your data. However, you may wish to buy a less pedestrian backup.

As an extra bonus, the company loads its drives with 10MB of shareware and public domain programs for testing purposes and leaves it on the drive when it's shipped—a real treat for anyone who likes to try out new software.

### MacBottom HD45

Personal Computer Peripherals Corporation makes no attempt to compete on price, aiming instead at the quality end of the market. The MacBottom is the smallest, lightest, and quietest of the drives considered here; yet it holds a 1200-hundred optional modem.

At $200, the modem is not inexpensive. It's equipped with Hayes-compatible commands, four dip switches, and a volume control. It's only unusual feature is its inclusion in the drive, which gives you one less piece of equipment to transport. The unit automatically parks the heads when it's shut down, another convenience for the traveler.

The MacBottom has a light on the front that shows disk access, and all its cables are permanently attached. The external 25-pin SCSI connector for daisy-chaining is the same as the Mac's. On the bottom of the case is the SCSI address selector, which can be changed with a few clicks of a pencil point. My only complaint is that the on/off switch, hidden on the back behind the power cord, is practically inaccessible. Since the manual has no instructions on removing the internal terminator for daisy-chaining three or more MacBottoms, you'll probably have to call the technical support number for assistance.

The software includes an excellent HFS backup program (also available separately), an ImageWriter spooler, a LaserWriter spooler, a floppy copy accessory, and a DA file finder, but no hard disk manager. The manual instructs you to erase the disk with the Finder menu choice when you need to reformat the disk. For those who are on a less-restricted budget, this drive is difficult to beat.

### Rodime 45 Plus

The Scottish company Rodime makes the Winchester drives installed in many of the hard disks on the market, including some Apple drives. Therefore, I was surprised that Rodime's own release for the retail market is not more unusual. This under-the-Mac drive is good, but not special.

---

**Table: Normal Use Times**

</tbody>
</table>

Although these usage test results don't match the benchmarks, the variations between the four drives are so slight they'd go unnoticed in normal use. Any differences in raw speed would be masked by such factors as available disk space, file fragmentation, and system size and version.
Reviews

I found its bulky case, with the fan attached to the back, made the drive seem rather intrusive.

The 45 Plus has an internal terminator and an external SCSI address switch that's adequate but requires a miniature screwdriver to set. There is a small light on the front of the case, but it's hard to see.

The Rodime manuals are just adequate and do not compare well with the others provided here. There is no mention of technical support beyond 'see your dealer,' and the manual doesn't even list a company phone number.

I used all four drives for several days within my normal work routine, and each performed flawlessly, with no perceptible differences in speed or ease of use. If forced to make a choice, I would take the MacBottom; but if price is an issue, the Jasmine would be hard to beat.—Scott Beamer

See Where to Buy for product details.

Gateway to the Future

Netway N1000A

If you're an MIS manager looking for common ground between 3270 IBM mainframes and Macintosh AppleTalk users, Netway N1000A from Tri-Data may be the answer. It can have your Macs effortlessly talking to the company computer in a matter of minutes. The N1000A can accommodate everyone from graphic artists downloading data for charts to senior executives accessing E-mail from the mainframe.

Replacing the huge IBM 3274 cluster controller, with one-tenth the installation hassles. And you can throw away all those clumsy coaxial cables!

Service for 16

The Netway N1000A consists of a network communications server (with a serial I/O port that supports baud rates of up to 9600) and terminal emulation software that can be placed on an AppleTalk network. As many as 16 Macintosh users can connect to the mainframe while still using the Mac interface to access data. The package also includes an AppleTalk port, an NRZI option module for line-condition selection, a modem cable, and an optional active-modem-eliminator direct-connect cable. For more complex downloads, you can get Mac-Mainframe, an optional file-transfer package ($995, including network license).

Preparing to Serve

Getting the Netway N1000A up and running shouldn't require more than a few minutes' work. Just connect the cables and modem and configure the server with the SNA protocols. If necessary, you can refer to a clearly written manual that works as well for the novice as for the experienced MIS staff. Once the server is configured, individual Macs can be set up to talk to the mainframe through the Netway (see "Mac to Netway"). A copy of the Presentation Services files showing the host and user names must be put on each user's disk. You can specify up to six macro-key assignments to automate such functions as logging on and off the system or sending your password and account number. Although some 3278 keyboard-mapping capabilities are provided, more extensive keyboard customizing would be nice.

With your Mac ready to emulate an IBM 3278-2 terminal, you're now prepared to communicate with the mainframe. At this point, you can run the macro strings defined in your configuration file to simplify logging on. The only weak links here are the limitations of the macros. Six macro-key assignments are not quite sufficient, given the number of commands you may regularly send to the mainframe. The program won't let you chain macros together to be sent in a batch; instead, you must select and execute each one individually.

Overall though, once you're online the Netway software works well. You can either stick with the terminal-emulation
features and merely access mainframe services like E-Mail (IBM PROFS, for example) or cut and paste data from the mainframe for use in a Mac application. Since the terminal emulation software also supports Switcher, you can easily toggle between the host and applications running locally on your Macintosh. (At press time, Tri-Data had not been able to test it extensively with MultiFinder but expects to do so in the near future.)

The Netway's overall performance is equal to that of the IBM 3274 cluster controller, and it is faster and easier to use than other Macintosh terminal-emulation software (such as MacTerminal). But perhaps the Netway's greatest advantage is that it lets you transform your data-processing environment from a centralized system dependent on a mainframe to a decentralized network of independent Macs. The Netway, in effect, turns your mainframe into a giant file server from which any Mac can download information for local processing quickly and easily, without ever leaving the friendly Mac interface. Accounting data can be downloaded and processed in an Excel spreadsheet, for example. You can also look forward to replacing those bulky IBM dumb terminals (and their awkward coaxial cables) with Macs.

The N1000A is a vast improvement over previous attempts to remove one of the last obstacles to integrating Macs into the corporate environment: IBM mainframe connectivity. The Netway so artfully bridges the Mac-to-mainframe gap that you'll wonder how you ever got along without it. —Ken Smith

See Where to Buy for product details.

**High Performance**

**Radius Accelerator SE**

**68020/68881 accelerator board for SE.**

**Pros:** Low base price, performs as well as Mac II.

**Cons:** If you need more than 1MB of memory, the resulting price/performance ratio is higher than competitors. **List price:** $995 for accelerator board. $400 for 68881 numeric coprocessor.

**Requires:** SE.

The only way to improve the performance of your SE is to upgrade its processor. Four developers—Levo, Peak, General Computer, and Radius—offer MC68020/68881 accelerator boards to accomplish this. Levo and Peak supplement this combination with an MC68851 paged memory management unit (PMMU), while General Computer and Radius do not. (For a discussion of other boards, see “Beefing Up the SE,” Macworld, September 1987.)

The Radius Accelerator for the SE is a $995 replacement CPU board that plugs into the expansion slot and uses an onboard 32-kilobyte cache to speed up access to memory on the system board. You may fill the floating-point coprocessor socket with a 68881 for an additional $395, or allegedly with a 68882 (when it becomes available) for even higher-speed math functions.

Running a 68020 as the CPU in a computer designed to run a 68000 at half the clock rate requires some changes in the storage architecture. To supply the 68020 with instructions and data as fast as it needs them, the accelerator board's memory must be twice as fast as the SE's. Also, because the 68020 can read 4 bytes at a time, the add-on board's memory should be accessible 32 bits at a time, rather than the SE's normal 16 at a time. If the memory system is fast enough, a Mac with a 68020 running at double the SE's clock speed would operate at four times the speed of the SE's 68000.

In addition, applications using real arithmetic (and especially math functions) run from 10 to 100 times faster than a regular SE if you install the optional 68881 and compile code to use it. Even applications that use Apple SANE will be automatically routed to the 68881. Radius ROM routines are smart enough to use the 68881 when it is present.

Instead of providing 1 to 4 megabytes of faster, 32-bits-wide main memory (as most add-on board makers do), Radius uses the system board's existing memory and incorporates a small amount of faster static RAM that can keep pace with the faster and wider accesses required by the CPU. This write-through caching scheme can be used to speed access to either application code or data or both. On machine start-up, you can disable the accelerator board and run your SE in its original form.

The Macintosh II inserts two wait states each time the CPU fetches an instruction or data from memory. An SE with a 68020 CPU accelerator running at almost 16 MHz, that can access memory with fewer than two wait states, has the potential to run faster than a Mac II.

Most of our tests found that the performance of the Radius Accelerator is nearly as good as a Mac II for most applications. PageMaker, Word, and Excel perform at least two times faster than on an unenhanced SE.

**Cache Me If You Can**

The 68020 can store 256 bytes of instructions in its cache and execute these instructions quickly. This can help prevent some of the waiting for memory fetches on a system bus. The advantage is realized when tiny loops in programs can fit entirely in the cache, so that after the first pass through the loop, the 68020 doesn't have to fetch instructions from memory. The 68020 can then run applications containing many small loops faster than if every instruction were fetched from memory.

Often if the main memory is slower than the CPU, a cache can help reduce the effects of wait states. On the other hand, programs that branch extensively can defeat the cache by making diverse program and/or data references, requiring the cache to be frequently flushed and refilled. This condition is called thrashing. The performance of a cache memory architecture therefore varies widely among different applications. On average, the Radius board is about 15 percent slower than some other, costlier boards (like the Prodigy SE or the HyperCharger), which contain full replacement memory.

---

**Mac to Netway**

Each Mac on the network must be configured with the Netway software before it can communicate with the mainframe. You can enter user and host names, set options for the cursor and the status line, and define macros.
Reviews

Compatibility
Not all manufacturers wrote their original Mac applications so that they'd run flawlessly and efficiently on 68020-based Macs. For example, applications like Super LaserSpoon and Lighthouse Pascal have a tendency to crash on the Radius board (and on the Mac II). (That problem should be short-lived, since manufacturers are rushing to fix such incompatibilities.) You can currently run those applications on the Radius board in 68000 emulation mode. Other applications have problems on Radius when the instruction cache is turned on.

Extendability
The Radius board provides a bus extension connector to which you can attach the Radius Full Page Display for higher-resolution large-screen graphics. Unfortunately, you cannot hook up any other large-screen monitor to an SE equipped with the Radius accelerator board. You can expand the memory up to 4MB with 1MB SIMM modules, but 1MB chips are very expensive. You add memory expansion boards to the system board, as you would do with a stock SE.

System Performance Benchmarks
Benchmarks are deceptive. We ran standard benchmarks like the Whetstone, the Dhrystone, and the Sieve of Eratosthenes—which may not tell the whole story. To add to the confusion, the same benchmark compiled in different versions of C showed a 50 percent variation in performance. In addition, we wrote a C program ourselves to test the accelerator board. The Henon program tests the overall accelerated SE system performance and is large enough to exceed the capacity of the cache. Unlike some simple numerical benchmarks, it also makes a large number of QuickDraw calls to draw graphics on the screen. The program was compiled like other benchmarks with a 68020/68881 version of Consultant Mac. In addition, we also carried out real-life tests, like measuring the time to open an application, quit an application, and scroll within a document, to find out if Radius accelerator performance is at least comparable to that of the Mac II.

Recommendations
The Radius performed fairly well, considering that it does not have the 32-bit memory and disk cache other accelerators do. Benchmarks were comparable, so if you are just looking for a low-priced accelerator, this is the one. In addition, you may not notice the difference between a Radius-accelerated SE and a Mac II for day-to-day applications.

But if you are interested in UNIX or true multitasking, or have memory-intensive applications, we recommend the Leveco Prodigy SE over the Radius. Also, if you are interested in large-screen landscape monitors, you'd be better off buying either a Leveco or a GCC board, since the Radius board works only with the Full Page Display.

Overall, the Radius board is a reliable, low-end Mac II substitute for the SE.
—Prasad Kaipa and Robert Davis

See Where to Buy for product details.

Benchmark Results
Benchmarks for a Mac II and an enhanced Mac SE: A special C compiler producing 68020 code and direct 68881 calls was used. The graphics benchmarks were compiled with Turbo Pascal version 1.0.

Money Worries?

MacMoney 2.03
Personal financial software. Pros: low price; easy to learn; very good tech support; fast data entry; flexible report generation. Cons: Some features are of questionable value; beginners can be overwhelmed by too many choices; no tutorial or demo data provided. List price: Version 2.1 $98.95. Requires: 512K. Copy protection: None.

Instead of feeling like a victim of your financial circumstances, you can use a program like MacMoney to gain understanding of your financial situation. You can then use that information to make decisions, such as determining whether you can afford to move into an apartment and get a new car if you get only a 5 percent raise next year.

Survivor Software's MacMoney will help you balance your checkbook, as well as write checks and alert you when bills are due. In fact, it will even write the checks for you. It can help you develop a budget, fill out tax returns, and prepare a first-rate financial statement to show a loan officer. Although the bookkeeping is not set up with general ledger, payable, and receivable modules, small-business owners may find the account-handling capabilities adequate for their needs.
Though beginners may be intimidated by the large number of menu choices available, getting started is really quite simple. Just put your beginning balance, and you’re ready to enter the information from your last bank statement. Because you can shift entries between categories at any time, you can put all your entries in one or two categories until you get a better feel for the program. The back of the manual lists several common categories like salary, rent, car expenses, and entertainment. Similar to the chart of accounts found in business accounting, the list of categories lets you sort transaction information into reports.

No One Does It Faster

Data entry is extremely fast. Three lists (Names, Categories, and ID Codes) appear on the screen at the same time. Many entries can be typed into these lists just once—ever. The three lists include the most common transaction names and categories, so you need only point and click to fill out a data entry form. For a typical entry you might click on the name of a supermarket. The program automatically inserts the payee, Safeway; the category, Food; the date; and the check number. Just fill in the amount and press Enter. The form looks like a check, but you can change it to resemble a deposit, credit card charge, withdrawal, or service charge slip.

Each bank account or credit card has a separate register of transactions. You can even have a register for cash, in case you want mortgage payment interest and principal credited to separate categories.

Experienced bookkeepers will be pleased to discover that the program handles errors in a traditional manner. MacMoney lets you add a Void category, use the memo line for transactions, produce an audit trail as a standard report, and reconcile bank balances. Another flexible feature is the ability to edit every transaction, even months later, so you can shift transactions from one category to another.

You can mark routine transactions such as mortgage or car payments so that the program automatically reminds you when they are due. With just a few mouse clicks you can adjust the amounts, enter them in your check register, and print out the checks on your ImageWriter. Sample checks are included in the package.

Where Does It All Go?

It takes a while to become familiar with the numerous controls on the two report-generating screens. With so many buttons to choose from, beginners may find it confusing to set up customized reports. These choices, however, offer a range and control in report preparation that is superior to more expensive accounting programs. MacMoney includes Income & Expense and Balance Sheet as standard reports, and Budget vs. Actuals and Net Worth for displaying data graphically. You can also create customized reports as templates for later use. It’s easy to customize graphic reports; my favorite is one of the standard menu choices, a pie chart of the largest expenses from the last month (see “Graphing Expenses”). MacMoney lets you save reports in ASCII format, allowing data export to any program that accepts text files. This could be useful if you want to further analyze your financial data, say, with Microsoft Excel, or dress up a report with a desktop publishing program. Graphs can be exported through the Clipboard.

MacMoney is slow to open and takes up a lot of disk space. To optimize disk space, you should put the three planning menu options (Loan Planning, Retirement Planning, and Future Value/Goal) on a separate program disk. These modules are not necessary for the operation of the program, and in fact there is no way to transfer tax-related categories. Version 2.1, which should be available by the time you read this, will offer the options of using account numbers, setting the start-up configuration, and including running balances in reports.

Survivor Software seems committed to providing its customers with good value for their money; a goal achieved with MacMoney perhaps better than with any other software I know. Still, those with modest needs may prefer a less elaborate program; on the other hand, MacMoney won’t fulfill the needs of business users who want to keep more traditional books. But for most people with money concerns, it should prove an invaluable tool.—Scott Beemer

See Where to Buy for product details.

Graphing Expenses

One of MacMoney’s standard graphs shows the largest expense categories from the previous month. By using the program’s standard and customized reports and graphs, you can easily analyze your current financial situation.
**Reviews**

**Four-Wall Challenge**

**MacRacquetball**

*MacRacquetball* is the new racquetball simulation game from Practical Computer Applications, the company that produced the popular MacGolf.

*MacRacquetball* games are played against the computer or against an opponent via modem or ImageWriter II cable (an AppleTalk version should be available by the time you read this). When you load the game disk, a configuration screen with a series of vertical scroll bars appears. These bars let you select and adjust the abilities and tendencies of the players. Certain scroll bars control a player’s strength, stamina, agility, and accuracy. Others determine predilections for types of serves (like drives and lobs), or volley shots (kills, passing, and ceiling shots), as well as the three hitting motions (forehand, backhand, and overhead). The player’s predominant style is designated by adjusting the settings labeled Aggressive, Reactive, and Defensive. Probably the most important scroll bar is the one that controls the speed of the ball: Game Speed. The higher the Game Speed setting, the greater the demands on your reflexes, which are not inconsiderable even at lower settings.

While you can adjust the scroll bars for your computer-opponent, the game limits the number of adjustments you can make for your own player. You can set strength, stamina, and agility, but your player’s overall style, serve, and shot selection are determined as you play.

When you’ve adjusted the scroll bars for both players, you’re ready for the court (although at any time in the game you can easily return to the configuration screen to adjust the characteristics).

**Court Sense**

You can choose the Warm Up mode to play by yourself, or you can go directly into a game. As the players enter the four-walled court and prepare for service, you’re presented with a full-perspective 3-D court. The players are digitized from live-action videotape and perform with impressive realism. To serve—or to execute any shot—you press the mouse button, releasing it as you push the mouse forward. Then you must move your player into position for the return. Determining exactly where you want your player to run is a real challenge. Even at a Game Speed of 20 percent you must quickly determine the best position for intersecting your opponent’s caroming shots. Geometry was never my forte; I played for hours before developing somewhat “instinctive” responses.

The player runs in the direction you move the mouse, but more slowly. A dark square on the court moves in unison with the mouse, showing where your player is headed. It’s important to focus on the square; if you focus on your player, the time lag between the mouse’s and the player’s movements can be confusing.

The manual warns that pushing the mouse too slowly will make your shot fall short, and a push that’s too fast will send your shot higher than you want. This mouse-pushing procedure is difficult to master; in fact, other than while serving, I had no success applying it. My mouse thrusts often seemed to have no effect whatsoever, but that may have been due to poor player positioning. However, you can return some shots without moving the mouse, simply by getting your player into position and clicking the mouse button.

**Ready, Aim...**

The point where you intend your shot to go is the aiming spot, which appears as a square or a diamond, depending on which wall (or ceiling) you direct it to. You control this aiming spot by holding down the Command key and moving the mouse. Skillful manipulation of the spot depends on quick recognition of where your opponent’s shot is headed. The operations are sequential: first get your player positioned, then maneuver the aiming spot. Developing adequate coordination of the two operations can be a slow and tedious process (one I’m still learning). However, the first time I swept the aiming spot to the rear wall and saw my player turn 180 degrees to drive his shot against it, my feeling was pure excitement. The ability to place a shot anywhere on the court takes the game to a sophisticated level of play. Playing over the modem against a live opponent is also great fun and can result in a fascinating tactical battle.

**Final Rally**

*MacRacquetball* is an extremely challenging game, and not without nuisances. I’ve yet to understand the spatial relationship that results in my player being struck by the ball, thus losing the point. And sometimes my computer-opponent’s behavior makes no sense. In a 21 to 0 game, I served every ball to the same place on center court and the opponent failed to return a single shot.

Expertise comes slowly. Manipulation of the mouse, recognition of shot angles, and control over the aiming spot are all dif-
How Much, How Soon, How Fast

Three programs were used to gauge how long each system took to compile and link MiniEdit to create a stand-alone application.

TDI Modula-2 was able to solve Towers of Hanoi with 9 disks in half the time it took the other systems.

The compiler is very efficient at generating compact code that executes quickly. But since it is a five-pass compiler, it’s not very fast (the upgrade is speedier). Be careful not to compile large implementation modules (64K of heap space) or the compiler will run out of memory and fail.

TDI Modula-2 for the Macintosh, Developer’s Version 1.00A

Development environment. Pros: Generates fast, compact code with full Toolbox access; compiles textbook-style programs; not limited by 32K segment size. Cons: Sketchy documentation; buggy editor; can’t compile large source modules (over 32K). List price: Version 3.00A $149.95 Requires: 512K. Copy protection: None.

For those of you who have been waiting for a solid, inexpensive, native-code Modula-2 compiler for the Macintosh, your wait is over. TDI Modula-2 for the Macintosh shares the strengths and weaknesses of its predecessors, TDI’s other Modula-2 compilers for Motorola 68000-based systems (Pinnaclle, Atari ST, and the Amiga).

As a development tool, TDI’s editor has a number of problems: it doesn’t consistently recognize tabs, the automatic indent doesn’t work, and it is slow handling files larger than about 10K. The editor does recognize invisible markers that the compiler puts in the file when it finds an error; however, which helps you locate compilation errors quickly. (Whatever editor you use, do not include tabs in the file, or the compiler will flag them as illegal characters.) TDI’s prerelease version of 3.00A has fixed bugs in the editor, although it is still somewhat limited when compared with other program editors.

- Richard Miller

See Where to Buy for product details.
Reviews

When you're using either the compiler or the linker, you'll see very little of the Macintosh interface. Instead you'll get a progress window without menus, where you are prompted with Standard File dialogs. When you click Cancel in the SPGetFile dialog, you exit the program and return either to the M2Shell or your Finder equivalent.

Although the documentation gives complete descriptions of the libraries and the system's general operation, no starting point is provided for Modula-2 novices. Specifics are poorly covered with sketchy information and too few examples. (TDI has promised rewritten documentation for version 3.00A.) However, helpful technical support is available by phone or via CompuServe.

If you're interested in programming your Macintosh in Modula-2, this package will provide a solid base; but if you are new to Modula-2, you will need additional references. *Inside Macintosh* is a must for anyone planning to program the Mac, but it is not a tutorial. I recommend *Macintosh Revealed* (vols. 1 and 2) by Stephen Chernicoff as a good introduction, since its Pascal approach adapts fairly easily to Modula-2. Experienced Macintosh programmers who are familiar with Modula-2 will find this package a pleasure to use. Those who plan to develop large applications, though, might want to consider another environment.—Dennis Cohen

Works Writing Enhancer

**WorksPlus Spell 1.0**

*Spelling checker for Microsoft Works.*  
**Pros:** Seamless integration with Works; fast; good at suggesting corrections; sensitive to case and transpositions.  
**Cons:** No word counter; hyphenation problems on a 512K; some questionable dictionary entries.  
**List price:** Version 1.0A1 $59.95.  
**Requires:** 512K.  
**Copy protection:** None.

WorksPlus Spell adds a spelling checker, hyphenation capability, and a limited glossary to the word processing module of Microsoft Works—giving users more of the power found in

![Spelling Corrections](image)

Spelling Corrections

Here the screen displays the usual spelling-checker choices: Cancel, Skip, Add Ignore, and Change.

Word 3.0, without sacrificing Works' friendliness and simplicity.

The Spelling Bee

WorksPlus Spell checks spelling against a 70,000-word dictionary, either interactively as you type or after you select a section of text. This fast-working program lets you access the dictionary to look up, add, and remove words, and it's also good at suggesting appropriate alternatives. The dictionary must be kept on the desktop, however, since it can't be accessed from within a folder.

When the spelling checker is running, it's impossible to change anything other than a highlighted word, but it's easy to interrupt the checking process and return to the document. When called upon to find a correction for a possible error, the program offers standard choices (see "Spelling Corrections"). But WorksPlus Spell has two peculiarities: the default choice is Change rather than Skip, and adding a word to either the document's dictionary or the main dictionary requires two steps.

The program recognizes capitalization, which reduces the number of words unnecessarily flagged, and it's also good at recognizing transposed letters. Despite these unusually nice features, WorksPlus Spell's dictionary appears to contain some incorrect spellings and some very rare words that could frequently represent typos—such as *abjection*, *shads*, *ytrium*, and *zaire*.

And the Extras

The hyphenation program works either automatically or along with the hyphenation helper, which asks the user to approve each choice. The automatic version requires a big chunk of memory; it won't load on a 512K Mac and will crash a Mac Plus if used with the spelling checker in interactive mode.

Hyphenation is flexible, automatically reformating when line length is changed or text is added. Undoing a hyphenation without changing the text involves reselecting that portion of the text and running the hyphenation helper again. Users can set the minimum number of characters on both sides of the hyphen, but the program defaults to the standard setting at the next work session.

The dictionary works well, as long as you choose an abbreviation that isn't in the main dictionary. However, there is no way to embed a carriage return into a dictionary entry. Version 1.1 is expected to allow both permanent changes in hyphenation preferences and carriage returns in the dictionary.

All in all, WorksPlus Spell adds some useful features to Microsoft Works. And if the upgrade successfully addresses the minor flaws of the current version, it will be better still.—Shel Horowitz

See *Where to Buy* for product details.

Behind the Scenes

**Scriptwriter 1.17**

Scriptwriting and word processing package.  
**Pros:** Versatile scriptwriting and editing features; advanced word processing capabilities.  
**Cons:** Learning dual-column editing takes some effort; master disk required for loading the Finder.  
**List price:** Version 1.25 $495.  
**Requires:** 512K.  
**Copy protection:** Key disk.

American Intelligence's powerful new theatrical and audiovisual scriptwriting program provides a much-needed tool for those occasions when the director stops the cameras and says, "Let's look at that script again." *Scriptwriter* allows for just about every contingency: changes, additions, deletions, and those last-minute do-it-all-over-again requests that are inevitable with scriptwriting.

High-Powered Scripting  
*Scriptwriter* offers screenplay and dual-column formats, as well as a word processor that supports screenplay and novel formats, as well as a word processor that supports screenplay and novel formats.**
mentary, and industry writers will be particularly pleased with Scriptwriter’s effective dual-column capabilities, although it takes some time to become adept at using the dual-column editing features.

Television and motion-picture writers will appreciate Scriptwriter’s automatic setup of scene and page numbers, along with an unlimited glossary function that allows single-key insertion of character names, scenes, parentheticals, dialogue insertion points, and script instructions. As you add, delete, or edit scenes, Scriptwriter automatically renumbers them as required. When you’re working with scripts that can easily go over one hundred pages, automatic renumbering of scenes saves considerable time and energy.

Perhaps Scriptwriter’s most valuable feature is its autopagination, which automatically breaks the page at an appropriate point, inserts a transitional word (such as continued), proceeds to the next page, and adds the character identification. You can also choose page-break options, such as Break Only After Dialog. Following your instructions, Scriptwriter determines whether to break the text or move the scene, dialogue, or block of words to the next page. You can program the auto-backup to save work in progress whenever keyboard input is halted, even for as short a period as 15 seconds. Scriptwriter offers two other useful features, which are not available on any other scripting program: a TelePrompter mode, which lets you scroll long scripts at variable rates without relying on the mouse, and the ability to print help files without forcing you to quit the program—so you can refer to hard-copy notes as you go along.

Scriptwriter’s fast word processor takes full advantage of the autopagination, page-breaking, and autobackup features. You can use its special spell-check file format with existing spelling checkers, and you can save files in ASCII (text-only) for transfer to other word processors. Scriptwriter supports unlimited windows but will not process footnotes, nor will it import graphics into the body of the text, although graphics can be imported into header and footer locations. After reviewing your word processing requirements, you may decide that you don’t need any other word processing software.

Top Billing

Although several packages exist for scriptwriters, including Scriptor and CineWrite, Scriptwriter appears to be in a class by itself. Scriptor is a formatting program that lacks a word processor and works only with Microsoft Word 1.05. Mac3’s CineWrite, developed in France, is Scriptwriter’s closest competitor; it offers both screenplay and dual-column script options, but its limited editing capabilities in dual-column mode make it clearly inferior to Scriptwriter.

Like Scriptwriter, CineWrite allows different character names and scene descriptions to be entered with two or three keystrokes, but it offers neither Scriptwriter’s intelligent page-breaking nor its autopagination. Unlike Scriptwriter, CineWrite allows you to see the final format only when you print it out. And it offers only one font (Chicago), while Scriptwriter supports loadable and downloadable fonts in 9- to 24-point sizes.

Rather than combine storyboarding and scripting in a single program, as Mac3 did with CineWrite, American Inteleware chose to develop a separate program called Storyboarder, which includes special formats for desktop publishing.
Reviews

presentation graphics, and sophisticated animation. Although CineWrite's storyboard feature lets you program MacPaint files to run in real time along with scene lists and descriptions, these effects take up so much memory that you'd probably need a hard disk to use them. Together, Scriptwriter and Storyboarder provide many more useful professional features than does CineWrite with its simpler graphics capabilities.

CineWrite offers a number of production tools (shot lists and notes) that are likely to benefit only a story promoter, film director, or production manager. Such extras are of questionable value to the writer and actually limit CineWrite's scripting potential. It seems as if CineWrite's developers couldn't decide whether to support writers or production planners. By aiming at both, they've created a program that doesn't fully support either. On the other hand, by emphasizing scripting and editing functions in one program and professional graphics and animation in the other, American Intelligence has managed to accommodate both groups.

The company also offers excellent user support through a toll-free number and provides an unlimited number of software upgrades for a one-time fee of $25.

Fast, powerful, and easy to use, Scriptwriter can, not surprisingly, be found in a wide variety of applications. It's being used by the U.S. Navy, Honeywell, Universal Studios, and "The Cosby Show." For a writer to whom the play's the thing, Scriptwriter certainly has the decided edge.—Richard Halmi

See Where to Buy for product details.

A Little Byte Music

Studio Session 1.0
Music composition software package.
Pros: Easy to use; excellent learning and composition tool; good sound reproduction.
Cons: Not yet MIDI compatible. List price: $79.95.
Requires: 512K. Copy protection: None.

Here is a unique product for the Mac that makes it possible for the most unschooled, ten-thumbed musicians to compose and play their personal masterpieces. On six instruments, no less.

One Piece at a Time
Studio Session has two main applications: the composition, arrangement, and playback of your own creations; and the mixing and mangling of the 21 sample songs and the 91 different "instruments" included in the sound library. Two additional sound library disks, the Heavy Metal Music Disk and the Country Music Disk, can be purchased separately. Studio Session also has a composition phrase library consisting of segments of the sample compositions, which can be pasted together at your discretion. You can also create your own segments and add them to the library.

Studio Session works best on a hard disk, but functions quite satisfactorily on a Mac 512K system if you don't mind occasional disk swapping.

When you start up Studio Session, you are presented with three icons: Player, Editor, and Phrase Library. For a quick view of what's going on, click on Player. An image of a tape player appears with six VU meters across the top, which allow you to control the activities of each music track. Below the VU meters are the buttons you'd expect on a tape player, as well as tempo control. There is even an animated cassette tape that plays, rewinds, and fast forwards like the "reel thing."

Before you can play a composition, all the required instruments must be in memory. Here's where the disk swapping comes in—the instruments are located on Music Discs 1 and 2, arranged in alphabetical order. Once the instruments have been loaded, click the Play button and listen. For the full effect of Studio Session, you should attach an external speaker to the Mac; better yet, plug the Mac into a stereo.

To alter existing song files, or to create new ones, you use the Editor. An entirely separate application from the Player, the Editor displays one of six staffs (or tracks), on which you place notes and other music notation by pointing and clicking. You can then build your composition by switching between staffs and adding new lines. (By the time you read this, a new version of Studio Session will probably be available, with eight tracks and full MIDI capability.) Whole sections can be cut and pasted from one score into another, and transposed up and down by an octave or a half-step at a time. You can also bend notes, tie notes together, and "swing" sections of your score. You can assign different time and key signatures and tempos, and change instruments anywhere in the score.

Spike Jones, Eat Your Heart Out
I took Studio Session's version of the theme from 2001 (Also Sprach Zarathustra) and replaced the crescendo horn section with digitized crowing roosters.
Compose Yourself
The Editor is at the heart of Studio Session. Here you build your composition—adding notes and rests, selecting time signatures and meters, and choosing instruments.

Frivolous, perhaps, but it demonstrated the software/movie/video animation soundtrack potential of this system for comedic, new wave, and “third-stream classical” productions in addition to more traditional applications.

Studio Session’s documentation is among the best I’ve ever seen. Still, it’s a large program with many effects available to users only after a lot of experimentation. (This is, of course, true of any musical instrument.)

Playing with Studio Session was some of the best fun I’ve had in a long time. I highly recommend this program as an entertainment, composition, and educational tool. It’s also great for a laugh. —Ken Goebner.

See Where to Buy for product details.

Macro-Making for the Mac

AutoMac II

Macro Programs Compared

AutoMac II is not the only macro package for the Macintosh. Besides Tempo, there’s also a macro utility called Touch n. Go included in Cordland’s TopDesk DA collection.

Tempo offers more features than its competitors, including up to 24-hour delays and macro script editing. Since it’s much larger than either AutoMac II or Touch n. Go, it’s better suited to hard disk systems. Still, Tempo is the only choice for creating fully automated presentations or programming functions to take place in your absence. Tempo installs as an extra desk accessory.

Touch n. Go is a lightweight, by comparison, but comes on a disk with six other TopDesk DAs. Unlike AutoMac, Touch n. Go is application-specific—its macros can’t travel from one application to another. And since Touch n. Go is a DA that must be installed with its own utility, if you have a full System file, you’re out of luck.

Macro-Making for the Mac

AutoMac II is a macro-generating program that installs automatically in memory (using only 15K) and resides there alongside whatever else you happen to be running. To generate macros using AutoMac II, first enter the Option-Backspace command. This calls up the dialog screen (see “The Recording Box”). Enter the key you want to control the macro you’re about to create. Click Record. That’s it. Perform the action you want to be turned into a macro exactly as you want it to be done. When you’re finished, press Option-Backspace again. Your first macro has been created.

How It Works

All AutoMac II does is record mouse movements and keystrokes exactly as performed, either as a simple event sequence or in real time. Whatever you do, in the order you do it, becomes the blueprint for the resulting macro. If you make a mistake while recording a macro, the macro will repeat the mistake every time, but don’t worry, macros can easily be redone.

Generally, you’ll record macros as event sequences. This means that the macro will execute the recorded events as fast as the Macintosh can respond, which is a lot faster than you can. Long, complex command sequences can be speeded up considerably, and switching from one format to another can be accomplished in seconds.

AutoMac II is also “immortal”: you won’t purge it by switching programs, so you can create macros in one application and transfer them to another. After you’ve created the macros for one application and saved them as a set, they’ll load automatically every time the application is used.

This brings up one qualification, however. AutoMac II records mouse movements and keystrokes independent of the environment in which they’re running. For example, if you run a macro created for MacWrite while you’re in MacPaint, the keystrokes and mouse movements will behave as though they were in MacWrite.

The result will probably be meaningless. If your macro includes a lot of mouse movements, make sure not to alter the environment, or your macro won’t behave as planned.

AutoMac II 2.0

A macro is a command sequence that executes a series of repetitive, intricate, or lengthy responses. You can use them to create glossaries, execute batch files, manipulate windows, set up presentations, and even create limited animations. The possibilities seem endless. Macros, in fact, offer so much potential for increased functionality that you might wonder why Apple doesn’t include a macro capability in the Macintosh System file. But it doesn’t, and that’s where AutoMac II comes in.

The Hands-off Approach

AutoMac II is a macro-generating program that installs automatically in memory (using only 15K) and resides there alongside whatever else you happen to be running. To generate macros using AutoMac II, first enter the Option-Backspace command. This calls up the dialog screen (see “The Recording Box”). Enter the key you want to control the macro you’re about to create. Click Record. That’s it. Perform the action you want to be turned into a macro exactly as you want it to be done. When you’re finished, press Option-Backspace again. Your first macro has been created.

How It Works

All AutoMac II does is record mouse movements and keystrokes exactly as performed, either as a simple event sequence or in real time. Whatever you do, in the order you do it, becomes the blueprint for the resulting macro. If you make a mistake while recording a macro, the macro will repeat the mistake every time, but don’t worry, macros can easily be redone.

Generally, you’ll record macros as event sequences. This means that the macro will execute the recorded events as fast as the Macintosh can respond, which is a lot faster than you can. Long, complex command sequences can be speeded up considerably, and switching from one format to another can be accomplished in seconds.

AutoMac II is also "immortal": you won’t purge it by switching programs, so you can create macros in one application and transfer them to another. After you’ve created the macros for one application and saved them as a set, they’ll load automatically every time the application is used.

This brings up one qualification, however. AutoMac II records mouse movements and keystrokes independent of the environment in which they’re running. For example, if you run a macro created for MacWrite while you’re in MacPaint, the keystrokes and mouse movements will behave as though they were in MacWrite.

The result will probably be meaningless. If your macro includes a lot of mouse movements, make sure not to alter the environment, or your macro won’t behave as planned.

Macro Programs Compared

AutoMac II is not the only macro package for the Macintosh. Besides Tempo, there’s also a macro utility called Touch n. Go included in Cordland’s TopDesk DA collection.

Tempo offers more features than its competitors, including up to 24-hour delays and macro script editing. Since it’s much larger than either AutoMac II or Touch n. Go, it’s better suited to hard disk systems. Still, Tempo is the only choice for creating fully automated presentations or programming functions to take place in your absence. Tempo installs as an extra desk accessory.

Touch n. Go is a lightweight, by comparison, but comes on a disk with six other TopDesk DAs. Unlike AutoMac, Touch n. Go is application-specific—its macros can’t travel from one application to another. And since Touch n. Go is a DA that must be installed with its own utility, if you have a full System file, you’re out of luck.

AutoMac II provides a simple dialog box in which to enter the key code and description of your customized macro.
AutoMac Recommended

Since it uses so little memory and offers mobile macros, I recommend AutoMac over the other programs mentioned. Because AutoMac II is memory resident, however, some programs that handle memory in nonstandard ways (many games, telecom programs, and Word 3.0) may not work properly. Programs that use a lot of #1-key equivalents also present problems. Fortunately, AutoMac II can easily be toggled on and off.

The AutoMac II disk contains a set of MacWrite macros and a utility for customizing #1-key choices, and its highly readable manual is packed with information. AutoMac II is easy to use, reliable, and powerful. It's the kind of program you don't realize you need until you have it; then you can't imagine being without it.—Eric Baldwin

MacRobots 1.0

| Children's educational game. Pros: Easy for young children to understand and use with minimal adult help; entertaining graphics and speech; variety of games. Cons: Games cannot be customized to meet individual child's needs. List price: $49.95. Requires: 128K. Copy protection: Key disk. |

Designing educational software for preschoolers isn't easy. A child who can't read obviously won't learn to use a program by studying a manual, so programmers have had to develop new ways to convey concepts and instructions to nonreaders—without depending on parents and teachers.

One obvious solution is the use of icons. Picture menus make sense to kids, who quickly learn to point and click the mouse. But for conveying instructions and asking questions, icons are no substitute for the spoken word. This is where speech synthesis software comes in. It allows the Mac to speak in plain, if somewhat mechanical, English. First Byte's SmoothTalker, which has been incorporated into several educational programs, set the stage by allowing the computer to interact in an entertaining way with kids who haven't yet learned how to read.

First Shapes

To teach the basics of preschool geometry, First Byte has developed First Shapes, which incorporates SmoothTalker speech synthesis. After an introduction from the robot-voiced Ted E. Bear, a picture menu offers five different game options (see "First Shapes Picture Menu"), from the simple Shapes to the challenging Make-a-Match.

Shapes provides an introduction to the five shapes (square, circle, triangle, rectangle, and oval) that the child will use in the other program modules. The Toy Factory teaches children to build customized dolls, trucks, robots, and other toys by choosing shapes for each part of each toy. Toy Fair is a simple drill-and-practice game: the child selects shapes in response to verbal requests. And Make-a-Match allows players to flip cards in pairs, looking for matching shapes and pictures.

Children are not penalized for wrong answers, and a Helper menu option allows parents or teachers to customize the program with personal names, messages, and other options. The manual that accompanies the program is useful, with lots of tips for maximizing the educational benefits of First Shapes.

MacRobots

Unicorn Software's MacRobots, an educational smorgasbord for preschoolers, also uses the SmoothTalker speech synthesizer. Like First Shapes, MacRobots provides easy access to several simple games via a picture menu (the child may also use pull-down menus or the keyboard to select options).

In Robot Story, the computer recites verses from a modernized nursery rhyme, illustrating each verse with an animated scene and allowing the child to type the correct number to finish the verse: "Ten little robots all in a line, I strolled away and then there were...How many?" Count the Robots is a simple counting game with graphic rewards and hints after answers. Robot Addition introduces addition with a similar game. Letter Match familiarizes children with letter shapes and the keyboard layout by asking them to locate and type letters to match the screen display. Finally, Robot Construction (a sort of computerized version of Mr. Potato Head) allows the child to select body parts to create a variety of unusual fantasy robots. It's not as fancy as First Shapes' Toy Factory, but younger kids still enjoy it.

Educational Objectives

Both of these programs were clearly kid-tested by their designers. Both use icons, picture menus, and speech so effectively that a typical nonreading child can
learn to use them with just a little initial guidance from an older helper. They're also entertaining enough that most young children will enjoy playing them for long periods at a time. While noncomputer preschool games offer the same benefits with less cost, these programs do provide kids with tools for developing skills necessary for learning to read and think logically. And probably just as important is the fact that they provide a way for children to become more comfortable when interacting with the computer itself.—George Beekman

It Only Hurts When I Stop Laughing

Bureaucracy

Interactive fiction (intermediate level).

Requires: 384K. Copy protection: None.

Bureaucracy: The word alone is enough to bring some people to their knees. When Douglas Adams, author of The Hitchhiker's Guide to the Galaxy, ran afoul of the English postal and banking systems, he decided to exact revenge. Drawing on his experiences and his own unique view of the human comedy, he created Bureaucracy, the latest of the madcap text misadventures from Infocom.

Pack Up Your Troubles ...

Things start out innocently enough. You have just moved into town to start a new job with the Happiee Corporation. Your furniture has been lost in transit somewhere, but that's OK—Happiee is sending you to Paris for a week of training and vacation. You leave this afternoon. Funny thing though, your plane ticket is at the airport and you have no way of getting there. To make things even more interesting, you have no money, your credit cards have been canceled, and your bank has sent your change-of-address form to the wrong place and won't let you access your account until the form is properly filed. As you explore your new neighborhood for clues to a way out, you encounter a cast that includes llamas, shogun-packing grandmas, nerd hackers, and a host of others. This is before you get to the airport, where things start getting unusual.

... and Smile, Smile, Smile

Bureaucracy will make you laugh, cry, curse, pull out your hair, and scream like a banshee. Although it is probably the most enjoyable exercise in frustration on the market, I can't recommend Bureaucracy to first-time text-adventure players unless they are avid Douglas Adams fans. But the experienced player will not want to miss this game.—Ken Goebner

See Where to Buy for product details.

Mac-Mainframe Solution

pclink 3.9

Terminal emulator. Pros: Versatile terminal emulation, command scripting capability, powerful Macintosh-to-VAX integration software for serial and Ethernet connections. Cons: None.

List price: $2000 for 5 users, $5000 for 20, $10,000 for 50, $15,000 for 100, $25,000 for 250, $75,000 for 500. Requires: 512K.

Copy protection: None.

Pacer Software's pclink is more than a terminal emulation program. It's a powerful integrated mainframe telecommunications product that brings ease of use to both casual and power users. pclink supports both asynchronous (RS-232C, up to 38,400 baud) and Ethernet communication protocols; it emulates six popular terminal types, including VT220, VT100, and Televideo 950. pclink stands on equal footing with many popular telecommunications programs, thanks to its programmable function keys, its powerful script language (including Macintosh-like interface features), its session log files, and its ability to browse or print Macintosh text files without quitting.

pclink's most important feature is the integrated Macintosh-to-mainframe communication environment it provides. The server software offers file transfer, virtual Macintosh disks, print spooling, and high-speed Ethernet connectivity. These features give heavy users high-performance VT100 emulation along with Ethernet connectivity; casual users will appreciate the ease with which they can access VMS and UNIX mainframe applications.

[Note: The text continues with information about customizing the terminal and other features.]

Customizing Your Terminal

To simplify lengthy keystroke commands, pclink provides 20 mouse-activated soft keys (on-screen function keys). The definition for each soft key (see "Defining a Soft Key") can consist of any or all of the following: a non-text leading command (for instance, to clear the pclink screen or move the cursor), a string of text (the host command), a non-text trailing command, the name of a disk file containing a set of soft-key definitions to load, or the name of a disk file containing a script file to execute.

pclink also provides a powerful scripting language for creating advanced...
Definitions of Soft Keys

pcLink's unique combination of terminal emulation, integrated mainframe software, and Ethernet support makes it an excellent product for mainframe computer users. I highly recommend pcLink for mainframe users with business and scientific applications. For serious programmers and code developers who don't need the integrated software capabilities, the Ethernet support alone makes pcLink well worth looking into.—Dave Burnard

See Where to Buy for product details.

Move Over, Dollars and Sense

In-House Accountant 1.0

Financial management package.

Pros: Easy to learn and use; clear documentation with many examples; good functionality.

Cons: $1 million limit; requires preprinted forms for invoices and statements. List price: $149.

Requires: 512K. Copy protection: None.

Personal financial management and small-business accounting are not all that different. Monogram's Dollars and Sense is probably the most popular financial management program for the Mac. In fact, many of its users are small-business owners.

Migent has capitalized on that overlap in its new Mac product called In-House Accountant. The program has so many features that it compares favorably with programs classified as accounting software, but its simplicity makes it an excellent choice for personal use as well.

Integrated Functions

In-House Accountant offers general ledger, accounts payable, and accounts receivable functions, and includes some minor inventory capabilities as well. These three functions are integrated into a single program that does not actually differentiate between them. Instead, you have accounts, names, and transactions. Names can refer to customers or vendors, if you're using the program for a business—or the name you write on your checks, if it's for personal use.
The program has a variety of other features, including single-level password protection. You can reconcile an account to your bank statement and enter transactions for all 12 months of the year, as well as view transactions from the previous year. The program readily handles more than one business or household. You can create a batch of either automatic or recurring items for handling repetitive transactions. Recurring transactions can be modified before posting, though automatic transactions cannot. The program includes a set of 18 functions that let you calculate some common financial amounts, including depreciation and loan calculations.

One of the program’s strengths is its reporting capability. It generates a good set of financial reports—income statement, balance sheet, trial balance, general ledger, journal listing, an aging report, and so on. In addition, you can create a variety of transaction subset reports by using account, date, and document-number ranges and other selection criteria. These options can be used to create detailed receivables and payables lists, a cash receipts journal, and a variety of other important financial reports. In-House Accountant also includes pie-chart and bar-graph commands for graphical account analysis.

There are a few things In-House Accountant won’t do. Unable to distinguish between open-item and balance-forward customers, it automatically assumes all are balance forward. It can handle neither individual amounts nor account balances greater than $999,999.99, which could be a problem for some potential business users.

I found some other minor flaws in the program. First, it labels miscellaneous income and expenses as extraordinary items on the income statement. The word extraordinary has a specific meaning in accounting terminology, and it doesn’t refer to miscellaneous items. Second, the reference section of the documentation is ridiculous. It consists of a series of one- or two-sentence descriptions for each menu command. All the important information is found in other sections of the manual, which are basically well written, clear, and detailed, with lots of examples. Third, you’ll have to order special forms if you want to print invoices or statements. The program should have plain-paper options for these types of output. Finally, none of the program’s limitations are mentioned either on the packaging or in the manual’s introductory section.

Overall, though, In-House Accountant is a very good program. Mijen’s has packed a remarkable amount of functionality into a simple, easy-to-use program, which it’s selling at a competitive price. The program is particularly appropriate for individuals but has some feature limitations that may not make it suitable for all businesses. It should give Dollars and Sense, and some of the dedicated small-business accounting products, a run for their money.—Steve Mann

See Where to Buy for product details.
Another excellent Breakout game is *Brickles*, a program with wonderful features that most *Timeout* fans should enjoy. Honorable mentions go to *Brickles*, *MacBugs*, and *Asbes*.

Best Implementation of Rogue and 2-D Maze Game: *The Dungeon of Doom* is an adaptation of the well-known game Rogue. In *The Dungeon of Doom*, you control a small character in a large multi-level maze. Various monsters try to impede your progress, while you collect weapons, gold, food, and other surprises. Played entirely with the mouse, the game features well-drawn, amusing graphics. As you explore each maze level, your path is traced to create a small (but potentially useful) map. Since *The Dungeon of Doom* is a magical realm, a variety of oddities like potions, scrolls, and rings can yield positive or negative effects. Experimenting with these magical objects should appeal to Russian roulette fans.

Best Egyptian Adventure and 3-D Maze: *The Scarab of Ra* is a nifty maze game that places you in the role of an archaeologist who has fallen into the inner chambers of the fabled Great Pyramid of Ra. To escape, you must explore increasingly complex maze levels, locate three sacred relics, and find a door to the outside. The game is graphically appealing because of its excellent design, its use of perspective, its detailed monsters, and its real hieroglyphics written on the walls. Although it is pretty easy to complete, *The Scarab of Ra* is thoroughly enjoyable and exhibits a fine sense of humor.

Best Motion Study: *Billiard Parlor* is loaded with special effects. Written in Reed College's Rascal programming language, *Billiard Parlor* offers several pool games, including billiards, eight ball, and rotation. The mouse serves as your pool cue, and you drag it away from the cue ball to aim and set the force of the shot. You can also set the English on the ball by selecting the exact spot of impact. Other features include instant replay, saved shots, FatBits, and trails behind the balls to illustrate their paths. Ball movement is very realistic, and excellent sound effects add to the fun.

*Billiard Parlor* is a must for pool fans.

Best Candidate for a Coronary: *Air Traffic Controller* is for the strong, the quick-minded, and the patient. Simulating the job of a real air traffic controller, this game can have you handling up to 5 airports and up to 150 planes. Even at the minimum configuration (1 airport, 5 planes), this program will challenge you. You must order each inbound plane to its proper approach path while avoiding near-misses. One collision or a landing off the runway, and the game is over. Outbound planes must be safely sent on their way without mishap. Options include settings for allowable altitude and distance (before a near-miss is recorded), length of shift, and number of planes and airports (see “Best Candidate for a Coronary”).

As in the real world of air traffic con-

### Shareware and Public Domain Game Awards

Here are my choices for the best public domain and shareware games. The following unofficial awards were given for excellence in software design and implementation, creativity, playability, and humor. Sometimes logical and sometimes arbitrary, these categories are not intended to be taken too seriously.

While public domain and shareware utility programs like *PaxKit* and *Xmodem* have enhanced our productivity, other such programs have given us respite from the trials and tribulations of everyday life. These games can be found on major bulletin-board systems like GEnie, CompuServe, and Delphi; they're also available from user groups.

Best Arcade Game: *Timeout* is a desk accessory version of the popular Breakout game. Although the game itself is simple, its accessibility from within other applications makes it the ideal diversion when you want to take a break. *Timeout* offers 15 speeds—from to000 slow to sofastyouthoughtaswellforgetit. You determine how long each game lasts, but when time runs out, the game ends. The idea, of course, is to achieve faster and faster times.

![Timeout](image-url)
On Time

**Time Logger 2.11**

**Time tracker.** Pros: Easy to use; easy to read and access records; AutoRun and manual operation; versatile default options; calculates hourly fees, inexpensive. Cons: Must be manually set to track some games, desk accessories, and utilities. List price: Shareware $15; site licenses available. Requires: 512KE. Copy protection: None.

When clients, the IRS, and others ask what you do with your Mac, *Time Logger* can provide a painless answer by automatically recording the time you spend in each application. For more detailed information, you can indicate in a dialog box precisely what you're doing each time you open or close any application (including the Finder), and each time you shut down or start up your Mac. The program also lets you calculate your online time, so you can separate business from leisure time, track client bills (*Time Logger* can calculate fees based on hourly rates), and log phone calls. For report purposes, *Time Logger* produces tab-delimited text files, which are readable by most databases, spreadsheets, and word processors.

Like most desk accessories, *Time Logger* is simple to install with Apple's Font/DA Mover. If you want to set AutoRun for startup and shutdown, drag the *Time Logger* into your System Folder. If you prefer keyboard controls to the mouse, then install the *Time Logger* F-key with Apple's *ResEdit* or Carlos Weber's Key Manager.

*Time Logger* lets you record various kinds of information in the Logger Files: client name, client code, comments, date work started, time work stopped, number of minutes worked (takes into account time-out periods), billing (your rate multiplied by the time logged on; if this amount is less than the minimum charge you've specified, your minimum is used). Since *Time Logger* lets you maintain several Logger Files, you can organize records anyway you want. Unlike other time usage programs, it lets you keep the files in different folders and on separate disks.

You'll find *Time Logger*'s files easy to access and read. Double-clicking on a Logger File will open the document in *MacWrite*. Or you can launch *Excel* and then select the Logger File. In fact, any program that can read text files should be able to read the Logger File without forcing you to put the application and the file in the same folder.

The Manual Advantage

The AutoRun mode won't disturb you as it records the amount of time you spend within an application. You can choose to record additional information in a dialog box upon entering and leaving an application. If you want specific entries but don't want to log everything you do, manual operation is faster than AutoRun. You can call *Time Logger* at any time to close, open, or alter the information it is recording. If, for example, you want to remain in an application, but have completed work for one client and are about to begin work for another, simply invoke the *Time Logger* dialog box and record the change. By selecting *Time Logger* with the Option key depressed, you can change your default fields and settings and even the file in which you want to store the record. You can also track the games, utilities, or other DAs that you can't record with the AutoRun feature. To record what you're doing, you can close or time-out *Time Logger* whenever you want.

*Time Logger* 2.11 has several advantages and no disadvantages when compared with a similar product, SoftView's *MacInsUse* 1.0 (see "Tracking Mac Usage," *Reviews, Macworld*, July 1987). Unlike *Time Logger*, *MacInsUse* cannot keep more than one log file on one disk, and it does not record time in the Finder. *MacInsUse*
reviews

lets you write to the file only when you leave an application, so if you’re working with more than one client in the same application, you must quit the application before going on to the next client. Also, reading the log files and transferring them into your spreadsheet or word processor is cumbersome, since the log file, templates, and the application you want to use must all be in one folder or on the desktop level.

Time Logger, with its comprehensive documentation, is an outstanding bargain at $15. The author, Loftus E. Becker, Jr., conscientiously supports and frequently updates the program. If you have any reason to record or report how you spend your time on the Mac, I recommend the versatile Time Logger over any other application. Its only drawback is that it does work, thereby confronting you with the evidence of how you really spend your time on the Mac.—Linda Joan Kaplan

See Where to Buy for product details.

Mouseballs

This noncomprehensive review comments on several mouse cleaning products, mouse pads and other mouse accessories.

Within a few years, computers have created a global industry, countless jobs, an infectious jargon and, arguably, a whole new way of perceiving the world. For any creation impacting so profoundly on human affairs, there must be an equally magnificent spawning of accessories.

Mouse Cleaning

Despite this reviewer’s failure to ever notice such sticky substances in the atmosphere, the mouse appears capable of extracting something resembling tar from the very air we breathe. Ergotron’s $16.95 Mouse Cleaner 360° is the first and only tool we have seen that can thoroughly clean the gummiest stuff off of mouse rollers in just a few seconds. Place its bristled scrubber ball in the mouse ball socket, then run the mouse in circles over a Velcro scrubber pad. Although it lacks an equally quick and effective way of cleaning mouse balls, Mouse Cleaner 360° is the only commercial system we’d recommend as a substitute for the old alcohol, blade, and Q-tip remedy.

Max the MouseDuster, available for $5.95 from Applied Elastomers, is a sticky, stretchy, plastic blob of synthotech weirdness, shaped like a 3-inch gumdrop cat. When you completely enclose a mouse ball with Max every speck of grime adheres to it. This product also picks up undesirable loose stuff from mousepads, clothing, and virtually anything else. Max is soap-and-water washable, albeit in a slimy fashion. If you don’t find Max’s texture disgusting to begin with, and if you have a general lint problem, you will probably find Max the MouseDuster handy for one thing or another.

The Kensington Mouse Cleaning Kit with Pocket is impressively packaged to justify its $24.95 price tag. The kit contains foam-tipped swabs, a tiny bottle of cleaning solution, a tiny can of compressed air, and a mouse storage pocket in the style and color of the Macintosh. In our test, the recommended procedure failed to fully clean dirty mouse rollers.

We also found Trackline’s $14.95 Real Clean lacking as a mouse cleaner. Its thumb-forefinger rotation, socket-cleanser tool takes too much time to wear the goop off rollers, and seems messy when used with cleansing solution.

Mouse Pads

Mouspad by Moustrak, Inc. ($7.95 to $10.95) is very similar in quality and style to the Kensington’s Mouseway pad, but we liked the softer Mouseway surface a little better for quick moves. At $9.95, the Mouseway is one of the most reasonably priced products we examined. The Mouseway gray does not match the color of the Macintosh as the label claims; instead, it resembles the color of an IBM PC. Now, no need to hiss.

The most handsome mouse pad on a wooden computer desk might be the genuine leather Mouse-Hide from Pilot Enterprises, $15.00. After a few weeks of heavy use, though, it was already getting shiny spots where the mouse skipped.

Wheels and Paws

A mouse’s rubbery little feet (on either side of the serial number) will eventually wear out with use, and it will become wobbly. A couple of products provide solutions to this problem and are improvements over standard-issue mouse performance.

Mouse Mover by Magnum Software gets you rolling smoothly with three metal ball bearings in a plastic frame that is easily snapped on. Since the roller balls of the Mouse Mover itself will most likely become clogged with time, its $19.95 retail price seems a bit steep.

A mouse movement enhancer with no moving parts is Mouse Ease by Trackline Design. For $2.95 you get four genuine mouse-size Teflon stick-on paws, similar to those now on new-model Apple mice, just the right thickness to provide optimal mouse ball surface contact. The nonstick properties of Teflon are best realized on hard surfaces, where movement is quick and easy.

Whatever accessories you purchase for your computer, or for the rest of your life, first examine them carefully, then make sure you can get a refund if you are not satisfied. And may the Schwartz be with you.—Keith McCandless

See Where to Buy for product details.
Portable, reliable power for the Macintosh Plus

How small is the BackPac 40™? See for yourself...

For those of you who were unable to visit Jasmine at MacWorld Expo in Boston and exclaim "I didn't realize it was so thin!" we'd like to provide you with the opportunity to do so now. We worked hard at Jasmine to integrate proven technology into such an extraordinarily small, light and convenient package. As quiet in operation as the Macintosh Plus itself, BackPac 40 offers you the convenience and portability of an internal hard disk with the reliability and ease of installation of an external hard disk.

Specifications:
- Size: 9" x 9" x 3/4" thick
- Weight less than 5 pounds
- Access time: 20 milliseconds
- Power supply: 10 watts

BackPac 40 comes pre-formatted and works right out of the box.

It is very easy to install with no dangling cords or cables. Once installed, BackPac 40 can be left in place permanently or removed at any time. The combined Macintosh Plus and BackPac 40 slips into a standard Macintosh carrying case.

To Order Call (415) 621-4339

BackPac 40 – $1299

Simple installation

1. Remove Mac power cord.
2. Remove battery door and place in storage receptacle.
3. Remove 2 lower screws with tool provided. Place in storage receptacle.
4. Snap BackPac 40 and SCSI connector into place on Macintosh Plus.
5. Tighten BackPac 40 fasteners with tool.
6. Plug Mac power cord into BackPac 40.
7. Power up Mac and BackPac 40.

Everything in its place—Convenient storage has been provided on the inner panel for installation tool, two screws, and battery door from your Mac.

Simple installation

- Silent, efficient: No fan required.
- Doesn't void Mac warranty.
- Daisy chain up to 6 SCSI devices.
- Back up software plus 9 MB of free shareware & public domain software.

BackPac Features:

Has that statistics package you thought was a tiger turned out to be something else?

Most Mac statistical packages call themselves 'professional,' 'comprehensive,' or 'complete.' But feed them some real problems, and you'll discover how toothless they really are. They can't do multivariate procedures. Or analyze financial time series. Or fit nonlinear models. Or compute large, multi-way crosstabs.

That's why, if you're serious about statistics, sooner or later you'll end up with SYSTAT. No other Mac package has SYSTAT's range of statistics and high resolution data graphics.

Mac Features: Pull-down menus, Clipboard. Desk Accessories and mouse control of spreadsheet data editor. Replay commands. 'Macintosh II' and 68020/68030 versions available.

Macintosh II, and LaserWriter® are registered trademarks of Apple Computer, Inc. PostScript® is a trademark of Adobe Systems, Inc.

Systat. Intelligent Software.
Absolutely.
With TOPS, a PC and a Macintosh can really talk together. Simply, transparently, reliably. In real time.

And now UNIX*-based computers can join the conversation.

TOPS has been extended to support computers from Sun Microsystems* and Pyramid Technology.*

And now TOPS for the Mac includes print spooling and file translators.

You can now access Microsoft Excel files from a Mac SE, for example, modify them on your PC AT under Lotus 1-2-3, and save them on your Sun Workstation.

TOPS uses no central file server—every machine on the LAN can serve every other. Yet TOPS is so affable that file servers from 3Com, Novell, Banyan and AppleShare can join right in.

According to InfoWorld and PC Week, TOPS is the easiest to learn and operate Local Area Network yet designed.

With TOPS you have your choice of LANs. Macs can talk solely to Macs, or PCs to PCs, or both can talk to each other or to UNIX-based computers. TOPS brings together parts of your office that until now were barely on speaking terms.

*Call for information on how to buy UNIX versions.
TOPS has over half the Fortune 500 companies talking.
With good reason.
Installation is quick and straightforward—roughly four minutes for a Macintosh and fifteen minutes for a PC.
And this talk is remarkably cheap. TOPS is $189 per Macintosh and $389 per PC.

Our TOPS family is growing. With TOPS PRINT™ (at $189) all your PCs can share Apple's LaserWriter™. And TOPS REPEATER™ (also at $189) allows you to expand AppleTalk™ and TOPS networks.
TOPS for Macs and PCs, TOPS PRINT and TOPS REPEATER are available at Businessland and other fine computer dealers.

Call us at 800-222-TOPS (in California, 800-445-TOPS)
And we'll do just what a Sun workstation, a PC and a Macintosh can now do. Talk.

TOPS Network
a sun microsystems co.

Researchers: Rex Farrance, Liza Weinan
This is the first Macworld Buyer's Guide, a listing of over 900 products. Since the world of Macintosh products now includes more than 3000 items and is constantly growing, we have chosen to provide an updated directory primarily for business and professional use. You will find here a wide range of business and professional products, including an array of over 50 accounting and spreadsheet programs; specialized programs for engineers, physicians, and real estate brokers; and all the elements of desktop publishing for professional and personal use. Also listed are graphics programs, communications software and hardware, storage items, systems and memory products, and every kind of input/output device. All categories include both software and hardware products to make your Macintosh a more wide-ranging and versatile tool.

Despite our best efforts, however, this guide isn't complete. It is intended to give you a very good idea of what the market offers at this time.

Product information was gathered directly from the manufacturers, and the prices given are those current at the time the information was collected. You should check each product with your dealer or the manufacturer before you buy to make certain it has the features you need and, most important, that it will run on your machine. No endorsement by Macworld is implied by this listing.

Note: Because many products fall into more than one category, please check a second or third category when looking for a certain product. (For instance, a design program for engineers may appear in the 2-D Graphics category or as an engineering item in the Professions category.) Also note that some manufacturers produce a series of products with minimal variations among them. Such series will be listed only once. An * in the Notes column indicates that a hard disk is recommended.

There are a number of other guides available for Macintosh users, most notably The Macintosh Buyer's Guide, The MacGuide, and The Book of Macintosh Software. CHA Services and The Public Domain Exchange are two of the many companies publishing programs in the public domain.
TAKE CHARGE PEOPLE CHOOSE C.A.T.

Successful business people hard-pressed to keep on top of their ever-growing list of contacts are finding C.A.T. is their most powerful and valuable personal productivity tool.

Just as success breeds success, so does success increasingly expand your contact network. And the more contacts you make, the more balls you must juggle at one time.

But C.A.T. puts you in control. It lets you categorize and group your contacts in an orderly manner reflecting the way you work and think. So you can manage them in more meaningful ways — and keep all the balls in the air at one time.

Before the amazing C.A.T., you could only design forms with a simple program that was unlikely to keep up with your future needs. Or you could program your own solutions — with much difficulty — using some rigid database.

But C.A.T. now lets you manage your contacts the common sense way — without programming.

Yet the sophisticated C.A.T. is so flexible it can be adapted to any business and so versatile it can be used in hundreds of ways, for example:
• Managing projects like new product introductions, promotions and meetings — C.A.T. tracks the status and details of each project.
• Doing mailings like invitations, form letters, newsletters and labels — C.A.T. files every mailing to each contact, activity and time.
• Recording day-to-day events — C.A.T. tracks trip planning, expense reporting, client management, personnel records, information requests, etc., etc., etc.

Take charge . . . with C.A.T. It lets you manage the quality as well as the quantity of information about your contacts.

C.A.T. is brought to you by Chang Labs, developer of the popular Rags to Riches integrated accounting system and applauded throughout the computer industry for our presale services and post-sales support.

Our team of business consultants is ready to answer your C.A.T. questions anytime — even before you make your choice. Give us a call at our toll-free number, describe your business and let our expert consultants match the right solution to your needs. Then any authorized Apple or C.A.T. dealer will help you put our suggestions to work.

he proliferation of high-quality software for accounting, record keeping, financial analysis, and special reporting has helped the Macintosh make extensive inroads into business use. Whatever type of business you have, it’s likely that, coupled with the right software, the Mac can make your workday simpler, more efficient, and more enjoyable. The following survey looks at the predominant categories of business needs.

**Spreadsheets and Integrated Software**

Spreadsheets and integrated products are second in popularity only to word processing software. If you take the time to learn a product and build appropriate templates, you can use one of these programs to automate just about any business or financial function. For complex calculation functions, you’ll probably need all the spreadsheet power and speed you can get. For simpler uses, it makes sense to check out products that are easy to learn and use.

The hands-down leader in the high-end integrated software category is Microsoft Excel; with spreadsheet, graphics, and database capabilities, it is the standard by which others are judged. Lotus’s Jazz has more features, including spreadsheet, graphics, database, word processing, and communications modules, though it cannot compete with Excel in power. For less complex needs, Microsoft has Works, a straightforward package that includes word processing, spreadsheet, database, communications, and graphics modules. Some users need no other program.

There are also good choices if you need only a spreadsheet. MacCalc handles large templates and has many of Excel’s capabilities at a much lower price. Trapeze takes an untraditional approach—its templates are constructed as a collection of blocks rather than cells.

Once you’ve decided on plain or fancy, picking a specific product is a matter of personal choice. Try a few programs and buy the one that is easiest to use, most flexible, or that combines features you need.

**Accounting**

Accounting software is used for recording and reporting day-to-day business transactions. It must handle the different types of transactions that occur in business, record them accurately, and prepare the types of reports that help you run your business. Most accounting programs record information accurately, but they vary widely in the types of transactions they can handle and the types of reports they provide. For comprehensive accounting functions, you may have to make a substantial software in-
vestment, though some inexpensive programs, like BPI’s *General Accounting for the Mac*, do a lot for the money.

Because accounting is central to running a business, do your homework before buying a particular software product. Carefully match it to your business’s needs, perhaps with consultation—an increasing number of third parties specialize in selecting accounting software. If you need to automate just part of your business, like professional billing, restrict your search to programs that emphasize your targeted area.

As in most product categories, the most creative accounting software in the microcomputer industry is being developed for the Mac. Products such as Chang’s *Rags to Riches* and Layered’s *Insight* take advantage of the Mac user interface to present easy-to-understand views of accounting data and what they mean. Look for even more imaginative products to come, including multiuser capability.

**Databases**

Database products can be divided into two general categories—low-end file managers and high-end relational databases. At the low end, a variety of products can be used for miscellaneous data-management tasks. They differ in reporting flexibility, forms-management capability, ease of learning, price, and other features. The wide choice of file managers for the Mac—there are literally dozens—can make it tough to find the right one. Some of the more popular programs are *Filemaker Plus*, which includes a forms generator; *Fact Finder*, *OverVue*, and *Record Holder*.

Soon, powerful *dB III* workalikes will provide access to existing templates for MS-DOS; they include *dB/Man* from Varosoft, *Mac Max* by Nantucket, and Ashton-Tate’s *dBase Mac*.

Some database products are hard to categorize. Borland’s *Reflex* is an inexpensive but powerful relational database that rivals the high-end products in some functions. Chang’s *C.A.T.* is dedicated specifically to managing daily business activities. *Business Filevision* is for applications that can be best expressed graphically. Some products are sold primarily as forms managers, marketing and sales programs, or mailing list managers.

For basic list management, a file manager may be the best. For complex applications, someone on your staff needs at least a general understanding of programming. It’s almost impossible to use the more sophisticated products without that skill.

**Other Applications**

For a small business, personal financial software is often more than sufficient for accounting. *MoneySoft* estimates that more than half the copies of *Dollars and Sense* are used for accounting. When shopping for financial management software, look for convenience in handling recurring transactions. For personal financial software, no widely used product was designed specifically for the Mac, though the recent *Mac Money* is having some success. For business presentations, several products with varying emphases are available (see “Graphics” and “Publishing”).

In tax preparation, the most popular product is Softview’s *MactIntax*, which completes personal and corporate returns and prints a full set of IRS-approved forms on both the ImageWriter and LaserWriter. Button-Down Software’s *Profit Stalker* is designed for portfolio management, and Pro-Plus’s *MarketPro* handles portfolio management, fundamental analysis, and technical analysis. You can do many financial management functions using a spreadsheet. In fact, a variety of *Excel* and *Works* templates handle tax preparation and planning, financial management, investment tracking and analysis, and other jobs. These templates usually are less expensive than dedicated programs, and you can modify the formulas to create customized solutions; for more information, see “Professions and Industries.”

**Business Desk Accessories**

So many desk accessories are on the market—so many new ones are released all the time—that it’s impossible to keep track of them all. However, a few deserve special mention.

Borland’s *Sidekick* is probably the most popular desk accessory for the Mac. It functions as a Rolodex with auto-dialer, notepad, outliner, spreadsheet, calendar, clock, simple file manager, communications program, and print spooler. Each of these can be installed as a desk accessory; and even if you buy the program for one function, you have the others when needed.

Imagine Software’s *Smart Alarms* has become very popular. It’s basically a reminder accessory that can be used for appointments, recurring events, or other types of activities. It’s useful for people who have to manage their time carefully, as is Softview’s *MactIntax* time log.

The key issue of multiuser capability has begun to be addressed; for more on this, see “Communications.” The market for Mac business software continues to grow in diversity and competition, so be sure to prepare yourself before you choose a package.

Travel High Without Being Tired
Introducing Our Latest Sider, Model C46. 40 Megs Primary Storage, 60 Megs Integral Tape Backup. $1995.00 Total.

First, The Problem. Apple is telling the world these days that the power, versatility and compatibility of the new Macintoshes are going to end forever any doubts that these are first-class business machines.

But what kind of business you actually get down to has as much to do with the peripherals you attach as it does the computer itself. Take mass storage. For many companies, serious business means nothing less than 40 megabytes of primary capacity and at least an equal amount of backup—ideally in the same subsystem package.

A few packages do exist with those specifications. But the price tags are absolutely stratospheric—which for many companies anxious to get down to business can be downright catastrophic.

First Class, The Solution. The Sider Model C46 changes all of that. Sure, you get capacity, speed, performance, reliability, backup and restore. You get a slim, smart-looking, easy-to-install unit that is compatible with the Macintosh Plus, SE and II—and the Apple II+, He and IIs as well. And with our 60 meg tape (not 40 meg, like the competition), you get backup you can lock up for security and, thanks to total Sider cartridge interchangeability, you get data you can pack up and take anywhere.

But what you get that really astounds is a price tag the others can only envy. It reads $1995.

It also reads First Class Peripherals, for those of you wondering how that price could possibly be attached to this product. For years, the names “Sider” and “First Class” have been synonymous with truly affordable, zero defect mass storage among Apple II users.

Now, we intend to establish the same standard in the Macintosh world. With a family of subsystems that includes besides the Model C46, both a 20- and 40-megabyte hard disk Sider subsystem and a Sider 60-megabyte tape backup subsystem.

Call us toll free for the name of the First Class Peripherals dealer nearest you. And find out for yourself how easy it is to get down the price of getting down to business.

Circle 445 on reader service card
Professions and Industries

Lawyers, doctors, dentists, religious organizations, various types of contractors, and specialty retailers rely on the common procedure of processing lists of clients, patients, members, or customers and communicating with the world through form letters and bills. Software developers for personal computers have automated many of the office functions of such groups, using database and word processing technology. The busy professionals who use these programs insist that they simplify common tasks without introducing new problems in operating the computer.

With its visual user interface, the Macintosh excels at offering an easy-to-learn, intuitive system. Basic applications like word processing take only a few minutes to learn, and streamlined professional applications for the day-to-day chores of numerous businesses have now appeared on the market.

The Professional Look

Mac software is available for managing nearly every type of professional activity. The mainstream categories that were developed first are now represented by scores of office-management programs. While many of these are quite similar from a programming viewpoint, the crucial factor is how effectively they are customized to their users' particular needs.

On the market are programs that track lawyers' hours and bill for them; update a medical office's inventory and patient records; and offer ways of analyzing, for investment and tax purposes, the profitability of a real estate holding. You can buy applications that focus on one aspect of a business or a larger package that integrates several tasks. In addition, such highly specialized businesses as a horse farm (MacHorse), a lawn-care business (Mac WeedMan), or a union local (Union Dues Manager) can be run on a Mac.

Businesses that thrive on good mailing-list management are especially well supplied with Mac software. Special applications for retail businesses, professional sales offices, collection agencies, video rental stores, and churches automate the most tiresome chores in these areas and improve tracking of prospects. Detailed catalogs of special purpose software are also available from several sources: good examples are Blyth Software's directory of business programs that use Omnis 3 Plus and Heizer Software's catalog of templates for Microsoft Excel.

The major products in this area differ more in focus than in actual capabilities. Blyth emphasizes its qualified developers and authorized development centers as sources of custom database applications. Odesta, maker of Double Helix, is actively involved in connectivity between the Mac and DEC's VAX environ-
ment. 4th Dimension has an edge in features like graphics fields, complex file structures, and the ability to build very Mac-like turnkey applications.

Different Origins
Professional software for vertical markets tends to come from a specialized group that uses tools specific to a task. Rather than being a full-time programmer, the author of real estate software, for example, may be a real estate consultant who has developed a custom application using a popular database instead of a traditional programming language.

Thus, most programs for vertical markets use a database as a programming language, since list management is the heart of the applications. Many of the software packages in this section "run under" the databases Omnis, Helix, FileVision, or 4th Dimension; the package needs one of these databases in either a full or an application-only (run-time) version. If you own the database, you can then modify the application package after you buy it, while if you use the application with a run-time version of the database, you are constrained to the developers' designs. In this unique development environment, upgrades that make the programs faster and more powerful may be produced by improvements in both the overall application and the particular customized database.

Picking a Package
Three key points are worth serious consideration in evaluating professional applications software. If you buy a word processor and decide you don't like it, chances are you can buy a different one and convert all your old files. However, if you buy an inventory manager and find it too slow or too limited to handle your store, most likely you will have to start over at substantial cost and inconvenience. Insist on a comprehensive, hands-on demonstration of any software that's going to be at the center of your office life for years to come.

• Price: Many of these programs are expensive, relative to other Mac software. The developers frequently feel that they have produced something of great value to a restricted market and therefore must set higher prices to recover their own investment in time. A $4000 program that straightens out a law office's billings may be a bargain, but a $20 sales tracker that "forgets" leads is too expensive. Fortunately, nearly all Mac software requires little training—and any product that scores well on the next two points will pay for itself in a few months at most.

• Completeness: Before you evaluate any software, make a list on paper of the information you think you need to track in your business (you might want to sketch out a few sample forms). Then make sure that the software you are considering can handle all the data you have listed. If it can't—some packages offer fairly restricted data structures—you can expect problems down the road. You may be able to pass on some chores, like word processing, to other software, but be very demanding about the central record-handling part of a professional application.

• Speed: A point that might not occur to you while watching a demonstration is the prospect of performance slowdown by the software with large sets of records. The typical Mac (512K, Plus, or SE) is intrinsically a fast machine, but its CPU's hands are busy painting all those user-friendly screens for you. This means that some applications may look magnificent on little 20-record demo data sets but can slow to an unacceptable crawl when working with real-world lists of several hundred clients or customers. Insist on a software demonstration that involves as much data as you are likely to handle in your own activities.

Since the developers of these programs often ask $1000 or more for some documentation and a disk or two, you have the right to demand more up-front information than is given for simple utilities. Ask the vendor for a list of satisfied customers and call at least three of them—they're usually glad to comment on the strengths and weaknesses of each application from months of firsthand experience.

What's Next?
We can expect higher speed and better integration of graphics. Most applications written for vertical markets are getting faster; the database programs have been recoded for increased speed, and STs and Mac IIs make formerly poky programs scoot along 40 to 200 percent faster. Also, more programs are imitating the revolutionary database graphics pioneered by FileVision, so you can expect well-designed text-plus-graphics screens to appear in most vertical-market software in the next few years. This is good news, since it means that friendly programs that respond as fast as you can point will be available to support most business activities. Although the Mac took a few years to penetrate many of these markets, there is no doubt that it is here to stay.

—Charles Setter

**MacLuggage™**

for the entire Macintosh SE™ System

Go Ahead, Take it ALL!

Circle 530 on reader service cord
The most important feature of QuicKeys™ is ease-of-use. Just select, point and you’re done.

“QuicKeys is the sort of outstanding product that you recognize instantly as a Mac classic; an essential product for every Mac in your office”

-Bob Perez, Business Evangelist, Apple Computer, Inc.

It’s a macro program for everyone. So easy to use you’ll want to use it with everything! Assign keys for repetitive tasks, programs, commands, desk accessories and more. You are unlimited in what QuicKeys can do for your Mac... and your speed.

This is the program you’ve wanted for your Mac. An absolute MUST for hard drive users. Doubles your speed on the Mac, easily. “QuicKeys made the forget my mouse.”

Steven Bobker, Editor-In-Chief, MacUser

Works with: 512E, Mac Plus, SE, Mac II. QuicKeys gives your new extended keyboard something to do. Works with standard keyboards, too. “QuicKeys brings new life to old and new keyboards.”

-Nell Shapiro, Editor-At-Large, MacUser, Chief Sysop, MAUG

The easiest, fastest way from one program to another on a Macintosh is with QuicKeys. “QuicKeys offers the most clever, accessible way of assigning actions to command, option or function keys.”

Bob LeVitus, Editor-In-Chief, MACazine

“How fast can you learn to use Quickeys? How fast did you read this sentence? “Extended keyboards...they do have those lovely, but useless, function keys. Hmm. Sure would be nice to be able to assign desk accessories to them.”

Mac The Knife, MacWeek

“QuicKeys is the only reason for buying an extended keyboard.”

David Bedney, Editor At Large, Computer Graphic Magazine

QuicKeys also works within programs. Assign command keys for operations like: Save, print, typeface selection and more. Any commands you want can be assigned with QuicKeys. Just $99.95.

CalendarMaker, DiskTop and QuicKeys are trademarks of CE Software. Other names indicated by™ or ® are trademarks of their respective manufacturers.
**DiskTop**

- DiskTop contains the most powerful yet easy to use find command available on the Macintosh. Hard drive users love it.
- With DiskTop you can find, copy, move, rename, create folders, and more without ever leaving the document you're working in.
- "There is, in my opinion, no better file management desk accessory for the Macintosh." - MacWorld, August 1987
- DiskTop saves time because you can do it...NOW!
- "There is, in my opinion, no better file management desk accessory for the Macintosh." - MacWorld, August 1987

Just $49.95.

---

**CalendarMaker**

- Everybody ought to have CalendarMaker. Make interesting, unique and attention getting calendars...with pictures and icons for even more visual excitement.
- CalendarMaker makes keeping track of time easier (and lots more fun!)
- Enter events manually or import files from programs including: MORE!, SideKick, BatteryPak, SmartAlarms, Export calendars to MacWrite, MacPaint, MacDraw, PageMaker and others.
- "Every year I have the same problem: finding the ideal calendar...In answer to this universal dilemma, CE Software has published CalendarMaker." - MacWorld, March 1987
- Makes calendars for years to come with perpetual dates and periodic events. It's the most professional, versatile calendar presentation program on the Macintosh.

Just $49.95.
Publishing

At one time, the scope of word processing was limited to manipulating words. The graphics orientation of the Macintosh, however, has expanded word processing horizons. The integration of graphics with text in a variety of fonts, sizes, and styles was the first step toward desktop publishing. Initially considered separate applications, word processing and page layout are now moving toward a common goal—publishing finished documents.

For serious desktop publishing, you probably need both a word processor and a page-make-up program. Since the Mac II and SE opened up the field, developers have been working to blend these two applications. Meanwhile, Mac publishing grows more and more competitive.

**Word Processing**

If your needs are limited to writing letters and memos, you may be satisfied with a basic word processing program such as *MacWrite*, or one with more features like *WriteNow*, which has a spelling checker and shows multiple columns on screen; or *MindWrite*, which offers a built-in outlining function.

However, these programs lack the breadth of features found at the high end of the market. For heavy-duty word processing needs—for example, if you create, edit, and reformat large documents, or need a table of contents or index—you may want to consider *Microsoft Word 3.0*, *LaserAuthor*, or one of the upcoming new products. While these programs normally take some effort to master, they return the investment with a myriad of additional capabilities to facilitate writing, editing, and formatting documents. Such additional features are a significant convenience if you do frequent, complex word processing.

In the high-end category, *Word 3.0* (with its upgrade, 3.01) is the reigning champion. However, several competitive programs are ready for release, including *WordPerfect*, a Mac version of the most popular word processing program for IBM PCs and compatibles, and *FullWrite Professional* from Ann Arbor Softworks, makers of the popular graphics program *FullPaint*.

**Desktop Publishing**

If your formatting needs are substantial, a desktop publishing program is probably what you need. The original front-runner in the field is Aldus's *PageMaker*, but new programs, especially *Ready, Set, Go! version 4* from Letraset, are challenging its dominance. The innovative *XPress* from Quark was first to bring color makeup to the Mac, and Interleaf's new package offers minicomputer power for about $8000. Each offers a
few unique concepts and features, but all provide the ability to mix text and graphics in a paste-up environment.

The available desktop publishing programs are less easily distinguishable from each other than word processors are. While some strengths and weaknesses are apparent, they are fighting for position in basically the same market. As with word processing, determine which programs provide (or lack) the features you emphasize.

Price, Value, and Ease of Use
The cost of software is always a factor in making a purchasing decision. Basic word processing programs generally fall in the range of $125 to $175, while those with more features usually cost between $200 and $400. Most desktop publishing programs range from $400 to $500, although a few cost up to $700.

The greatest price you pay in purchasing a program will not be measured in dollars but in the time and effort required to implement it for your work. So you should factor in the issues of features, speed, and ease of use. If you don't require a feature-laden program, the shorter learning period required by a simpler program is attractive. On the other hand, don't make the mistake of buying a program that will ultimately be inadequate, just because it's easier to pick up. Remember, too, that many dealers discount a program from its list price.

Other Key Considerations
- In addition to correcting spelling, a spelling checker can identify typographical errors like missing, repeated, or reversed characters. Similarly, automatic hyphenation can divide words that fall at the end of a line. While these features are typically found in a word processing program, they are also beginning to crop up in some desktop publishing programs: XPress, for example, has a spelling checker, and Ready, Set, Go! 4 offers both a spelling checker and style sheets.
- If your word processing program has no integrated spelling checker, numerous programs are sold separately. They usually take the form of a desk accessory, which you invoke while using the word processor.
- Outlining is another useful tool in preparing and reorganizing documents. Some word processing programs, such as Word 3.0 and MindWrite, integrate it. Other independent packages include Living Videotext's More, an elegant and powerful outliner, and Acta from Symmetry, an able, practical desk accessory.
- How text and graphics interact on the page is a major issue. The more basic word processing programs such as MacWrite and WriteNow allow graphics to exist only within their own horizontal area, so you cannot place text next to a graphic image. Although some, like Word 3.0, allow graphics next to text, their methods are sometimes cumbersome.

While all desktop publishing programs allow you to place graphics next to text, some provide unique capabilities in this area. XPress and Ready, Set, Go! 4, for example, automatically wrap text around graphic images, even if they are irregularly shaped.
- Style sheets are just beginning to find their way into Macintosh writing and publishing programs. They allow you to associate various elements of your document and quickly reformat them. With substantial documents such as reports, longer newsletters, magazines, or even books, style sheets are invaluable. Expect them to be implemented widely in the coming year.

Into the Future
As these two areas continue to mature, overlapping functions will increase. Desktop publishing programs will be adorned with features traditionally associated with such word processing programs as spelling checkers, style sheets, indexing, and tables of contents, while word processing programs will incorporate more page-layout capabilities, such as true screen-to-printer fidelity and better handling of graphics. In addition, graphics and text will mix more smoothly.

Programs currently available on the IBM PC and compatibles will continue to influence the evolution of Macintosh word processing. For example, the macro programming capability of WordPerfect and others will show up in Mac programs. Macros save time by customizing a program's operation through automating sequences of keystrokes (or mouse clicks) to repeat a given task.

Finally, batch-oriented minicomputer-style programs are expected in the next six months from PS Compose and others (Interleaf's is available now). These products are best suited to book-length, multivolume, or multiple-author environments.

The term document processing suggests the interface of word processing and page makeup, and signifies the progress being made in Macintosh publishing. With the added power of the Mac II and the SE, developers will introduce some very innovative products for the market.

**BRING YOUR MOUSE UP TO SPEED**

**FAST PAD™**

Fast Pad's finely textured, low friction surface gives you incredibly quick, pixel by pixel control without annoying skips. Boosts the performance of any mouse, including ones with new teflon bottom. Wipes clean and maintains its finish for years.

Apple® Platinum, Blue and Dark Grey.

Apple is a registered trademark of Apple Computer Inc.

**BOOKSHELF TO BRIEFCASE**

**SAFE, CONVENIENT, EASY-TO-FIND DISK STORAGE**

**Disk Book.**

Free-standing design and individual pockets let you view all titles at a glance. Unique top seal keeps disks in—dust out. 10, 16 and 32 disk models. (16 has pockets for manuals, pads and pens.)

**Traveller.**

Slim, compact travel companions fit easily in coat pocket or purse. Folding design securely holds and protects disks. 4, 8 and 12 disk models.

Disk books and Travellers are crafted of stain and static resistant Cordura nylon fabrics, with reinforced edging for durability. Snag-free pockets—secure velcro closure—four popular colors.

Circle 786 on reader service card
Laser FX is one of the most powerful utility programs to be produced for the new desktop publishing industry. It allows both the novice and the experienced user the flexibility of design never before possible in the new microcomputer marketplace (no programming knowledge is necessary). Simply take any PostScript font and use any of the 30 effects to create a dazzling typographical masterpiece. You can print directly from Laser FX or paste directly into Quark XPress, Ready,Set,Go!, PageMaker 2.0, Microsoft Word 3.0, or most other popular desktop publishing packages. Laser FX has the ability to read PICT files or paint files created in other programs such as MacDraw or MacPaint. This allows you to add special graphical effects to your pictures. The uses for this one-of-a-kind program are limitless (limited only by your imagination). Any desktop publishing task can be greatly enhanced with Laser FX. It can be used for creating special effects in newsletters, for designing logos with only a minimum of effort, or adding that extra pizazz to your presentation. The program is so simple that you will be using it expertly within minutes. You can use any PostScript font that is resident in your laser printer or any downloadable PostScript font. Desktop publishing will never be the same!

Happy Publishing!!!!!
Graphics programs have evolved and diversified more than any other type of Macintosh program. Although MacPaint is taken for granted now, it was revolutionary when introduced and set a user interface standard still emulated by many others. But rather than simply building on MacPaint's breakthrough, Mac graphics have proliferated in a dozen directions, offering specialized features for disciplines ranging from the fine arts to architecture to desktop publishing.

Their users are just as diverse. Workers who occasionally place illustrations into office reports may get by with an inexpensive paint program like MacPaint or FullPaint. Those who make elaborate presentations can benefit from such business graphics programs as More, Power Point, and Microsoft Chart. Technical illustrators may find Adobe Illustrator appropriate, while desktop publishers can create graphics in paint and draw programs, select images from clip-art disks, or digitize pictures with a 300-dots-per-inch (dpi) scanner. Engineers and architects can choose among a variety of 2-D and 3-D programs, each suited to a particular area of professional design.

Graphics applications can be broken down into several major categories.

**Painting and Drawing**

Applications that use bit-mapped graphics, like MacPaint, FullPaint, and MacBillboard, are known as paint programs. They simulate such real tools as a paintbrush, an eraser, or a pencil. These programs are usually appropriate for the fine arts, detailed technical illustrations, and other illustrations that require dot-by-dot detail. Although you can edit pictures pixel by pixel, paint programs operate at a resolution of 72 dpi, producing relatively coarse drawings by today's standards. FullPaint broke the 72-dpi barrier by allowing 300-dpi editing for more precise LaserWriter output, but working at that scale is time consuming.

Object-oriented programs such as MacDraw and MacDraft record elements of a drawing as separate objects that you can restructure if necessary. While a rectangle drawn with a paint program is simply a pattern of pixels, a draw program produces dynamic objects. For example, a rectangle with a certain size, border width, and pattern fill can be resized without distorting its proportions or shading. Draw programs are suitable for drafting applications (floor plans, simple architectural renderings, and the like), flowcharts, and technical drawings that make use of gray scales and laser fonts.
Hybrids

Several programs have the attributes of both paint and draw programs. SuperPaint and GraphicWorks combine bit-mapped and object-oriented graphics, as well as LaserWriter fonts. While the two programs have similar capabilities and prices, differences in user interface and specialized tools make comparison shopping a must. Another interesting hybrid is LaserPaint, which is in a higher price bracket but offers word processing and color-separation modules in addition to draw and paint modules. You can customize any of these programs by adding laser or bit-mapped fonts, which range from mathematical symbols to decorative script.

PostScript

PostScript-based graphics programs like Cricket Draw and Illustrator take advantage of the printing capabilities of the LaserWriter (300 dpi) and high-resolution printing devices like phototypesetters (up to 2500 dpi). While drawing programs utilize some PostScript capabilities, such as gray scales, PostScript-based programs capo nonprofessional users impressive special effects, including rotated and angled text or objects, text on an irregular path, and fountains (gradient fills). Artists use Illustrator's Bezier curves to trace drawings and then shade and refine them with the program's other tools. Cricket Draw, a general-purpose drawing program, places an impressive collection of PostScript effects in an easy-to-use interface.

Grayscale Editing

Desktop publishers can now choose among a number of 300-dpi scanners to digitize photos or artwork for publications. Digitized photos can be retouched with ImageStudio from LetraSet, which allows you to work in 65 levels of gray. A Mac II with a color graphics card and color monitor can display all 65 shades, offering an ideal environment in which to edit pictures. ImageStudio's tools follow the MacPaint tradition by closely mimicking the functions of artists' tools, including charcoal, watercolors, and even fingerpaint. It is currently the only program in this category, though others will follow soon.

Computer-Aided Design and Drafting

Macintosh drawing programs didn't remain in two dimensions for long. Over the years, a number of three-dimensional graphics programs have appeared, including Mac3D, Easy3D, MacSpace, MacModel, Phoenix 3D, and Dimensions. Responding to the need for more sophisticated capabilities, both MacSpace and Easy3D evolved into professional versions, SpaceEdit and Pro3D. A promising newcomer, Super 3D, should be available soon. These packages range in price from $50 to $2500 and are appropriate for applications ranging from the graphic arts to architectural rendering. In addition to general-purpose 3-D software, such specialized programs as Schema, NewStudio, and MacPerspective allow architects to view their creations in three dimensions.

In the two-dimensional CAD arena, programs like MiniCad, EZ-Draft, and MGMStation offer architects, engineers, and draftsmen the features and precision they need, and a Macintosh version of the popular VersaCAD is in the works. Although the Mac has yet to fulfill Apple's dreams of "desktop engineering," it is winning converts among architects, engineers, and other designers because of its relatively low price, its widening software base, and the fact that Mac software requires less training time than do CAD programs on other PCs.

Color

Mac owners who wanted color output were once limited to the ImageWriter II or pen plotters. Now the Mac II offers impressive color capability, but because color output devices are still scarce, the color generally goes no further than the screen. Color has been added to some programs, including Mac3D, VideoWorks II, Cricket Draw, GraphicWorks, SpaceEdit, and MGMStation. Cricket Draw, LaserPaint, and Illustrator allow artists to make color separations, but the process requires a good deal of expertise. Film recorders from Matrix, Dunn Instruments, and Presentation Technologies have been released this year. Lightspeed's Color Page Layout System, a graphic design program that runs on the Mac II, includes an interface to a color scanner for input and a thermal printer for color output.

The Future

In addition to color output devices, established standards are urgently needed for storing and transferring graphic images; to date, many programs offer a hodgepodge of file format options (MacPaint, PICT, TIFF, EPSF, and so on). While the diversity of programs precludes a universal graphics file format, developers should work together to ensure that, for example, one program's TIFF files are compatible with another's.

The Mac II has opened up a new world of graphics; the ability to display 256 colors on a large monitor is a far cry from the small-screen, one-bit-per-pixel, black-and-white Mac of only a year ago. The Mac II's open architecture will promote the development of add-on products such as floating-point coprocessors to speed the display of 3-D images.

Programs in all the categories mentioned above will continue to improve. New, as yet unheared-of types of programs will appear (no one knew of PostScript effects programs or gray-level editors until recently). And perhaps someone will bring us a color version of MacPaint to begin the cycle of Macintosh graphics evolution again on a grander scale.

Erfert Nielsen

**Shipping Now!**

**Clone Your Modem**

For less than the cost of another modem, you can offer telecommunications services to everyone on your AppleTalk® network. With ComServe®, you no longer need a modem at each Macintosh®—with all the accompanying wiring complexities and line charges.

- Gain network-wide access to modems, mainframes, and minis.
- Eliminate dedicated hardware. ComServe transparently runs in the background of a Mac. And, it’s AppleShare™ compatible.
- Save, at $195 per server. Share expensive, high-speed modems.

Call now or ask your dealer for ComServe. From Infosphere, the only full-family AppleTalk software vendor.

**Still the Best for Small Nets**

Still only $250 per hard disk server for as many user nodes as you like—still the only file sharing solution that offers: "Bulletproof" Automatic Crash Recovery so users never lose data. MacServe™ is the most practical choice for small AppleTalk® networks. And that's why MacServe is still the leader with over 30,000 installations.

- Forget dedicated Macs. MacServe runs in the background.
- Grow a network transparently. Add Macs, PCs, hard disks, servers, printers, modems and E-Mail, as you need them.

Call now or ask your dealer for MacServe. From Infosphere, the only full-family AppleTalk software vendor.

CMO MacCenter.
Two years in the making.
One thing you'll come to appreciate about
CMO is our almost religious attention to
detail. Volume sales are our lifeblood, so we
have to be good.

During the years, we've developed a
system of service and support that is
without equal in the industry. That means
we're fast, we're accurate, and we
accommodate your needs.

MacCenter is the result of that experience.
We're committed to providing Mac users,
like you, the latest products at attractive
prices. And we back everything we sell with
the factory warranties, expert consultation
and technical amenities we hope will keep
you coming back.

MacCenter was two years in the making.
We think it was time well spent.
CMO designed MacCenter for you.
Call us. Compare us. Why wait?

Mountain 20 MB Removable Bernoulli $1429
Sigma Designs LaserView Display Sys. $1899
ProApp 20S 20 MB Hard Disk SubSys. $699
Silicon Beach Soft. Super Paint $54

Communications

Telecommunications may be defined as the electronic transfer of information, usually between computers and/or remote terminals. Typical data transfers occur over telephone lines, local-area networks, or other cabling systems. Their applications range from accessing an electronic information service, such as CompuServe, to sharing a LaserWriter with other users in an office.

To link a single computer with the outside world, you need a modem, telephone lines, and software to make your Mac act like a terminal.

Ways of Communicating

- **Electronic mail** and messaging send unformatted (text only) messages in the standard ASCII code (American Standard for Computer Information Interchange) understood by virtually all computers. The ASCII format does not support special Macintosh characters like bulletts, Greek letters, or letters with umlauts or accents. Text files are not checked for errors, so a noisy phone line can add typos to messages.

- **File transfers** send fully formatted files. Error-checking protocols such as XModem (for Mac-to-Mac transfers) or Kermit (for many Mac-to-mainframe transfers) monitor transmission, because a single error can render the whole file useless. Mac-to-Mac files are made in a format called MacBinary, which transfers the file's name, type, creator, and other information as well as its text. Transferring the file through an intermediate non-Mac system can require binary hexadecimal (binhex) conversion to the other machine and retranslation to the receiving Mac. Most software now handles these format conversions automatically.

- **Terminal emulation** makes a Macintosh look like a standard "dumb" terminal to the remote computer. Terminal-emulator software lets you enter data directly into a remote computer, but it is used more commonly to adapt a Mac for electronic mail and file transfers.

- **Local-area networks** have dedicated wiring that allows multiple users in the same facility to use the same device, usually a LaserWriter. Special software is needed, though its presence may not be obvious; the software for shared printers is included in the System file and the printer drivers.

- **File sharing** gives multiple users in one facility access to the same files via a local-area network. Some software, such as AppleShare, requires a Mac equipped with a hard disk on the network running as a dedicated file server. Other approaches, such as TOPS and Hypernet, offer distributed file serving by
dividing file-serving software among the networked Macs without a dedicated server.

- **Disk serving**, facilitated by such products as Share and the Iomega Bernoulli Box 10-4-10, allows you to partition a hard disk into volumes. Each volume can then be accessed by different users simultaneously.

### Hardware

Communications hardware requirements vary with their uses. A modem converts computer data into a form that can cross telephone wires. (Dedicated digital phone lines are so costly that only large organizations can afford them.) Macintosh modems have previously been external, but the Mac II and the SE can accept internal modems.

Speed, standards, and price are major factors in picking modems. The standard speeds are 300, 1200, and 2400 baud (which functionally means bits per second), although some 9600-baud modems have reached the market. Most modems now work at 1200 or 2400 baud (which is best for file transfers). Although some information services charge a premium for access at higher speeds, the cost per bit is almost always lower and the time savings significant. Standards are not firm for 9600 baud; if you need to send data that fast, the best approach is to pick matching modems. Prices are coming down, ranging from under $200 to nearly $1000, depending on baud rate.

The command codes used to control modem operation are a separate issue. The de facto standard is a set of commands developed by Hayes Microcomputer several years ago. Some communications software, such as Hayes's own Smartcom II, automatically uses the Hayes command set and won't work properly with incompatible modems; other terminal-emulation software, such as Red Ryder, Microphone, and iTalk, does not require precise Hayes compatibility.

### Software

The range of telecommunications software is broad enough to meet virtually all needs, and programs vary widely in ease of use and flexibility. Some, such as FModem or TermWorks, are simple to use because they offer few choices and their defaults suffice for most ordinary needs. Others, like Smartcom II, combine a more friendly interface with power, but present an array of choices that can be bewildering. Users familiar with communications may prefer a package like Red Ryder, which provides extensive control without the overhead imposed by graphic interfaces.

More powerful programs, including iTalk, Microphone, Red Ryder, and Smartcom II, can automate communications by executing preprogrammed routines to log onto a service. Microphone and Red Ryder can even write a routine by recording your actions during a session.

Most communications software is for general purposes, but some programs (like AppleLink and Dow Jones's StraightTalk) are written for limited applications, such as connecting to specific services. Generally, the best buy is software versatile enough to do many tasks, unless you have specific requirements that such software can't satisfy.

### Local-Area Networks

You need both special hardware and software for local-area networks, although basic needs can be met by standard Apple System software. The prime hardware choice is AppleTalk, which connects as many as 25 Macs. AppleTalk connectors plug into the Mac's printer port, interfacing with electronics already built in. AppleTalk cards are available also for IBM PCs and compatibles.

AppleTalk, first used to connect multiple Macs with a single LaserWriter, has simple software requirements: the Control Panel desk accessory to turn the network on, the appropriate printer driver, and some routines in the System file. New products allow sharing of modems, although costs make this most attractive for high-speed modems. Others products, like hardware servers from Solana Electronics and Ahaton Technology, allow connection of multiple modems to an AppleTalk cable.

Computers on local-area networks run multiuser applications (such as database programs) that let them access files on the server. Most file-sharing software can do without a dedicated file server; and TOPS allows configurations that enable Macs and PCs to share files, though with limitations. You need software like MacLink Plus or Apple's Delta Exchange to read formats for other PCs. Some programs, including Microsoft's Word and Excel, and Living Videotext's More, also have limited data-exchange capabilities, as do the desk accessories Mock Terminal and SideKick.

### Trends

Terminal emulators are reasonably stable, with powerful programs available from discount houses for under $100. Moderns are in transition, with 1200-baud models dropping in price, 2400 baud becoming commonplace, and higher speeds looming on the horizon. However, the appeal of raw speed is tempered by the lack of standards and by questions about phone-line quality, which sometimes can impair 2400-baud transmission. Apple and third parties are developing connections to the Ethernet backbone, for access to VAX and other mainframes.

Networks are booming, with file-serving software proliferating rapidly. The open architectures of the SE and Mac II should accelerate the trend, because they can accommodate cards to connect with local-area networks, such as the 10-megahertz Ethernet, that are much faster than AppleTalk. The growth of multiuser software also encourages network development. Yet hardware and software costs remain high enough to warrant caution before committing yourself to a network.

</table>
Ever since paper replaced cave walls as man's favorite vehicle for expression, the attempt to communicate ideas has been an enduring source of frustration. That frustration has just been eased dramatically. Because Letraset introduces Ready, Set, Go! 4.0—an enhanced version of what InfoWorld called "the new champion among Macintosh desktop publishing programs."

To put it simply, Ready, Set, Go! 4.0 is the easiest, fastest, most creative way yet devised of helping you organize, visualize and edit your thoughts onto professional-quality pages. In fact, it removes any meaningful distinction between what you can do at your desk and what might otherwise require large budgets, long lead times and a studio full of designers.

The technically inclined will be pleased to note that it has a unique
it any easier to have
tadier to express them.

block architecture that enables you
to envision the finished page before
its finished.

Integrated word processing with
real-time hyphenation that lets
you create and design text and image
simultaneously. Plus such essential
tools as arbitrary runarounds, custom
page sizes, style sheets and support
for high-resolution graphics.

For those more concerned with
the ultimate outcome of these fea-
tures, Ready, Set, Go! 4.0
will help you make a raw concept
blossom into a newsletter of finished
elegance. Transform random brain-
storms into a report of symphonic
coherence. Or create a dazzling busi-
ness presentation from a jumble of
brilliant insights.

And although other software
packages may talk about doing all
this, Ready, Set, Go! 4.0 is the only
one that can put it down on paper.

For more information, in-
cluding the location of your nearest
authorized Letraset graphic design
software dealer, call (800) 722-0377.

If you purchase Ready, Set, Go! 3.0
between June 1-August 1, you receive
an upgrade at no charge.

As the Macintosh has increased in power, mass storage devices have grown more popular. When HFS (Hierarchical File System) software and SCSI (Small Computer Systems Interface) hardware overcame the technical difficulties of making a hard disk for the Mac, many companies entered the market. Speed and convenience are the primary advantages of hard disks, which run faster than floppy disks and hold files too large for them. You can also avoid swapping floppy disks and can store all your applications and files in one place, while retrieving the space each floppy uses to store its individual System and application files.

There are essentially two types of storage devices. Archival storage—like WORM (Write Once, Read Many) devices, tape drives, or video disk players—is for large amounts of unmodifiable (read only) data, such as years of employee records or an encyclopedia. Modifiable Winchester hard disks are widely used for daily applications and tasks. Most devices store information magnetically, in the same way a cassette tape or a floppy disk does.

Types of Storage

**Hard disk** is now used informally to mean anything other than a floppy disk, but actually it is a set of ridged metal platters on which a magnetic head rides back and forth to write or read information. Hard disks are delicate because the head can crash into the platter very easily, causing damage akin to a record needle scratching a record. Most drives include a utility program that parks the heads to protect the disk, and the better ones do this automatically. Although most hard disks are fixed in their cases, some are removable; these, however, are relatively expensive and are also sensitive to shock.

Other devices serving the same function include Bernoulli drives, large floppy disks, and WORM drives, all of which store numerous files for both programs and data. Bernoulli technology is based on a thin floppy disk riding on a steady stream of air. Its removable cartridges are reasonably priced, so they can be used as large floppy disks. But Bernoulli devices themselves, such as the Iomega Bernoulli Box 10+10, are costly; moreover, the individual cartridges go bad and must be replaced more frequently than floppy disks.

Similar technology has been used to create large 3½-inch floppy disks like those from Jasmine and Berning. Like a Bernoulli system, this is good for people who create libraries of digitized art or sounds, and in an office where people share a hard disk, each person can have a large floppy for confidentiality.
and convenience.

The advent of lasers and digital recording technology has given WORM drives, introduced by LoDown, the ability to write and read information to an optical disk, but they can't be modified. This may seem impractical because disks fill up quickly, but they can be removed and replaced, and they hold 10 to 80 times as much as a standard hard disk. However, WORM technology is expensive.

Like WORMs, a video disk player (similar to a VCR without a recording facility) can archive large amounts of data and offers easy, fast accessibility, but because it also interfaces with television and similar hardware, it is useful primarily for storing graphic and sound data. Video players have not yet evolved sufficiently for daily tasks with a Mac, but Apple's HyperCard should start an upsurge and refinement in them.

How to Choose

While you can get hard disks that hold from 10 to 900 megabytes (MB) of storage, 20MB is the most popular size, and a number of dependable products are available. However, additions in storage space generally give you more speed at a lower rate of price increase. For a 20MB hard disk, costs range from $570 to $1300. Jasmine offers some of the best ratios of price to performance, if you don't count additional software.

On the 128K and 512K Macs, hard disks are connected through the external drive port or the serial port. Apple, Paradise, and MacBottom still make useful serial drives, but unless you have a 128K or 512K, there is no reason to consider one. SCSI drives, the standard connection for storage devices on the Mac Plus and beyond, can access at a much faster rate. For older Macs, you can install an external SCSI port for about $100.

Since each type of Mac has a different SCSI controller on which the speed of the hard disk depends, initialize your disk on the machine you'll use it with. For example, you can't maximize the speed advantage of a Mac II with a hard disk initialized on a Plus. The DataFrame 20 and 40XB drives are exceptions to this rule. And not all hard disks work on every Macintosh without being reformatted. The DataFrame 20 comes close; it can move from the Plus to the SE or the Mac II with no drop in performance.

Another option is to use a hard disk inside the Mac, making it easier to transport. Apple approves installation of third-party devices in the SE and the II, both of which have strong power supplies designed to take the extra load. You can purchase internal hard disks for the earlier models, but they require the addition of a fan and may strain the power supply, leading to burnout. Fans are the source of most of the noise from storage devices, but this is not a primary consideration unless you prize silence (if so, you should search for a disk with an acceptable sound level).

Other Considerations

Before you choose a SCSI device, weigh its speed, price/performance ratio, warranty, and the reliability of its manufacturer (several companies have gone out of business in the recent past). Hard disks fail more often than floppy disks, making the warranty worth noting; three months has been the norm, but more vendors now offer a full year.

Also, some hard-disk configurations are incompatible with other hardware, so check carefully to make sure yours agree. And not all hard disks are fast enough for speedy networking or file serving.

Software is often sold separately. The DataFrame hard disks include print-spoiling, backup, and disk-management utilities—which partially accounts for their higher price tags. Jasmine and others include public domain software.

Managing a Hard Disk

It's easy for a hard disk to become an electronic mess. The time you take to organize your folders will repay itself by making files easy to locate later. Utility programs such as Finder alternatives and catalogers can help you in this area.

When you access a document repeatedly on a hard disk, each time you save it the document fragments slightly, eventually reducing disk speed and efficiency. When this happens, utilities like Disk Express help reorganize your files and retain disk speed.

Frequent backup is necessary to protect against a hard disk's susceptibility to system crashes; after you've made significant investments of time and effort to load your applications and files, the last thing you want is to lose it all. It's best to back up the entire disk as well as original files. Fortunately, a tape drive can provide backup; usually one tape will hold the contents of an entire hard disk. A number of tape drives are now available, priced between $1300 and $1500.

The Future

The trend is toward offering more storage without corresponding price increases. In addition, the amount of information that can be stored on small floppy disks will grow. WORM drives should come down in price and become more practical for individual users. Beyond that looms the possibility of large optical disks that can be both written and erased; these may someday replace hard disks entirely.

With the Mac II's versatility and the coming of UNIX, the Mac is entering new markets, such as engineering and science, by connecting to mainframes. RAM caches will work with hard disks, like CMS's 320MB Power Tower (at the high end of the market, $15,000). Yet even if you don't require a huge amount of storage space, a proliferating variety of hard disks is available. The difficulty in choosing is due not to lack of options but to so many.

Meet Professor MacTeach™ He's here to introduce you to a unique and effective way to learn software like Excel®, Word 3.0®, and PageMaker 2.0™. You can be “up-to-speed” in about an hour without reading a manual.

These expertly-designed tutorials are available at all levels to match your experience. Each tutorial package contains an audio cassette, practice disk, and summary card. Your skills develop quickly because you learn using the real software, as friendly instructors guide you step-by-step through the various features of each program.

Call the professor at (408) 559-8635, or send in the attached coupon, and learn how easy it is to become truly proficient in the latest software... for less than $50.

For more call collect. Excel and Word are registered trademarks of Microsoft Corp. PageMaker is a trademark of Aldus Corp. MORE is a trademark of Living Videotext. Professor MacTeach is a trademark of Personal Training Systems.

PRESS YOUR EXCEL ADVANTAGE TO THE LIMIT.

Introducing MacSoft™ for Microsoft Excel. MacSoft™, a combination desk accessory and application, makes Excel even better by making spreadsheets smaller and safer. Smaller because MacSoft™ shrinks the size of your spreadsheets on disk by as much as 95%. Automatically, as you use Excel. You get 95% more use from your disk space. With almost 0% effort. Safer because MacSoft™ adds effortless backup and file-level password protection to Excel. It also shows a history of spreadsheet changes and lets you see which spreadsheets are linked together. With MacSoft™ your numbers are safe and secure, and better documented. It helps Excel work harder, so your work is easier.

For only $79.95, MacSoft™ is the small wonder that gives Excel users a bigger advantage. See your dealer, or call for info or to order with a 30-day money-back guarantee. Excel more with less. With MacSoft™.

Introducing GraphicsWorks™ 1.1, the graphics and text package so complete, The New York Times rates it first among Macintosh™ graphics software. It's the only program that allows 300dpi (and above) full-page scanned-image editing. Its many unique features include full LaserWriter® support for scanned images and text, the ability to edit and manipulate bit maps as objects, and an unlimited number of Draw, Paint and Write layers. It even gives you ThinBits™ allowing you to work on an entire image without the expense of a large-screen monitor.

In short, it gives you superior power at a price "the rest of us" can afford.

So if you want a complete graphics and text package for the Macintosh™ II (supports color), SE, Plus or 512K, get the one with the works: GraphicsWorks 1.1.

Mindscape
The Mac 128K and 512K handle basic applications in word processing, file management, and simple graphics. To get the most out of today's powerful software, however, you need at least 512K of memory (preferably a megabyte), 128K ROM, and two 800K disk drives (or a 20MB SCSI hard disk). For many current applications, you need a Plus, an SE, or a Mac II. If you bought a Mac early on, you can upgrade to benefit from the latest advances.

Four types of upgrades—ROMs and disk drives, added memory, coprocessors and CPUs, and I/O cards—can give you almost as much power as a Mac II. For word processing and limited desktop publishing, you do not need a processor upgrade; an inexpensive memory upgrade may be sufficient. If you do a lot of numerical calculations or use CAD on your Mac, you may want a numeric coprocessor and additional memory. For engineering and scientific simulations, complex graphics, or special effects, you could use all three: memory, processor, and coprocessor upgrades. If connectivity to other computers is your main focus, you can buy cards that allow your Mac to emulate an IBM PC, exchange data, connect to UNIX machines, or connect and control laboratory instruments.

ROMs and Drives

In 1986, the Mac Plus introduced a new 128K ROM and an 800K internal disk drive—twice as large as those in the 128K and 512K Macs. This combination upgrade from Apple is one of the cheapest and most essential. Without 128K ROM, you cannot use stable hierarchical filing systems (HFS) or file servers, nor can you connect to hard disks of more than 32MB. While the Mac II and SE have 256K ROM, no upgrade to that is currently available from 128K ROM.

Memory

With more memory, applications run faster, and more documents and desk accessories can be open simultaneously. You can set up a RAM disk or disk cache (either Apple cache in the control panel or Turbocharger from Nevins) on your Mac with extra memory to increase speed even further. You can add up to 4MB directly into an SE or Plus, and 8MB into a Mac II.

Both Apple and third-party vendors offer memory upgrades; though Apple's prices are considerably higher, their upgrades are dependable and always compatible. Along with price and the vendor's reputation, these are important considerations. With more memory, you need a fan to offset the additional heat inside the Mac case; look for upgrades that install a fan rather than mounting an external fan on top of the case.

Some memory upgrades include SCSI ports for your 512K. Vendors like SuperMac go beyond this, offering an extra 68000 processor to reduce the
workload of your main processor, in addition to a 2MB memory upgrade, a SCSI port, and a fan, all of which make the Mac run 15 to 20 percent faster than a Mac Plus.

**Processors and Coprocessors**

The Mac II has a more powerful processor than the Plus and the SE. Its 68020 processor allows applications to run faster, accesses more memory, and works well with other processors to deliver high performance. When coupled with the 68881 “math chip,” it can perform numerical calculations up to 200 times faster than a Plus. When the 68851 page memory management unit (PMMU) is added to Mac II, you can run a UNIX operating system and address more than 8MB of memory. Adding a graphics coprocessor or 80286 coprocessor to the Mac II enables you to run IBM applications in a window.

You can also upgrade your processor and add coprocessors to the Plus or SE to create a workhorse like the Mac II. Inserting a card from AST in the SE also allows you to run IBM applications. Or you can buy an accelerator card with 68020, 68881, or 68851 PMMU/chips to change the SE into a “portable Mac II.” Unfortunately, standards in SE cards are still emerging. Since the SE has only one slot, decide carefully which coprocessor or processor upgrade you want. Most accelerator upgrades allow you to connect to at least one large screen monitor. If you prefer a particular monitor, you may have to choose an accelerator board compatible with it, or vice versa.

You can also add the 68020/68881 combination and an extra megabyte of memory to a Mac Plus for under $2000 from Leveco, GCC, Peak, Network Specialties, or Radius. Just make sure that your upgrade comes with a fan and that the power supply is adjusted to correct specifications. Again, weigh price/performance ratios, compatibility, warranty, and stability of the vendor before you buy.

All power upgrades have disadvantages. Some applications, disk accessories, and utilities will not run on a Mac II. Prodigy, or other system upgraded to higher clock speed. Mac Plus upgrades strain its power supply; unless you can reduce the load, failure is inevitable. Since Apple does not authorize additions to the Plus, all external upgrades must be removed before your Mac is serviced by an official dealer.

**I/O Connectivity**

Proper input/output connections and protocols are imperative to connect a Mac to laboratory equipment for control and data acquisition needs, to DEC or IBM mainframes, or to other personal computers. Unlike the earlier Macs, the Plus has a SCSI port for high-speed hard disk connections; you can daisy-chain up to seven SCSI devices to a Mac Plus. To read and write IBM data rather than run IBM applications, options are available. If you are serious about having UNIX capability, it’s best to buy a Mac II, due to the size of Apple’s UNIX operating system. But by the time you read this, UNIX may be available from third parties.

For connectivity to laboratory instrumentation, National Instruments, MacADIOS from GW Instruments, and Reed College provide interface boxes. The National Instruments card for the Mac SE provides an industry-standard IEEE 488 port to which laboratory instruments can be directly connected. To connect the Macintosh to other computer systems, such as DEC and IBM mainframes, several universities and industries use Ethernet connections, which are available through Apple, Kinetics, Dove, and other third parties.

**Monitors**

Several manufacturers have introduced large screens that can be connected to the Plus, SE, or Mac II. Some of these have higher resolution than the Mac screen itself, and some are large enough to show two actual-size 8½ by 11-inch pages. Large color screens are also available for use with the Mac II. While the resolution is nice on a bigger screen, unless the screen font and cursor sizes are increased, reading is difficult. For serious desktop publishing or CAD, big screens are very helpful but cost $2000 to $3000.

For desktop publishing, you may want full-page display, for spreadsheet and CAD applications, a display that can show a page horizontally may be right. Make sure that your applications and hardware are compatible with the display you choose.

**Portables**

Some portable Macs are available with LCD or electroluminescent displays, but they weigh as much as the Mac Plus itself. Currently Dynamac, Colby, and Intelic offer portables, but high price and weight make each one a dubious choice. A year from now, we should see other lightweight portables.

**The Future**

True multitasking of applications is not yet available on the Macintosh. To run applications that now take hours and days to calculate instead of seconds, another approach, called multiprocessing, can be used.

The Mac II’s processor-independent Nubus architecture gives it a lot of growth potential as a workstation. Currently in the works are several graphics and sound accelerators, which will make the Mac II faster and enable it to do tasks like graphics animation and architectural rendering, and to enter new areas like broadcast graphics. Network cards will enable you to emulate and connect to any computer you wish.

Choosing an upgrade can be a confusing and expensive process. Take your time in deciding, get good advice, and above all, know how much power you really need before you take the plunge.

Software Products

By Lyle Seidman
Tallgrass, The First Name In Tape Makes Backup Second Nature.

INTRODUCING THE TG-4040! Designed specifically to meet the expansion needs of the complete Apple Macintosh™ family, by combining 40 Mbytes of tape backup and 40 Mbytes of optional hard disk in a completely integrated solution.

With backup that's every bit as sophisticated as you expect from Tallgrass, a leader in the mass storage marketplace for over 6 years.

Tallgrass has made backing up your Macintosh more practical than ever. And so simple, backing up data becomes second nature.

APPLE ENDORSED IT. TALLGRASS MADE IT BETTER!

Apple endorsed the industry standard QIC 100 tape backup format which, by the way, Tallgrass invented. Now Tallgrass has made it even better.

TWICE AS FAST.

Our tape drive works double-time, backing you up twice as fast as our closest competitors. Including Apple. But the Tallgrass 4040 will slow down, if need be, to read an Apple tape. And we'll guarantee that compatibility.

WITH OR WITHOUT DISK.

Our high performance disk won't slow you down either. Plus, only Tallgrass offers you the ability to add the hard disk at a later date. With or without disk, it's the only solution flexible enough to grow as your business grows.

A TRUE 40 MB OF TAPE BACKUP.

Most competitors won't allow you to back up the full capacity of your 40 Mbyte disk. Tallgrass corrects this problem by providing a formatted tape capacity of over 42 Mbytes. A unique tape overflow feature allows you to back up disks of even larger capacities.

WHEN YOU CARE ABOUT YOUR DATA, BACK IT UP.

When the lights come back on, your data may not. That's why Tallgrass took the industry's most reliable medium—magnetic tape—and perfected a format that's becoming an Apple standard.

Even people who jump out of airplanes believe in backup. They don't just carry a chute. They carry parachutes!

How should you feel about tape backup? Take the spare tire out of your trunk for a month and see if that bothers you.

Breakthrough: We store 40 Mbytes of backup on this tiny tape cartridge, with legendary Tallgrass simplicity and reliability.
You think they filmed 22 years of Lassie with just one dog? Never. There were always at least two backup Lassies in the wings.

Nobody ever broke their No. 2 pencil during a test. Unless they had just one.

The TG-3040 is available in Apple platinum or beige.

This Apple 'sider' file neatly beside your Apple for easy tape access. An ideal companion for your Mac Plus, Mac SE and Mac II.

TALLGRASS BACKS YOU UP WITH SERVICE AND SUPPORT.

Tallgrass has been backing its products since 1981, a statement that very few of our competitors can make. Our reputation for service and support is second to none. And you can be sure we'll be here to back you up as you move forward.

If you want to reduce the chances that you'll ever get locked out, just go to the trouble of stashing a backup key.

Circle 6 on reader service card
Input and Output

Until recently, the Macintosh came with a mouse, a keyboard, and a monitor, all of which limited the need for, and means of, customizing the system. Now SE and Mac II owners must buy a keyboard separately, and a monitor for the II is also an extra. The Apple Desktop introduced with the Mac II and the SE lets you daisy-chain up to 16 devices to the II or SE, but choosing input and output devices requires some thought. Alternative input devices take the place of the Mac's mouse or keyboard, and output devices transform the Mac's graphics and text into printed pages or monitor displays. In contrast to what was available during the early days of the Mac, many useful substitutes for its stock components are now on the market.

Making a Choice

The usefulness of input and output devices depends on the work you do and the software you run. Many alternate devices are rather expensive, so decide carefully whether their advantages are worth the cost. If the product you get isn't compatible with the connectors on your Mac, you'll need an adapter.

Mouse and Keyboard Replacements

Since it can pick up dust and dirt from the tabletop, the Mac's electromechanical mouse requires routine maintenance. An optical mouse, like the A+ Mouse from Mouse Systems, is not as susceptible to dirt, but it can be tricky to manipulate. If you aren't comfortable with the standard mouse's operation, others, such as Kensington's Turbo Mouse, move the pointer differently.

Apple offers two versions of its keyboard for the Mac SE and the II: a standard model (similar to one on the Apple IGS) and an enhanced model with extra keys to support IBM PC emulation. DataDesk's Mac-101 keyboard, modeled after Apple's enhanced board, includes 12 function keys, separate cursor control keys, and a full numeric keypad. None of these boards works with the Plus or 512K Enhanced, so about the only enhancement for an older Mac is to add Apple's numeric keypad, which fits alongside the regular keyboard.

As mouse alternatives, joysticks and trackballs are ideal for playing games, and graphics tablets replace the mouse for artwork (see "Graphics").

Scanners

Scanners bypass the mouse and keyboard to input text and/or graphics at rapid speeds. Though their features and prices vary widely, they all optically scan the surface of a piece of paper (up to about 8½ by 14 inches in size) and convert the image into data for processing by the Mac.
A unique graphics scanner for the Mac is Thund-derware’s ThunderScan, which uses the ImageWriter for the actual scanning by replacing the printer’s ribbon. Though ThunderScan is inexpensive and can reproduce images as well as a desktop scanner, scanning a full 8-by 10-inch picture may take 20 minutes. Other scanners come in two basic types: flatbed and sheet-fed, both of which output the same high-resolution graphics. Sheet-fed models are more common and generally less expensive, but must be used with individual, cut originals.

Designed expressly for desktop publishing, scanners have an upward resolution of 300 dots per inch, the same as the LaserWriter. To accommodate full-page graphics, your Mac should be equipped with at least one megabyte of memory. Most pages take only 15 to 30 seconds to scan, although you must rescan after adjusting controls to refine the image.

Video Digitizers and Bar Code Readers

Video digitizers take a snapshot of still or real-life images, then turn the picture into digital data for the Mac. You use a video recorder to take the picture, and a digitizer, like Koala’s MacVision or Magic from New Image, to convert the image into binary form.

The typical bar code reader, such as the PC-380 from TIPS Electronics, connects to the Mac between the computer and the keyboard. Waving the reader over the code picks up the data and enters it into the Mac, for use in applications like word processing and spreadsheets. You can also print your own bar codes using the ImageWriter or LaserWriter. Others, like the Videx Time Wand and the Caulin Softstrip Reader, handle bar code data in unique ways.

Dot Matrix and Daisy Wheel Printing

The ImageWriter is the only printer you can use to print graphics and text created by all Mac software, but a few dot matrix models, such as the NEC Pinwriter, Okidata Microline 192/193, and Toshiba P-1340, can print text as well as graphics from selected applications. NEC’s color printers can be used (with NEC software) to make color prints with the Mac. Both Apple’s BusinessWriter and the Toshiba P-1340 have a 24-pin printhead, in contrast to the ImageWriter’s 9 pins, and produce high-quality text in one pass.

You can use daisy wheel printers with the Mac as long as they have the proper serial interface. A daisy wheel printer driver (included with some applications such as Microsoft Word 3.0) adjusts the Mac’s special text format for proper printing. Of course, daisy wheels can offer neither graphics capability nor variable type styles.

Laser Printing

The Apple LaserWriter is the premier laser printer for the Macintosh, but you can use just about any other model. Laser printers can be loosely separated into two groups: those, like the LaserWriter, that use PostScript, and those that don’t. Without PostScript, many of the unique laser printer effects from programs like MacDraw, PageMaker, and Word cannot be reproduced. A PostScript-compatible printer like the Texas Instruments Omni 2115 is also able to output fancy text and graphics.

Non-PostScript laser printers, such as the Hewlett-Packard Laserjets, are used primarily as substitute daisy wheels. Their print quality is high, and they output much faster than conventional daisy wheels.

Plotters

Charts, graphs, and technical drawings can be reproduced on the Mac with a color plotter, which connects like a printer and uses a driver program run separately or accessed through a desktop accessory. Plotters that operate well with the Macintosh include the Hewlett-Packard HP 7470 and 7475, the Toshiba P-351, and the Apple Plotter 410. All have multiple pens for full-color plots. While almost any plotter can connect to the Mac, a separate driver, such as MacPlot, MacPlots II, Plotstart, or Plot-B, is required. Some software packages, including Cricket Graph and EZ-Draft, have built-in plotter interfaces.

Film Recorders and Monitors

Film recorders, like those from Presentation Technologies, Matrix, and Dunn Instruments, capture the image of the Mac’s screen on 35mm film, which is transferred to color slide film for presentations. Expansion monitors relieve the eyestrain of staring at the Mac’s 9-inch monochrome screen all day. Many add-on monitors let you display an entire 8½-by 11-inch page at once, a feature that is useful for desktop publishing. See “Systems and Memory” for more information.

Coming Attractions

Many of the Mac’s existing input/output products, especially image scanners, are being refined. Expansion monitors and graphics boards will give rise to high-resolution light pens and touch screens, two technologies familiar in the IBM PC world. Largely in response to the desktop publishing boom, programmers and manufacturers have started to tailor their wares to specific applications. Marked improvements in software and hardware design should come soon. Make sure you get the latest version of any product when you buy an alternate device (call the manufacturer before purchasing).

While today’s crop of alternate input/output devices for the Macintosh may seem diverse, it’s only a sample of what is likely to come in the next year or two. The new open architecture of the Mac SE and the Mac II, and their extensive color capabilities, will greatly increase the buyer’s options. The Mac has grown up quickly.

**POWER TOOLS.**

From Coral Software, the developer of the first full Common Lisp for any microcomputer, two languages which bring advanced symbolic programming to the rest of us: Object Logo and Coral Lisp.

Logo and Lisp, two of the most advanced programming languages available, are now available on the Macintosh, in efficient, high-quality, low-cost implementations. Object Logo and Coral Lisp offer unprecedented opportunities for education, exploration, AI research, and program production.

Both languages offer:
- multiple inheritance object-oriented programming system
- fast incremental native-code compiler with dynamic linking
- high-level Macintosh interface tools
- advanced symbolic and list processing capabilities
- advanced math package; bignums, ratios, and complex number arithmetic
- debugging tools; source-code stepper and trace facility
- multi-window integrated editor
- interactive low-level Macintosh Toolbox access
- 400+ page manual, with complete cross-index and comprehensive examples

Additional Features
- Object Logo: Turtle graphics with multiple object-oriented turtles
- Coral Lisp: Dialog objects
- Full lexical closures, dynamic variables, separate function and value cells.
- Apple Logo compatibility
- Object Logo and Coral Lisp are already in use at the Apple Vivarium project. They can be yours for less than $100 each. If you want to explore new worlds of programming, call or write today.

"Object Logo is truly breakthrough software at a bargain price."

– MacWorld

To order call or write: Coral Software, P.O. Box 307, Cambridge, MA, 02142. (800) 531-1027, in MA, (617) 547-2662.

Object Logo and Coral Lisp: Where limitations are left behind.

More sophisticated desktop publishers are using Microtek desktop scanners with their IBM-PCs and Macintoshes than any other. This was true in 1985, 1986, and is still true in 1987! Several independent surveys have verified this: Over 15,000 have chosen Microtek manufactured scanners.

Why do more people choose Microtek? One reason is Microtek's product "family." You can choose from four different image scanners; plus Optical Character Readers; plus Fax communication tools; plus Raster to Vector conversion software.

Over 15,000 Desktop Publishers Made Microtek #1.

Our family gives you room to grow with the confidence that all members will work together.

Another reason why over 15,000 desktop publishers have made us #1 is that Microtek products are more reliable, and more feature-rich than others. You can count on receiving more capability for your money with Microtek. We are the choice of the serious user! Contact your local Microtek Dealer or call us to see why.

Introducing Design.
The first thinking tool for both sides of your brain.

Now there's a powerful graphics and text handling program to help you visualize complex systems.

*Design* lets you create understandable graphic representations of projects and processes on your Macintosh. So you can organize quickly, analyze effectively, and communicate clearly.

Draw flow charts, organizational charts, computer programs, communication networks, presentation graphics and production line processes—in record time. Once you connect one object to another in a diagram, it stays connected, no matter where you move it. *Design* makes it easier to establish, maintain and understand logical relationships.

Build *Design* diagrams up to 999 pages. And arrange them in hierarchical structure. You can also develop successively detailed descriptions within one multi-level diagram. Or hide detail, so the big picture is easier to see. Even edit, manipulate and stylize text inside any graphic object. And create "hypertext" links to organize text across multiple pages.

What's more, you can always upgrade to *Design* development systems from Meta Software. *Design + DA* lets you write Macintosh™ Desk Accessories, mini-applications that extend the power and capabilities of *Design*. And *Design Open Architecture* is a programmable system for developing final applications.

That's the verbal description of what *Design* can do. For a more graphic illustration, look to your right.

We worked 453,000 hours so you can scan any image in 20 seconds.

Datacopy Scanners let you get the most out of desktop publishing.

Thirteen years of experience went into making Datacopy scanners the best available. But all our work wouldn’t mean a thing unless it meant something very important to you: Better and easier Desktop Publishing.

Datacopy scanners are powerful tools for Desktop Publishing. Both our Model 730 and JetReader™ scanners easily perform the most complex of scanning operations. And at the same time bring 300 dot-per-inch quality graphics to any newsletter, report, or presentation. The Model 730—the world’s most popular flatbed scanner—even scans bound documents.

And while we spent countless hours perfecting scanners, we spent many more developing powerful software. Like MacImage™ — software that lets you cut, edit, reduce or enlarge any picture or image. Eliminating scissors, glue and hours from Desktop Publishing.

So whatever your Desktop Publishing task may be, whether it’s on the Macintosh™ or PC, remember, Datacopy worked long hours so you won’t have to.

For information call 800-821-2898.

The VT600's resolution of six hundred dots per inch insures smooth curves and sharp detail both at large sizes and in small text—as shown in this block of eight-point copy.

See it in our fine print . . .

...and in the quality of our smooth headlines and crisp illustrations. Until now, you've had to choose between the cost savings and convenience of plain-paper output and the high quality obtained from phototypesetting.

The VT600 eliminates the trade-offs. With an imaging resolution of 600 x 600 dots per inch, a VT600 produces camera-ready typeset text and graphics on plain paper, right in your office. Because VT600 images contain four times the information of 300 dpi output, all the subtleties of graphics and text are reproduced with exceptional fidelity. The VT600—a breakthrough for electronic publishing.

PostScript compatibility—the VT600 plain-paper typesetter is plug-compatible with your existing front end PostScript applications.

Up to 150 typesyles on disk—for increased system performance, flexibility and efficiency. Up to 10 prints per minute can be generated by the VT600—as much as six times faster than other laser printers for certain applications. Low cost per print—one-third the cost of phototypesetting.

The convenience of plain-paper imaging—immediate results without chemical processing. Designed for the office—attractive packaging, silent operation, very small footprint.

For complete information call 800 631-8134; in New Jersey call 201 887-8000, ext 999.

The VT600 . . . advancing the state of the art of laser printers while preserving high aesthetic standards for type and graphics.
MacTilt SE
The Mac SE sitting on the desk leaves the screen too low for comfortable operation. MacTilt SE elevates the Mac 4" and provides 30° tilt and 360° rotation for better viewing and greater operator comfort. $89.95

MacTilt
With a silky-smooth, one hand motion, your Macintosh can be adjusted to relieve operator stress, ease neck, back, and eye strain, and increase productivity. The MacTilt elevates the Mac 4", and provides 30° tilt and 360° rotation at the touch of a finger. $89.95

The Muzzle
The Muzzle protects your confidential files, documents, and other sensitive data. A locking bracket effectively prevents the Mac SE from being powered up, eliminating access to any data on the hard disk. The entire Muzzle can also be secured to a desk or workstation with a cable or chain to physically secure the Mac in place. Muzzle $49.95
MacTilt SE/Muzzle $129.95

Mouse Cleaner
By regularly cleaning your Mouse, you can eliminate sluggish operation and expensive repair bills. By removing the grime from the tracking rollers, free cursor movement is quickly restored. Compatible with IBM, Apple, Atari, Amiga, Microsoft Mouse, and others. $16.95

MacBuffer LW
MacBuffer LW increases office productivity by eliminating the need to wait for the LaserWriter. This means that every operator on the network can send MacBuffer LW their print jobs and get back to work. MacBuffer LW can handle unlimited Macs and LaserWriters, provides for full queue management, and is totally transparent to operators. Available in 1, 2, 3, and 4 Meg models. Call for pricing.

Pedestal Base
The same outstanding features and user benefits of the MacTilt are now available for your Large Screen Display, Commercial CRT, Personal or Portable Computer, or Graphics Monitor. Enjoy a better viewing angle and reduced eye, neck, and back strain. Call for specific models. $89.95-$99.95
They came. They saw. They got eyestrain.

But you don’t have to be from outer space to know that’s exactly what happens when you stare at a computer screen for too long.

Unless, of course, that screen happens to be unusually large, and easy to read.

Like the new Stretch Screen,™ from NSI.

Stretch Screen is a 20” high-resolution monitor that works with any Macintosh™ from the 128K all the way up to the new SE.

It’s got over a million screen pixels (1024 x 1024, to be exact) so you get a full 80 dots per inch of crystal clear viewing. Which means that laying out multiple pages or tracking monster spreadsheets is a beauty to behold. And tilt and swivel positioning makes it easy not only on the eyeballs, but on the neck and back, too.

That’s not all. Unlike other large monitors, the Stretch Screen installs in just fifteen minutes, thanks to a unique clip-on card that simply snaps onto your Macintosh’s motherboard. (The cable fits neatly into the security slot.) With no soldering required, the Stretch Screen won’t void the Apple warranty, and it comes with a full, one-year warranty of its own.

Eye the power of a Mac II.

There’s nothing alien about wanting big performance to go with your big screen. That’s why we built the Jump! Board 020™. This clip-on upgrade installs in the same easy way as the Stretch Screen and gives you up to four megs of RAM, two different clock speeds (12 or 16Mhz), and a performance increase of 400% over the Mac 128K.

Want to get a good look at these products? Call us at (415) 467-8411 or (212) 995-2224, Fax (415) 467-2516 and we’ll give you the name of the NSI dealer nearest you.

He’ll show you an eyeful.

Network Specialties, Inc.
Project Billing is a time billing package designed for ad agencies, graphic designers, architects and engineers. This package will track all aspects of your project billing including budgets for time and expense, actual costs and billed out amounts for both employee and expenses, and project profitability. It will also automatically mark-up expenses, and provide productivity reports by employee or project, plus print your client bills in a variety of formats.

This is how Project Billing can help you office:
- Tracks employee productivity by cost and billable rates
- Automatically marks up expenses
- Provides profitability analysis by project
- Tracks billing of time and expense
- Prints bills and adds interest
- Work-In-Progress holds detail from month-to-month
- Enables progress (partial) billing, while holding all detail
- Multi-user option available

Call or write for more information or the name of your local authorized dealer:

SATORI
Satori Software
2910 Second Avenue, Suite 580
Seattle, WA 98121

LEGAL BILLING
Legal Billing is a time billing package designed specifically for attorneys and accountants. Legal Billing is a full featured system, and yet it is incredibly easy to use. Most firms are up and running in 40 minutes or less!

Legal Billing is designed for:
- Billable rates
- Time tracking
- Hourly billing
- Multiple time input
- Quick and easy

Features:
- Allows simple and fast entry of information, automatically sorted by time, client, employee and activity
- Customized productivity reports
- Automatic interest added to past due balances
- Client statements formatted in any way
- Multiple billing rates for each employee
- Aging Report can be customized
- True Work-In-Progress feature holds activity details from month to month

$595.

LEGAL BILLING II
Legal Billing II is an easy-to-use, advanced system designed for small to medium size firms. Includes all features of the basic system plus much more!
- Full trust account reporting
- Archiving of billed services and costs
- Additional billing options
- Handles more employee and activity codes
- Multi-user option available

$895.

$1295. Legal Billing II +
- Multi-user version

BULK MAILER
BULK MAILER
NEW VERSION! BulkMailer is a powerful program specially designed for managing lists. BulkMailer does everything you want in a mail list program, including duplication elimination, zip and alpha sorts, 1 to 1 up labels printed, easy-entry defaults, multiple label format, plus, much, much more.

This is the only program to offer all these features:
- Duplication elimination
- Zip or alpha sort
- Case sort or zip +
- 1 to 1 up labels or roster format
- Powerful coding capabilities
- Sophisticated global editing and deleting
- Mail merge with Microsoft Word
- Easy-to-use entry defaults
- Coding and date expiration fields
- Large record capacity (up to 90,000 names)
- Hard disk compatible

Now shipping version 3.0
$149. Bulk Mailer
- up to 8,000 names

$350. Bulk Mailer +
- up to 90,000 names

Information on the Mac's latest software, hardware, and accessories

Edited by Eileen Drapiza

This section covers Macintosh products formally announced but not yet evaluated by Macworld. All prices are suggested retail. Please call vendors for information on availability.

SOFTWARE

AEC Information Manager Database that enables design and construction managers to automate, schedule, organize, and track the many aspects of a project. 1MB min. memory. $595. AEC Management Systems, Inc., 310/428-3694.

Arithmetic, Algebra 1, and MacFunction Course supplements or programs for self-study and review of mathematical concepts. 512K min. memory. $49.95. True Basic, 603/643-3882.

Client Portrait Double Helix template for client management in law offices. 512K min. memory. $59.50. GreenLight, 312/782-6496.

Command Typographer Typography package with user-definable kerning; automatic hyphenation and justification; and online help. Outputs to PostScript devices. 1MB min. memory. $495. Laser Text Publishing Systems, 212/925-4551.

DA-Switcher Utility that enables use of multiple sets of desk accessories and grouping of individual sets with specified applications. 512KE min. memory. $499.95. Olduvai Software, 305/665-4665.

DrawStructures Chemical structure library requiring a drawing program that reads PICT files. Not compatible with Cricket Draw. $79.95; educational discount available. Modern Graphics, 317/253-4316.

Dr. B. Careful Teaches students (grades 6 to 11) about AIDS. Divided into definition, transmission, prevention, treatment, question, exercise, and game sections. 512K min. memory. $70. Canadian CourseMaker International Inc., 416/738-8722.

EmDash Fonts Downloadable laser fonts, including ArchiText, UpStart, and Basic. Price depends on font and style. EmDash, 312/441-6699.

Form Names Construction Kit Form design program. Includes gray shades, hairlines, foreground and background drawing planes for visible and invisible objects, text editing, interactive fields, some unique object alignment, distribution and copy/paste techniques, and the option to fill out the forms on screen. 512K min. memory. $89. New Directions Software, 403/250-1969.

Grant Manager and Personnel Manager Grant Manager is for grant and fund accounting; Personnel Manager is a companion program. 512K min. memory. $495 each. Niles & Associates, 415/655-6666.

GraphPainter For creating presentation-quality graphs. Includes eight drawing tools and seven curve fits. 512K min. memory. $50. Greg Brasel, 314/256-3317.

Icon-It Customize floating icon bars for frequently used menu items, desk accessories, F-keys, and macros. 512KE min. memory. $79.95. Olduvai Software, 305/665-4665.

Mac 'N Med Medical office management system. Registers patients, tracks insurance and financial information, prints insurance forms, generates patient financial statements and deposit slips. 512K min. memory. $399.95, multiuser $599.95, demo disk $10. Somerville MD Associates, 302/678-2131.

MasterWorks Three courses covering Microsoft Works database, spreadsheet, and form-letter function. 512K min. memory. $49.95 each. Personal Training Systems, 408/559-8635.

Maze Survival Strategy game in which the goal is to keep a colony of bugs alive inside a changing maze. 128K min. memory. $39.95. Olduvai Software, 305/665-4665.

New Products

**PICTures** Object-oriented clip art collection created in *SuperPaint* and stored in PICT format. Ad-Techs, 806/353-7063.

**PIXymbols One** PostScript-based pictorial symbol fonts. $70. Page Studio Graphics, 602/839-2763.

**P.O.S./Mac Point-of-Sale** Includes invoice, price quote preparation, inventory control, accounts receivable, sales tax tracking, multiple commission calculations, and more than 24 levels of reporting. Requires a non-run-time version of *Omnis 3 Plus*. $995. Software Complement, 717/686-5592.

**Power Tools** Software engineering tool set designed to support software from concept through code to maintenance. 512K min. memory. $3295. Iconix Software, 213/458-0092.

**Professor Craps** Casino craps simulation teaches how to bet and lay odds, understand the table and percentages, and develop personal strategy. 512K min. memory. $49.95. Scorpio Systems International, 415/398-5155.

**Prosper** Sales and client management program tracks and schedules activities. Includes a partly user-definable relational database. Provides computer-assisted phone calling. 512K min. memory. $495 including 1200-baud modem. Twenty-first Century Software, 504/888-3600.

**Read-It! and Read-It! TS** Both provide optical character recognition for 300-dpi scanners. *Read-It! TS* is for ThunderScan. 512K min. memory; requires 300-dpi scanner. $295 each. Olduvai Software, 305/665-4665.

**Reggie** Converts *MacDraw, MacPaint*, and clipboard images to DEC's ReGIS or SIXEL formats for importing Mac graphics into DEC host-based applications. 512K min. memory. $99. White Pine Software, 603/886-9050.

**Thinking Tools** More than 250 electronic/electrical symbols in PICT format. $49.95. Thinking Tools, 301/383-6490.

**3+ for Macintosh** Extension of the 3+ network operating system that allows integration with IBM PCs and compatibles. 3Com Corp., 408/562-6400.

**WordFinder** 220,000-synonym thesaurus that installs as a DA. $59.95. Microlytics, 716/248-9150.

**HARDWARE**

**DaynaFile** External SCSI disk drive that lets a Mac read from and write to MS-DOS formatted data disks while running Mac applications. $799. Dayna Communications, Inc., 801/531-0600.

**hammer Hard Drive Series** SCSI mass storage sub-systems include 91MB internal hard disk for the Mac II, and 155- and 300MB external hard disks. Bundled with Hard Disk Partition, Hard Disk Util, and other commercial utilities. hammer91, $2495; 155, $3495; 300, $4595. FWB Software, 415/474-8055.

Why is Analyze!™ more powerful than the boss? Because like your boss it's fast, efficient and most importantly, Analyze! is never wrong.

Analyze! is an electronic spreadsheet program for the Macintosh™ that turns you and your computer into financial wizards. Analyze! is easy to use, yet sophisticated enough to keep track of anything, from your checkbook to your company's general ledger.

Analyze! commands can be entered from the mouse or keyboard. Dozens of built-in functions make complex calculations effortless.

Your data can be presented using one of Analyze!s 8 breathtaking graph models. As many as 4 graphs in 2, 4 or 16 colors can be displayed to create professional looking sales reports.

Additional features like a macro language to automate your spreadsheets, powerful print, sort functions and compatibility with other popular spreadsheets will make you wonder how you ever lived without Analyze!.

Analyze! is easy to learn, supported by an informative reference manual and our expertly trained Technical Support Division.

Ask for a dealer demonstration of this fine product, or call our Technical Support Line at (305) 790-0772.

Get More from your Macintosh... for less.

Memory upgrade kits for the Macintosh Plus — Up to four megabytes of RAM, instantly accessible to all your applications with no modification. Completely non-destructive installation uses existing memory expansion sockets. All RamPlus and Ram II"kits use the new 1 Megabit CMOS DRAM

- RamPlus 2 - Two megabytes $299
- RamPlus 4 - Four megabytes $799

NEW! VideoEx - Expand your Mac II video to 8 bit color Only $99.95

VA: Composite Video Adapter for Macintosh 128 to SE.
Connects your Macintosh Computer to large screen displays, monitors, and projectors. Harmless to install.
- VA-Plus for the 128 to Plus $99.95
- VA-SE for the Macintosh SE $149.95

Memory expansion kits for the Macintosh SE, Plus, and II — Up to 8 megabytes additional memory for the powerful new members of the Macintosh family. Install in minutes, and are completely compatible with all internal enhancements.
- Ram II - Two megabytes $599
- Ram II + II - Four megabytes $999
- Ram II/s - Two megabytes $699
- Ram II + II/s - Four megabytes $1199

NEW! For your Mac II!
- Ram I - 1 to 2 Meg for Mac II $200
(Note: "s" models are surface mount)

SCSI port for the Macintosh 512c Completely Apple compatible. Non-destructive installation. Works with all SCSI devices. Installation Tool included. $99.95

Now Available for the Macintosh

If your backup program isn't fast, you won't use it. Fastback for the Macintosh is the only program that can copy a full 10-Megabyte hard drive to standard floppy disks in less than 10 minutes! The minutes you save with Fastback may add up to hours compared to other backup programs.

Fastback is also the only program that uses advanced error correction techniques to recover data from damaged backup disks. And Fastback is powerful -- you can backup all your files, select folders and files for backup, or have Fastback select only the files which have changed. Fastback will even count up the disks you need and print labels for them.

Protect the data on your hard disk now. Remember, among those who use hard disks on their Macintosh systems, there will only be two types -- those who use Fastback, and those who wish they had! See your dealer today and ask for Fastback from Fifth Generation Systems, the leader in disk backup software.

Quick Tips

Answers to your questions

by Lon Poole

The June Quick Tips suggested capturing screen snapshots of the Key Caps keyboards you display by pressing the Shift, ⌘, or Option keys with the aid of the Camera desk accessory. Several readers have written to suggest the following easier method:

1. Open the Key Caps window and press a combination of Shift, ⌘, and Option keys to display the desired font set.

2. While pressing the keys, freeze the Key Caps display by placing the pointer over the Key Caps window title bar and pressing the mouse button. (You may also place the pointer at the upper-left corner of the screen.) Then release the keys—as long as you hold the mouse button down, the Key Caps display doesn't change.

3. While holding down the mouse button, press ⌘-Shift-3 to create a MacPaint document containing an image of the screen, ⌘-Shift-4 to print the screen image on an ImageWriter, or ⌘-Shift-Caps Lock-4 to print just the Key Caps window.

4. Let go of the mouse button to begin printing or saving to disk.

Thanks to Steven L. Harkesen of Green ville, Texas, Arthur Tedley of Idaho Falls, Idaho, and Mark Johnson of Ibaraki-shi, Japan, for suggesting this method. Camera is still useful for making snapshots of the screen while you are pressing the mouse button, for example when you are looking at a menu.

Slim Macro Selects Fat Cell

June's Quick Tips also included an Excel macro for finding the cell that has the longest number of characters in a column. Bob Umlas of Palisades, New York, has submitted an elegant improvement. It uses Excel’s array processing to trim the macro from 44 lines to 13 (see "Fat Finder II").

This macro has a much simpler "user interface" than the one published in June. All you do is select any cell in the column you want to check, and run the macro. Instead of asking you to enter the number of cells in the column, the macro uses the function SELECTLASTCELL() to compute that number.

The key to this macro lies in cell A9. The LEN function normally works with one cell, but here it is used on a column of cells—that is, an array. Basically, the MATCH function compares the longest MAX(LEN(SELECTION)) against each cell in the column. It reports the row number of the first cell whose length matches the longest cell's length. The formula in cell A9 subtracts 1 from that row number to get an offset from the first row. Using that offset, the formula in cell A11 then selects the desired cell.

When you enter the formula in cell A9 (by pressing the Enter key or clicking the Enter box), hold down the ⌘ key to make the formula an array formula. The macro won't work otherwise.

When you see a pattern you like, make it the desktop pattern by clicking on the miniature desktop.

To design your own pattern, use the magnified swatch next to the miniature desktop as you would use FatBits in MacPaint. Clicking on a white space turns it black, and clicking on a black space makes it white. As you change the magnified pattern, watch the miniature desktop next to it. Click the miniature desktop when you have the pattern you want.

Q Nonsense in WriteNow
I use the spelling checker in WriteNow extensively, but when I noticed that it was not picking up some typos, I investigated. I found the dictionary has some words that should not be there. Some, like allous and orgasmatronx, don't even exist. I've compiled a list of more than 1200 of

How To/Quick Tips

Pattern Picking
Use the Control Panel to change the desktop pattern. Click the miniature menu bar to see pattern choices and click below when you see one you like. Or edit the magnified pattern using FatBits techniques.

these expendable words and nonwords that our department has found in the dictionary. You can remove them by selecting them and clicking WriteNow's Forget button.

Why were the developers so sloppy?
Robert Holland
Milpitas, California

Don’t remove those nonsense words! Doing so actually removes perfectly good words from the dictionary.

You may see some nonsense words among suggested alternatives to misspelled words, but they’re not actually in the dictionary. WriteNow constructs a list of alternatives by manipulating the currently selected word when you click the Guess button. It may create a thousand derivatives from one misspelled word, many of them synthetic words. To winnow the bogus derivatives from the list, WriteNow checks the list against its dictionary. Because of the way WriteNow checks its dictionary, there’s a statistical probability (1 in 80,000) that it won’t catch a misspelled word. The nonsense words you see are spurious derivatives that WriteNow didn’t catch.

WriteNow lets those counterfeit words pass as correctly spelled alternatives because it mistakes them for legitimate words in its dictionary. When looking up a word in its dictionary, WriteNow actually looks up a numeric code calculated from the word. If the program finds the calculated code in the dictionary, it assumes the spelling is accurate. By chance, a nonsense word may generate the same code as a legitimate word. If so, the nonsense word

(continues)
Levco’s Prodigy SE transforms your Macintosh SE into a high-performance workstation capable of running software up to 100 times faster. By boosting the speed of Macintosh applications, the Prodigy SE will save you thousands of hours and dollars. Prodigy SE plugs into the Macintosh SE’s internal expansion bus, and features specialized hardware options.

**68020 processor boosts software speed**

Prodigy SE’s true 32-bit, 16 MHz 68020 processor effectively doubles the clock speed and data path of the Macintosh SE. Standard applications run 4-8 times faster, revolutionizing the productivity of desktop publishers, consultants and business users.

**Math co-processor crunches numbers faster**

Calculation-intensive software runs up to 100 times faster with the optional 68881 math co-processor, creating an ideal workstation for data analysis, CAD/CAM, software development and desktop engineering.

**Expandable RAM and Memory Management**

Prodigy SE features one megabyte of RAM, and is expandable to 32 megabytes. The optional 68851 paged Memory Management unit provides the Macintosh with virtual memory capabilities previously available only on mini or mainframe computers.

**The complete system from a single source**

As an authorized Apple® VAR, Levco provides completely bundled Macintosh systems, authorized Apple service and product warranty.

Levco
6160 Lusk Blvd.
Suite C-203
San Diego, CA 92121
(619) 457-2011

Circle 493 on reader service card
If you remove a nonsense word you think is in the dictionary, you actually delete its numeric code from the dictionary. This effectively removes the genuine, correctly spelled word with the matching numeric. Unfortunately, there’s no way for a WriteNow user to tell which real word is removed when a nonsense word is “removed.”

WriteNow uses the coded lookup scheme because it’s faster and uses much less disk space and memory than full-word lookups, according to John Anderson, who wrote the spelling checker. “All spelling checkers have trade-offs,” he said. “Our top priorities were speed and the ability to check spelling in reduced memory environments such as Switcher and MultiFinder.” He claims the WriteNow dictionary is clean and accurate. The checking method has a known error rate, as described in the WriteNow manual.

Window Tiles

Tip: Microsoft Word 3.0 has several window management features, including its Window menu and the Option-W command that rotates through the open windows in turn. In addition, the program does window tiling. Clicking the zoom boxes of windows (or double-clicking their title bars or size boxes) shrinks the window and arranges them so at least a portion of each window is visible.

Stanley K. Dorst
Pittsburgh, Pennsylvania

There’s an exception to Word’s window tiling. If you resize or move a window after opening it and later click its zoom box (or double-click its title bar or size box), Word zooms the window to full size. Click again and the window assumes the size and location you gave it.

Improve Your Score

Tip: I’ve heard people complain about Professional Composer’s inability to use different meter signatures simultaneously. Actually, it’s quite easy to use different meters on different staves of a multipart score with Mark of the Unicorn’s excellent manuscript program.

At any time, you can replace a meter signature on one staff with a signature you cut or copy from another place in the score. Start by setting up the meter signatures you need. To do that, insert the first time signature. Then add a bar line, insert another signature, and repeat until you’ve set up all the signatures the piece requires.

To substitute one signature for another, backspace to remove the signature you don’t want. Then cut or copy the replacement signature from anywhere in the score and paste it at the spot just vacated. As long as you use equivalent meters in parallel measures across all the staves, the notation will be properly aligned (see “Many Meters Made”).

Professional Composer has a different problem you can circumvent. Dynamic markings such as forte and piano sometimes collide with note heads, stems, or beams. To fix this situation, add a nonprinting 32nd rest where you want the dynamic marking. Then attach the dynamic to the 32nd rest (see “Dynamic Collision”). Be sure to do this on each staff, to keep the parts aligned. Only the dynamic marks appear when you print the document.

Rocky J. Renier
Columbus, Ohio

External 20 MG

Price Breakthrough....$569!

This AMCAD S-20+ Hard Drive product from AMCAD utilizes reliable Rodime drive technology. The S-20+ is a high speed, SCSI drive providing true value and quality.

Guarantee Two week money back satisfaction.

Warranty One year parts and labor with direct watts line access to the service department.

- Includes cabling, software and documentation.
- Plug and play, already formatted at 21.3 MG.
- Integrated power supply.
- Two SCSI ports.
- Allows daisy chaining of up to 7 SCSI peripherals.
- Conveniently fits under the Mac Plus or Mac SE.

Many Meters Made

With Professional Composer you can use different meter signatures on different staves by cutting and pasting.

Dynamic Collision

Keep dynamics from colliding with notes in a Professional Composer score by attaching the notes to non-printing 32nd rests.

How To/Quick Tips

"Many Mete­rs Made

With Professional Composer you can use different meter signatures on different staves by cutting and pasting.

Dynamic Collision

Keep dynamics from colliding with notes in a Professional Composer score by attaching the notes to non-printing 32nd rests.

David Barnett of New York suggests a useful extension to the first tip. It allows mismatched time signatures on parallel measures, for example 5/4 on one staff and 4/4 on another staff. In the measure with more beats, use the Tuplet command and specify that the tuplet marking not be printed.

Thickening a Cricket Graph Plot

Tip: In Cricket Graph, the Overlay Plot button lets you add points from a new data set to an existing scatter or line plot. However, it won't let you overlay a data set with only one data point or a data set containing data that fall on a perfect vertical or horizontal line. If you try, a message pops up saying zero-range data can't be used. Even when the data points easily fall within the bounds of the established axes on the current plot, adding zero-range data is impossible. I have encountered many situations with real scientific data where this has been an issue.

You can trick Cricket Graph into overlaying a single data point. First, duplicate the one point in the data table where it appears. Do that by copying the data point from one row and pasting it to the next row in the data table. Then change the values in one of the two rows by some minuscule amount. Finally, overlay both data points on your graph. Cricket Graph plots the two nearly identical points on top of each other as if there were only one point. Suppose you have plotted cases 1 through 10 and want to add case 11, which has only one data point: \( x = 3.5, y = 2.6 \). Create a second data point for case 11 with \( x = 3.50001 \) and \( y = 2.60001 \). When you overlay the two points, they will appear as one on the graph.

A similar trick applies when adding or creating plots of data that fall on a vertical or horizontal line. To plot a horizontal line, for instance, just change one of the \( y \) values (vertical axis) by a trivial amount to make the \( y \)-range nonzero. Once they are plotted, you can change the range of the axes at will.

Jeffrey D. Lindsay
Appleton, Wisconsin

Reduce Scrolling

Tip: You can reduce the time spent scrolling to find documents you use regularly. Prefix the names of those documents (continues)
More people use CompuServe than any other online computer information service on Earth. Over 380,000 members access hundreds of information, communications and entertainment services online, converge regularly and exchange ideas on an ever-expanding list of special-interest Forums. They have access to a combination of more financial information, a greater variety of shopping services, and deeper research resources than any other online computer service. Anywhere.

Of course, it's conceivable that there's a service like ours somewhere that could give you more for your money. But you may have to travel a few light-years to find it. Instead, all you have to do is visit your nearest computer dealer today. To order CompuServe direct, or for more information, write: CompuServe, 5000 Arlington Centre Blvd., Columbus, Ohio 43220. Or call 800 848-8199. In Ohio and Canada, call 614 457-0802.
with the letter A, view by Name or Kind, and they will appear at the top of the list. Conversely, prefix items you don’t often open with the letter Z so they appear at the bottom of the list.

Peggy A. Clark
Hartford, Wisconsin

That technique is safe to use on documents and folders you create, but may cause trouble if you use it on applications and special documents such as help files, dictionaries, and preference settings. In addition to letter prefixes, you can also use digits and symbols. The Macintosh sorts characters in the order shown in “Orderly Arrangement.”

Mac under the Rising Sun
Tip: I have recently returned from a long stay in Japan and would like to pass on some tips about using a Macintosh there.

Macs sold in Japan have the garden-variety U.S. power supply. They work fine most of the time, but there can be a voltage problem. Japanese current is nominally 100 volts. (Half the country uses 50 Hz, and the other half uses 60 Hz. The dividing line is somewhere between Tokyo and Osaka, with Tokyo being in the 60 Hz region.) Many areas suffer brownouts in the afternoons, especially the Tokyo region. Voltage usually drops into the 90-95 volt range, and often drops as low as 85 volts. For some reason, this makes the Mac run hotter.

If you are not going to use your Mac in the afternoons, then there will be no problem. Otherwise, you will need a step-up transformer. These are available in Japan in wattages ranging from 30 to 1500. Prices start around $30.

Another point to remember is that most Japanese outlets are not grounded. In fact, my Mac came with a two-prong plug, which I replaced with a grounded three-prong plug. You need a grounded plug adapter, also available there. The transformers are two-prong types, but you can run a wire from the transformer base plate to a grounding point.

Modems pose an interesting problem. A U.S. modem, using the Bell standard and a plug-in adapter power supply, will work fine in Japan at 1200 baud, but will be illegal. Japanese modems use the CCITT standard; Bell modems are not approved. But the CCITT and Bell standards overlap at 1200 baud, so they are compatible. A Bell modem can connect to a CCITT at 1200, but not at any other rate. There is no problem (other than the high cost of the long-distance phone call) in calling up your favorite U.S. BBS from Japan using your U.S. modem. Most Japanese BBSs use 1200 baud, and several are in English.

Buy your software in the United States! It usually costs twice as much in Japan.

Jerry Levinson
Honolulu, Hawaii

All modems sold for use on personal computers in the U.S. use the standard Bell 212A protocols. These protocols determine bow information is converted from the digital form it has in a computer to the analog form it has in the phone system.

We pay from $25 to $100 for tips published here. Send tips or questions to Quick Tips, Macworld, 501 Second St., San Francisco, CA 94107. Send electronic mail to CompuServe 70370,702 or The Source BOW440. All published submissions become the property of Macworld.

Orderly Arrangement
Prefix document and folder names with a digit, a symbol, or a letter to determine where they appear in an alphabetic list of names. The Macintosh sorts symbols, digits, and letters in the order shown here.
$199 is just too good a price.

Add 800K of Apple-compatible storage to your Mac for $200 less than a comparable drive from Apple.

Functionally identical to Apple's external Macintosh drives, these 3.5 drives are as reliable as they are quiet. They connect directly to a Mac SE, Mac Plus or Mac 512 enhanced computer through the external drive port. No interface card or cables are necessary.

Drives include a manual disk eject button, an LED "in-use" access light, and a platinum-colored case.

At $199, it's easy to see why we're making so much noise about them.

Award-winning utilities no one should keep quiet.

Here's the utilities package no Macintosh owner should be without. Winner of the 1987 MacWorld World Class Award—as well as Mac User Editor's Choice and A+ Magazine's Reader's Choice awards—Copy II makes it easy to perform any disk-related task. With it, you can format and verify disks; verify files; change the status of protect, invisible and locked files; copy disks; even view and edit any block on a disk.

Copy II also allows you to undelete accidentally deleted files from either hard disks or diskettes. Back up popular copy-protected programs and run many of them from your hard disk. And—if you own an SE—dramatically speed up that slow upper internal drive.

"It may be the copying function that gets you interested in Copy II Mac... but MacTools® itself [the utilities] is worth the cost of the software." —CompuServe

For the dealer nearest you, or to order direct:

Circle 607 on reader service card
Our idea of "Hayes Compatible" has nothing to do with other modems and everything to do with personal computers. Which is the reason why Hayes modems are compatible with over 100 different personal computers, including all Apple® computers.

For the Apple II, II+, IIe, IIc and IIgs, we offer the Smartmodem 2400™ and Smartmodem 1200™. Or the internal Smartmodem 1200A™, a modem that plugs into Apple expansion slots for fast, economical 1200 bps operation. And our new Smartcom 1®, powerful menu-driven software with autodial/autoanswer and XMODEM protocol, brings out the best in both Apple computers and Hayes modems.

Our Smartmodem 2400 and Smartmodem 1200 are also compatible with all versions of the Apple Macintosh™, including the Macintosh Plus, Macintosh SE and Macintosh II. There's even a specially bundled package for the Macintosh that contains a Smartmodem 1200, modem cables and Smartcom II® software. Smartcom II is our award-winning software specially designed to take advantage of the power and graphics capabilities of the Macintosh.

Last but not least, there's another feature that Hayes 2400 and 1200 bps modems offer that will make them even more compatible with Apple computers, and that's a new low price.
Getting Started with Music

Scoring and sequencing, mastering MIDI, and outfitting your Mac to make music

by Jim Hetd

For Mac owners with a musical bent, this is a wonderful time to be alive. The Mac may be best known for changing the way people publish, but it's becoming a prominent force in the way people make music, too.

Whether you're a beginner who has trouble pecking out Chopsticks, a film score composer, or lead guitarist for the Bleeding Eardrums, there's a place for the Mac in your musical life.

And you don't have to break the bank to find it. You can sample the world of computer music applications for nothing more than the price of a program and a cable to hook your Macintosh into a stereo system (see "Music on a Guitar String"). When you're ready to move up to a synthesizer, you'll be pleasantly surprised. The same electronics advances that have spawned $9.95 digital watches have made possible synthesizers that cost less than a color television. This month, I look at the ways in which you and a Mac can make beautiful music together.

Music to the Macs

The Macintosh is a multitalented performer. In fact, a Mac can play so many musical roles that it might help to briefly audition each type before examining the most popular ones (see “Music Makers”).

- Sequencing Several programs turn the Mac into an electronic multitrack recorder that records, edits, and plays back performances using one or more synthesizers attached to the Mac. The alchemy that makes this possible goes by the name Musical Instrument Digital Interface (MIDI), a synthesizer-communications standard built into virtually every synthesizer made today.

- Scoring The process of putting notes on paper is traditionally a grueling task for composers, who must wrestle with staff paper and white-out, and for music-publishing houses, which usually use a mutated typewriter called a Musicwriter. Scoring programs will do for composers what word processors have done for writers.

- Composition A fascinating new genre of programs, called intelligent instruments, lets the Mac collaborate with you by storing groups of phrases you have entered, analyzing their structure, and rearranging the notes into new rhythms and patterns based on the originals.

- Sound editing On some synthesizers, adjusting the many knobs and but-

It Really Moves.

Omnis 3 Plus has a new "front end." One that puts its "flat out" performance advantage in the hands of just about every Macintosh™ user. We call it Omnis Express. And it's part of every Omnis 3 Plus database package.

Omnis Express provides easy access to the speed and power of Omnis 3 Plus. With Omnis Express, you can quickly create relational database solutions — complete with screen layouts, menus and report-generation capabilities without the tedious development time typical of other programmable Macintosh databases.

Which means someone with virtually no programming experience can develop full-functioned-yet-easy-to-use applications in hours instead of weeks. The applications you create today can be customized to meet your needs tomorrow. And because Omnis 3 Plus is multi-user, it can easily grow as more users are added — with the same level of performance.

For information on how Omnis 3 Plus/Express can help you, see your local Apple dealer. Or call Blyth today at 1-800-843-8615 (in Calif., call 1-800-223-8050). And ask for the location of the Omnis Development and Support Center nearest you.

Because with Omnis Express you'll soon find yourself moving up in the business world.
EZTax-PREP is a comprehensive, professional-level tax preparation package. Toll-free customer support is included free. It has every feature you want:

"The features leader." InfoWorld
"Everything about (It) ... inspires confidence." Magazine
"Excellent support." I.N., IA.
"One of the user-friendliest programs I have encountered." F.S.B., TX.
"This is the third year I've used EZTax-PREP and I think it's better than ever." H.G.S., FL.

Try it yourself. For just $15.00, we'll send you a copy of EZTax-PREP to try out on your '86 returns. That $15.00 will be credited to the EZTax-PREP package available in January for $130. (MAC $99).

To order: Call toll-free. Use VISA, MasterCard or American Express; or send a check for $15.00 + $3.00 shipping/handling. (Add 6% sales tax in PA)

After just a few minutes with EZTax-PREP, you'll wonder how you managed without it.

800-543-1040

How To/Getting Started

code. (SMPTE, pronounced simply, stands for Society of Motion Picture and Television Engineers.) The SMPTE code allows engineers to synchronize a sound track with an action. Many sequencers, as well as a new generation of cue programs, work with the SMPTE code to simplify the chore of calculating how long a musical passage must be in order to fit a given scene.

Songs for Beginners

You say you're neither a synthesizer owner nor a sound track composer? You can still choose from a combination of programs designed to let you sound off with a minimal musical background and no additional equipment. Foremost among such packages are Great Wave Software's ConcertWare+, Impulse's Studio Session, and MacroMind's MusicWorks. All are excellent introductions to computer music applications and share many traits with their more sophisticated siblings.

With all three programs, you enter music on conventional staves by using the mouse and on-screen palettes, which provide one-click access to note and rest values. MusicWorks also provides a proportional-notation display, in which notes with longer durations are wider. Unlike the symbols in conventional music notation, proportional notation provides a graphic indication of a note's duration (see "Making Note of It").

These programs also let you cut, copy, and paste passages and print your compositions. None of the three programs are intended to be scoring tools, however, so don't expect to find elements of music notation like tremolo slashes or glissando symbols. Such elements are the province of Electronic Arts' Deluxe Music Construction Set, Mark of the Unicorn's Professional Composer, or Southworth Music Systems' forthcoming High Score (see "From Keyboard to Score," Macworld, December 1986). These three take advantage of Adobe Systems' Sonata music font to produce sharp copy on LaserWriters and other PostScript printers.

Of the three programs in the suitable-for-beginners league, ConcertWare+ has the best notation features. It also offers support for the Sonata font, the ability to add lyrics, and a unique Copy Picture command that copies part or all of a score to the Clipboard as a picture for pasting into MacDraw or a desktop publishing program.

(continues)
Serious MacBusiness.

You'll get at least twice as much done per day: word, data processing or desktop publishing. We make getting down to MacBusiness as easy as apple pie.

Our LaserFeeder adds two, 220-sheet bins plus 40–60 envelopes to your LaserWriter's 100-sheet internal paper supply. With LaserFeeder in place, selecting the proper paper type for each page or printing an envelope is a simple mouse-click instead of a bite out of production time, thanks to BDT's resource software.

Flipper collates everything discretely face down in a 400-page hopper.

If you need LOTS of paper and envelope choices, consider MultiFeeder: five, 220-sheet trays, one envelope tray. More envelope trays optional. Same simple print dialog. Same clear displays. Same Flipper. Huge production time savings.

For further information, please call or write: BDT Products, Inc., 17152 Armstrong Ave., Irvine, CA 92714.
Outside Calif. 800-FIND BDT—(800)-346-3238.
Inside Calif. 714/660-1386.

Easy as apple pie

Music on a Guitar String

Sampling the Mac music waters need not mean parting with an entire paycheck. Concert-Ware+ ($69.95) lets you enter notes, print scores, play four-part music, and experiment with sound waves. For $89.95, Studio Session will introduce you to Macintosh-sampled instruments. If music notation and Sanskrit look the same to you, Opcode Systems' Music Mouse ($59.95) lets you make music with a mouse.

The Mac's built-in speaker wasn't intended to reproduce anything more than alert beeps, so attaching the Mac to a stereo system or a small external speaker will give you far better sound. To tap into a stereo system, use a cable with a ¼-inch mini phone plug on one end that branches into two RCA phone plugs (Radio Shack catalog number 42-2153). If you need a longer cable, add a patch extension cord (Radio Shack catalog number 42-2353). Attach the mini phone plug to the jack to the right of the modem connector, as you face the back of the Mac; attach the RCA plugs to the AUX inputs on a receiver or an amplifier. To avoid damaging the speakers and your ears when the Mac beeps, turn the receiver's volume down and use the Control Panel desk accessory to turn the Mac's speaker volume down. After turning on the power, adjust both volume controls to a comfortable level.

Concert-Ware+ is also the best of the three if you want to learn about sound. Using the package's Instrument Maker application, you draw and edit waveforms and define a sound envelope, which governs a sound's percussiveness. For example, a piano has a sharp attack (as the hammers hit the strings) and a gradual decay (as the strings stop vibrating and the sound fades out). Wind instruments have a gradual attack and little decay—until the musician runs out of breath.

Aural Gratification

Considering the Mac's limited sound-synthesizing capabilities, the end product of Instrument Maker is surprisingly good. But if it's not good enough for you, Concert-Ware+ MIDI can send songs to a synthesizer—or let you enter songs from a synthesizer. If the notion of playing a song and then printing out its score sounds too good to be true, it is. Any performer's rendition of a piece varies from the precise timing specified by music notation. Concert-Ware+ MIDI—and professional sequencer and scoring packages as well—must attempt to round off variances in timing through a process called quantization.

Generally the process works well, but you still must fine-tune the final score.

If you don't have a synthesizer and you aren't happy with the Mac's attempt to imitate one, consider Bogas Productions' Studio Session, the first Mac music program to use sampled sound. Sampled sound is a digitized version of the real thing, produced by feeding an audio signal into a hardware device called an analog-to-digital converter, which turns a continuously varying (analog) sound wave—the kind our ears recognize—into a series of numbers stored by sampling software. If you've ever marveled at a compact disk's startling clarity, you've experienced the most common application of sampled sound.

As explained in "Sampling Sound," the quality of the more than 60 instrument sounds included with Studio Session can't approach a compact disk's realism. Still, it is remarkable. Compuserve and user-group libraries are brimming with songs and additional sounds, and you can create your own with the Impulse Audio Digitizer, whose SoundCap software was (continues)
We want product managers as great as our products.

Apple products have a reputation for innovation, the ability to communicate clearly and graphically, and versatility. So the people we select as Apple Product Managers should display the same virtues.

If you have experience in microcomputer product management, why not become a part of the company that launched the industry and continues to shape its direction. Look into these opportunities today with Apple:

**System Software Product Manager**

You will plan and coordinate the development of new versions of the Macintosh™ operating system. This will involve working with engineering, marketing, customers and applications developers to determine new product needs. You must have 2-5 years' experience in applications, operating systems or software development; a BS or MS in computer science, software engineering or a related field; and a background or education in business management. Knowledge of the PC industry and Macintosh hardware/software is required. A familiarity with the UNIX® operating system and programming the Macintosh are pluses. Reply to Dept. JS-MW1.

**Macintosh Product Manager**

Working with engineering and other functional groups, you will plan, manage and coordinate the development of new CPU products. You should have a BS or MS in EE or CS, 3-5 years' experience with hardware development, Macintosh hardware/software user experience; and a background or education in business management. Reply to Dept. JS-MW2.

**A/UX Product Manager**

Working with engineering, marketing, customers, and application developers, you will plan, execute, and coordinate the development of A/UX software products plus determine future product needs. You should have a BS or MS in computer science or software engineering. You'll also need 3-5 years with UNIX Kernel development, Macintosh hardware/software user experience, knowledge of products and competitors in the technical workstation marketplace and a background or education in business management. Reply to Dept. JS-MW3.

**Networking and Communications Product Managers**

In one position, you will take responsibility for product line planning, market and competitive analysis, technology assessing, and managing the business side of the development process. You will also work with marketing and other groups on product positioning, pricing, and support.

A second position very similar to the first is also available. However, you will focus on managing our educational product lines.

For both positions, you must have a BS in engineering (CS or EE preferred) (MS or MBA a plus). Your background should include 1-2 years' product marketing, sales or field support experience; 2-3 years' in product or project management; and 2-3 years' experience in at least 2 of the following: LAN, MS-DOS, Network Servers, Networked Multi-User Microcomputers, and Educational Networks. Experience in the education arena is necessary for the second position. Reply to Dept. JS-MW4.

**Monitor Product Manager**

You will be responsible for defining monitor strategy and will interact with all functional areas of the company to drive product definition and implementation. You must be familiar with basic display technology and computer video architecture and should have a technical degree plus an MBA and 2-3 years' product management experience of computer display devices. Reply to Dept. JS-MW5.

**Printer Product Managers**

In helping to form printer product line strategies, you will develop a thorough understanding of relevant markets, applications, and customer needs. We have one position available to work with the LaserWriter™ printer and a second position available to work with ImageWriter™ II printers and ImageWriter LQ. For both, you must have 3-5 years' experience in engineering and marketing and be familiar with basic printing technologies and system software. A BS in CS, EE or ME or equivalent experience is required and Macintosh experience or an MBA is a plus. Reply to Dept. JS-MW6.

To apply, please send your resume indicating appropriate department code to APPLE COMPUTER, INC., Human Resources, 20025 Mariani Ave., MS9-C, Cupertino, CA 95014. Principals only, please.

Multitasking with VersaTerm
Introducing KaleidaGraph

VersaTerm-PRO™
Version 2.10
Price: $295.00
Special upgrade price for registered VersaTerm Owners.
All the features of standard VersaTerm AND...
The most complete Tektronix 4165 Graphics Terminal Emulation available on the Macintosh!
Enhanced Tektronix 4014 Graphics Emulation
Now! Executes In the Background!

VersaTerm™
Version 3.10
Price: $99.00
Terminal Emulation:
- DEC VT100
- DEC VT52
- Tektronix 4014
- Tektronix 4010
- Diamond
- Daisy
- AppleTalk compatible: DEC/VAX AppleTalk gateway.

KaleidaGraph™
Version 1.00
Price: $179.00
A Data Analysis and Graphics Application for Business, Engineering and Science.
Plot Types:
- Line Graph
- Scatter Plot
- Bar Graph
- Column Plot
- Pie Chart
- Box Plot
- Probability Plots
- Stacked Column

Plot Features:
- Selectable markers and patterns, including bar line plots.
- Log or linear axes.
- User selectable axis limits and ticks.
- Customized labels and legends, including titles.
- Display error bars.
- Linear and Normal probability distribution plots.
- Residuals Regression.

TekPrint™
Version 2.00
Price: $79.00
Now supports Hewlett Packard 7470 and 7475 Plotters!
Used in conjunction with either VersaTerm or VersaTerm-PRO, Tektronix graphics may be printed or plotted at resolution to either a LaserWriter, ImageWriter, or an EPSON compatible pen plotter.

Colors from your LaserWriter
Brilliant color pages with your equipment in minutes...

Starter Pack $39.95
plus shipping ($3), TX residents add 9%.

How To/Getting Started
used to create Studio Session's original sounds (see "Is It Live or Is It Mac?" Macworld, August 1986). Another feat that puts Studio Session a cut above its fellows is its ability to produce six simultaneous notes, or voices, instead of the usual four.

Synthesizers and MIDI
Six simultaneous Mac-sampled voices isn't bad, but if you're serious about music, it isn't enough. That's where synthesizers come in. The last five years have brought advances in synthesizer technology that make the microcomputer industry look sluggish.

The primary advance has been a boost in the price/performance ratio, and leading the way has been Casio. Its CZ-101 is a 10-pound, battery-operated marvel, with a 69-key miniature keyboard, 16 preset sounds, room for 16 of your own sounds, and a MIDI interface. It retails for $499, but I've seen it as low as $249. And it sounds great. Sequential, Korg, and Yamaha also make synthesizers for under $1000, and for a little more, you can have a sampling keyboard like Ensoniq's $1395 ESQ-1.

You play guitar? Don't fret. Roland Corporation and Octave Plateau Electronics manufacture MIDI guitar controllers that you can pair with your MIDI-equipped synthesizer. Drummers can make rhythm with Palmtree Instruments' Airdrums, two cylindrical sticks that are sensitive to acceleration in six directions. You wave the sticks around, and they generate MIDI signals for a standard synthesizer or a drum synthesizer called a "drum machine." Horn players can play synthesizers via a MIDI-modified horn or a "breath controller." Singers can serenade "pitch-to-MIDI" converters that translate audio signals into MIDI signals. In short, synthesizers aren't just for keyboard players anymore.

All of today's synthesizers come with built-in MIDI interfaces, but the Mac isn't similarly endowed. To attach a synthesizer to the Mac, you need a MIDI adapter, an add-on that plugs into the printer or modem port and converts MIDI signals into a stream of bits that the Mac recognizes, and vice versa. MIDI interfaces must have two basic connectors: a MIDI Out connector that transmits MIDI information, and a MIDI In connector that accepts it. (continues)
Finally, a drawing program designed to take your creativity out of the shadows and into the limelight.

Introducing "Draw it again Sam" the new object-oriented drawing program that brings flexibility and a new creative dimension to your computer graphics.

"Draw it again Sam" shares many of the same impressive features of other drawing programs like MacDraw and MacDraft. But "Draw it again Sam" is unique.

Only "Draw it again Sam" lets you create your own libraries. With a click of an on-screen icon or by menu selection, you can access and scroll through limitless libraries. This feature allows you to store and retrieve frequently-used art or forms like logos and text.

Only "Draw it again Sam" gives you up to ten layered drawing planes. Now you can produce color separations or cell animation quickly and easily. The possibilities here are endless.

And only "Draw it again Sam" uses "QuickDraw" drawing modes to their fullest potential. Now you can create magnificent visual effects like pattern combinations, inversions, and see-through objects. This is virtually impossible with other drawing programs.

The countless colors and shapes achieved by "Draw it again Sam" are breathtaking. And only "Draw it again Sam" lets you modify and manipulate objects limitlessly—after they’re drawn! It takes full advantage of the high resolution available on many of today’s printers and, being object-oriented, requires far less storage room.

Limitless libraries, up to ten layered drawing planes, "QuickDraw" drawing modes—and this is just the beginning. To find out more or to order your copy of this amazing new program, call (215) 644-3580 and say "Draw it again Sam."

You wouldn't know it to look at him. But he has an investment plan that's working, even though he's not.

From Elm Street to Wall Street, people all over America are discovering that U.S. Savings Bonds have changed. When held for five years or more, Bonds pay competitive rates, like money market accounts. They're also free from state and local income tax. Find out more, call anytime 1-800-US-BONDS.

Opocode Systems offers a large selection of MIDI adapters. The Professional 512 and Professional Plus both offer one MIDI input and two MIDI outputs; the Studio Plus has two MIDI inputs (allowing you to record two keyboards simultaneously) and six MIDI outputs. Southworth Music Systems makes the more sophisticated Jam Box/4, which supports several time codes (including SMPTE), allowing you to synchronize a sequencer to a multitrack tape deck or to a drum machine.

A One-Mac Band

A MIDI link enables you to manage a synthesizer's sounds using patch editors and librarians, but the real fun begins when you add a sequencer program. So named because they store sequences of notes, sequencers turn the Mac into a tapeless tape deck. Click a Record button, and the sequencer stores the MIDI data that a synthesizer transmits when you play it—data that indicate what keys you pressed, how long you pressed them, and (with some synthesizers) how hard. When you're finished, click Rewind, then Play, and the synthesizer plays back your performance.

But that's just the beginning. Sequencers let you create complete arrangements by using MIDI's ability to control numerous synthesizers through 16 independent data channels. By playing back existing tracks while recording new ones, you could send a bass and chord accompaniment to Channel 1, a flute solo to Channel 2, and a horn section to Channel 3. And the sound quality of the recording won't suffer as you add tracks. Sequencers store MIDI data, not actual sounds, so every playback is an original performance.

If that doesn't sound sweet enough, sequencers also enable you to edit recorded sequences. Looping features cause (continues)
No matter what kind of game you’re in the mood for, you’ll find that if it’s in a box marked FIREBIRD, it’s really hot!

Firebird offers the excitement of a whole range of challenges — Adventures and Strategies for long rainy weekends, Arcade games for exhilarating evenings, Simulations when you need to get away from it all.

Look for the Firebird — it stands for top-quality entertainment software in virtually every category.

How About These Fireworks From Firebird!

The world has been waiting for a sequel to the highly-acclaimed PAWN, with its revolutionary text-handling system. Here at last is GUILD OF THIEVES, an extraordinary trip through legendary Kerovnia. One of the most sophisticated parsers on the market lets you input complicated sentences and interact with a whole cast of fascinating characters.

You’ll think of Firebird every time you yearn for Adventure!

You’ll find the Firebird logo on other addictive Adventures, too. There’s the award-winning PAWN, forerunner of GUILD OF THIEVES — and KNIGHT ORC, a magical world of illusion enhanced by superb graphics and character interaction.

Fire From Firebird

When your mood changes from Adventure to Strategy, try these two from Firebird! TRACKER introduces you to a whole new concept in military warfare, while the revolutionary UNIVERSAL MILITARY SIMULATOR will provide you with the opportunity to recast all of history’s most dramatic battles. This is Firebird — the best in entertainment software of every description. We’ll prove to you that you don’t have to keep switching brands to satisfy your obsession for challenge.

certain tracks to repeat. Transposition
commands change a sequence's key signature. Quantization commands correct time-
ing errors. Punch in features play a piece
up to a predetermined point, then snap
into record mode to let you rerecord a pas-
tage. Editing features let you alter the char-
acteristics of individual notes.

Sequencer shoppers have several im-
pressive products to choose from. Indeed,
there are more professional-quality Mac se-
quencers than there are word processors.
The top three contenders are Mark of the
Unicorn's Performer, Passport Design's
Master Tracks Pro, and Southworth Music
Systems' MIDI Paint. Opcode Systems' 
Sequencer was one of the first Mac se-
quencers, and while it has evolved into a
powerful program over the years, it lacks
the fine individual-note editing capabilities
of its competitors. Unlike the other se-
quencers mentioned, which store one se-
quence per file, Sequencer lets you store
up to 26 sequences per file and then create
a master sequence that plays the others to
create a complete song.

And there are more sequencers on
the way. At this writing, Sonus Corporation
was putting the final touches on its pro-
oriented Masterpiece, which, like
Sequencer, lets you combine separate
sequences into a song. Lastly, Southworth
Music Systems recently announced One
Step, a $69 sequencer with much of MIDI
Paint's power, but designed for the
newcomer.

Because the sequencers I just men-
tioned are all capable programs, it's best to
audition them to find the one you're most
comfortable with. One area to assess is the
way each program lets you edit sequences.
Performer takes a numeric approach that
allows great precision but can be hard to
use, while MIDI Paint and Master Tracks
Pro both provide a visual editing window
that shows notes on a proportional grid.
You move or alter notes by dragging them,
and you click on a note to display a Per-
former-like numeric editing window.
MasterPiece offers both approaches in
one window.

If you're interested in exchanging files
with other sequencers, make sure your
equipment supports the new MIDI file for-
amat. At this writing, the MIDI file format
was close to being officially adopted by the
MIDI Manufacturers Association. In the

Why you should buy a mouse with no moving parts.

One simple reason. No moving parts. And that means no problems.

Introducing the A+ Mouse from Mouse Systems. The A+ Mouse is an all optical mouse with no moving parts. It doesn't depend on friction, so there aren't any parts that can slip, get dirty or wear out. It doesn't have a rolling ball, a commutator, little teeny bearings and shafts, or plastic housings housing who-knows-what.

Instead, our mouse uses a mirror-like pad that reflects a tiny beam of light to track your slightest hand movement. No other mouse moves as fast or is as reliable. Especially when you're moving around in spreadsheets and graphics software or editing text and manipulating data. That's because our mouse gives you up to 200 counts per inch and digital accuracy for exceptional cursor control.

Plus solid state electronics to ensure precision. No matter what Apple system you have, we have an A+ Mouse that's right for you.

The A+ Mouse is compatible with the Macintosh 512K, Macintosh Plus, Apple IIc and Apple IIe (which requires the Apple mouse card).

The A+ Mouse ADB is ideal for the Macintosh SE, Macintosh II, and Apple IIGS.

The A+ Mouse. The mouse you'll never have to clean, repair or replace. It's so reliable, it's the only mouse which comes with a Lifetime Warranty.* See your local dealer for a demonstration. Today.

A+ MOUSE

**Sampling Sound**

You're already familiar with one form of sampling: the motion picture. By taking 24 separate photographs every second, a movie camera obtains a sampling of the continuously changing (analog) action in front of it. A projector then shows the samples at the same speed, and your eye and brain fill in the gaps, giving the illusion of continuous motion.

Sound sampling works similarly. By taking periodic "pictures" of a sound wave as a sound is produced, a computer obtains a set of numbers that represents the sound wave's shape. Each picture, or sample, is a numeric snapshot showing the sound's amplitude when the sample was taken. The computer then recreates the sound by supplying the numbers to a circuit called a digital-to-analog converter, which generates waveforms that closely resemble the original.

Sound is more difficult to sample than visual action because of the speed with which sound waves vibrate. The middle C on a piano produces a sound wave that repeats 261 times every second, while the highest C produces a 4186-cycle-per-second waveform. To accurately render sound within the audible range, which extends up to approximately 20,000 cycles per second, thousands of samples must be taken every second. The faster the sampling rate, the more accurately the picture of the original sound becomes. Digital audio equipment takes 44,100 samples every second. Because the Mac Plus and SE must also spend time managing memory, creating screen displays, and handling other chores, they're limited to roughly 22,000 samples per second—not swift enough to earn a place in your stereo system, but fast enough to sound at least as good as an inexpensive table radio.

Another factor that influences sound quality is the sampling resolution—the ability of the computer to recognize changes in loudness of the sound being sampled. Compact disk equipment uses 14-bit sampling, meaning it's able to recognize and reproduce 16,000 different loudness levels—more than the human ear can discern. The Macintosh uses 8-bit sampling and is able to recognize only 255 dynamic levels. When the dynamic level of a sample lies between two points, the Mac rounds it off to the nearest level. This approximation results in sampling errors that you hear as noise.

The Mac II can sample at 44,100 samples per second but, like other Macs, it uses only 8 bits of resolution. Other improvements in the Mac II's audio circuitry give it better sound-reproduction capabilities than the Plus and the SE have, but don't expect to see any wine goblets shatter in front of Mac II speakers.

The Mac II's real potential in sound sampling lies in its speed and expandability. For example, Southworth Music Systems is developing a 24-bit sound sampling board equipped with a high-speed signal processing microprocessor. Forthcoming boards will turn the Mac II into a professional-quality digital recorder.

In the meantime, this format is gaining momentum as an unofficial standard in the Mac sequencer field.

**Smart Songsters**

I could talk about sequencers until I run into the Macworld Best-Sellers page, but I wouldn't be doing justice to another fascinating category of music software: intelligent instrument programs. These software collaborators store and analyze phrases and then improvise music with some characteristics of the originals.

Musical Luddites who aim their noses skyward at the notion of computer-composed music haven't played with Jam Factory, one of three intelligent instrument programs from Intelligent Music. In Jam Factory, four "players" store notes you play at a MIDI keyboard, and then the program analyzes the music. From there, the program generates new passages that contain the notes you played, but in a more random order. The order isn't completely random, however, because the probability of a given note occurring depends on how often it occurred in the original phrase. That's what allows Jam Factory's improvisations to resemble the original phrases.

The basic concepts behind Jam Factory aren't new. In 1961, computer music scientists developed what they called an analog composing machine. In one experiment, they used it to analyze Stephen Foster songs and compose new songs that had that Dixie flavor. And even Mozart once experimented with random composition, using dice to choose notes, then building a melody and supporting harmony based on those selections.

Jam Factory would make the flamboyant Amadeus squeal with glee. The screen is jam-packed with performance controls, buttons, and graphs for altering the phrases. Jam Factory plays—'their tempo, rhythm, randomness, key signature, and more. Jam Factory turns the Mac into a musical instrument, letting you change the program's renditions of your phrases by "playing" the on-screen controls. You can store the results of a performance, commit that flash of brilliance to disk, and replay it later.

If it sounds to you like there's more to Jam Factory than I've described, you're
It’s one thing to have great graphics. It’s something else to make them move.

**VideoWorks™ II for:**
- Business Presentations
- Animated Slide Shows
- Multi-media Storyboards
- Educational Movies
- Entertaining Animations
- Suggested Retail Price $195

MacroMind has been making the Macintosh look great for years. Now let us make you look great with VideoWorks™ II! The Overview window creates slide shows that can include animation, wipes, fades, timers or sound. VideoWorks™ II works great with the Macintosh II (in either 16 or 256 colors) or the Macintosh 512, Plus, SE.

Create animation on your Macintosh with VideoWorks™ II. Take any artwork you have and create animated presentations, storyboards, educational courseware, point of sale displays or music videos. From MacroMind® Inc., the creators of MusicWorks™, M.U.D.™, Art Grabber™, ComicWorks™, GraphicWorks™, Maze Wars+™.

Original VideoWorks owners can upgrade to VideoWorks II for $100. Send your check, VISA or MC order along with your VideoWorks Movies disk.

How To/Getting Started

right. Intelligent Music wisely offers a $5 demonstration disk that lets you experience the program for yourself. While you're at it, get the demo disks ($5 each) for Jam Factory's cousins—M, a composition and performance program, and UpBeat, an intelligent rhythm program designed for use with drum machines. UpBeat takes basic rhythms that you enter and devises accents and fills that take the mechanized "boom-chaka-boom" feel out of drum synthesizers.

Another fun program in the intelligent music class is Laurie Spiegel's Music Mouse, available from Opcode Systems. Music Mouse requires no keyboard or note-reading skills: it turns the Mac into a musical instrument by drawing a grid on the screen over which you drag the pointer to create music, which plays through the Mac's speaker or a MIDI synthesizer. Music Mouse isn't intelligent in the sense of improvising phrases, but in that it creates harmonies in any of five scales as you drag the mouse. At $59.95, it's an inexpensive and easy way to make music.

Fade Out

If you want to learn more about computer music applications and synthesizers, consider a subscription to Keyboard magazine ($19.95 per year from GPI Publications, 20085 Stevens Creek, Cupertino, CA 95015). Each month Keyboard reviews the latest in synthesizers and computer software, but not at the expense of the creative aspects of music making. David Crombie's book The New Complete Synthesizer ( Omnibus Press, 1986) provides an excellent introduction to synthesizer technology.

The Mac has quickly become the computer of choice for music applications, and the future sounds even better. The Mac II, with its faster processing and expandability, will play a large role in sampling and professional audio applications. Synthesizer makers will continue to cram more and better sounds into less-expensive packages, and increasingly intelligent music packages will enable music lovers with less-than-virtuoso keyboard skills to experience the joy of listening to their own music.

And joy is what making music is all about. 

---

New dimensions in Bible study.

We're celebrating over 5 years of market leadership! Version 4.0 of THE WORD processor includes the complete text of the KJV or NIV Bible for just $199.95. Our software searches for any word or text string. You can even create indexes on concepts and build your own library of research material.

Our new INSTANT ACCESS add-on product for just $49.95 finds any word instantly! And our family of products is still growing with topical cross references and personal commentary to annotate your Bible, and Greek and Hebrew transliterations which include Strong's Concordance.

If We Didn't Build MicahDrives Better We Wouldn't Back Them 8 Times Longer!

Hard drives from the new Micah are made to the highest standards of any drives for the Macintosh. That's why we offer a full 2 year limited warranty—8 times the industry standard and double the warranty given by virtually every other hard disk manufacturer.

Compare Micah's Construction
- Automatic mechanical park & lock of drive heads on shut down.
- Exclusive shock mounting of the drive assembly.
- The ability to withstand bangs & bumps up to 65 g's (operational) and 160 g's (non-operational) without failure.
- Superior airflow for longer life.
- All external drives fit directly underneath the Mac, taking up no additional space and increasing height by 3".
- Internal drives are designed for installation by the user on all Macs from the 512 up to the Macintosh II.

MicahDrives are sold and supported directly by the manufacturer for complete reliability, after-the-sale support and maximum value. After you've compared our construction, extras, prices and warranty you'll see why Micah is the hard decision that's easy to make.

Circle 352 on reader service card
Like most professionals in today’s multivendor environment, you have words stored on one system, spreadsheet and financial data on another and a need to combine information from both for presentation-quality documents on a third.

A software solution from OmniGate allows a Wang VS, Macs and IBM PCs to start talking to each other to meet your needs. Nearly 30 translators make sharing information across vendor lines easy and economical.

**Share And Share Alike**

Say you’ve got files stored on a Wang system and a desktop-publishing requirement using a Macintosh. Now you can connect them and transfer and translate documents and data files back and forth. Plug your Wang WP documents into MacWrite or Microsoft Word and merge them into PageMaker. Mail the PageMaker document to other Macintosh users via Wang OFFICE. Move data files or a Lotus 1-2-3 spreadsheet from a Wang VS to an Excel spreadsheet. Graph the figures using Excel and then insert them into the PageMaker layout.

Macintosh users can also access applications on the Wang VS. With our Macintosh 2110 terminal emulator, your Wang becomes an application and file server.

And OmniGate’s solution set lets your Wang system do double duty if IBM PCs are part of your system. IBM PC users can transfer and translate information while in Wang 2110 terminal mode. Your Wang system becomes a versatile file and application server for both the Macintosh and the PC.

You need no special hardware to introduce your machines to each other, because our solution is a software solution. No document and file-format translator boxes. No special wires or cables. Implement our solution using dial-up, switched or dedicated telecommunication links. No special training is required to use an OmniGate solution, either.

**Let’s Meet Today**

Call OmniGate at 415-781-6464 to meet the dealer nearest you. Once you’ve seen the OmniGate solution set, you’ll know why we must go on meeting like this!
Insights on Quark XPress

Text, font, and page-layout tips to make the life of the electronic publisher a little easier

by Valerie Kuletz

In the beginning there was PageMaker; a program that was difficult enough for those unschooled in text manipulation and graphic composition—a craft requiring considerable skill and knowledge of design, typography, and applications. Today, a number of other complex third-generation programs offer features that many people lack the background to use. In fact, the current crop of desktop publishing programs has become so sophisticated that it’s easy to feel overwhelmed. Quark XPress 1.03 is no exception.

You can use XPress for publications ranging from newsletters and magazines to reports, short books, and manuals. It features a powerful word processor and an impressive collection of text-control tools such as kerning, automatic hyphenation, and tracking (global kerning). XPress also offers color separation; the ability to wrap text around arbitrary shapes; and batch pagination, which allows you to format long manuscripts by simply placing the first column.

Many of XPress’s features imply flexibility and versatility. However, they can confuse both beginners and seasoned desktop publishers. For example, flowing text through columns and jumping across pages is a great feature, but too often “continued on page 10” bears no resemblance to reality. Since few of us are expert users of all the various graphics, text, printing, and page-composition tools featured in XPress, and since the manual won’t answer all your questions, here’s a collection of tips that should make life with XPress a little easier.

I would like to give special thanks to Robert Cowart for his invaluable research and testing of XPress. I would also like to thank XPress users Ed Nies, Joel Leipzig, and Jim Morton for their research contributions.

(continues)
We'd like to help you increase your memory.

Custom Memory Systems, Inc., the world's leading supplier of Memory and Storage Sub-Systems for Sun Microsystems, Inc.™ computers is now offering Memory and Storage Sub-Systems for the Macintosh™ family. For your Mac II™, utilizing State-of-the-Art technology, the SIMM (Single In-line Memory Module) is available in two (2) configurations:

- 1 Megabyte per board.
- 256 Kilobytes per board.

All Memory products have a lifetime warranty.

For the entire Macintosh family, a complete array of Storage Sub-Systems are available, ranging from 96 Megabytes (with or without 50 Megabyte tape back up) to 1.14 Gigabytes of fast access on-line storage in a single ergonomically designed package. All Storage Sub-Systems come with a Two (2) Year Warranty.

How To / Insights

Text Tips

XPress's text handling lends a great deal of typographic control, but you have to know how to use it. These tips help you save time and avoid frustration when you're working with the rich assortment of text tools.

Hyphenation

XPress's automatic hyphenation provides two ways to suppress hyphenation of a particular word. To prevent hyphenation of all occurrences, add the word to the Hyphenation Exceptions list. Don't hyphenate words on the exception list: enter procrastinate rather than pro-cr-as-tinate. To avoid hyphenating a single occurrence of a word, place the insertion point just before the word and press Hyphen.

Large Type with Small Type

Once upon a medieval time, monks labored in solitude to produce stunning illuminated letters at the beginning of a passage. The drop caps that designers use today usually come ready-made from a type font, but positioning them in Xpress still requires some effort.

To control the amount of space between the large type and surrounding text, use three boxes instead of just one for the drop cap and one for the smaller text. First position the drop cap and make its box transparent so the text flows around the letter. If the text hugs the large type too closely, create a third (nontransparent) text block for the drop cap, slightly larger than its original box, to act as a placeholder. Resize this buffer box (by its handles) to adjust the spacing.

Creating Headlines

Suppose you want to align a single-column headline with the text in the adjoining column. If you type the headline into the body-text block and change its font size, you may throw off the horizontal alignment. So when placing headlines on multicolumned pages, create a separate text box to hold the headline text. Then, after you flow your body text into the columns, resize the headline box to force the text to reflow until it's aligned. Keep adjusting the position of the headline box until the baseline across columns is even (see "Matching Headlines to Text").

(continues)
Your future is history.

The business software you've wanted for your Macintosh has been running on the IBM PC for years. It's written in dBASE, but now you can run it on your Macintosh.

With McMax,

McMax runs dBASE programs up to 10 times faster and gives you an outstanding choice of existing applications. Accounting, order entry and inventory control systems. Time billing, estimating and taxes. Payroll, personnel and mailing lists. Just transfer what you need to your Mac and it's yours.

If you'd rather do it yourself, you'll find that McMax is just what you need.

Pull-down menus and an Assist mode help you manage your data with no programming experience. And whenever you want to, you can take control with a rich set of English-like commands that you use interactively or in your own custom programs.

Whatever your mind can conceive, McMax makes it easier to achieve. It's the business database management standard, made better. To learn more, write Nantucket Corporation, 12555 Jefferson Blvd, Los Angeles, CA 90066.

Or call (213) 390-7923 today. Because today, McMax means business.

THE THUNDERSCAN FACE-OFF.

WHICH SCANNED IMAGE COST NEARLY TEN TIMES MORE TO PRODUCE?

It's tough, isn't it. They both look great. But the image on the left was digitized by a scanner that costs over $2,000. The image on the right by ThunderScan. The scanner that replaces ImageWriter's ribbon cartridge. Just $249 complete.

Now, we'll admit, the more expensive scanners are faster than ThunderScan. But what we lack in speed, we make up for in software power. And that can actually save you time in the long run. Because with ThunderScan there's no rescanning an image to get it right.

ThunderScan saves true gray shades. So once an image is scanned, you can change it any way you want. Control contrast and brightness. Create special effects. Take your image at face value or enhance it to your art's desire.

ThunderScan also gives you true half-tones. So you can tap the full resolution of your printer. (We tapped the Linotronic® 300 for the above images, but you can use your ImageWriter™ or LaserWriter™).

Now you can plug high-resolution halftones into your PageMaker®, Quark XPress™ or ReadySetGo!™ documents. Or use your scanned images with painting and drawing software like Illustrator™ and LaserPaint™.

ThunderScan's special effects include straight line screens, rotations and frames. Plus, you get a lasso for working with irregular shaped areas. And with our new Power Port, ThunderScan is Macintosh™ Plus and SE compatible, right out of the box. No wonder ThunderScan was recently voted "Best Digitizer/Scanner" in Macworld's first annual World Class Awards.

So if you want a sophisticated, high-resolution scanner and like the idea of saving money, the choice is as plain as the nose on your...well, you get the picture. Now get yourself a ThunderScan.

Circle 167 on reader service card
Importing
XPress 1.05 can't read Microsoft Word 3.0 files directly; you must convert them into ASCII text or Word 1.05 format before importing. (Quark expects the next version of XPress to be compatible with Word 3.0.)

Speed-Selecting
Don't forget that XPress lets you triple-click to select a line, quadruple-click to select a paragraph, and quintuple-click to select all the text in a chain.

Text Wraparound
The Text Outset command for picture boxes lets you specify the amount of white space between a graphic box and the text that flows around it. But there's a hitch: you must use the rectangular-box tool, not the rounded-corner one, if you want to adjust the white space.

Linking
After you finish with the text-linking tool, be sure to deselect it by switching to another tool; otherwise, one misplaced mouse click could wreck havoc on the structure of your document.

Page Layout and Graphic Design
Page-layout possibilities seem endless, but do the complications. A few tips can take some of the guesswork out of your page makeup.

Column and Graphic Combos
Multicolumn layouts present particular problems. For example, if you've set up a three-column grid for your text, how do you put two graphics side by side in the middle of page 5? If you position them without the aid of the grid, chances are you won't align them precisely enough. Instead, create a new text box that spans all three columns and position it where you want the graphics inserted. With the Modify command, change the number of columns to two. Then draw two graphics boxes in the new text block and load the art files as usual.

(continues)
Making a Mac-like Manual

XPress enables you to create a professional-looking manual in the Macintosh documentation format.

Positioning Text and Graphics

To accurately position text and graphics boxes, position the first box and then move the ruler's zero point to correspond to either the box's horizontal or vertical alignment. That makes it easy to align additional boxes by selecting Modify from the Item menu. You don't have to use the zero point of the left column (see "Making a Mac-like Manual").

Marginalia

Suppose you want to create a multi-column manual with the left column reserved for subheadings (called banging beads when all text beneath them is indented), thumbnail drawings such as icons, and special notes to readers. It's a familiar Mac manual design, but it takes an extra step to prevent the main text from flowing into the left column (see "Making a Mac-like Manual").

The secret is to use the zero point of the left column and then create a separate text box for anything that belongs in the reserved column and align it with the corresponding text. Because there is no way to "lock" the left-column items to the text they belong with, heavy editing, insertion of text or picture boxes, or any other significant change will force you to reposition left-column material. To avoid tedious tracking the migration, you could leave subheadings and notes destined for the left column within the main body of text until the end of the editing process.

Makeshift Style Guides

XPress lacks style guides, but you can devise your own by creating a file of model paragraphs (as short as a single word or letter) for formats you use often. Shrink this formats-file window and move it off to the side. When you open your document, resize it so that your small "formats" window stays in sight. Now you can jump back and forth between the document and your "style guide," copying the paragraph formats to your target document (see "Making Style Guides").

(continues)
Stop the red menace.

Introducing MacProof 3.0

You toil for hours getting an important business proposal just right. Only to have your boss send it back to you with more red marks on it than white space. That's not a pretty sight.

With MacProof™ 3.0, you may never see red again. MacProof is a Desk Accessory software package for the Macintosh®, that points out possible errors in style, usage and the mechanics of writing. A few clicks of the mouse makes a correction. MacProof can even make you a better writer over time by indicating possible mistakes, suggesting solutions — and letting you decide what action to take.

All the proof you need.

MacProof incorporates features that can make writing a breeze instead of a burden. An 80,000 word dictionary checks your spelling. Writing mechanics such as punctuation, capitalization and double words are reviewed.

MacProof checks for problems of usage such as sexist or sexist words, words that are often confused (e.g. its and it's) and imprecise or wordy writing. It even searches for problems in style such as an overuse of “be” verbs or non-standard words that make your writing less active and precise.

Extra credit.

MacProof adjusts itself to suit your writing style and problem areas. You decide which aspects of usage, style or mechanics you want checked and MacProof will check only those areas.

You can even add your own usage category for MacProof to analyze. And since MacProof works as a Desk Accessory, you can check for errors, review solutions and make corrections without ever leaving your document.

MacProof can give you word, sentence and paragraph counts in a document. Other features allow you to analyze the structure and flow of a document. And MacProof works with most word processing software for the Macintosh, including MacWrite™, Microsoft Word™ 3.0, PageMaker™, WriteNow™ and MindWrite™.

Get out of the red.

Discover how easy it is to become a great communicator and protect yourself against the red threat with MacProof 3.0. For your copy of MacProof, see your local Macintosh software dealer. Or write:

Automated Language Processing Systems

Circle 590 on reader service card
For example, here's how you would enter a title in your document with a format we'll call "Style 1." Copy a sample (even a single character will do) from Style 1 into your document as a new paragraph, and then start typing. (If you paste the Style 1 selection into an existing paragraph, it merely conforms to the existing format.) To change the format of type already entered in the document, use the Copy Format technique: click in the paragraph you want to alter, move the I-beam pointer to the desired format, and press Option-Shift-click.

To control the formats for entire pages, set up master pages as detailed in the XPress manual under "Designing and Using Default Pages," chapter 2, page 40.

Moving Graphics Blocks

Because XPress doesn't let you copy boxes between pages, you have to jump through a few hoops to move a picture from one page to another. Start by selecting the box with the graphic you want to move and press ⌘-M to display the box's specifications. Write down the specs. Go to the new page and create a graphics box of any size. Press ⌘-M again and type in the numbers you recorded to replicate the old box's size, location, and scaling. Finally, paste in the graphic itself.

Production

Even the best of all possible documents isn't complete until it has been printed. The following tips can help you avoid snafus on your way to the finished product, especially if you're using a high-end Linotronic 100 or Linotronic 300 to produce printing masters.

Color Separations

XPress was one of the first Mac programs to allow you to separate and print color overlays automatically. If you design a newsletter with green borders around black type, XPress can print the borders on one sheet and the type on another. The program can also add registration marks to each page to allow the printer to align the colors properly. But be careful. When the Registration Marks box in the print dialog box is checked, the image automatically shifts 1/4 inch down and to the right. On a page that is 8 by 10 inches or less, that isn't a problem. But if you're using a LaserWriter for standard 8 1/2 by 11-inch pages, it means that any image within 1 inch of the right-hand or bottom edge of the page will not print. With Linotronic typesetting equipment, or other equipment with sheets larger than 8 1/2 by 11 inches, turning on Registration Marks poses no problems.

Avoiding Improper Spacing

Sometimes, despite all your fine-tuning, the output from very high resolution printers (such as the Linotronic 100 and 300 typesetting machines) does not match what you see on the Macintosh screen. This can be a big headache because it usually turns up at the last possible moment. Here's one way to avoid unexpected line breaks and word spacing in Linotronic galley: edit text only in XPress's actual size, not in reduced or enlarged views. (This should not be a problem with the LaserWriter or the ImageWriter.)

Fonts for the Linotronic

Experienced desktop publishers have learned the hard way to stick with known fonts for Linotronic output. Some swear by Adobe's fonts for reliable accuracy in leading, kerning, and character-width values. They'll try an appealing font from another publisher only if they've heard from reliable sources that the face reproduces accurately on the Linotronic 100 and 300. Because the resolution is so much higher on these typesetters, slight inaccuracies in a font's character-width tables can cause an extra line wrap (not apparent on screen or in ImageWriter or LaserWriter proofs) that could disrupt an entire layout. When using unfamiliar fonts, always test them thoroughly on the Linotronic well ahead of your deadline. Be especially careful if you're using fonts with very thin strokes in the characters; they may virtually disappear in the Linotronic version.

Incompatible Fonts

More and more typesetting and copy shops are beginning to offer Linotronic services. However, just because an establishment can afford a $40,000 machine doesn't necessarily mean its employees know how to use it. This is particularly true with any but the most common fonts (such as Times and Helvetica). If you are using less popular PostScript fonts, here's an easy way to avoid hassling with people who may claim that they can't print your document because it contains weird fonts. Before embarking on your trip to the typesetter, create your own Mac boot disk complete with the System, the XPress program, all the screen fonts (installed with Font/DA Mover), and downloadable PostScript font files for each font in your document. Take this disk with you and boot up the typesetter's Mac with it. Then run Chooser (from the Apple menu) and select the correct output device. Finally, run XPress, open your document, and print it.

Gray Scales

Here's a hint about using the Shade feature for blocks and borders. The gray scales (darkness of shading) differ for each type of printer—LaserWriter, ImageWriter, Linotronic, and so on—because the dot size differs for each machine. Check a gray-scale sample printout from the printer you intend to use before you finish your design.

Saving Time

To cut printing time when you are doing lots of proofing, select Rough printing, which excludes pictures. See Where to Buy for product details.
The winner of MacUser's Editors' Choice Award and Macworld's World Class readers survey is the top-selling data base manager for the Macintosh — and for good reasons.

FileMaker® Plus is the first product to combine flexible and powerful data base management with professional forms capability.

Let's start with forms, an essential part of your day-to-day business activities. Number-crunching forms like invoices, purchase orders, and expense reports. Text-filled forms like contracts and form letters.

FileMaker Plus makes handling forms straightforward because it's designed for business people. You can quickly create any form you want—match a preprinted form, or invent your own. Arrange pictures, text, numbers, and dates anywhere on the page for maximum impact. Include your logo. And to make life even easier, there's an extra disk of templates for mailing labels, proposals, Rolodex® cards, and more. Ready to go as soon as you open the box.

That's form. Now let's talk substance — complete data base management. FileMaker Plus lets you find, organize, and analyze all the information vital to running your business.

Have FileMaker look up pricing information from your product file and instantly calculate, sort, and summarize your invoices. Automate your weekly sales report. Produce contact lists, form letters, and mailing labels from the same data—without retyping. And preview your reports on the screen to get them just the way you want them. Impressive, every time.

What's more, you can exchange information with other applications such as Microsoft® Word, Microsoft Excel, MacWrite® MacPaint™, and MacDraw™. FileMaker Plus is fully compatible with the entire Macintosh product line from the Macintosh 512 up to the Macintosh II, the ImageWriter® II and LaserWriter® Plus, and the latest system software such as MultiFinder™ and AppleShare™.

Nashoba Systems stands behind FileMaker Plus by providing free technical support, and by ensuring your satisfaction with a money-back guarantee.

For only $295, you can keep your business running at top performance. Call us today at 1-800-274-0610 for the dealer nearest you.

Mac System Tools

A consumer’s guide to fans for preventing Mac burnout

by Barbara J. Chan and Gordon Haig

Most personal computers have an internal fan. But the original Macintosh and Macintosh Plus do not, because they were designed to usurp little desk space and to be quiet.

So why does any Macintosh user need a fan? Computers operate on electricity, electricity generates heat, and heat deteriorates electronic components. Insulators dry out, crack, or crumble and semiconductor components age. The Mac has two circuit boards: an analog (or power) board, which drives both the computer and the video screen; and a system (or logic) board, which is the brain and memory bank. The analog board is the hottest part and is the most likely to fail through prolonged use. We’ve seen Macs go up in smoke because the flyback transformer overheated, blistered, and melted down inside, while the pin solder cracked and spread out across the board. Apple could have made the components more heat-resistant by making the conductors bigger and spacing them further apart—but then the Mac would have been bigger, slower, heavier, and more costly.

While researching this article we questioned independent technicians who disassemble and analyze failed boards. (We tried people at Apple, but no one would go on record.) According to Loy Spurlock, president of Computer Quick in La Mirada, California, between 60 and 75 percent of the Macs brought in for repair have problems with the analog board. Chuck Rusch of Eugene, Oregon, writes in MacHacker that 100 percent of the Macs two years old or older that he has examined had visibly cracked joints on the analog board. He says the damage results from the strain of repeated expansion and contraction on the solder. Computer Quick’s records indicate that in the summer, when the average high temperature is 84 degrees, three times as many power boards fail as in winter, when the average high is 67 degrees. These service technicians maintain that at least some, and perhaps many, of these failures could be prevented by additional cooling.

Floppy disks also expand when heated. In fact, if heat builds up, the disk can expand enough to cause temporary misalignment—which may make the disk unreadable when cool. About 1 in 50 file-recovery problems handled by the Berkeley Macintosh User Group’s help line result from this problem, according to Steve Costa, the group’s file-recovery expert. The Apple manual says that the Mac requires an ambient temperature between 50 and 104 degrees Fahrenheit. But the temperature at your desk is not the only factor influencing the Mac’s internal temperature. The convection cooling system—designed for a closed box—is compromised when people insert a board or internal hard disk. Those extras draw more power, generate more heat, and in some cases block the flow of cooling air on which the original design depended. (Even external devices such as hard disks may interfere with this crucial airflow if they are positioned too close to the air-intake vents at the bottom of the Mac.) Under these conditions, or in any situation where reliability is critical, additional cooling is essential to keeping the Macintosh system functional. Extra air circulated throughout the case can reduce the temperature inside by as much as 68 percent, thereby prolonging the life of the Macintosh.

Dancing the Fandango

Cooling systems offer a variety of extra features—such as a built-in surge suppressor or a special tool for installation and

The Best Bitmap Font Editor.

Imagine gaining absolute control over your letters, documents, reports, and pictures, by customizing the actual printed letters themselves. Create unique individual characters never seen before. Call these characters up with the stroke of a key. Size them precisely and repeatably up to 127 points high.

With FONTastic Plus, all this will become second nature to you. FONTastic Plus gives you unlimited access to every Macintosh bitmap font. And the power to make as many new fonts as you can imagine. Text fonts, display fonts, symbol fonts, logos or foreign language fonts are all as simple as clicking the mouse.

Fatbits editing like MacPaint—but with three sizes of fatbits—makes it easy to create and modify characters. Use cut and paste to copy common letter parts from one character to another. Background and guideline layers help maintain a consistent look from letter to letter. An integrated font mover makes installing fonts as easy as cut and paste. Instant print samples let you see how the font looks in print, without having to install it and type a sample.

FONTastic Plus is the next step in font editing. Fast, powerful, easy to use, and only $79.95.
If you've ever watched his show Firing Line, you know Bill Buckley to be one of the most articulate, erudite people who ever spoke the King's English. His superior vocabulary makes you lean forward in your chair to keep up with him. If anyone could get by without a thesaurus, he could. But we have his letter praising our comprehensive, contemporary Word Finder. No big words, just a nice letter saying how much he liked it and uses it. Didn't mention the 220,000 synonyms for 15,000 words. Didn't say anything about how in just seconds Word Finder performs the whole cycle of look-up and replacement, so you continue writing without taking your eyes off the screen or your fingers off the keyboard. Nothing about how simple it is—just select the word you want an alternate for, and up pops a window of synonyms. Pick a new word and the window disappears, and your new word takes the place of the old word. But he did say: "It's a bloody miracle. Word Finder has changed my life. I never used to use a thesaurus." * To order call 800-828-6293 (in New York State call 716-377-0130).

Word Finder installs as a desk accessory. It is not copy protected. Retail $59.95

*Mr. Buckley volunteered this statement about Word Finder, and is not being compensated for his endorsement.
Blowbard Industries MacFan removal (see "Cooling Tools").

We tested five systems. The Fanny Mac and MacFan fit snugly into the Macintosh handle. The System Saver Mac protrudes 2 inches above the Macintosh handle. The Mac'N Frost covers the entire cop, including the vents. The fanless MacChimney convection device sits on top of the Macintosh like the Tin Man's hat.

The fans are all rotary or propeller types. (The MaxChill piezoelectric fan had been discontinued at press time.) The MacChimney uses no power; instead, warm air rises through the chimney, drawing fresh

Kensington Microware System Saver Mac air through the Macintosh, much like someone sucking on a straw.

As with most Mac accessories, the cooling units come in several colors and

How To/Mac Tools

Cooling Compared
This bar chart shows how much each cooling device lowered the average temperature of a Mac's power (analog) and system boards. Without a fan, the Mac's power board averaged 130.2 degrees Fahrenheit, while room temperature averaged 75 degrees.

Playing Fantan
We tested a 512K Macintosh, which was enhanced with the new ROM. The Mac we used has a SuperMac SCSI board installed on the system board and a newer Mac Plus-type analog board. To establish a point of comparison, we measured the temperature of this Macintosh without any additional cooling devices. We measured the inside temperature using two thermometer probes; we put one above and in front of the flyback transformer at the top of the analog board and the other above the system board to the right of the 68000 chip. The average temperatures were 130.2 and 87.7 degrees Fahrenheit, respectively, with an average room temperature of 75 degrees.

We then tested the five cooling systems on this same Macintosh over a six-month period; the results appear in "Cooling Compared." The temperature at the analog board peaked at 55 degrees above room temperature and at 12.7 degrees above room temperature at the system board.

All five systems were effective; they managed to reduce the temperature at each location by an average of 22 degrees. The Mac N'Frost was the most effective, though, reducing the analog-board temperature...
The Mac+PC™ Coprocessor Card from

Add the following capabilities to your Macintosh

- Configure up to full 640K memory for DOS applications
- Download or run with third party 5.25" SCSI diskette drives
- Use Mac 3½" disk drives for DOS programs and data
- Dedicate or share Macintosh hard disk for DOS applications
- Work in the multiprocessing environments of either “Switcher” or Multifinder™
- Use Apple Imagewriter/laser printers or IBM® compatible letter quality printers (option)
- Communicate with MS DOS compatibles using 2 Com.ports
- Emulate IBM CGA/MDA equivalent graphics in DOS window using Mac graphics
- Use our utilities to transfer files between Macintosh and MS DOS
- All of the above without affecting the beauty of your Macintosh and under $1,000.00

Which One Is Fantastic?
If you’re working at home in a quiet room, consider the MacChimney. It’s cheap, silent, and it works.

For those on the go, only Fanny Mac and MacFan are worth considering. They can remain in the Macintosh handle and pack neatly into your carrying case.

For people operating a Macintosh with hard disk and printer in an office or some other noisy environment, we recommend the Mac’N’Frost because it is the coolest, it has a full control center, and it is easy to install.

See Where to Buy for product details.
How your Mac family and your 3270 family can be one big happy family.

Your Macintoshes and your mainframe. They have some truly amazing capabilities. Except for one: the ability to easily talk to one another.

But there is a universal solution that unites all your Macs—the 512 KE, the Plus, the SE, even the Mac II—with your 3270 world. It's Fri-Data's NETWAY 1000A.

This 3270 gateway for your Macs delivers perfect 3274 controller emulation. So it doesn't compromise your SNA or Bisync mainframe environment one bit.

Since we connect to AppleTalk, you are part of a local area network filled with high-end workgroup solutions. Giving you the best of both worlds: 3270 workstation capabilities and a sophisticated LAN.

But that's not all. With our file transfer capability, your Mac and mainframe can exchange text, Mac application files, binary files, and even IBM PC files.

And with our Switcher compatibility, you can integrate an IBM host session with several Mac applications. Without disconnecting from the host.

Given all these capabilities, you may think NETWAY 1000A is an expensive solution. Well, you're in for a pleasant surprise. For a workgroup of 16 Macs, NETWAY 1000A costs less than $200 per active 3278 terminal session.

And if all this sounds too good to be true, here's another pleasant surprise. Fri-Data's NETWAY 1000A has been delivering the best Mac-to-mainframe solutions for more than two years. For many of the biggest names in the Fortune 1000.

The Fri-Data NETWAY 1000A. Exactly what your Mac family, 3270 family, and, ultimately, your corporate family needs.

Contact us about our demo program and connect your Macintosh to your IBM host today. Fri-Data, 505 E. Middlefield Road, Mountain View, CA 94043, Telex: 172282, AppleLink: D0120, (415) 969-3700.

TRI-DATA
Satisfying our customers for 20 years.

Circle 51 on reader service card
Tecmar Introduces
QT-Mac40™ — the Very Fast,
Very Small, 40MB Tape Backup
for Macintosh.

It's up to twice as fast as many
tape drives. It's so small it fits
anywhere on your desk, or in
your briefcase. And it stores a
big 40 megabytes of data on
a single, mini tape cartridge.

It's the QT-Mac40! And it's only from Tecmar, a world leader
in tape backup for personal computers, with more than 70,000
satisfied customers.

- User-friendly, icon-
interface software
- SCSI interface for speed
and compatibility
- Compatible with all
internal and external
hard disks for the
Macintosh
- Background backup
operation—allows use of
Mac while backup is
being performed
- Automatic, unattended
operation—for periodic
backup of entire disk or
just-modified files
- Backup modes—mirror
image, file-by-file and
desktop
- Data encryption—
ensures security of
sensitive information
- Apple Tape Backup
40SC™ AppleShare™
and A/UX™ compatible

You Need QT-Mac40... if you keep important data on a
hard disk. Work in progress should be backed up periodically—
daily or weekly. At up to 3MB/minute-backup speed it won't
take long. And, if you're too busy, QT-Mac40 can back up by
itself automatically and unattended.

You Need QT-Mac40... if you could use extra room on
your hard disk. Seldom accessed files can be archived onto
tape and shelved, giving you room to grow. And with
QT-Mac40's unique Tape Library System you can quickly
find the location of any archived file
without installing a single tape.

You Need QT-Mac40... if you
would like to share large amounts
of data. A single, inexpensive
Tecmar QualityTape™ Mini-
Cartridge easily fits into a shirt
pocket or overnight-mail pouch.
And QIC-100 compatibility assures
tape interchangeability between drives.

Guaranteed Quality. QT-Mac40's two-year warranty
includes Tecmar's exclusive QuickTurn™ Quality Service. It
guarantees that if you have any trouble with your QT-Mac40
in the first six months of operation, Tecmar will send a
replacement within 48 hours. That's made-in-the-U.S.A.
quality... guaranteed!

For more information on QT-Mac40 call (216) 349-1009.
Or write Tecmar, Inc., 6225 Cochran Road, Solon, Ohio
44139-3377.
Updates

Highlights of software updates recently received but not yet tested. The first price is the upgrade cost for registered owners; the second is the list price.

**Family Roots** version 1.2B prints charts, allows selective text styling, and supports hard disks. Quinsept, Inc., P.O. Box 216, Lexington, MA 02173, 617/641-2930. $22.50; $72.50 new.

**Fluent Fonts** version 2.0 includes 18 new typefaces and more sizes within families. Kerning pairs have been added to some fonts. CasadyWare, P.O. Box 223779, Carmel, CA 93922, 408/646-4660. Free to those who purchased after April 15, 1987; otherwise $12; $49.95 new.

**Idealliner** version 2.3 fixes problems with zoom windows. Lets you view section numbers, customize outline numbering, and preview outlines before printing. Also includes selective text styling. Jimmy Mac Software, P.O. Box 957, Murfreesboro, TN 37133, 615/895-6427. Free; $40 new.

**MacInUse** version 2.0 is compatible with AppleShare, TOPS, MacServe, and other network products. Design Form feature lets you customize screens for soliciting information. An F-key records information to the data file from within an application. Tracks application usage under Switcher. Softview, Inc., 4820 Adohr Ln., Ste. F, Camarillo, CA 93010, 805/388-2626.

**Spellswell** version 2.0A is compatible with Word 3.01 and Symmetry's Acta. Includes guess feature, expanded proofreading capabilities, transfer function, and improved user interface. Working Software, 321 Alvarado St., Ste. H, Monterey, CA 93940, 408/375-2828, 800/331-4321; 800/851-1986 in California. Free with disk and receipt if purchased after June 1, 1987; otherwise, $18.50; $74.95 new.

**TimeMinder** version 1.4 is compatible with Switcher. Allows you to halt time tracking for interruptions. Atrix Software, 405 Bruce Ave., Grand Forks, ND 58201, 701/746-7202. Free; $139.95 new.

**TOPS for the Macintosh** version 3.18.87 includes a LaserWriter spooler and a data translation application. Centram, 2560 Ninth St. #220, Berkeley, CA 94710, 415/549-5900. Free if purchased after June 1, 1987; otherwise $29; $189 new.

**World Builder** version 1.1 is compatible with Soundwave from Impulse. Fixes a serious bug in previous version. Silicon Beach Software, 9580 Black Mountain Rd., Ste. E, P.O. Box 26430, San Diego, CA 92126, 619/695-6956. Free; $79.95 new.

To have products listed in this section, send upgraded software, an outline of major changes since the previous release, upgrade price, suggested retail price, company name, mailing address, and phone number to Updates, Macworld, 501 Second St., San Francisco, CA 94107.

You can have immediate access to your *Macworld* issues by storing them in our *Macworld* file boxes. They're a perfect way to keep every issue of *Macworld* in top condition and always at your fingertips. The cost is $7.95 for one file box; $14.95 for two file boxes; $21.95 for three file boxes. Each file holds up to 12 issues and is bound in rich blue leatherette and embossed in gold leaf lettering. They're rugged, compact, convenient. Charge orders (minimum $15) are accepted. Call TOLL-FREE 1-800-972-5858.

Unconditionally Guaranteed!

The Macworld Directory is a comprehensive listing, by category, of products and services available for the Apple Macintosh. It provides advertisers with a low-cost advertising alternative and our readers with an easy reference guide.

FORMAT: The standard format includes a product ID, a 300-character descriptive ad, and a company name, address, and telephone number.

Advertisers may choose among categories already in use, or they may create their own. Display advertisers can cross-reference their current ad to the Macworld Directory for increased exposure.

RATES: Listings are accepted for a three-time consecutive insertion at a rate of $850. We offer a six-time insertion at $2,500 that reflects a 15% frequency discount. Listings must be prepaid (except for established display advertisers) upon submission of ad copy. Checks, money orders, Visa, and MasterCard are accepted.

DEADLINE: For copy deadlines and further information please contact Niki Stranz, your Macworld Directory Account Manager, at 415/547-7722 or 800/435-7766 (800/435-7760 in California). Please send copy and prepayment to the Macworld Directory, 501 Second St., San Francisco, CA 94107.

Softworks, Inc., P.O. Box 2285, Huntington, CT 06484, 203/926-1116
With the price of most large-screen monitors hovering in the $2,000 range, we thought we'd do something a little radical with ours. Like knock a grand off.

Ah, you say, but at only $995, what can one possibly expect from the 15" Hi-Top Full Page Display (besides change back from your thousand?)

How about everything?

Start with a unique Macintosh™ clip-on connector board that's so easy to install you can do it for yourself. In all of fifteen minutes. Add dual-screen software that lets the Hi-Top work in concert with your Mac (whether it's the 512K, Plus or SE), so you can drag windows and palettes and desk accessories from one screen to the other.

Add screen resolution of 77 dpi (with a 720 x 900 display), for crystal clear viewing from edge to edge. And a footprint that takes up only two-thirds the space of that other, more well-known Full Page Display — but adds tilt-and-swivel positioning, to boot.

A warranty, that lasts a full year.

And a service organization — Xerox — that stands behind it.

All for only $995.

Ah, you may be thinking, but what's the catch?

The catch is that you've got to order before December 1st. After that, the price goes up to $1,395. So just call (212) 995-2224 or (415) 467-8411* and have your VISA or MasterCard ready (COD orders are available too). We'll have your Hi-Top delivered right to your door within two weeks.

What could be less annoying?

THE HI-TOP MONITOR

MacRecorder II Plus
Why MacChimney™ is leaving other cooling devices in the dust!

MacChimney for the Macintosh™ is the remarkable new cooling device with no moving parts. MacChimney extends the life of your Mac™ by significantly reducing its operating temperature — without the excessive and potentially damaging airflow created by rotary fans.

Rotary fan cooling devices are very good at drawing air into the Mac. The problem is that they draw in too much air, and with it airborne dust which can build up on the sensitive internal components. This can cause serious problems after months of operation.

MacChimney works in harmony with the sound engineering principle already at work in the Macintosh — free convection cooling. The chimney shape and additional height greatly hasten the flow of air along its existing path through the Mac. This increase in the rate of airflow by over 60% is a healthy rate for the Macintosh. The up to 3300% increase produced by conventional fans is not.

MacChimney is shipped flat and can be assembled easily in a couple of minutes. It fits tightly and securely on top of the Mac's case, and can be moved on or off in seconds.

MacChimney works on the Macintosh Plus and all Macintosh models except the SE and II, and with add-on memory boards up to 4 megabytes.

At only $17.95, including postage, handling, and a 15 day money back guarantee, MacChimney is priced well below mechanical cooling devices, and costs less to operate. Since MacChimney is priced too low to be carried by most retail stores, you can order MacChimney directly from Silicon Comforts and expect delivery within 10 days. Volume inquiries are welcome.

$17.95*

MacChimney is made of a Mac-compatible cardboard laminate that is strong, long-lasting, and stain resistant. Attractively finished in a color combination of Mac beige and platinum, it goes well with both the old and new machine colors.

...The ideal solution is the MacChimney, a totally silent and very inexpensive device for cooling the Mac... Arthur Naiman, co-author of The Macintosh Bible

MacChimney™ is a trademark of Silicon Comforts. Macintosh and Mac are trademarks of Apple Computer, Inc.
Apple’s original Lisa™ is now
The Lisa Professional. Run Macintosh™ software on the Lisa Pro as never before! A
larger 12” screen, 800K floppy, a newly developed 20MB internal hard disk is now available
as well as HFS™. Run the most popular Mac business programs on the market for less,
hundreds less! Built with all the quality you would expect and a national service center
supporting you...just a phone call away.

Five different configurations available with
prices starting at less than one thousand
dollars. New user, a second computer or
network file server...an affordable solution.
And for a limited time, you buy a qualifying
10Mb or larger system, we’ll buy the
software...up to $425 worth.* Choose from a
selected list of best sellers.

All systems include hard disks: initialized,
loaded and ready to go. Just plug it in, turn it
on and get ready to mouse around! It’s just
that simple.

Call for our Lisa Fact Book for more details.
But you better hurry...only 7,000 are available
at these low prices!

*Not all systems qualify. Please call for details.

Beck-Tech, P.O. Box 5027, Berkeley, CA 94705-0027, 415/548-4054, 800/227-2400 ext. 999. $99.

Mac’N Frost

MacChimney
Silicon Comforts, 2500 Bancroft Way #117, Berkeley, CA 94704, 415/658-9543. $18.

MacFan
Blowhard Industries, 6457 W. Howard St., Niles, IL 60648, 312/647-0564, 800/468-3577. $129.95.

System Saver Mac

Here's the most complete and authoritative biography of Steve Jobs, cofounder of Apple Computer, Inc. Told against the backdrop of the personal computer industry, this book accounts Jobs' early life and rise to fame and fortune. You'll gain insight into his personality, character, Zen management style, and the complex combination of elements leading to his great business success.

Jeffrey Young provides you with an exciting, in-depth insider's account of Jobs' unique contributions to the Macintosh computer. Young also details Jobs' departure from Apple, and the story of his new beginning at Next, Inc. Hardcover, 432 pages, $18.95.

At bookstores now, or call 1-800-ALL-BOOK.
In Connecticut, call (203) 966-5470.

Valid through 2/16/88

It's easy to get more information on products advertised in MacWorld.

Here's how:
   a. Print or type your name and address and circle the appropriate answer to each question.
   b. Circle the numbers that correspond to the reader service numbers for the products that interest you. These numbers appear in the ads and in the Advertiser Index.
   c. Apply first-class postage before mailing.

Valid through 2/16/88

Circle number 999 to subscribe to MacWorld. We will bill you $30 for a 1-year (12-issue) subscription (U.S. only).

November 1987

Valid through 2/16/88

Do your publications look old and dull? Are your I's dropping and A's sagging?

Get rid of the wrinkles in desktop publishing with a face-lift from Complementary Type™

Our new collection of display typefaces will tighten up the appearance of all your printed communications, giving them a more modern, professional look. Complementary Type faces can be automatically downloaded from a Macintosh™ to a Postscript® printer. Every font includes foreign language diacritics and is not copy protected.

Choose from 13 exciting new looks on seven disks:
- FATTI PATTI
- Cut Outs
- Highland Gothic
- H.G. Light
- Nouveau
- Kasse
- Hobnob
- Fletcher Gothic
- Perita Light
- Perita Medium
- Calculus
- MICHELLE
- Bodetett - 100s of borders

You wouldn't know it to look at him. But he has an investment plan that's working, even though he's not.

From Elm Street to Wall Street, people all over America are discovering that U.S. Savings Bonds have changed.

When held for five years or more, Bonds pay competitive rates, like money market accounts. They're also free from state and local income tax. Find out more, call anytime 1-800-US-BONDS.

Bonds held less than five years earn a lower rate.

A public service of this publication.

---

Choosing a database manager is no easy task. It's by far the most confusing and fiercely competitive field in Mac software. But now your buying decision is crystal clear, because the editors of MacUser and the readers of MACazine have both selected OverVUE as the Best Database of the Year.

Said MacUser (Jan. 1986), in selecting OverVUE for its Editors Choice Award: "OverVUE 2.0 is a deceiving program in that the more you use it, the more you realize what it can do. Power, speed and logical menus make this a dream database."

When MACazine (Jan. 1986) bestowed OverVUE with its Readers' Choice Award, they wrote: "We selected OverVUE because of its ease of use, clairvoyance and statistical capabilities. The fact that OverVUE was subsequently selected by our readers as Best Database simply confirms our original assessment: the product is a jewel and the customer support a bonus!"

OverVUE's clean sweep of these two prestigious awards only confirms what everyone else has been saying all along:

InfoWorld (July 8, 1985): "It is Macintosh software done right."

Icon Review (Fall 1985): "OverVUE 2.0 is our favorite database workhorse...it simply offers the best balance of power and ease-of-use available on the market today."

Nibble Mac (Oct. 1985): "OverVUE is not only easy to set up, it's the easiest for data entry. Its tools for entering repetitive data minimize typing time."

Online Today (electronic version—Nov. 1985): OverVUE 2.0 is a heavy duty data management tool...It does all the things a good relational database manager should!"

OverVUE's features and power make it the ultimate database choice. Clearly, users and editors alike think OverVUE is something special. We think you will, too.

So visit your nearest software dealer and purchase your very own copy of OverVUE, the Best Database of the Year.

The Word is Out...

"Absolutely AMAZING word processing program. I want it WriteNow!"
Robert Forras, MacTimes

"WriteNow feels perfect.... It's hot. Highly recommended. This is THE word processor to use if you use a Mac."
John Dvorak, San Francisco Examiner

"Right now, WriteNow comes the closest to delivering on the promise of future word processing."
Michael Miller, InfoWorld

"This is the word processor that we designed and built Macintosh for."
Steve Jobs, NeXT Inc.

"T/Maker's WriteNow For Macintosh is a polished word processor that retains the elegance of MacWrite but adds features like multiple windows, footnotes, multiple columns, and a spell checker."
Dan Farber, MacWorld Magazine

"...WriteNow adds up to a great new word processor. ...its ease of use and speed put it way ahead of Microsoft Word and MacWrite for most jobs."
Vicky Jo Varner, The MACazine

Best New Word Processor
MacUser Magazine 1986

Performance Word Processing for the Macintosh

Finally, a Mouse that’s really quick. One that doesn’t require a lot of room on your desk. One that’s easy to use, even on a desk full of papers. Turbo Mouse from Kensington.

Turbo Mouse turns mouse technology upside down. It puts the mouse ball on top, rather than on the bottom like a standard mouse. You move only the mouse ball, not the whole mouse. That’s why Turbo Mouse is quicker, quieter, and easier to use.

Turbo Mouse doesn’t get its speed only from this ease of use. It has an automatic acceleration feature that senses the speed at which you are working and moves the cursor further when you move the mouse ball faster. Turbo Mouse has two mouse buttons—one for right-handed users and another for lefties. And, since it’s only 4” x 6”, Turbo Mouse will fit neatly at the end of your keyboard.

For Macintosh™, Mac Plus, Apple* IIe, or Iic, ask for model 62350. For Macintosh SE, Mac II, or Apple IIgs, ask for Turbo Mouse ADB, model 62352. For more information, or a dealer near you, call (800) 535-4242. In NY (212) 475-5200.
